FINANCIAL CONDITION

In our opinion, the Balance Sheet presents fairly the financial condition of the Association at December 31, 1953.

SCOPE OF EXAMINATION

Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedure as we considered necessary in the circumstances.

Should further information be desired, kindly advise us.

Very truly yours,
HOWARD T. COX & COMPANY
Fred J. Sublette,
Certified Public Accountant.

Report of Auditor to Texas Memorial Medical Library Association

January 16, 1954

Dr. R. W. Kimbro, President
Texas Memorial Medical Library Association
Cleburne, Texas
Dear Sir:

We have completed our examination of the books of account and record of the Texas Memorial Medical Library Association, Austin, Texas, for the calendar year, 1953, and present our report.

BALANCE SHEET

The Balance Sheet, in our opinion, correctly presents the financial position of your Association at December 31, 1953.

The income from the funds appearing on the Balance Sheet shall be for the use and benefit of libraries maintained and operated by the Texas Medical Association. The income from the Texas Pediatric Society Library Endowment Fund is restricted to use in connection with the Pediatric Service only. The proceeds of the Dr. Karl John Karnaky Fund is limited to the buying of film for the library.

The Undistributed Income includes the unexpended balance of funds as follows:

Texas Pediatric Society Library Endowment Fund	$ 92.69
Unrestricted Investment Funds	602.06
	$694.75

Should further information be desired, kindly advise us.

Very truly yours,
HOWARD T. COX & COMPANY
Fred J. Sublette,
Certified Public Accountant.

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

The Board of Trustees desires to make a supplemental report along with certain recommendations, especially in regard to the financial structure of the Association, taking into consideration the duties and obligations of the Board of Trustees in regard to the allocation of dues.

Although the Board of Trustees, under Articles IV and XI of the Constitution, is charged with the duties of handling the business affairs of the Association, and the distribution of the funds as set forth under Article IV of the Constitution and also under Chapter II, Section 6 and Chapter XIII, Section 8 of the By-Laws, it is the desire of the Board at all times to keep the House of Delegates informed of its actions, especially in regard to finances.

In this connection, the Board would like to call to the attention of the House of Delegates that in 1950 the House of Delegates provided for an increase in the dues of the Association from $35 to $50. The additional $15 dues provision was set forth under Chapter XIII, Section 2 and reads as follows: "Additional dues of $15 per capita on the membership of component county medical societies, making a total of $50 per capita per annum, shall be collected and added to the General Fund until the mortgage on the new Association headquarters and library building is retired."

In Section 8 of Chapter XIII, we find the following provision: "The Trustees may divide the General Fund, herein provided for, into such funds as may be for the best interests of the Association, and may make appropriations therefrom to meet the requirements of the Association."

It is the desire of the Board of Trustees at all times to comply with all provisions of the Constitution and By-Laws. However, there are times when the Board of Trustees, in carrying out its duties, finds it necessary to reallocate monies from one fund to another in order to act in the best interest of the Association.

The Board would like to point out that in 1948 under Chapter VIII of the By-Laws, Section 5, the powers and duties of the Council on Medical Defense were set forth. In the second paragraph of Section 5 was this provision: "The Medical Defense Fund shall be a special fund entrusted to the Board of Trustees for investment and re-investment. The annual income of the fund shall be allocated to the payment of benefits to the members in good standing of the Association, and the balance remaining shall revert either to the corpus of the Medical Defense Fund or to the General Fund. *No loan shall be made from the corpus of this fund to any other activity of the Association*" (emphasis added).

Since the House of Delegates instructed the Board of Trustees to build a headquarters and Library building, it was therefore dependent on the Board of Trustees to utilize such funds as were available in the different accounts of the Association to make payments for the building as they became due.

On December 31, 1949, there was $44,444.11 in the Medical Defense Fund, and in 1950 the House of Delegates amended this Section 5, Chapter VIII so that it now reads as follows: "The Medical Defense Fund shall be a special fund entrusted to the Board of Trustees for investment and re-investment, *and such other purposes as the Board shall determine.* The annual income of the fund shall be allocated to the payment of benefits to the members in good standing of the Association, and the balance remaining shall revert either to the corpus of the Medical Defense Fund or to the General Fund."

Therefore, after this change was made by the House of Delegates, the Board of Trustees utilized the monies then in the Medical Defense Fund for the purpose of making payments on the amounts due for the construction of the building. At this time, there is a balance owed by the General Fund to the Medical Defense Fund of $61,198.90.

It is the understanding of the present Board of Trustees that there was an understanding between the Council on Medical Defense and the Board of Trustees that the funds borrowed from the Medical Defense Fund by the General Fund would be repaid as soon as possible.

It is the feeling of the Board of Trustees at this time that after meeting the payments due to Equitable Life Assurance Society of the United States, whatever portion of the $15 as set up under Chapter XIII, Section 2 remains should be utilized to repay the monies borrowed from the Medical Defense Fund since that money was used for payments on construction of the building. Also, in view of the increase in malpractice suits that are being filed against physician members in Texas and the increase in malpractice insurance rates, the Council on Medical Defense should have adequate funds to render assistance to any member of the Association against whom a malpractice suit is filed.

The Board of Trustees would like to call to your attention that all of the surplus monies of the Association on hand at the time the contract for construction of our Library building was made were utilized in paying for the construction of the building. This included, among other things, money from the sale of United States savings bonds and certain stocks that belonged to the Association. It is the

feeling of the Board of Trustees that these funds also should be repaid so that in case of any emergency the Association would have at least some monies in reserve so that the best interest of the Association and its members could be protected and that an additional assessment would not have to be levied by the House of Delegates.

While it is the opinion of members of the Board of Trustees that they have the authority under the Constitution and By-Laws to carry out the policies as set forth above, it was felt in this case it would be in order to present the matter to the House of Delegates with the following recommendations:

1. That after making payments due under the note and mortgage to the Equitable Life Assurance Society of the United States, any part of the monies remaining from the $15 allocated to pay off the loan on the building be utilized to repay the monies borrowed from the Medical Defense Fund.

2. That the reserve funds of the Association which were utilized by the Board of Trustees in making payments on the construction of the building be repaid also from any unused portion of the $15 allocated for the construction of the building.

For the information of the House of Delegates, under the note and mortgage with the Equitable Life Assurance Society, the Association is required to pay $2,514.90 per month or a total of $30,178.80 per year. The note bears 4 per cent interest. The Association has made the following advance payments, over and above that required by the note, as follows: November 28, 1952, $30,000; March 10, 1953, $30,000; May 21, 1953, $40,000; September 15, 1953, $30,000; or a total of $130,000.00 that has been prepaid on our note, leaving at this time an unpaid balance of $255,506.56.

It is the intention of the Board of Trustees, if the above recommendations meet with the approval of the House of Delegates, to repay the monies borrowed from other funds of the Association and, when they are repaid, make advance payments on our loan as often as possible.

Respectfully submitted,
R. W. KIMBRO, Chairman,
G. V. BRINDLEY, Vice-Chairman,
DENTON KERR, Secretary,
E. A. ROWLEY,
SAM N. KEY.

Speaker Deaton: You have heard the report and the supplemental report of the Board of Trustees. This is referred to the Reference Committee on Finance. The next item of business is the report of the Board of Councilors, Dr. R. G. Baker of Fort Worth, chairman.

Dr. Baker: The report is submitted as printed:

REPORT OF BOARD OF COUNCILORS

The usual meetings of the Board of Councilors have been held, with complete attendance at almost every meeting. Disposition has been made of all matters before the Board at each of its meetings.

Several other meetings have been attended by individual Councilors, or committees from the Board of Councilors, furnishing and receiving information and advice on matters not the sole concern of the Board.

Cooperation and help have been given to and received from various officers, councils, and committees with benefit to all concerned.

An interlocking liaison has been established with the Texas Pharmaceutical Association to handle possible interprofessional disputes and to promote a better relationship between doctors and druggists. This was accomplished by a committee from the Board of Councilors and a committee from the Pharmaceutical Association.

The Board is participating in certain contemplated and current action to effect closer cooperation between various agencies of the Texas Medical Association, seeking to eliminate some overlapping and at times conflicting activities.

Several intradistrict changes have been made by rearranging county society jurisdictions to meet population changes of local nature.

A good many questions, which are answered clearly in either the State Association's Constitution and By-Laws or the Principles of Medical Ethics of the American Medical Association, are submitted to the Board of Councilors for rulings. Copies of these documents are, or should be, in the possession of each county medical society. They explain, among other things, individual conduct and obligations of members and the responsibilities and actions of county medical societies.

For the first time in several years a disciplinary action of a county medical society has been appealed to the Board of Councilors, where it was upheld. An appeal then was carried to the Judicial Council of the American Medical Association, which sustained the original county society action and the appeal action of the Board of Councilors.

It is expected that a supplementary report from the Board of Councilors will be submitted to the House of Delegates.

Recommendation

The Board strongly recommends that county society members, especially officers, familiarize themselves with those portions of the Association's Constitution and By-Laws and of the Principles of Medical Ethics of the American Medical Association dealing with the individual conduct and obligations of members and the responsibilities and action of county medical societies.

Respectfully submitted,
R. G. BAKER, Chairman,
J. T. BILLUPS, Secretary.

Speaker Deaton: The report of the Board of Councilors is referred to the Reference Committee on Reports of Officers and Committees.

The next item of business is the report of the Delegates to the American Medical Association; Dr. Copeland will present that report.

Dr. J. B. Copeland, San Antonio: At the request of Dr. Robert B. Homan of El Paso, who is chairman of the delegation, I make this report:

REPORT OF DELEGATES TO AMERICAN MEDICAL ASSOCIATION

There were three mandated resolutions from the House of Delegates last year requesting the delegation from Texas to submit the resolutions to the House of Delgates of the American Medical Association.

Extension of Social Security

The first resolution was as follows:

"*Whereas*, among the few remaining groups of self-employed individuals in this nation not now included in Social Security coverage are many who prefer to exercise their God-Given right to provide for themselves in their own old age; and

"*Whereas*, the extension of Social Security was a campaign promise of President Eisenhower; and

"*Whereas*, legislation now proposed and pending com-

mittee action is intended to accomplish this campaign promise; and

"*Whereas,* legislation now proposed further attempts to increase vastly the scope of federal medical and hospitalization care; and

"*Whereas,* the Board of Trustees and the House of Delegates of the American Medical Association have shown no inclination to oppose the present administration; therefore be it

"RESOLVED, by the House of Delegates of the Texas Medical Association in regular session assembled this twenty-sixth day of April, 1953: That the delegates from the Texas Medical Association be instructed to present a resolution to the American Medical Association through the House of Delegates of the American Medical Association demanding unequivocal opposition to any extension of Social Security; and be it further

"RESOLVED: That a copy of this resolution be spread upon the minutes of this meeting, and that copies be sent to:

1. All delegates to the American Medical Association;
2. Officers and chairmen of committees of the American Medical Association;
3. Officers of the Association of American Physicians and Surgeons;
4. The president of each state medical association with a letter suggesting that the medical association of his respective state take similar action at the earliest possible moment."

This resolution was introduced in the House of Delegates of the American Medical Association by Dr. Robert B. Homan, Jr., and the policy as set forth in the resolution was adopted as the policy of the American Medical Association. Only recently, Dr. F. J. L. Blasingame of Wharton appeared before the House Ways and Means Committee of Congress testifying in opposition to the extension of social security.

Public Condemnation of Physicians

The second resolution was as follows:

"*Whereas,* the President of the Texas Medical Association stressed the necessity of harmony within the profession; and

"*Whereas,* certain spokesmen for an allied medical organization, and certain physicians who have written articles, have in recent months made statements for publication that would tend to divide the doctors into warring groups and undermine the confidence of the public in the physician of their choice; and

"*Whereas,* the support of newspapers and magazines has been openly sought by these groups in fighting an alleged evil, instead of the usual courses open to them through the offices of the parent organization, namely, the American Medical Association; and

"*Whereas,* many of the statements of these spokesmen for some of the allied medical organization are (1) beneath the dignity that doctors strive to attain for their profession, and (2) inclined or intended to cast aspersions upon, arouse suspicions against, or undermine the public confidence in any particular group within the medical profession; therefore be it

"RESOLVED: That the House of Delegates of the Texas Medical Association call attention to its delegates to the AMA to this serious breach of etiquette and of ethics; and be it further

"RESOLVED: That the delegates be instructed to support a reasonable measure which will discipline the offenders or prevent the recurrence of unwarranted attack on one group of physicians by another, and be it further

"RESOLVED: That the Texas delegation to the AMA endorse and support any reasonable regulation that would severely discipline any individual or group of doctors or spokesmen for them that would enlist the aid of the newspapers or magazines to condemn any group of physicians until they have been duly charged and convicted by our own regulatory bodies; and be it further

"RESOLVED: That the Texas delegation to the AMA, in order to implement a reasonable regulatory procedure which would prevent recurrence of these unfortunate articles in the lay press, introduce a resolution at the June session of the AMA House of Delegates which would incorporate a press, radio, and television code at the national level with authority to regulate and pass on medical press, radio, and television releases by members of the American Medical Association."

The above resolution, generally referred to as the Hawley resolution, was introduced in the House of Delegates of AMA by Dr. J. B. Copeland of Texas, and there were ten other resolutions covering the like subject from the following nine states: California, Florida, Illinois, Minnesota, New York, Oklahoma, Pennsylvania, West Virginia, and Wisconsin.

As you know, these resolutions were stimulated by recent newspaper and magazine articles reporting statements attributed to an official spokesman of an allied medical organization, Dr. Paul R. Hawley of the American College of Surgeons. The members of this organization are also members of the American Medical Association, and recognizing the importance of the general problem involved and the interest of the public, as well as that of the profession, the reference committee of the AMA held open hearings on the matters contained in these resolutions. All of the resolutions were carefully studied, including the one from Texas, and the reference committee took no action on these resolutions but instead requested the House of Delegates to give careful objective consideration to the ethical problem involved. It was felt that the Principles of Medical Ethics as formulated, interpreted and applied by the American Medical Association, must be considered the only fundamental and controlling application of ethics for the entire profession and that any statement relating to ethical matters by other organizations, within the general profession of medicine, advances views of only a particular group and is without official sanction of the entire profession as represented by the American Medical Association.

It was the feeling of the reference committee of AMA, in considering the resolutions, that the harm done to the profession by the current articles in the national publications, which lower the confidence of patients in their doctors, cannot be objectively evaluated. This highlights the fact that when individuals or groups without official status in the AMA or its component county societies utter or publish ill-considered statements, the result is too often that the confidence of the public in the medical profession is placed in jeopardy.

Federal Medical Services

The third resolution was as follows:

"*Whereas,* a great many of the patients being treated at taxpayer's expense in Veterans Administration hospitals are being treated for nonservice-connected disabilities; and

"*Whereas,* undoubtedly many of these patients are able to pay for their medical care, or, if indigent, can be provided such care at less cost by local communities; and

"*Whereas,* the Special Committee on Federal Medical Services, appointed by the Board of Trustees of the American Medical Association, recommended to the American Medical Association House of Delegates in Denver, December 2, 1952, that it go on record as opposing the care of nonservice-connected disabilities in Veterans Administration hospitals; and

"*Whereas,* the Booz, Allen, and Hamilton survey recommends that Congress look into this problem of federal care, via the Veterans Administration of nonservice-connected disabilities; and

"*Whereas,* the Hoover Commission and other independent agencies have called attention to the extravagant building program of the Veterans Administration, the careless expenditure of funds in government hospitals, and the wasteful use of medical and nursing talent in these institutions; and

"*Whereas,* an elected representative of the American Legion, speaking before the American Medical Association House of Delegates in Denver in December, 1952, denounced those 'chiselers' who are bringing the medical services of the Veterans Administration into disrepute with the taxpayers—both lay and physician; and also

"*Whereas,* the House of Delegates of the American Medical Association has resolved, with admirable restraint, to await the outcome of a proposed conference of the appropriate committees of (1) Congress, (2) the Veterans Administration, (3) the American Legion, and (4) the American Medical Association, before adopting the recommendations of the Special Committee on Federal Medical Services; therefore be it

"RESOLVED by the House of Delegates of the Texas Medical Association in regular session on this twenty-ninth day of April, 1953: That the delegates of the Texas Medical Association be instructed to present a resolution to the American Medical Association through the House of Delegates of the American Medical Association requesting the continuation of the efforts of the American Medical Association to bring about changes in legislation which will correct the existing evils which are permissible by the present existing laws."

This resolution was introduced in the House of Delegates of the AMA by Dr. Robert B. Homan, Jr., and was referred to the Reference Committee on Insurance and Medical Service, and was one of many like resolutions from other states.

After several hours of open hearings and lengthy executive sessions of the reference committee, the following report was made:

"Your Committee recommends with respect to the provision of medical care and hospitalization benefits for veterans in Veterans Administration and other federal hospitals that new legislation be enacted limiting such care to the following two categories:

"(a) Veterans with peacetime or wartime service whose disabilities or diseases are service-incurred or aggravated; and

"(b) Within the limits of existing facilities to veterans with wartime service suffering from tuberculosis or psychiatric or neurological disorders of nonservice-connected origin, who are unable to defray the expenses of necessary hospitalization.

"Your Committee recommends that the provision of medical care and hospitalization in Veterans Administration hospitals for the remaining groups of veterans with nonservice-connected disabilities be discontinued and that the responsibility for the care of such veterans revert to the individual and the community, where it rightfully belongs.

"The recommendation of the Committee with respect to the treatment of veterans with tuberculosis and neuropsychiatric disorders of nonservice origin in federal hospitals is believed necessary at this time because of the inadequacy of local facilities designed to provide treatment for all such cases. It is the feeling of the Committee, however, that the entire question of whether the care of these patients is a local or a federal responsibility must be reanalyzed by the Congress. The rapidly expanding veteran population and the need for facilities for the remainder of our citizens afflicted with these diseases suggests that community facilities must be developed under state or local administration for the benefit of all. Preferential treatment for veterans with these nonservice-connected disabilities cannot be continued indefinitely, in view of its detrimental effect on the health and the economy of the entire nation.

"In conclusion, your committee would like to stress the fact that these recommendations do not suggest any limitation or impairment of the hospitalization or medical care now available to veterans who have become physically handicapped as a result of military service. Your committee is in complete accord with that program.

"Your committee also recommends most earnestly that all of the facilities of the American Medical Association and of its constituent state and component county societies be employed immediately to disseminate background information and accurate statistical data in this regard. Every effort should be made to inform the profession and the public concerning the nature of the problem, the position of the American Medical Association and the reasons on which that position is predicated."

Federal Legislation

It is the recommendation of the delegates of the American Medical Association that all members of the House of Delegates carefully read the report of the Council on Medical Jurisprudence as it sets forth many important pieces of federal legislation that are now being considered by the national Congress and also presents the views of the AMA and the action and recommendations of the Council on Medical Jurisprudence of the Texas Medical Association.

We respectfully request that each member of this House of Delegates contact his Congressmen and Senators concerning matters pending in the national Congress as set forth in the report of the Council on Medical Jurisprudence and make his views known to them and find out what their views are on these subjects.

Relations Between Osteopathy and Medicine

Also presented to the House of Delegates of the American Medical Association was the report of the Committee for the Study of Relations Between Osteopathy and Medicine.

The House of Delegates of AMA recommended that this be passed over by the House of Delegates and referred to the component state associations for their consideration before final action is taken by the House of Delegates of the AMA.

In this connection, we have a resolution to offer:

Whereas, the House of Delegates of the American Medical Association has referred to each state medical association the thought-provoking report of the special Committee for the Study of Relations Between Osteopathy and Medicine, headed by Dr. J. L. Cline as chairman; and

Whereas, the officials of the American Osteopathic Association apparently have not yet made known any desire for a comprehensive collaboration with the medical profession on any of their problems; and

Whereas, there is no apparent tendency by the existing colleges of osteopathy to abandon or abrogate the original concepts which made the practice of osteopathy a cult; and

Whereas, there is some overlapping of interests and responsibilities in the matter of public health between the medical profession and the practitioners of osteopathy, therefore be it

RESOLVED by the House of Delegates of the Texas Medical Association:

1. That we express our sincere appreciation to Dr. Cline and his committee members for a thorough and interesting review of the matter of the relationship of the medical profession to osteopathy.

2. That it is our opinion that further progress on the possible solution of any mutual problems of medicine and osteopathy can come only when responsible officials of the American Osteopathic Association shall manifest a sincere desire to discuss mutual problems, and when the colleges of osteopathy shall give evidence of abandoning or abrogating the original concepts which classify the practice of osteopathy as a cult.

3. That we suggest that the present special committee of the Board of Trustees, headed by Dr. Cline, be continued, to stand ready at any time, upon the proper expressed desire of responsible officials of the American Osteopathic Association, to study further any problems of mutual concern to the medical profession and osteopathy, with further reports back to the House of Delegates of the American Medical Association as worth-while mutual studies are requested and carried out.

4. That a copy of these resolutions be presented to the House of Delegates of the American Medical Association at the forthcoming session in San Francisco.

Respectfully submitted,

ROBERT B. HOMAN, JR., Chairman,
T. C. TERRELL,
M. O. ROUSE,
J. B. COPELAND,
A. C. SCOTT, JR.,
JOHN K. GLEN.

Speaker Deaton: This report will be referred to the Reference Committee on Reports of Officers and Committees except the resolution, which will be referred to the Reference Committee on Medical Service and Public Relations.

This brings us to the reports of the several councils of the Association. The first is the report of the Executive Council; Dr. George Turner of El Paso will make the report.

Dr. Turner: That report is published:

REPORT OF EXECUTIVE COUNCIL

The Executive Council met in the Sam Thompson Room of the Association headquarters building on September 13, 1953, and again on January 24, 1954.

Dr. George Turner, President, Texas Medical Association, presided at both sessions. The question of nonservice-connected medical care for war veterans in Veterans Administration hospitals was discussed at length. President Turner summed up the situation as follows: "The Association's position is that medical care and treatment for nonservice-connected disabilities should be paid for by the veteran himself or be made the responsibility of his respective community."

Dr. C. M. Cash of San Benito was presented the General Practitioner's Plaque for 1953.

Reports of the councils and committees were presented at each session of the Executive Council. These reports appear under individual listing and should be given careful attention. The Council on Medical Jurisprudence stressed the importance of the members of the Association being informed of the membership of the following state boards:

State Board of Health—Dr. J. B. Copeland, San Antonio, chairman; Dr. George Turner, El Paso, vice-chairman; J. P. Burden, San Angelo; Dr. O. B. Kiel, Wichita Falls; A. C. Sloan, D.D.S., Dallas; Dr. F. W. Yeager, Corpus Christi; Dr. Hampton C. Robinson, Houston; Elmer C. Baum, D. O., Austin; and J. T. Stryker, Woodville.

Board for Texas State Hospitals and Special Schools—James Marvin Windham, Livingston, chairman; J. R. Hill, Dallas, vice-chairman; Mrs. Lawrence Tarlton, Fort Worth; Dr. James Wooten, Columbus; Rufus Higgs, Stephenville; Durwood Manford, Smiley; Claud Gilmer, Rocksprings; Dr. Raleigh R. Ross, Austin; and John Dudley, Houston.

State Board of Medical Examiners—Dr. H. L. Klotz, Austin, president; Everett W. Wilson, D. O., San Antonio, vice-president; Dr. M. H. Crabb, Fort Worth, secretary; Dr. L. H. Denman, Lufkin; Dr. Howard O. Smith, Marlin; Dr. Chester B. Gardner, Merkel; Dr. Cecil Greer, Houston; R. L. Martin, D. O., Mt. Pleasant; R. H. Peterson, D. O., Wichita Falls; Dr. J. G. Rodarte, Temple; Dr. Wendel A. Stiles, Dallas; and Dr. Denton Kerr, Houston.

The January meeting was preceded one day by the third annual meeting of the presidents and secretaries of county medical societies. Featured on this program were Dr. Frank Wilson, director of the American Medical Association Washington office; Dr. Everett C. Fox of Dallas; and Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association.

Dr. M. O. Rouse, Dallas, chairman, Council on Medical Education and Hospitals, asked the members to contact Governor Allan Shivers and urge that he present to the proposed special session of the Legislature the need of funds for the medical schools of Texas.

Members of the Woman's Auxiliary to the Texas Medical Association were in attendance at each meeting of the Council.

The Executive Secretary reported a membership in the Association of 6,713 at the close of the fiscal year on December 31, 1953. His report showed 5,751 Texas doctors belonging to the American Medical Association; 250 more members would increase the delegates from Texas to the AMA to seven.

Respectfully submitted,
GEORGE TURNER, President,
N. C. FORRESTER,
Executive Secretary.

Speaker Deaton: The report of the Executive Council will be referred to the Reference Committee on Reports of Officers and Committees. The next report is that of the Council on Medical Defense, Dr. McGehee, chairman.

Dr. Charles L. McGehee, San Antonio: In addition to the printed report we have a supplemental report which we would like to submit. (The reports follow:)

REPORT OF COUNCIL ON MEDICAL DEFENSE

The Council on Medical Defense has been active this year in working with the medical schools in order that an adequate program covering medical jurisprudence could be taught in the three medical schools in Texas.

It has been the feeling of this Council that many modern-day questions should be added to the teaching of a course in medical jurisprudence in order that the young physician will have a working knowledge of present-day medical jurisprudence when he starts to practice medicine. The Council has received splendid cooperation from the medical schools, and it is the intention of the Council to continue its work along these lines.

Malpractice Coverage

Also, it is the intention of the Council to make a study of malpractice conditions in Texas at a very early date. Among the questions that have confronted the Council is one pending at the present time in which the National Bureau of Casualty Underwriters has filed an application

with the Board of Insurance Commissioners for increased rates for malpractice coverage. The Council has made a study of this matter and will appear before the Board of Insurance Commissioners in opposition to the filing for rate increase as made by the National Bureau of Casualty Underwriters.

Based on the information the Council has been able to obtain from the Medical Protective Company, which covers approximately 80 per cent of the physicians in Texas, the Council does not feel that the request made by the National Bureau of Casualty Underwriters is sound. The Council has had occasion to obtain the actuarial experience, premium income, and loss ratio from the Medical Protective Company, and based on this information, if any increase at all is justified, it should not exceed over 10 per cent of the present premium. In the request filed by the National Bureau of Casualty Underwriters, an organization composed of quite a number of the casualty companies which write approximately 20 per cent of the malpractice business in Texas, the premium would increase for example, from $25 to $40 on $5,000 to $15,000 coverage for physicians not doing major surgery and from $25 to $60 for the $5,000 to $15,000 coverage on those doing major surgery.

The Council will cover this matter more thoroughly in a supplemental report to be presented to the House of Delegates at the annual meeting.

The Council wishes to thank the membership of the Council on Medical Economics, the Board of Trustees, and the officers of the Association, in joining in opposition to the rate increase as requested by the National Bureau of Casualty Underwriters. The Council would like to commend the Medical Protective Company of Fort Wayne, Ind., for its cooperation in furnishing the information giving the experience of the company which does cover approximately 80 per cent of those carrying malpractice insurance in the state.

Respectfully submitted,
CHARLES L. MCGEHEE, Chairman,
JOE NICHOLS,
P. M. KUYKENDALL,
HAROLD M. WILLIAMS,
JOHN H. WOOTTERS,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL DEFENSE

The Council on Medical Defense files this supplemental report concerning the action of the Board of Insurance Commissioners in granting an increase for malpractice insurance.

As will be found in the original report of the Council, an application for increased rates for malpractice insurance was filed by the National Bureau of Casualty Underwriters with the Board of Insurance Commissioners under date of February 26, 1954.

The National Bureau of Casualty Underwriters is an organization which represents numerous casualty companies writing multiple lines of insurance, which includes fire, casualty, and other types, of which malpractice insurance for physicians is one phase.

This Council has made a diligent effort to obtain a list of the companies that are members of the National Bureau of Casualty Underwriters which write malpractice insurance in Texas, and based on the information received from a representative of the Casualty Division of the Board of Insurance Commissioners, the following companies do write malpractice insurance in Texas. The Council is endeavoring to give not only the name, but to the best of its ability the number of physicians that they cover with insurance.

Company	*Texas Physicians Covered*
MEMBERS OF NATIONAL BUREAU OF CASUALTY UNDERWRITERS	
Aetna Casualty and Surety Company	806.5
American Surety Company of New York	?
Fidelity and Casualty Company of New York	36.0
Glens Falls Indemnity Company	8.0
Hartford Accident and Indemnity Company	453.0
Metropolitan Casualty Company of New York	168.3
National Surety Corporation	19.0
New Amsterdam Casualty Company	227.3
Travelers Indemnity Company	69.8
United States Casualty Company	4.0
NOT MEMBERS OF NATIONAL BUREAU OF CASUALTY UNDERWRITERS	
Continental Casualty Company, Chicago	1.0
Employees Liability Assurance Corporation	32
General Accident, Fire, and Life Company	6.0
American Employees Insurance Company	29.2
St. Paul Mercury Indemnity Company	253.2
American Casualty Company	42.6
Service Mutual Company	12.7
Medical Protective Company	In excess of 4,100

The names of the companies and the number of physicians insured represent the latest information available on file with the Casualty Division of the Board of Insurance Commissioners and in most cases represent the figures filed with the commission in 1951. The information on Medical Protective Company represents the latest information obtained from that company as of April 30, 1954.

At the hearing before the Casualty Commissioner and his technical staff, held on March 25, 1954, as reported in the Council's original report, the Texas Medical Association was represented by many of its key officers and council chairmen and other representatives. The National Bureau of Casualty Underwriters was represented by R. L. Jewell, Jr.; H. H. Winn represented the loyalty group which included Metropolitan Casualty; and Robert Lancaster, general manager of the Medical Protective Company, appeared and submitted in detail the position of the Medical Protective Company. Mr. Lancaster stated that insofar as his company was concerned, based on its premium income and loss ratio, a 10 per cent increase in rates was all his company felt would be justified.

For the information of the House of Delegates, the Council is listing below the experience in Texas covering a period of five years, showing the loss ratio by year of the Medical Protective Company:

Year	Loss Ratio (%)
1949	54.59
1950	28.73
1951	38.74
1952	26.03
1953	64.44

A jump will be noted in the loss ratio from 1952, when it was 26.03 per cent losses, to 1953, when it was 64.44 per cent; however, the average for the five years was 42.54 per cent.

The Council obtained information on April 30, 1954, that the rates in table 1 would be in effect on May 24, 1954. Also, for the first time in the history of our state, based on the filing of the National Bureau of Casualty Underwriters, physicians and surgeons are separated, which this Council thinks is inadvisable and is not a sound basis to be followed.

It will be noted from the table of rates that on a 25/75 insurance policy the rate has increased 33⅓ per cent and that on the 5/15 insurance policy, it exceeds 50 per cent. Based on the experience of the company carrying the coverage of over 4,100 physicians carrying malpractice insurance coverage, the increase is completely out of line.

TABLE 1.—*Malpractice Insurance Rates in Texas.*

	Rate Before 5/24/54 $2,500/$7,500	Rate 5/24/54 $2,500/$7,500	Rate Before $5,000/$15,000 5/24/54	Rate $5,000/$15,000 5/24/54
Physicians	$20.00	$30.00	$25.00	$38.00
Employed physicians	6.67	10.00	8.33	12.50
Physicians in military service	....	....	15.00	15.00
X-ray therapy by insured physician	30.00	46.00	50.00	57.00
X-ray therapy by employed physician	10.00	15.00	16.67	19.00
X-ray therapy by physician in military service	....	....	*	22.50
Partnership liability	33⅓%	33⅓%	33⅓%	33⅓%
Surgeons	20.00	30.00	25.00	38.00
Employed surgeons	6.67	10.00	8.33	12.50
Surgeons in military service	....	....	15.00	15.00
X-ray therapy by insured surgeon	30.00	46.00	50.00	57.00
X-ray therapy by employed surgeon	10.00	15.00	16.67	19.00
X-ray therapy by surgeon in military service	....	....	*	22.50
Partnership liability	33⅓%	33⅓%	33⅓%	33⅓%
Employed technicians	10.00	14.00	12.50	15.00
Employed technicians—x-ray therapy	10.00	10.00	12.50	13.00
Shock therapy by physician or surgeon	....	....	....	38.00
Shock therapy by employed physician or surgeon	....	....	....	12.50
Shock therapy by physician or surgeon in military service	....	....	*	15.00

*No additional rate for this coverage.

Texas is the only state in the Union at this time operating under a rating law. The law eliminates competitive rates between the companies desiring to write this type of business. Based on the action taken in increasing the rates, the Council feels it is absolutely unnecessary and discriminatory, and is considering the possibility of appealing from the action of the Insurance Commissioner authorizing the increase. If redress is not obtained by court action—if it is decided to take court action—then it will be necessary to present a bill in the Legislature repealing the rating law and allowing companies to operate on a competitive basis and on the basis of free enterprise. Such a bill would give the Board of Insurance Commissioners authority to examine the financial stability of the company and to see that the company is operating on a sound basis financially, but would allow a company to make a filing on a rate that it feels is fair to the insured.

In order that this may be accomplished, the Council recommends that all component county medical societies be alerted to contact their Senators and Representatives and discuss this matter in detail with them, asking for their active support and assistance in repealing this unfair and discriminatory law.

The Council feels that it is absolutely unfair to physicians of this state to be placed at the mercy of the companies writing a very small percentage of the malpractice insurance coverage in Texas. On the present basis, they can come in from time to time and, while writing a small percentage of the business, keep insisting year after year on increases in rates; this is not the first time the same group has filed with the commission an application for rate increase and also other types of filing which the Council feels are detrimental to the medical profession in Texas.

It is the opinion of this Council that the rate increase allowed by the commission could result in the physicians of Texas paying additional premiums in excess of $120,000 per year.

The Council recommends that each individual physician study the new rate increase, the experience of the company listed above as carrying the largest amount of coverage of physicians in Texas, and see the amount of coverage carried by the other companies which are requesting this filing. The bureau companies insure only 20 per cent of the doctors in Texas while the other companies insure 80 per cent. The bureau companies which requested the rate increase informed the Casualty Commissioner and his technical staff that their loss ratio had been approximately 183 per cent but they requested only a 100 per cent increase in rates, along with some other requests which will put an additional cost on the physicians of this state, such as the 33⅓ per cent of the base premiums where there are partners, which this Council does not feel is justified.

The filing of the National Bureau companies is based on a national experience as required under the Texas rating law, instead of the experience of companies operating and doing business and using only their experience in Texas. It is definitely unfair to the physicians of Texas, where the experience is good, to be thrown into a common experience with other states, where the experience is extremely bad. It is the feeling of this Council that if the companies experiencing this large loss ratio cannot operate on a basis equal to that of the Medical Protective Company, which has the largest coverage of physicians of any company in the state, then they should cease writing the business if they so desire.

It has been brought to the attention of this Council that some of the companies would not write malpractice coverage unless they could obtain most of the other insurance, such as automobile coverage, fire, and other types of casualty insurance.

Recommendations

There are many other phases of this matter that could be discussed at great length; however, it is the desire of the Council on Medical Defense to make the following recommendations:

1. That the Council on Medical Defense, the Board of Trustees, and the Council on Medical Jurisprudence take the necessary action to eliminate the unfairness of the Texas rating law.

2. That each physician in Texas be presented a copy of this report with the request that he take the matter up with his Senator and Representative and seek their support in repeal of the Texas rating law.

3. That each physician in Texas be furnished a list of the companies which are members of the National Bureau of Casualty Underwriters and write malpractice insurance in Texas and which, as members of the National Bureau of Casualty Underwriters, sought and obtained this unfair and discriminatory rate increase.

The Council on Medical Defense wishes again to commend the Medical Protective Company for its cooperation with this Council in furnishing its experience on premium income and losses and other pertinent information which has been of great assistance.

It is the feeling of the Council on Medical Defense that

in order to carry out its proper functions as set forth in the Constitution and By-Laws, it is necessary that adequate funds be made available so that the interest of the members of the Association can be adequately protected. Therefore, the Council is requesting that the Board of Trustees repay to the Medical Defense Fund the monies that were borrowed from said fund and used in the construction of the Library building. If the funds cannot be paid at one time, it is requested that the funds be repaid as soon as possible.

Respectfully submitted,
CHARLES L. MCGEHEE, Chairman,
JOE NICHOLS,
P. M. KUYKENDALL,
HAROLD M. WILLIAMS,
JOHN H. WOOTTERS,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

Speaker Deaton: These reports will be referred to the Reference Committee on Medical Service and Public Relations. The next report is from the Council on Medical Jurisprudence, Dr. Copeland.

Dr. J. B. Copeland, San Antonio: The Council on Medical Jurisprudence in addition to the printed report has also a supplemental report with information that we desire to make available to you. (The reports follow:)

REPORT OF COUNCIL ON MEDICAL JURISPRUDENCE

During the past year, the Council on Medical Jurisprudence has been active in its support of the Bricker Amendment, which is pending in our national Congress, and shall continue to support actively that amendment until it is finally disposed of.

It was during the first session of the Eighty-Third Congress that Senator John Bricker of Ohio and sixty-three cosponsors introduced S. J. R. 1, which proposed the adoption of a Constitutional amendment limiting the treaty making authority. This resolution was referred to the Senate Judiciary Committee along with S. J. R. 43, which was sponsored by the American Bar Association. On June 15, 1953, the committee submitted a favorable report on S. J. R. 1, with amendments, and recommended that it be adopted. The amended version of the resolution, as approved by the committee, stipulated that any provision of a treaty that violated the Constitution would be invalid and that the treaty power could be used to establish or modify internal law in the United States only through the enactment of domestic legislation that could have been adopted in the absence of such treaty.

It has been of paramount interest to the medical profession that the Bricker Amendment be adopted. It is important first to recognize the fact that treaties become the supreme law of the land if ratified by two-thirds of the Senate present and voting. In addition, it must be noted that significant changes have occurred during the past few years in the scope of treaties and executive agreements negotiated by the executive branch of the government. Although these instruments formerly involved only international matters, there are now pending treaties or executive agreements, the ratification of which would change our domestic laws.

In the health field three specific situations can be explored. They deal with the activities of the United Nations treaties of friendship with other countries and the conventions of the International Labor Organization. The United Nations charter, which was ratified in 1945, has two general sections that lay the framework for broad treaty provisions in the field of health.

Article 55 provides in part "The United Nations shall promote solutions of international, economic, social, health and related problems." Article 56 provides that ". . . all members of the United Nations pledge themselves to take joint and separate action in cooperation with the organization for the achievement of the purposes set forth in Article 55."

Agreements and treaties negotiated pursuant to these provisions could fundamentally change medical practice in this country if ratified by two-thirds of the Senate present and voting.

The second example deals with a series of friendship treaties that were before the Senate this past year. These include treaties with Denmark, Holland, Israel, and Greece, which dealt with immigration quotas, citizenship requirements, and *matters of professional licensure in the various states.* If these treaties had been ratified as originally prepared, some of the requirements of the state medical licensing boards, as set by the law of the individual states, would have been abrogated.

The International Labor Organization, an affiliate of the United Nations, in June, 1952, adopted a convention known as the "Minimum Standards of Social Security." This convention includes almost all of the socialistic medical proposals that until now have been rejected by the Congress. If this convention is ratified under the existing provision of the Constitution, government control of medicine will have been achieved. Because of the danger of the socialization of medicine by international treaty, the American Medical Association, supported by the component state medical associations, favors a redefinition of existing treaty-making powers.

A modified version of the Bricker Amendment was reported favorably by the Senate Judiciary Committee, as indicated above, on June 15, 1953. During the discussion of the amendment on the floor of the Senate numerous amendments to the resolution were presented. In voting on the resolution. the Senate considered the matter section by section. The most controversial and the one of greatest interest to the medical profession was the section which provided that executive agreements and treaties should become effective as internal law in the United States only through the enactment of legislation by the Senate and House of Representatives. The Senate defeated this section by a vote of fifty to forty-two. The next move was on a motion by Senator Wayne Morse, Oregon, to send the entire matter back to the Judiciary Committee. This motion was defeated by a substantial majority. An amendment was then presented by Senator Walter George, Georgia, which would require enabling legislation in the case of executive agreements affecting internal affairs. On the final balloting the vote was sixty for and thirty-one against. Sixty-one affirmative votes would have been necessary for the two-thirds required to amend the Constitution. Since the vote was taken, Senator Alton Lennon, North Carolina, who was absent on the day of the final vote, has filed a motion to reconsider the entire issue. It is probable that this matter will be discussed again in the Senate and voted on again early in April.

Senator Price Daniel of Texas was a co-author of the original Bricker Amendment and voted in support of it at all times and in opposition to substitutes that would have been detrimental to the amendment. He also voted for the George Amendment. Senator Lyndon B. Johnson of Texas was active in his support of the George Amendment. The George Amendment would definitely have supported the stand of the medical profession. The Association must continue its support of the Bricker Amendment if the preser-

vation of liberty in this country is not to be abrogated by some treaty or executive agreement.

Federal Aid to Medical Education

The Council has been active in support of the American Medical Association's position on federal aid to medical education. Among the bills considered by the Eighty-Second Congress dealing with federal aid to medical education was S. 337. That bill proposed that federal aid be provided to medical, dental, nursing, public health, osteopathic, and allied technical schools. The bill proposed the granting of funds based on formulas geared to the number of students normally enrolled with additional amounts for new students. Grants would also be authorized for constructing and equipping old and new schools. Scholarships and student maintenance would also be provided under certain circumstances. The Committee on Legislation of the American Medical Association voted to oppose the measure and in this it was supported by the component state medical associations across the country, for if the measure was enacted, it was felt it would establish a system under which an objectionable degree of federal control would be inevitable. The bill would create an opportunity for the exercise of political pressure and intervention and would jeopardize the academic freedom of medical schools. It is the intention of this Council to file a supplemental report at the meeting of the House of Delegates in order that members may be informed of the latest moves concerning this type of legislation at that time.

Veterans' Care

Medical benefits for veterans with nonservice connected disabilities is a recurring question considered by the American Medical Association House of Delegates, and the AMA stand is supported by the Council on Medical Jurisprudence.

In June, 1953, the American Medical Association adopted a firm policy with respect to the provision of medical care for veterans. Despite the fact that this question will not be considered by the Eighty-Third Congress, it is felt that the medical profession, generally, and key legislative medical personnel, particularly, should be completely briefed on the subject.

The AMA recommended that no change be made in the present law with respect to the provision of medical care for veterans with service connected disabilities. With respect to nonservice connected disabilities, it was recommended that except in neuropsychiatric and tuberculous cases responsibility for providing medical care revert to the individual or to the state or local government. In cases involving tuberculosis and neuropsychiatric conditions, it was recommended that temporarily, in view of the shortage of facilities in certain areas, responsibility be continued at the federal level if facilities are available.

The present law provides that medical care, hospitalization, and domiciliary care be allowed for all veterans with service connected disabilities. The law further provides that such care shall be available to veterans with nonservice connected conditions, within existing facilities, providing they are unable to pay for such care. The law provides that the signing of a prescribed statement under oath by a veteran with a nonservice connected disability shall constitute proof of his inability to pay.

The provision of medical care for veterans with nonservice connected disabilities was authorized approximately thirty years ago. At that time there were only about 5,000,000 veterans and there were in Veterans Administration hospitals approximately 16,000 beds, many of which were unoccupied, It was the surplus of beds at that time that suggested the expansion of the program to include veterans with nonservice connected disabilities. Today there are over 20,000,000 veterans; there are about 120,000 Veterans Administration hospital beds; and there is a waiting list of about 20,000 veterans every month, only a few of whom have service connected disabilities.

When the program began, the Veterans Administration medical load consisted of about 17 per cent nonservice connected cases. Today annual admissions and discharges approximate 525,000, of which 85 per cent are nonservice connected. It is impossible to predict what the extent of this program may be in the year 1975, although it has been estimated by General Frank Hines, past Veterans Administration Administrator, that there will be a need for 400,000 beds at Veterans Administration hospitals at that time, assuming that there is no change in the present law.

The cost of the Veterans Administration medical care program in 1934 was about $17,000,000. In 1944 it increased to $102,000,000, and for the past year it amounted to about $745,000,000. Thus, in the past ten years the cost of this program has increased by more than 700 per cent.

It should be noted that variations in statistics cited by representatives of veterans organizations and the medical profession are caused, to some extent, by the fact that one group is discussing the patient load as of a given day, and the other is discussing total annual admissions and discharges. The average daily patient load in Veterans Administration hospitals approximates 110,000, of which about 65 per cent are nonservice connected cases. The annual admissions and discharges now approximate 525,000, of which about 85 per cent are nonservice connected cases. In an attempt to explain away further the nonservice connected problem, the Veterans Administration has issued a breakdown of the nonservice connected load. The one thing to be borne in mind is that all of the figures and statistics used by the American Medical Association were obtained from the Veterans Administration and, therefore, it is logical to assume that they are accurate.

In discussing this very important problem it is preferable not to indulge in any lengthy consideration of the adequacy of the forms used by the Veterans Administration, the extent of the abuse in the utilization of Veterans Administration facilities, and the efficiency of the Veterans Administration in administering the program. Instead, complete emphasis should be placed on the more specific issues which follow:

1. The moral justification for the provision of medical care for veterans with nonservice connected disabilities.
2. The effect of the present program on civilian teaching establishments.
3. The resulting overlapping in federal medical facilities and an artificial shortage of physicians and allied health personnel.
4. The increased cost of medical care and hospitalization for the general public.
5. The justification for the huge federal tax burden.
6. The question as to whether veterans themselves actually desire this type of a handout.

The action of the House of Delegates of the American Medical Association is supported in full by the Council on Medical Jurisprudence.

Health Insurance Plans

Another question that it is necessary to consider is federal subsidization of private health insurance plans. There have been several bills introduced in the Eighty-Third Congress dealing with this matter, one of which is H. R. 6949 by Charles Wolverton of New Jersey. The administration bill has just been introduced and this matter will be covered in the Council's supplemental report.

Social Security

In regard to the question of social security coverage for physicians, numerous bills have been introduced at the present time concerning this matter. In June, 1949, and again in 1953, the House of Delegates of the American Medical Association adopted a resolution opposing the compulsory inclusion of physicians under the Social Security Act. Hearings will be held by the Ways and Means Committee of the House of Representatives at a very early date on the recommended changes to the Social Security Act. The key figure with respect to these changes in the law is Mr. Daniel A. Reed, of New York, the chairman of the House Ways and Means Committee. It is the intention of the Council on Medical Jurisprudence to cover this matter in greater detail in the supplemental report, bringing physicians up to date on what should be done by the rank and file of the Texas Medical Association. However, if it is necessary to take action prior to that date, the component county societies will be alerted and informed of what is taking place.

In the Council's supplemental report will be covered other federal legislation that the Council feels is of interest to members and should be supported or opposed.

For general information, the Council is reproducing an exact copy of a letter written by Dr. Frank Wilson to the Honorable Lyndon B. Johnson of Texas. The Council believes there should be one correction in the letter written by Dr. Wilson to Senator Johnson in that from the information available to the Council, Senator Johnson was active in support of the George substitute for the Bricker Amendment. The George Amendment was actively supported by the medical profession after the defeat of the original Bricker Amendment.

"AMERICAN MEDICAL ASSOCIATION
WASHINGTON OFFICE

March 3, 1954

Honorable Lyndon B. Johnson
United States Senate
Washington, D. C.
Dear Senator Johnson:

I want you to know that the American Medical Association is cognizant of and grateful for the leadership and understanding of world affairs which you showed by your vote for the 'Bricker Amendment' as announced on Page 2251 of the Congressional Record, February 26, 1954.

The medical profession is in favor of the principles embodied in this legislation for the reasons outlined in an editorial published in the Journal of the American Medical Association dated February 20, 1954, a copy of which was delivered to your office the morning of February 26, 1954.

Briefly stated, the physicians of the country believe that purely internal affairs such as medical care and licensure of physicians should not be subject to international legislation, without at least the Congress having the opportunity to pass on these subjects.

You may be assured that the physicians of your state are aware of your vote on this issue.

Yours sincerely,
F. E. Wilson, M. D.
Director"

State Appropriations

At the present time, the Texas Legislature is in session and there are certain appropriations which have been requested by Governor Allan Shivers in his message to the Legislature. Among the requests made by the Governor was one for an appropriation to the Southwestern Medical School of the University of Texas in the amount of $3,500,000 for a new clinical science building. Governor Shivers stated in his message: "It is a shame and a disgrace to the State of Texas and to the great University that bears its name to house a medical school in the shacks on this campus at Dallas. If you do not agree, you should visit them as I have done recently."

This request of the Governor is receiving the active support of the Council on Medical Jurisprudence.

Also, the Council is supporting a request to the Legislature for an increase in the appropriation covering the state health officer's salary. Recently, the State Board of Health of Texas was able to obtain the services of an outstanding physician trained in public health work, Dr. Henry A. Holle. Dr. Holle is a native Texan and received his education at Texas Agricultural and Mechanical College and the University of Texas Medical Branch at Galveston. He is recognized as one of the outstanding public health men in the nation today. It is hoped that the appropriation will be increased so that his salary will be $15,000 a year, for in accepting the position as state health officer of Texas, it was necessary that Dr. Holle accept a reduction in salary. It is the feeling of the Council that an increase in salary should be made.

There will be many other matters covered in the Council's supplemental report as mentioned above.

We wish to thank Mrs. E. W. Coyle, President of the State Woman's Auxiliary, the Board of Trustees, and the rank and file of the membership of the component societies for the fine support they have given the Council. On numerous occasions, the Council has called on them to support measures that have received action from this Council and it has always received wholehearted cooperation.

Respectfully submitted,
J. B. COPELAND, Chairman,
J. W. RAINER,
ROBERT D. MORETON,
JOHN K. GLEN,
G. W. CLEVELAND,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL JURISPRUDENCE

Since the filing of its original report, certain other action has been taken by the Council on Medical Jurisprudence concerning the called session of the Texas Legislature. During the called session of the Legislature, the Council was active in support of and cooperated with the Council on Medical Education and Hospitals in obtaining $3,500,000 for a new clinical science building for the Southwestern Medical School, University of Texas. This was approved by the Legislature and the money has been appropriated and is available now for the building of this building.

Also, the Council supported and was able to obtain an increase in salary for the State Health Officer from $10,600 to $15,000 a year.

These were the only matters considered by the Council on Medical Jurisprudence during the special session.

In regard to the *Bricker Amendment* (S. J. R. 1), which failed to carry in the United States Senate by one vote, it is still pending, and although Senator Alton Lennon of North Carolina has filed a motion to reconsider the entire issue, no action has been taken as of this date. The Bricker Amendment was actively supported by the medical profession and this Council.

On the expansion of the *Hill-Burton Act* (H. R. 8149 and S. 2758), H. R. 8149 has passed the House of Repre-

sentatives and hearings are now being held in the Senate. The American Medical Association has made certain recommendations concerning certain amendments which it is felt should be adopted before the bill is passed, and representatives of the American Medical Association have appeared before the House and Senate committees setting forth their views.

On *social security* (H. R. 7199), hearings are being held at this time and Dr. F. J. L. Blasingame appeared before the House Ways and Means Committee as a representative of the AMA and testified at length in opposition of organized medicine to compulsory coverage and certain other phases of the social security bill.

On the *reinsurance bill* for health plans (H. R. 8356 and S. 3114), hearings are now in progress before the House Committee on Interstate and Foreign Commerce and the Senate Labor and Public Welfare Committee. This bill also has been opposed by the medical profession as it is believed it will not fulfill its intended purpose and may, in fact, inhibit the satisfactory progress which is now being made by voluntary insurance companies and health plans.

In cooperation with the Board of Trustees of the AMA, after making a study of the following bills, this Council recommends to the House of Delegates that it go on record as opposing the bills mentioned below:

H. R. 6950, which provides $40,000,000 over five years for long-term loans to assist voluntary nonprofit health associations to obtain facilities and equipment. The physicians of Texas, acting in their capacity as citizens, should be active in their opposition because such loans can be had privately, thereby eliminating the unnecessary intrusion of the federal government into private medical and financial affairs.

H. R. 6951, which amends the Public Health Service Act to provide federal mortgage loan insurance for medical facilities and would favor voluntary prepayment health plans. There should be active opposition to this bill as the program would be entirely federally controlled and would amount to class legislation for a special group and there would be no state surveys or state participation.

H. R. 7700, which supersedes H. R. 6951 as mentioned above and would provide federal mortgage loan insurance for medical facilities favoring prepayment plans. There should be active opposition to this bill for the same reasons as set forth in regard to H. R. 6951.

Another bill the Council wishes to call to your attention is H. R. 8300, dealing with certain *tax deductions for medical expenses,* which passed the House of Representatives on March 18, 1954, and on which hearings are now being held in the Senate. The Board of Trustees of AMA endorsed a section of the omnibus tax revision bill which has passed the House, as the section endorsed would ease the financial burden of families with unusual medical expense. Under the present law, only medical expense in excess of 5 per cent of taxable income may be deducted.

There are numerous other bills pending which will be reported to the component county societies by the Council on Medical Jurisprudence from time to time as the matters are presented to the federal Congress.

The Council sent to each president of the component county societies copies of resolutions on the social security bill and the reinsurance bill. The resolution and analysis on the social security bill was prepared by the Harris County Medical Society and the one on the reinsurance bill by the Tarrant County Medical Society. Also sent to the president of each component county medical society was the testimony of Dr. F. J. L. Blasingame which was presented to the House Ways and Means Committee.

If these resolutions have not been presented to your society for its information, you should see that the president of your local society does present these to the full membership, and it would be well that copies be furnished to each member of your component county society.

The Council would like to call to your attention the fact that this is an election year, and at the present time, some lively congressional races are in sight. For example: Congressman Wingate Lucas of Tarrant County is opposed by Jim Wright of Weatherford; Congressman Ken Regan is opposed by State Senator J. T. Rutherford of Odessa; Clark Thompson of Galveston is opposed by Clyde Kennelly of Hempstead; Congressman Brady Gentry of Tyler is opposed by Lindley Beckworth; Congressman O. C. Fisher of San Angelo is opposed by Sam Connally of San Saba. Incumbent Congressman Frank Wilson of Dallas is retiring from Congress and the following residents of Dallas have filed for his place: Wallace Savage, Leslie Hacker, and Todd Mitchell. One of the districts which has drawn the most candidates is for the vacancy in the Corpus Christi district where Congressman John Lyle is retiring. The candidates at the present time are State Senators John Bell and William Shireman and Representative Gabe Garrett and DeWitt DeWitt. There will probably be other candidates who will file in most of these places.

Sixteen of the incumbent state Senators are up for reelection and 150 members of the House of Representatives will be up for reelection.

It is most important that you, the members of your county societies and woman's auxiliaries become familiar with the candidates and the things they stand for. More information concerning these matters will be made available to members of the component county societies later.

Among other bills pending in the federal Congress is *H. R. 8857,* introduced in the House of Representatives by Chairman Reed of the House Ways and Means Committee, which would require all employers even of only one person to participate in the federal-state unemployment compensation program. Under present law, employers are required to participate only if they have eight or more employees. The only physicians exempted under the bill would be those with no employees. Under present law, employers may report and pay the tax quarterly or annually. The bill would eliminate the quarterly system. The United States tax is 3 per cent of the payroll but a credit of 2.7 per cent is allowed employers providing they pay this amount as state unemployment taxes. H. R. 8857 has the administration's support. The House committee is expected to be busy several weeks in executive session on the social security extension bill, and accordingly, no hearing date has yet been set for committee hearings on this bill.

The Council considered the report and recommendations from the Texas Society of Pathologists concerning the premarital and prenatal laws of Texas. After a discussion, the Council recommends that a committee from the Texas Society of Pathologists meet with the new state health officer and a committee from the State Board of Health to see if their differences can be adjusted, and if the matter cannot be adjusted, that the matter again be brought to the attention of this Council.

Respectfully submitted,
J. B. COPELAND, Chairman,
J. W. RAINER,
ROBERT D. MORETON,
JOHN K. GLEN,
G. W. CLEVELAND,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

Speaker Deaton: The reports will be referred to the Reference Committee on Medical Service and Public Relations. The next report will be that of the Council on Scientific Work, Dr. May Owen, Fort Worth.

(Dr. Owen then presented her report:)

REPORT OF COUNCIL ON SCIENTIFIC WORK

A 1954 annual session which would be of value and enjoyment to the great majority of the members of the Texas Medical Association has been the chief goal of the Council on Scientific Work during the past year. Details of the program are announced elsewhere, but attention should be called especially to the following features: (1) two simultaneous general section programs which cover in one and one-half days important developments in almost every field of medicine, (2) six out-of-state guest speakers, who are authorities in their respective fields and well known for their teaching ability, (3) well planned specialty society programs open to all members of the Texas Medical Association, and (4) streamlining of the opening exercises and other activities which in previous years may have tended to drag, an example being the President's entertainment, which this year will be an informal, outdoor supper and floor show full of gaiety and without speeches or introductions.

Plans already are under way for the 1955 session in Fort Worth, to be held April 25, 26, and 27, and suggestions from any member of the Association for making it a still better meeting will be welcomed by the Council.

The Council a year ago introduced amendments to Article III, Section 3, of the Constitution and Chapter VII, Section 1, of the By-Laws which would permit the House of Delegates to elect officers at any of its regular meetings during the annual session after other business has been completed. These amendments will be before the House for final action this year, being included in the report of the Committee on Revision of the Constitution and By-Laws. The Council heartily recommends adoption of these amendments so as to clear the latter part of the annual session period for strictly scientific purposes.

Respectfully submitted,

MAY OWEN, Chairman,
CLYDE A. STEVENSON,
L. BONHAM JONES,
KLEBERG ECKHARDT,
GEORGE W. WALDRON,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

Speaker Deaton: This report is referred to the Reference Committee on Scientific Work, except that part dealing with the amendments to the Constitution and By-Laws, which is referred to the Reference Committee on Amendments to the Constitution and By-Laws. The next item of business is the report of the Council on Medical Economics, Dr. Harvey Renger, Hallettsville.

Dr. Renger: The report is printed. We do have also a supplemental report:

REPORT OF COUNCIL ON MEDICAL ECONOMICS

Through the year's activity the Council on Medical Economics has finally clarified the position of the Texas Medical Association in regard to group insurance for its members. Investigation has revealed that the Metropolitan Casualty Insurance Company of New York had been approved by the Texas Medical Association and is the only company approved for group insurance for the Texas Medical Association members.

Significant Laws

The laws pertaining to premarital and prenatal examinations and certificates of health have been discussed with the State Department of Health and the law is rather specific in its outline. Portions significant in that they pertain to medical activity follow:

"Every physician or other person permitted by law to attend a pregnant woman during gestation shall, in the case of each woman so attended, take or cause to be taken a sample of the blood of such women at the time of the first examination and visit, and submit such sample to an approved laboratory for a standard serologic test for syphilis."—H. R. 597, Section 1, Fifty-First Legislature.

". . . that the bearer [employee in any type of food handling concern] had been actually and thoroughly examined by such physician within a week prior to the time of such employment, and that such examination disclosed the fact that such person to be employed was free from any transmissable condition of any infectious or contagious disease. . . ."—Texas Health Certificate Law, H. R. 142, Forty-Sixth Legislature, Approved April 26, 1939.

"The certificate shall state that the applicant has been given an actual and thorough examination, including a standard serologic test for syphilis. The examination shall not have been more than fifteen (15) days prior to the date of issuance of such license. . . ."—H. R. 588, Fifty-First Legislature.

Inquiries

The Council is interested in establishing some responsible group or individuals who could be in a position to answer the inquiries that are directed to the Texas Medical Association in regard to its various activities and functions as an organization and also in regard to statistical information of the individual members. Many such inquiries go unanswered because of lack of coordination of the various councils, and the Council on Medical Economics wishes to make a recommendation to alleviate such a condition.

Health Insurance

The Council is alarmed at the articles that have appeared in the Scripps-Howard newspapers against the voluntary health insurance companies. It seems that the companies of poor repute have cast a shadow on the many health insurance companies that have been giving such an excellent coverage to so many people over the United States.

Physicians Placement

The report of the Physicians Placement Service has been prepared by Mrs. Wacille Johnson of the Physicians Placement Service, who is to be complimented on the efficient manner in which she has attended to the duties of the Physicians Placement Service. The report follows:

Since January 1, 1953, the Physicians Placement Service has had requests from 601 physicians seeking locations in Texas for the practice of medicine. Of this number 108 have located in Texas, 52 selecting the available locations on file with this service and 56 accepting other positions throughout the state. One hundred and seventy-seven physicians were dropped for various reasons such as further training, military service, and location in other states. There are currently 323 physicians seeking locations in Texas.

From January 1, 1953, this service has had requests for aid from 196 locations. These locations include communities in need of general practitioners and clinics and physicians desiring associates. Of these locations 84 were filled, 52 by physicians on file in this office and 32 by other means. Thirty-nine locations were removed for various reasons. There are currently 73 locations on file seeking additional physicians.

It is interesting to note that in 1952 this office had requests from 399 physicians seeking locations and during the past year requests for aid came from 601 physicians. This is partly due to the increased publicity which the placement service has received during the past year and the improved manner in which the listings of locations are presented. For several years the locations were mimeographed as a list of opportunities giving all the openings together in one list regardless of whether or not they were specialty openings. This has been completely revised and separate booklets are maintained according to specialty. Each physician receives only that booklet which contains the specialty openings in which he is interested. These booklets have attractive covers and have been well received.

The placement service was very fortunate in having an article printed in *The Journal of the American Medical Association* giving a complete history of its activities in the December 19, 1953, issue. Also *Medical Economics* in January, 1954, featured pictures of the booklets of locations sent out by this office with captions describing them. This publicity has been a great factor in the increased amount of applications from physicians requesting aid in locating in Texas.

Recommendations

To assist in avoiding any possible detrimental public relations by letting inquiries to the Association go unanswered, the Council on Medical Economics recommends that some responsible group, possibly the Council itself, be authorized to direct inquiries to the respective chairman of the council or committee which is involved and if the inquiry does not normally fall under the jurisdiction of any council or committee of the Association, that the Council on Medical Economics solve the problems as best it is able.

The Council also recommends that after further investigation, the Texas Medical Association through its Committee on Public Relations and the voluntary health insurance companies issue a statement concerning the unfavorable newspaper articles recently published by Scripps-Howard newspapers.

Respectfully submitted,

HARVEY RENGER, Chairman,
A. G. BARSH,
R. R. ROSS,
H. H. CARTWRIGHT,
E. W. JONES,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL ECONOMICS

The original report of the Council on Medical Economics has been approved by the Council except for the following recommendations and corrections:

1. In the "significant laws" regarding the issuance of health certificates for food houses, it was suggested that that law be referred to the Committee on Public Health for investigation and to see if it should be improved upon by the compulsory requirement of chest x-rays and serologic tests.

2. In the clarification of inquiries and of recommendations which have been noted about the central office receiving inquiries from outside sources in regard to the various acts and functions of the Texas Medical organization and requests for statistical information relative to the individual members, such as costs of operations and cost of education, it seems that there is no definite correlation of the different committees for the answering of these inquiries. It is suggested by this Council that some responsible group, possibly the Council on Medical Economics itself, be authorized to direct information to the respective chairmen of the councils or committees which are involved in the different inquiries. In the past, some of these inquiries have received a noncommittal answer which has been detrimental to public relations of the Texas Medical Association.

3. The Council went on record rejecting the plea of the premedical students' request for assistance in establishing a premedical loan fund.

Respectfully submitted,

HARVEY RENGER, Chairman,
A. G. BARSH,
R. R. ROSS,
H. H. CARTWRIGHT,
E. W. JONES,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

Speaker Deaton: The reports will be referred to the Reference Committee on Medical Service and Public Relations. The next report is from the Council on Medical Education and Hospitals, Dr. M. O. Rouse, Dallas.

Dr. Rouse: The main report is printed. We also have a supplemental report:

REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Medical education in Texas—undergraduate, graduate, and postgraduate—makes slow but definite progress.

Finances for Medical Schools

Baylor University College of Medicine at Houston, under the leadership of Dean Emeritus W. H. Moursund, is carrying on an active campaign for regular financial support from its alumni and friends to supplement the income from other sources. The present Legislature at its last session made an appreciated increase in the regular budget for Southwestern Medical School of the University of Texas at Dallas but failed to appropriate money for the clinical sciences structure needed to round out the building program. Some increases were made by the Legislature for the maintenance of the departments of the Medical Branch of the University of Texas at Galveston, but the increases were not adequate to meet fully the needs for the expanded facilities of the new John Sealy Hospital. Likewise, the Legislature did not come through with additional funds needed to equip completely the new M. D. Anderson Hospital for Cancer Research at Houston, nor for the full building needs of the Dental College of the University of Texas. A "revolving fund" appropriation was made for the Postgraduate School of Medicine of the University of Texas, which it is hoped will result in permanent support of the main administrative costs of this branch.

The legislators, as individuals, seemed predominantly favorable to increased tax support of these medical projects

but professed to be unable to find sources of increased revenue. The Governor has indicated that he will submit to the Legislature, which convened March 15 in a special session, the matter of appropriations to meet the aforementioned needs.

The Council on Medical Education and Hospitals actively aided the administrators of the different medical branches of the University of Texas in appearances before the proper finance or appropriation committees of the Legislature last year, which action seemed to be appreciated greatly by the University officials. The Council feels that members of the Texas Medical Association can wield a powerful influence on their home legislators in stimulating the legislators to help provide the needed funds, so the Council calls on all physicians to contact personally the representative or senator from his district, stat. and p.r.n. There is likewise an obligation of physicians and their friends to accept cheerfully any slight increase in state taxes that may be necessary to meet the situation adequately.

Dr. Grant Taylor, with an illustrious record of medical education and service at Duke University School of Medicine, Durham, N. C., and elsewhere, has been selected as dean of the Postgraduate School of Medicine of the University of Texas, and under his aggressive leadership even more progress is anticipated.

Residencies in State Hospitals

At its January meeting, the Council on Medical Education and Hospitals had the privilege of conferring with medical staff members of the Board for Texas State Hospitals and Special Schools, who outlined their plans for the possible development of residencies in neuropsychiatry in some of the state hospitals and also reviewed a plan for organizing a consulting staff for the Austin State Hospital. The Council heartily commended and approved these plans and expressed a hope that the consultation staff organization worked out at Austin may serve as a model for similar consultation staffs in other localities where there are state hospitals. The Council feels that it is the obligation, as well as privilege, of a physician practicing near a state hospital to serve as he may in consultation with the full time staff of the state hospital in his vicinity.

Training for Office Assistants

To the Council on Medical Education and Hospitals was made an interesting suggestion that there is a need in Texas for one or more educational institutions to train young ladies who can furnish a superior type of assistance to physicians in private offices. Such a young lady not only should be a competent stenographer but also should know some simple principles of nursing so she can prepare a patient for examination and give simple hypodermic medications; she should know some bookkeeping; and she should have that well rounded culture which four years of college can give, with its attending knowledge of how to handle people.

Discussions are under way with the administration of the Texas State College for Women at Denton, where a favorable initial response has been met. By the time of the annual meeting in May, further details should be available. Meanwhile, St. Paul's Hospital in Dallas also has done some fine work in special evening training for medical stenographers.

Audio-Digest Foundation

Attention has been called to a splendid contribution to the field of postgraduate medical education which now has been made available to the entire country by the Audio-Digest Foundation of California. In brief, Audio-Digest prepares weekly tape recordings of digests of current medical literature, with tapes of one hour's duration, which can be played on any tape machine for individual physicians, staff groups, or county medical societies. By a special adapter, the tapes can be played by a machine carried in the physician's car as he goes from call to call. Audio-Digest goes a step further in making "digest" recordings for different specialty groups available twice each month. As a further service, Audio-Digest is accumulating hour-long lecture recordings by nationally recognized experts, which are available for more specialized audiences.

Audio-Digest Foundation is a nonprofit corporation, a subsidiary of the California Medical Association, and its profits will go entirely to medical education or other fields of medicine. The Council on Medical Education and Hospitals urges that individual physicians and county medical societies investigate the potentialities of this service because a wealth of excellent material is available at a minimum cost. The address is 800 North Glendale Avenue, Glendale, Calif.

Telephone Postgraduate Broadcasts

The special Committee on Telephone Postgraduate Broadcasts has arranged four unusually splendid programs, or symposiums, for 1954, the first one coming in February and the second in March. A fine plan of having all the faculty for each program from one center has been followed. There has been some decrease in the number of societies taking the programs, and the Council has carefully reviewed the matter.

The Council plans to record, on tape and on platters or disks, the two postgraduate programs scheduled for this fall in an effort to make superior programs given by Texas men available at minimal cost to participating societies and available at the regular meeting times of the societies. Further details on this will be available at the May meeting.

Collaborated Projects

It has been the pleasure of the Council on Medical Education and Hospitals to collaborate actively and sympathetically with other regular groups of the Texas Medical Association on interesting projects. With the Committee on Public Relations and other groups a program was presented for students on the campus of each of the three medical schools in Texas and was proclaimed an outstanding success at each. The Council has had conferences with representatives of the Texas Hospital Association and with the chairman of the Committee on Nursing Care of the Texas Medical Association relative to the problem of nursing education and the supply of nurses in the state.

Specific recommendations of this Council will be included in a supplemental report at San Antonio in May.

Respectfully submitted,
MILFORD O. ROUSE, Chairman,
J. L. MATTHEWS,
TRUMAN BLOCKER, JR.,
W. S. BARCUS,
R. LEE CLARK, JR.,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

The Council on Medical Education and Hospitals feels that one of the causes of the present nursing shortage is the diversion of many trained nurses for physicians' offices, and that such shortage might be lessened over a long range

period by the training of medical assistants capable of replacing nurses in these offices. Other considerations highlight the need for such training. The Council commends the Texas State College for Women for its manifested interest in this field and recommends that the House of Delegates commend this college for pioneering in this educational effort and offer the cooperation of the medical profession in providing the "on the job training" which will be required; also it urges other educational institutions to consider similar courses of varying lengths to train young women adequately to assist in doctors' offices.

Dr. James A. Bethea, executive director of the Board for the Texas State Hospitals and Special Schools, has pointed out that in Texas the present legislative appropriations for patients in state mental hospitals is approximately $2 per day per patient, a sum pitifully inadequate even for custodial care to say nothing of proper professional service. The Council recommends that all physicians heartily support the request of the board at the next session of the Legislature for more adequate appropriations for professional care of patients in state hospitals.

A canvass of all agencies engaged in postgraduate medical education shows increased interest and activity. This Council recommends increased postgraduate study by all physicians with more enthusiastic support of all postgraduate facilities, especially of the Postgraduate School of Medicine of the University of Texas.

Attention is directed to the forthcoming statewide election in November on a Constitutional amendment which will make possible the creation of special hospital tax districts in the larger centers of the state. This is of great importance to city-county hospitals and to medical education, and the Council recommends that all physicians work diligently in behalf of the proposed amendment.

The Council has made a comprehensive study of the postgraduate and other teaching facilities with tape recordings and illustrations offered by the Audio-Digest Foundation of 800 North Glendale Avenue, Glendale, Calif., which foundation has a booth in the technical exhibits at this meeting. Members of the Council recommend that all physicians acquaint themselves with the material offered, which gives a practical, inexpensive, and interesting method of keeping up with medical literature and securing outstanding medical programs for staff meetings, county societies, and similar groups.

A review of the telephone postgraduate programs for February and March shows some decline in the number of participating societies. For the pair of telephone postgraduate programs this fall, one in October on antibiotics and one in November on recent advances in the management of cancer, tape recordings will be made and released for use by county societies and hospital staffs immediately after the telephone broadcasts themselves. Full information on costs and other details will be published in the TEXAS STATE JOURNAL OF MEDICINE and sent to each county society. The broadcasts this fall will be used to check on possible ways of having the splendid programs given by Texas physicians utilized by many more groups and physicians. The Council feels that the postgraduate panels and symposiums given under the sponsorship of the Texas Medical Association will always serve a very useful purpose, and it recommends that another series of four such postgraduate programs for individual societies and other medical groups be planned and given in 1955 under the direction of a special postgraduate committee, with the technique of presentation by telephone, tape, or other method to be determined after the fall (1954) pair of broadcasts, with costs of the 1955 programs to be worked out equitably with the Board of Trustees.

Respectfully submitted,
MILFORD O. ROUSE, Chairman,
J. L. MATTHEWS,
TRUMAN BLOCKER, JR.,
W. S. BARCUS,
R. LEE CLARK, JR.,
GEORGE TURNER (ex-officio),
N. C. FORRESTER (ex-officio).

Dr. Rouse: You will be interested to know that the telephone broadcast costs have been less than half of what we estimated, but we are in hopes that more societies will make use of the broadcasts.

Speaker Deaton: These reports will be referred to the Reference Committee on Medical Service and Public Relations. The next item of business is the report of the Committee on Cancer from Dr. Porter Brown, Fort Worth. I have not seen Dr. Brown in the House; is there anyone else to make that report? If not, we will pass that. The next is the report of the Committee on Medical History. We are honored to have Dr. Felix P. Miller of El Paso to make this report.

REPORT OF COMMITTEE ON MEDICAL HISTORY

Dr. Miller: This is as much a surprise to me as it is to you. I was appointed on this Committee, but I understood Dr. Tate Miller was going to put this on.

Just the other day I had a visit with a grandson of Sam Houston and his wife. Her grandfather was one of the early doctors in Texas. I failed to find him in any list of early physicians in Texas. She has promised to give me the information I desire and will write to her relatives in his old home town for facts. From my conversation with them I believe it will be a very interesting history, and I hope some day to compile that and have it for you. This is my first experience on medical history.

I believe the Bible says, "By their records ye shall know them." Recently this man who is a grandson of Sam Houston told me of a doctor who had never made any mistakes. Recently he had operated on a child for intestinal obstruction and inadvertently opened the bladder, which was repaired immediately without any trouble. The patient got well, both of the intestinal obstruction and any possibility of injury to the bladder. The doctor wrote up the operation and described in detail and intimately the operation for intestinal obstruction and at the end he said, "The bladder was explored and no stones were found." That perhaps is not authentic medical history.

Only today coming down on the train I saw in the *Scientific American* an article on fifty years ago by Dr. Victor C. Vaughn of Michigan. Fifty years ago he said that typhoid fever in the United States caused over $50,000,000 worth of damage annually. It is strange that he estimated the value of each dead man at only $1,000. It reminds me of what a little girl in the paper said the other day; she said that life must be very valuable. It costs more and we are holding on longer. So I think his valuation of life taken by typhoid fever was certainly low enough fifty years ago. With the increased cost of things, that would be a very minimum.

I doubt if I would get ten hands if I asked how many of you have seen a case of typhoid fever in the past five years. How many of you have seen an epidemic of yellow fever? I had the pleasure in 1898 of being quarantined with Dr. Allen J. Smith, by some very celebrated men, Drs.

Agemonte and Guiteruez, during the epidemic of yellow fever in Galveston. The happiest two weeks of my life were spent with Dr. Smith, professor of pathology at the University of Pennsylvania. That day is past. I saw the ports of Galveston, Houston, Atlanta, New Orleans, Philadelphia, and others quarantined for weeks at a time—shotgun quarantine.

One of my classmates was caught by the rigid quarantine in Galveston and made his escape to the mainland but was met upon his arrival in Belton by his father, who promptly quarantined him in a graveyard. It was a common practice in such epidemics that most men fled in absolute terror, to return afterwards and live influential lives.

Those of you who have not read the Decameron of Bocaccio—I do not mean the love stories, but I mean the preface about the black plague which scourged Florence, Italy, in 1300 and 1400—have a treat in store: "When the living barely sufficed to bury the dead," and when a man took care of his wife the best he could; his family had all died and had been taken away by the dead wagon. His wife was carried out into the harbor in a rowboat to a worn out sailing ship where she was placed on the deck with hundreds of other victims, a hole bored in the bottom of the ship, and it sunk—the only way that they could be buried. I have read that the only way that they could bury the dead during similar epidemics in New Orleans was by digging trenches, which were dug and the yellow fever victims thrown in and covered up.

Few people realize the things that have been accomplished in the practice of medicine in a lifetime, in fifty years. A man's worth to a community or to medical science or to his medical association is in the things that he creates for the betterment of his fellow man. The earlier generation, of which I am a late member, blazed the trail upon which later generations travel. We have seen such wonderful improvements in a lifetime, in my lifetime. I have seen surgery placed upon a higher plane, hospitals, laboratories, and roentgen rays added to our armamentarium. I had a demonstrator's part early in the days of the medical school at Galveston in carrying on for Dr. Seth M. Morris and Dr. Mangunat in their lectures on physics. I taught, just like the book said, Steele and Gannaud, that the atom cannot be divided. On the title page in Steele's "Physics," that I had at the University, it says, "The works of God are far from naught, unless our eyes are blind in seeing."

The celebrated Dr. William Osler, Dr. Oliver Wendell Holmes, and others say that the credulity of man regarding medicine and disease has not changed in the centuries but is the same in all times and all ages. "The desire to take medicine is perhaps the greatest feature that distinguishes man from animals."

I had the pleasure of seeing Dr. William H. Welch, Baltimore, in the early days and hearing him tell how the practice of medicine had been liberated by Dr. Rudolf Virchow from, you might call it, a religious cult by demonstrating the microscopic cell life and the causes of diseases, and how other men have given their lives for the advancement of medicine. This we hope to present to you at some future time in some more connected course than we have today.

Speaker Deaton: This report on Medical History will be referred to the Reference Committee on Reports of Officers and Committees. I want to thank you, Dr. Miller, for this interesting report.

The next is the report of the Committee on Public Relations, Dr. Troy Shafer of Harlingen.

Dr. Shafer: The report is printed and is respectfully submitted without supplement:

REPORT OF COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations has recognized that the future of American medicine continues in the hands of the "public climate of mind" and that medicine's vulnerable area with the public continues to lie in the socioeconomic area (costs, availability, distribution, and office operation and management). There is no quarrel with quality.

The Committee's program has been divided into three general areas: internal professional relations, relations with the public en masse, and relations with the public at the individual office.

In carrying out its program under the supervision of the Board of Trustees, the Committee properly has worked in close liaison with many of the councils and other committees of the Association.

Internal Relations

The Committee's broad objective regarding internal relations has been to assist in all ways possible in the stimulation of individual interest in attendance at state and county society levels.

The third annual Presidents and Secretaries Conference was successfully completed in January. The meeting's purpose was to provide factual information to elected officers throughout Texas medicine on the objectives and the activities of organized medicine at the county, state, and national levels. Increasing interest and attendance at these meetings is definitely noted.

Three Medical Students' Day programs were successfully completed during the same period. These meetings had as their objectives to bring future doctors into active county society participation at earlier dates, thus to strengthen attendance and interest in those societies in the future. In close liaison with the Council on Medical Education and Hospitals and with the cooperation of the local county medical societies and the three Texas medical schools, a meeting and open forum presented to junior and senior students the practical aspects of future practice in terms of: "Your Practice and Public Opinion," "Your Practice and the Medical Society," "The Legal Side of Your Practice," "The Business Side of Your Practice," and "Your Responsibility as Doctors."

In an effort to improve communication to the individual doctor, PR Diagnotes was added to the TEXAS STATE JOURNAL OF MEDICINE as a monthly feature, and numerous special bulletins on varying subjects were released periodically throughout the state.

External Relations

The Committee has continued to stress the desirability of efficient mediation committees, availability at the county society level of round-the-clock medical service (at the same time using all possible channels to educate the public that doctors will and do make home calls but that the best care is available at his office or clinic). Special effort also has been extended in the area of doctor distribution throughout Texas and in the field of office operation and management.

The Committee worked closely with the Council on Medical Economics, Committee on Rural Health, and the special Committee on Doctor Distribution, composed of representatives of all three groups, to overcome the generally accepted misnomer "doctor shortage." The Committee cooperated in the completion of a successful pilot survey in Councilor District 7 to determine community needs for additional doctors and was able to report the need in this district nonexistent. The extension of this survey with the

consequent improvement in public understanding of the adequacy of doctor distribution generally throughout Texas will come about rapidly with the provision of a competent field secretary to work with Councilors and society officers throughout the entire state.

Office Management

The Committee has completed and distributed outline guides for doctors' secretaries, "Better Secretaries—Training Tips." This guide is supplemented on request with a full lecture or study series. The Committee has urged the establishment at community level of actual training courses following this outline in business schools, high schools, night schools, or junior colleges.

Special Projects

Aside from its traditional role as information outlet for organized medicine in relations with press, radio, and television, the Committee has completed several separate special projects.

Twenty-nine major Texas newspapers cooperated with local county societies in publishing commemorative special sections observing the one hundredth anniversary of the Texas Medical Association and citing medicine's contributions during the century. Theme of the sections generally was "You Get Your Dollar's Worth in Medical Care Today." It is estimated that more than 80 per cent of the people in Texas had an opportunity to read one or more of the sections. It should be noted also that although many other state associations have conducted similar projects, the cooperation received from the Texas press was the most extensive ever afforded a state medical association.

The Committee completed the preparation and distribution of the following pamphlets and handbooks:

1. Presidents and Secretaries Handbook, 1954—a handbook of condensed helpful information on the organizational aspects of Texas medicine for county and state officers.
2. Outline Guide, PR Activities, County Medical Societies—a broad range of suggestions for public relations activity at the county society level.
3. My Town Needs a Doctor—a pamphlet of community responsibility in getting and keeping doctors.
4. The State Program, Public Relations Committee—a handbook of materials and programs available to county medical societies.
5. Information Kit, VA Medical Care—a collection of material on veterans' medical services from the American Medical Association's Department of Public Relations.
6. Handbook, Woman's Auxiliary to the Texas Medical Association—a detailed compendium of facts on Auxiliary organization, objectives, and activities.

The Committee wishes to underscore once more its desire to be of service to all other committees and councils at all times within the limit of its facilities.

Respectfully submitted,
TROY A. SHAFER, Chairman,
VAN D. GOODALL,
SAM BARNES,
HUGH SAVAGE,
H. M. ANDERSON,
M. C. OVERTON, JR.,
W. D. BLASSINGAME.

Speaker Deaton: This report is submitted to the Reference Committee on Medical Service and Public Relations. The next is the report of the Committee on Tuberculosis. Is Dr. W. D. Anderson of San Angelo, chairman of that committee, ready?

Dr. Anderson: This report is printed, but I should like to give this: The contract has been let and work is started on the South Texas Tuberculosis Sanatorium at Harlingen, which will give Texans in that area a 400-bed tuberculosis hospital which is to be completed in late 1955. Also the Committee has given its endorsement to the Texas Tuberculosis Association and its "Searchlight on Tuberculosis." This is an ambitious program to evaluate the tuberculosis program and problem in Texas in its every phase, from the grass-roots on up, and this the Committee believes merits the support of every Texas doctor. (The committee report follows:)

REPORT OF COMMITTEE ON TUBERCULOSIS

The Committee on Tuberculosis is pleased to report a noticeable improvement in the over-all picture of tuberculosis in Texas during the past year. The tuberculosis hospitals have shown progression in bed capacity, organization, personnel, and patient results. With the closing of the Weaver H. Baker Memorial Tuberculosis Sanatorium at Mission last year, approximately 400 of these patients were transferred to an unused portion of the Veterans Administration Hospital at Legion near Kerrville on a temporary basis. Others were moved to the new San Antonio State Tuberculosis Hospital, San Antonio. This unit is a new hospital well situated and well planned for 400 tuberculosis patients. With the appropriations made by the last State Legislature for a complete new plant for the East Texas Tuberculosis Hospital at Tyler, within a relative short period Texas will have another new, modern, tuberculosis sanatorium. Construction has recently started on the Harlingen State Tuberculosis Sanatorium which in time will accommodate 400 tuberculous patients from the Rio Grande Valley area. McKnight State Sanatorium near Carlsbad continues to be the most efficiently organized and operated hospital of the entire system.

With the recent appointment of Dr. Roger Hanna as director of the state tuberculosis hospitals, much more improvement and progress may be expected of these hospitals as contrasted to previous years when no tuberculosis specialist or even anyone remotely interested in tuberculosis control was a member of the executive staff of the Board for Texas State Hospitals and Special Schools. This was one of the recommendations of this Committee for the past several years that has been fulfilled at last.

The employment of capable, well trained personnel has been the crying need of every hospital in Texas. This is particularly true of the tuberculosis hospitals. During the past year favorable and substantial progress in procuring trained personnel has taken place in the tuberculosis hospital system. There are now three full-time hospital superintendents on the job. Otherwise, medical staff personnel is rather inadequate, and there are a number of alien, unlicensed and non-English speaking doctors on the staffs of the state tuberculosis hospitals. Again, this Committee would like to make a direct appeal to the House of Delegates for some suggestions toward solving this problem. This Committee continues to believe that Texas patients in state sanatoriums are entitled to talk their medical problems over with a doctor who can speak English well enough that they can understand each other! The personnel of other departments has shown a slow, gradual, but noticeable improvement in qualifications, abilities, and interest. At present there are occupational therapists at each hospital who in time will add much toward the rehabilitation of arrested, inactive cases. The interest and participation in rehabilitation has shown a phenomenal growth in these institutions during the past twelve months.

The waiting lists have grown considerably during the

past year. It now requires from two to three months for patients to be admitted for treatment. At first glance this is not a healthy situation and in some cases it is not, but underneath it does reflect better hospital care in that the patients remain hospitalized longer and the rate of patients leaving against medical advice is going down noticeably at each hospital. Too, a patient waiting at home now is not in such a serious situation as in previous years when there was nothing to do except rest. With the widespread use of antimicrobial therapy most patients who enter the sanatorium have had their drug therapy started at home by their family physicians. Frequently patients entering a sanatorium do not show enough on roentgen-ray, physical, or laboratory examinations to make a definite diagnosis of pulmonary tuberculosis. After reviewing roentgenograms made at their homes, the sanatorium physician is aware of the phenomenal clearing and healing of the disease. The Committee is encouraged to believe that within a few years the waiting list of state sanatoriums will have disappeared, even with the present bed capacity.

Likewise, the death rate in Texas from tuberculosis has decreased in the past year as it has throughout the nation. Even the number of cases reported to the State Department of Health has dropped from approximately 56 per 100,000 population in 1951 to 48 per 100,000 in 1953.

Inasmuch as the diagnosis, treatment, and cure of tuberculosis have evolved from the nonspecific, old-time rest treatment and hopes for a cure to our modern day specific antimicrobial therapy, sanatorium rest, and education along with proven surgical measures, physicians now are able to give a patient not only a promise of curing his tuberculosis but perhaps a complete eradication of his disease.

Recommendation

This Committee recommends that each county medical society in the state devote at least one meeting a year to keeping its membership up to date on tuberculosis developments. A letter to this effect has been mailed to each county society president and secretary.

Respectfully submitted,
W. D. ANDERSON, Chairman,
ORVILLE E. EGBERT,
JOHN A. WIGGINS,
RALPH E. GRAY,
ERNEST E. HOLT.

Speaker Deaton: The report of the Committee on Tuberculosis is referred to the Reference Committee on Scientific Work. Next is the report of the Committee on Library Endowment, Dr. B. E. Pickett, Carrizo Springs.

Dr. Pickett: Mr. Speaker, the report of the Committee on Library Endowment is already printed. It is submitted without recommendations, with this statement: that twelve days ago I was notified that I was appointed chairman of this Committee, taking the place of Dr. J. M. Travis, resigned.

REPORT OF COMMITTEE ON LIBRARY ENDOWMENT

The Memorial Library of the Texas Medical Association is one of the Association's most valuable assets because it is used by many doctors. It is the fountain of knowledge on which physicians can depend and from which they can draw at any time. The knowledge is valuable and the Library is essential. Many valuable books are available and many more are needed. These volumes are in constant use and therefore deteriorate, and these should be replaced. The Library should grow and must grow. It takes money to replace these volumes and to pay expenses and one source which is emphasized is the endowment from doctors and members. Some have made valuable contributions, and the Committee on Library Endowment hopes to have more.

The beloved Dr. L. H. Reeves, Fort Worth, recently has donated his library with a considerable sum of money by his will, for which the Committee extends many thanks. Others are contemplating a similar action—this procedure should be encouraged. It has been suggested that the representative from the TEXAS STATE JOURNAL OF MEDICINE, while securing information relative to deceased members in regard to the obituary, tactfully suggest to the family the donation of the library of the deceased which may contain some valuable books and also encourage them in making other contributions.

Recommendations

The Committee recommends that the woman's auxiliary of the different parts of the state be contacted and asked to make a contribution each year to the Library, even though it may be a small one, and that a suitable plaque be placed wherein names of the donors could be permanently inscribed. The Committee also urges that all the medical societies give publicity for the need of funds for this Committee.

Respectfully submitted,
B. E. PICKETT, Chairman,
JOE T. GILBERT,
V. R. HURST,
R. D. LITTLE,
AUGUST J. STREIT.

Speaker Deaton: This report is referred to the Reference Committee on Finance. The next is the report of the Committee on Mental Health, which is printed and will be referred to the Reference Committee on Scientific Work. (The report follows:)

REPORT OF COMMITTEE ON MENTAL HEALTH

The Committee on Mental Health has taken no concerted action on any specific project.

Some members of the Committee now serve on the advisory committee to the Board for Texas State Hospitals and Special Schools. This advisory committee is composed of representatives from the following organizations: the Hogg Foundation for Mental Hygiene of the University of Texas, Texas Society for Mental Health, Committee on Mental Health of the Texas Medical Association, Committee on Tuberculosis of the Texas Medical Association, Texas Neuropsychiatric Association, Texas Association for Retarded Children, Texas Association of School Administrators, Texas Dental Association, and the Texas Society for Crippled Children.

The advisory committee meets regularly in Austin every two months. While its function is purely advisory, yet, there are strong indications that it will have a definite influence on the shaping of medical, rehabilitative, and educational policies of the board. Additional reports on these activities, as well as recommendations for action by the Texas Medical Association, will be submitted in the future.

The Committee has had a conference with the budget officer of the Legislative Budget Council. This official is seeking advice on suitable research projects, a psychiatric residency training program, and other "in training programs," which can be adapted within the various state hospitals. The objective is to outline a program which will have an appeal to the Legislature and produce larger appropriations.

The Woman's Auxiliary, through its mental health committee, is now taking an active interest in mental health in Texas. This Committee is desirous of working in close cooperation with the Auxiliary.

To date there has been no definitive activity from or with the Committee on Mental Health of the American Medical Association.

Recommendation

It is recommended that the Texas Medical Association, through its Councils on Medical Jurisprudence and on Medical Education and Hospitals, give assistance to the Legislative Budget Council and/or the Board for Texas State Hospitals and Special Schools and that the Association take an active interest in securing sufficient appropriations for efficient conduct of the hospital system.

Respectfully submitted,
HAMILTON FORD, Chairman,
DAVID WADE,
A. B. COOPER,
ABE HAUSER,
EDGAR EZELL.

Speaker Deaton: Next will be the report of the Committee on General Arrangements for the Annual Session, Dr. Jones, chairman.

Dr. L. Bonham Jones: This Committee has little to say, for I am sure the work we have attempted to do will speak much louder than anything we can say. The Committee on General Arrangements on behalf of the Bexar County Medical Society again welcomes to San Antonio the delegates, members, and visitors to the annual session of the Texas Medical Association. We trust that your visit to our city will be pleasant and profitable.

The work of the Committee on General Arrangements appears somewhat minor compared to the extensive and detailed work of the central office in arranging the annual session. From a ringside seat, it is gratifying to see the efficiency and effectiveness of the administrative organization headed by Mr. N. C. Forrester. A session such as this would be very difficult to arrange without the help of such a person as our managing editor, Miss Harriet Cunningham. We are grateful to the local committee chairmen and their committeemen, who have given much of their time to make this meeting a success. The San Antonio Chamber of Commerce has given much help and advice in arranging the convention. The booklet on San Antonio which was mailed to every doctor in the state was provided by the Chamber of Commerce.

Your attention is directed to the President's Party with Buffet at La Villita on Tuesday evening. This is an occasion to honor our President, and we believe it will be long remembered.

(The Committee's formal report was submitted in print and follows:)

REPORT OF COMMITTEE ON GENERAL ARRANGEMENTS

The Committee on General Arrangements for the 1954 Annual Session has made available to the Texas Medical Association the best of San Antonio's facilities for such a meeting. The Municipal Auditorium will house the scientific sessions and exhibits. It will be subdivided to provide two large meeting areas to accommodate each of the two scientific sections.

It is anticipated that some visitors may not be able to secure accommodations in the downtown hotels, although a majority of their rooms have been made available during the session. However, there are many beautiful and comfortable tourist courts within a few minutes of the center of town, which may well be preferred by many members. A list of recommended facilities appears in the official program.

Special attention is directed to the "President's Party with Buffet" at La Villita. This has been planned as the social highlight of the meeting, primarily to honor the State President, but also to provide relaxation and diversion for all. Everyone should enjoy the evening, whether his taste runs to food or entertainment, to dancing, or just to socializing.

The Committee hopes that every member or visitor will feel when he leaves San Antonio that he has been to a real scientific meeting, and that he has had a lot of fun and recreation on the side.

L. BONHAM JONES, Chairman,
ROBERT R. NIXON,
CHARLES L. MCGEHEE,
EDWARD D. DUMAS,
JOHN M. SMITH, JR.

Speaker Deaton: This report is referred to the Reference Committee on Reports of Officers and Committees. The next item is the report of the Committee on Scientific Exhibits, Dr. James D. Murphy of Fort Worth. I believe Dr. Murphy had to leave, but he asked me to say that the committee has no supplemental report, but he did ask that the doctors please go by and see the exhibits. This report will be referred to the Reference Committee on Scientific Work. (The report follows:)

REPORT OF COMMITTEE ON SCIENTIFIC EXHIBITS

The Committee on Scientific Exhibits is proud to report that all medical societies, previous exhibitors, and prospective exhibitors were first notified about October 15, 1953, that exhibit space would be available at the forthcoming annual session in San Antonio. Twenty applications were received. These exhibitors have spent considerable time and effort in preparing their exhibits, which are from the fields of general medicine, radiology, urology, ophthalmology, gynecology, and surgery.

This year, as in the past years, two certificates of merit will be awarded, one to the institution or group presenting the best exhibit and the other to the best individual exhibit.

It is respectfully requested that each member of the Association visit these exhibits.

Respectfully submitted,
JAMES D. MURPHY, Chairman.
DEAN B. JONES,
J. E. MILLER,
H. F. CONNALLY, JR.,
EDWARD T. SMITH.

Speaker Deaton: Next is the report on rural health, Dr. Callan.

(Dr. Chester U. Callan, Rotan, then submitted his report:)

REPORT OF COMMITTEE ON RURAL HEALTH

It is the opinion of the Committee on Rural Health that the doctors of Texas should make some effort to assist people living in rural areas to solve their health problems. In the larger cities there is usually a city health organization which studies and attempts to solve all the health problems. However, the individual living in a rural area as a rule has little, if any, help. There are many counties in Texas that do not have a county health officer; as a result the persons living in rural areas have little assistance in solving their health problems.

Although the pressure on the medical profession toward the socialization of medicine has apparently eased, this is by no means permanent. Health is on the mind of every individual in this country. The President recently made plain that there are still problems in health that must be solved. The medical profession is given a time interval in which to solve its own problems. If it does not grasp this opportunity, public pressure will force the problems back into the hands of governmental agencies.

Recommendations

For several years the rural health problem has been one of the weak points in our defense against socialized medicine. Realizing that there is a need for a planned, aggressive program to overcome this weakness, the Committee on Rural Health recommends the following:

1. That the Texas Medical Association urge its members to take an active interest in local rural health committees when formed.

2. That the Texas Medical Association urge the Extension Service of Texas Agricultural and Mechanical College to provide a field worker for the formation of such committees.

Respectfully submitted,
CHESTER U. CALLAN, Chairman,
R. D. HOLT, JR.,
HAROLD LINDLEY,
STEPHEN B. TUCKER,
JAMES H. HARRIS,
GEORGE D. BRUCE.

Speaker Deaton: This report is referred to the Reference Committee on Medical Service and Public Relations. Next we will ask for the report of the Committee on Revision of Constitution and By-Laws, Dr. Charles Hardwicke, Austin.

Dr. Hardwicke: The report of the Committee on Revision of Constitution and By-Laws is contained in the printed reports:

REPORT OF COMMITTEE ON REVISION OF CONSTITUTION AND BY-LAWS

A number of amendments involving changes in the Constitution were introduced before the House of Delegates at the 1953 annual session and are subject to final action this year. The Committee on Revision of the Constitution and By-Laws wishes to call attention to these proposals.

Trustees

Dr. L. C. Powell of Beaumont introduced a series of amendments to the Constitution and By-Laws providing for an increase in the number of Trustees from five to seven, for changing the term of office for Trustees from five to three years, and for dividing the state into trustee districts to assure geographical representation by the Trustees. Dr. Powell's proposed amendments to the Constitution as introduced and recorded in the transactions of the House on page 425 of the June, 1953, JOURAL follow:

"Be it resolved: That Article III of the Constitution of the Texas Medical Association be amended so that, as amended, said article shall provide as follows:

" 'Sec. 1. The officers of this Association shall be a President, a President-Elect, a Vice-President, a Secretary, a Treasurer, seven Trustees, a Councilor for each councilor district, a Speaker, and Vice-Speaker of the House of Delegates.

" 'Sec. 2. The President shall automatically assume office at the expiration of his term as President-Elect. The President-Elect, Vice-President, Speaker, and Vice-Speaker of the House of Delegates shall be elected for terms of one year each. The Secretary, Treasurer, and Councilors shall be elected for terms of three years each. The Trustees shall be elected for terms of three years each. All officers shall serve until their successors are elected and installed.

" 'Sec. 3. The officers of this Association shall be elected by the House of Delegates on the morning of the last day of the annual session, and no person shall be elected to any such office who is not in attendance on that annual session, and who has not been a member of the Association for the preceding two years.'

"Be it further resolved: That Article IV of the Constitution of the Texas Medical Association be amended so that, as amended, said article shall provide as follows:

" 'Sec. 1. The business affairs of the Association shall be managed by a Board of Trustees, comprising seven members, elected in accordance with this Constitution and By-Laws. All funds of the Association shall be subject to the exclusive control of the Board of Trustees, except as otherwise provided in this Constitution and By-Laws. The Board of Trustees shall decide all questions not specifically delegated to other authorities by this Constitution and By-Laws. It shall in general serve as a board of directors, within the meaning of the corporate laws of the State of Texas.'

"Be it further resolved: That Article IX of the Constitution of the Texas Medical Association be amended so that as amended, said article shall provide as follows:

" 'Sec. 1. The House of Delegates shall divide the state into appropriate trustee districts.

" 'Sec. 2. The House of Delegates shall divide the state into appropriate councilor districts.

" 'Sec. 3. The House of Delegates shall provide for the organization and chartering of such district societies as will promote the best interests of the profession. Such societies shall be composed only of members of component county societies of their respective councilor districts and shall be exclusively scientific and educational in character.' "

Dr. Powell called for amendments to Chapter III of the By-Laws to conform with his proposed constitutional amendments. In studying Dr. Powell's amendments, the Committee on Revision of the Constitution and By-Laws became aware of additional internal changes in the By-Laws which would be necessary to avoid discrepancy in fact and intent if Dr. Powell's proposed constitutional amendments are adopted. The Committee therefore wishes to offer the following substitute amendments to the By-Laws which would be in keeping with the constitutional amendments, provided that the constitutional amendments are adopted. The By-Law changes can go into effect at the same time as the constitutional changes and there will be no internal conflict between parts of the Constitution and By-Laws. The proposed substitutes, which have been approved by Dr. Powell, follow:

Amend Chapter III, Section 1, of the By-Laws so that the first portion will read: "The Board of Trustees shall have charge of all properties and moneys of the Association, and shall manage its financial affairs after the manner and with the usual authority of boards of directors of corporations under the laws of the State of Texas. The Board of Trustees shall consist of one Trustee from each trustee district elected by the House of Delegates upon nomination from the floor. The term of office of Trustees shall be three years, and their election shall be arranged in such manner that one-third, as nearly as possible, shall be elected each year. Tenure of office as Trustee by election and by appointment, either or both, shall not exceed three terms, provided, however, that serving as much as one year of the three-year

term shall be considered as serving a full term. Trustees shall be ex-officio members . . ." (continue with the old wording from there).

Amend Chapter III, Section 1, so that in the last three sentences "four members" instead of "three members" may call a meeting of the Board of Trustees and shall constitute a quorum.

Amend Chapter III by the addition of the following new sections:

"Sec. 2. The House of Delegates shall divide the state into appropriate trustee districts as provided for in Article IX of the Constitution of the State Association.

"Sec. 3. There shall be seven trustee districts as follows: District 1—Councilor Districts 1, 2, 3, and 4; District 2—Councilor Districts 5 and 6; District 3—Councilor Districts 7, 8, and 12; District 4—Councilor District 9; District 5—Councilor Districts 10, 11, and 15; District 6—Councilor District 13; and District 7—Councilor District 14.

"Sec. 4. The House of Delegates at its next election following adoption of amendments providing for the seven-member, district-representative type of Board of Trustees shall elect one Trustee from each trustee district. These Trustees shall draw lots for terms of office of one, one, two, two, three, three, and three years respectively, after the completion of which terms successors in office shall be members of the trustee districts of those whom they succeed, be nominated from the floor, be elected by the House, and serve regular three-year terms. Members of the Board of Trustees at the time of adoption of the amendments establishing the seven-member Board shall complete their current terms of office, serving in addition to the seven new Trustees, but their places on the Board shall not be filled upon expiration of their terms."

Amend Chapter VII, Section 1, by substituting in the first sentence for "a Trustee" the following: "two or three Trustees (depending upon which terms have expired)."

Honorary and Inactive Membership

Two series of amendments dealing with honorary and inactive membership, primarily to eliminate dues for these classifications, were introduced at the 1953 annual session and are subject to final action this year.

Dr. Thomas J. Vanzant of Houston, on behalf of the Harris County Medical Society, presented the following amendments to the Constitution (page 426, June, 1953, JOURNAL):

"Amend Article II, Section 1, of the Constitution so that it will read: 'This Association shall consist of the several component county medical societies, duly and constitutionally chartered. Its membership shall comprise only those members of said component county societies who have been duly elected, who have been reported to the office of the Executive Secretary as members, and for whom the Executive Secretary has received the annual per capita assessment, made in accordance with the By-Laws of the Association.

" 'The House of Delegates, upon nomination of component county societies, may elect to honorary membership those physicians of honorable standing who have contributed notably to the advance of ethical medicine, and who may have, because of age or other laudable reasons, reached a point of inactivity or comparative inactivity in the practice of medicine, or who have been members of organized medicine for a period of fifty years or longer; provided that when so nominated and elected said honorary members shall be entitled to all the privileges of membership as set out in this Constitution and By-Laws. The county society secretaries shall include all such honorary members in their respective annual reports, with such notations thereon as will at once declare their status. Failure so to report honorary membership shall terminate the same as in the case of other membership.

" 'It is also provided that county societies may elect to military membership those members or physicians otherwise eligible and accepted for regular membership who are at the time serving with the Armed Forces of our country, including the Coast Guard, and such similar services in time of war, such membership to terminate with their discharge from service.

" 'It is also provided that county societies may elect to inactive membership those members who have retired from the active practice of medicine. The House of Delegates, upon nomination of component county societies, may elect those physicians to inactive membership, provided that when so nominated and elected said inactive members shall be entitled to all of the privileges of membership as set out in this Constitution and By-Laws; provided further that county society secretaries shall include all such inactive members in their respective annual reports, with such notation thereon as will at once declare their status. Failure so to report inactive membership shall terminate the same, as in the case of other membership.'

"Amend Article XI, Section 2, of the Constitution so that it will read: 'The House of Delegates shall provide for an equal per capita assessment of component county societies, and for the proper distribution of the amount so raised into the several funds of the Association, as established by the Board of Trustees or the House of Delegates; provided that no assessment shall be made upon inactive members or honorary members or members emeritus of the Texas Medical Association elected in accordance with this Constitution and By-Laws.' "

Dr. Vanzant also introduced changes in the By-Laws to amend Chapter I, Section 3; Chapter X, Section 5; Chapter XIII, Section 5; and Chapter XIII, Section 6, as corollaries to the proposed constitutional amendments.

The Board of Councilors introduced a set of amendments covering essentially the same changes as those proposed by the Harris County Medical Society and Dr. Vanzant. However, those of the Board of Councilors were slightly more comprehensive and covered such details as refund of dues. The Board of Councilors included military as well as honorary and inactive members in the elimination of dues and stated that prior membership in the Texas Medical Association would be prerequisite to election to honorary, inactive, or military membership. The entire series of amendments, both to the Constitution and the By-Laws, proposed by the Board of Councilors (pages 431-432, June, 1953, JOURNAL) follow:

"Amend Article II, Section 1, paragraph 1, beginning with line 10, to read as follows: '. . . provided that the House of Delegates, upon nomination of component county societies, may elect to honorary membership those physician members of honorable standing who have contributed notably to the advance of ethical medicine, and who may have, because of age or other laudable reasons, reached a point of inactivity or comparative inactivity in the practice of medicine, or who have been members of organized medicine for a period of fifty years or longer; and when so nominated and elected said honorary members shall be entitled to all of the privileges of membership as set out in this Constitution and By-Laws; provided that county society secretaries shall include all such honorary members in their respective annual reports, with such notation thereon as will at once declare their status.

" 'It is also provided that county societies may elect to military membership those members who are at the time serving with the Armed Forces of our country, including the Coast Guard, and such similar services in time of war, such membership to terminate with their discharge from service.'

"Amend Article II, Secton 1, paragraph 2, to read as follows: 'It is also provided that county societies may nominate for inactive membership those physician members who have retired from the active practice of medicine. The House of Delegates, upon nomination of component county societies, may elect those physician members to inactive membership; when so nominated and elected said inactive members shall be entitled to all of the privileges of membership as set out in this Constitution and By-Laws; provided that county society secretaries shall include all such inactive members in their respective annual reports, with such notation thereon as will at once declare their status.'

"Amend Article XI, Section 2, to read as follows: 'The House of Delegates shall provide for an equal per capita assessment of component county societies, and for the proper distribution of the amount so raised into the several funds of the Association, as established by the Board of Trustees or the House of Delegates; provided that no assessment shall be made upon honorary members, inactive members, or members emeritus of the Texas Medical Association elected in accordance with this Constitution and By-Laws.'

"Amend Chapter I, Section 3, beginning with line 5, to read as follows: '. . . allowed all of the privileges of membership, including subscription or right to subscribe to the TEXAS STATE JOURNAL OF MEDICINE, pending decision on appeal. Any member dropped from the rolls of a component county society for non-payment of dues, or any honorary or inactive member dropped for cause, is to be considered as coming within the provisions of this section.' The rest of the section will remain unchanged.

"Amend Chapter X, Section 5, to read as follows: 'Component county societies may nominate for honorary membership in the Texas Medical Association, physician members of good professional and moral standing in their respective jurisdictions who have rendered extraordinary service to the cause of ethical medicine, and who have for good and sufficient reason withdrawn partially or entirely from the practice of medicine, in accordance with Section 1 of Article II of the Constitution of the Association; and when elected by the House of Delegates to the State Association the said honorary members shall be carried on the rolls of their respective county societies and reported in the annual reports of the county societies, as provided herein.'

"Amend Chapter X, Section 5, by the addition at the end of the following sentence: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to honorary status shall be refunded the originally paid dues in full.'

"Amend Chapter X, Section 7, to read as follows: 'County medical societies may nominate for inactive membership those physician members who have retired from the active practice of medicine. The House of Delegates, upon nomination of component county societies, may elect those physicians to inactive membership in the Association. When so nominated and elected, the inactive members shall be entitled to all of the privileges of membership. County society secretaries shall include all such inactive members in their respective annual reports with such notation thereon as will at once declare their status.'

"Amend Chapter X, Section 7, by the addition at the end of the following sentence: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to inactive status shall be refunded the originally paid dues in full.'

"Amend Chapter X, Section 8, to read as follows: 'County medical societies may elect to military membership those members who are on temporary duty in the Armed Forces of our country.'

"Amend Chapter X, Section 8, by the addition at the end of the following sentence: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to military status shall be refunded the originally paid dues in full provided that such election occurs within the first six months of the membership year. One-half of the originally paid dues shall be refunded provided that such election to military membership occurs after the first six months of the membership year.'

"Amend Chapter XIII, Section 4, to read as follows: 'Military members, as provided for in the Constitution and these By-Laws of the Texas Medical Association, shall pay no dues but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.'

"Amend Chapter XIII, Section 5, to read as follows: 'Honorary members, as provided for in the Constitution and these By-Laws of the Texas Medical Association shall pay no dues, but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.'

"Amend Chapter XIII, Section 6, to read as follows: 'Inactive members, as provided for in the Constitution and these By-Laws, shall pay no dues, but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.' "

The Committee on Revision of the Constitution and By-Laws recommends the adoption of the amendments dealing with honorary, inactive, and military members as submitted by the Board of Councilors in preference to those offered by the Harris County Medical Society and Dr. Vanzant.

Election of Officers

The Council on Scientific Work offered amendments which would permit the election of officers at a meeting of the House of Delegates other than on the last day of the session (pages 407 and 430-431, June, 1953, JOURNAL). These amendments, subject to final action by the House this year, follow:

"Amend Article III, Section 3, of the Constitution to read as follows: 'The officers of this Association shall be elected by the House of Delegates in regular session at the time of the annual session, after the completion of all other business, and no person shall be elected to any such office who is not in attendance on that annual session, and who has not been a member of the Association for the preceding two years.'

"Amend Chapter VII, Section 1, so that the first part shall read: 'The House of Delegates in regular session at the time of the annual session shall elect . . .,' the remainder of the section to continue unchanged."

Alternate Delegates

Dr. Thomas J. Vanzant, Houston, on behalf of the Harris County Medical Society last year introduced an amendment to Chapter VI, Section 6, of the By-Laws with the intent of simplifying the procedure for replacing a delegate by an alternate delegate. When the amendment was discussed by the House of Delegates, it was pointed out that the proposed wording would create complications not anticipated by the Harris County Medical Society, and the amendment was tabled despite what seemed to be a general feeling that the idea behind the amendment had merit. The Committee on

Revision of the Constitution and By-Laws has prepared an alternate amendment, approved by Dr. Vanzant, which it is believed will serve the purpose of the original amendment without creating the same difficulties. The suggested amendment follows:

Delete Section 6, Chapter VI, of the By-Laws, and substitute for it the following: "Sec. 6. If a delegate, once seated by the House of Delegates, is unable to continue in attendance because of unavoidable circumstances, he may be replaced by an alternate delegate. Under such circumstances, the delegate's alternate, or another alternate elected by his society, may be seated in the delegate's stead by complying with the requirements of these By-Laws pertaining to the seating of delegates."

Committee on Blood Banks

The Committee on Revision of the Constitution and By-Laws wishes to offer for consideration new By-Laws providing for the establishment of a Committee on Blood Banks as a standing committee of the Association. In its report to the House of Delegates in 1952, the special Committee on Blood Banks recommended that a "permanent committee" be established to continue activity in the field of blood banking. The Reference Committee on Scientific Work, to which the report was referred, concurred in the recommendation, which then was adopted by the House of Delegates (pages 384-385 and 399, June, 1952, JOURNAL). However, no amendments to implement the recommendation were submitted at that time or at the 1953 session. The following amendments, based largely on the recommendations in the 1952 committee report and approved by the present Committee on Blood Banks, are submitted for immediate adoption:

Amend Chapter II, Section 3, of the By-Laws by adding to the list of standing committee members appointed by the President-Elect, a member of the Committee on Blood Banks. Thus, the listing of standing committees will be concluded ". . . Committee on Library Endowment, Committee on Mental Health, and Committee on Blood Banks."

Amend Chapter VIII of the By-Laws by the addition of a new Section 17, subsequent sections to be renumbered accordingly, to read:

"Sec. 17. (b-8) The Committee on Blood Banks shall consist of five members, each with a term of office for five years and with one term expiring each year. Succession in office shall be on appointment by the President-Elect at the time of election of officers and shall not require confirmation by the House; provided that the Speaker shall allow a motion, if made, requesting another appointment. The members of the first Committee shall be appointed for one, two, three, four, and five years, and thereafter succession in office shall be in accordance with the aforementioned procedure. Tenure in office shall not exceed two terms, provided, however, that serving as much as two years of the five-year term shall be considered as serving a full term. The President shall appoint the chairman when the position may become vacant.

"It shall be the duty of this Committee to study current problems of blood banking, to encourage the establishment of blood banks where needed, to formulate minimum standards for the approval of blood banks in Texas and to urge the adoption of such standards by all blood banks in the state, to cooperate in the development of a system of exchanging blood with appropriate reciprocal credit among the blood banks meeting the minimum standards throughout the state, and in general to foster an integrated system of blood banks which can meet best the needs for blood and blood products within the state and, as feasible, throughout the nation."

Respectfully submitted,

CHARLES P. HARDWICKE, Chairman,
ROBERT B. HOMAN, JR.,
G. V. EDGAR,
HARVEY RENGER,
D. SCOTT HAMMOND,
HOBART O. DEATON,
JACK G. KERR,
J. J. HINCHEY.

Speaker Deaton: This report is referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Vice-Speaker Charles P. Hardwicke, Austin: Next is the report of the Committee on Nursing Care, Dr. A. C. Scott, of Temple.

Dr. Scott: This report is printed:

REPORT OF COMMITTEE ON NURSING CARE

The Committee on Nursing Care has had only one formal meeting since the last annual session. It met January 23 and presented a report to the Executive Council on January 24.

Last fall the Association President appointed two members of this Committee, Dr. C. Forrest Jorns, Houston, and Dr. A. C. Scott, Jr., Temple, as representatives of the Association on a joint committee requested by the State Board of Nurse Examiners to study the curriculum required of registered nurses, the problem of nurse recruitment, and other nursing problems.

The chairman attended a meeting in Austin on November 19, 1953, of this joint committee with representatives of the Texas Hospital Association, the Texas League for Nursing, and all members of the State Board of Nurse Examiners.

A subcommittee of this group was selected to meet and propose definite changes in the curriculum of the training program for registered nurses. The chairman of the Medical Association's Committee on Nursing Care was appointed on this subcommittee.

At the meeting of the Committee on Nursing Care January 23 the following business was transacted:

1. A letter from Mrs. Myrtle Dehn Lane, state president of the Licensed Vocational Nurses' Association, addressed to the President of the Texas Medical Association, demanding answers to six questions pertaining to her association, was studied at the President's request. After full consideration and upon the advice of Mr. Philip Overton, general counsel of the Association, the Committee recommended that the President write Mrs. Lane that without more information about her organization, the Texas Medical Association is not in a position to answer her questions.

Mrs. Lane's letter contained an accusation that Dr. Harvey Renger, Hallettsville, chairman of the Council on Medical Economics, as a private physician, used the prestige of his office to form a competing organization to the Licensed Vocational Nurses' Association. The Committee feels that Dr. Renger was entirely within his rights in stimulating or assisting in any organization that would work for the betterment of patient care, that Dr. Renger was only one of many professional individuals who had participated in the formation of the competing vocational nurses' organization, and that the Association should without doubt back Dr. Renger in his action.

2. Two members of the Committee, who are members of the State Board of Vocational Nurse Examiners, brought

up matters relative to needed changes in the law, and the Committee has recommendations it wishes to make.

3. The Committee recommended in its January report to the Executive Council that the Association stimulate and assist in establishing nurse recruitment programs in high schools, patterned after the Michigan plan.

4. The Committee also recommended that the State Association, through its President, participate in the organization of a Joint Commission for the Improvement of the Care of the Patient similar to that of the National Joint Commission as recommended by the American Medical Association, American Hospital Association, American Nurses Association, and the National League for Nursing; and that the President appoint three representatives, preferably from the Committee on Nursing Care or the Council on Medical Education and Hospitals or from both, who would meet jointly with representatives from the Texas League for Nursing, Texas Graduate Nurses Association, and Texas Hospital Association to consider the feasibility of forming such a state commission.

Following approval of the Committee's report by the Executive Council on January 24, the President requested members of the Committee on Nursing Care to meet with hospital administrators and representatives of the nurses' organizations on January 30, 1954, to help organize a state Joint Commission for the Improvement of the Care of the Patient similar to the national organization. Dr. G. E. Brereton, Dr. Truman Blocker, and the chairman attended this meeting and assisted in formulating by-laws for this organization, which herewith follow:

BY-LAWS OF TEXAS JOINT COMMISSION FOR THE IMPROVEMENT OF THE CARE OF THE PATIENT

Article I.—Name.

The name of this organization shall be "Texas Joint Commission for the Improvement of the Care of the Patient."

Article II.—Purposes and Objectives.

The major purpose of this commission is to stimulate, implement, assist in, and sponsor activities which will contribute to the care of the patient as may be mutually satisfactory to the appointing organizations.

To achieve this objective, the commission performs as a service agency to the parent organizations. It shall be the intention of the commission to obtain a better understanding of the problems and programs of all represented groups; to serve as a source of information on trends within the programs of the participating organizations; to facilitate the development of a more unified public relations approach by the participating organizations; to explore the needs for and stimulate studies in areas of patient care in which the organizations participate; and to perform such functions and carry on such activities contributing to the major objectives as may be mutually satisfactory to the appointing organizations and to the commission.

Article III.—Membership.

A. The appointing organizations shall consist of the Texas Medical Association, Texas Hospital Association, Texas Graduate Nurses Association, and Texas League for Nursing.

B. The *appointed membership* shall consist of four representatives from the Texas Medical Association, four representatives from the Texas Hospital Association, two representatives from the Texas Graduate Nurses Association, and two representatives from the Texas League for Nursing.

The representation from nursing shall be divided equally between the Texas Graduate Nurses Association and the Texas League for Nursing and should encompass representation of the interests of practical nursing, public health nursing, hospital nursing service, and nursing education.

C. *Ex-officio membership,* without vote, shall be (1) The presidents of the Texas Hospital Association, Texas Medical Association, Texas Graduate Nurses Association, and the Texas League for Nursing, or their duly appointed alternates; (2) the secretaries or executive secretaries of Texas League for Nursing, Texas Graduate Nurses Association, Texas Medical Association, and Texas Hospital Association; and (3) editors of official organs of each association respectively.

Article IV.—Authority for Appointment.

Each of the parent organizations shall have authority to appoint representatives in accordance with Articles III and V. The four organizations shall be known as the *appointing organizations.*

Article V.—Terms of Appointment.

Each appointment shall be for two years.

Article VI.—Voting Privileges and Quorum.

Only appointed members present shall have a vote, except that in the absence of an appointed member a designated ex-officio member of the appointing group shall have the power to vote. *A decision shall be reached by a majority vote.*

A quorum shall consist of seven voting members providing all of the appointing organizations shall be represented.

Article VII.—Officers.

There shall be a chairman, a vice-chairman, and a secretary-treasurer. The first two shall not be from the same major group (nursing, medicine, and hospitals).

The chairman shall be elected for a one-year term at the annual meeting and may be re-elected for one additional term. He shall take office the following January 1.

The vice-chairman shall be elected in the same manner and at the same meeting as the chairman and may be re-elected for one term.

The secretary may be an employee of the commission, or a member of the staff of an appointing organization. He shall be elected for a two-year term.

The chairman shall preside at meetings and perform the usual functions of presidents of similar organizations. The vice-chairman shall have the duties generally ascribed to vice-chairmen. The secretary shall perform the functions customary for that position in similar organizations.

Article VIII.—Meetings.

There shall be at least two regular meetings annually. The first regular meeting of the year will be the annual meeting. Special meetings may be called by the chairman.

Attendance to meetings shall be limited to appointed members, ex-officio members, and other individuals who may be invited by the chairman to participate in the program or whose presence may be requested by one of the appointing organizations and approved by the chairman.

Article IX.—Committees.

There shall be an Executive Committee of four members consisting of the chairman, vice-chairman, and one other elected annually at the annual meeting to represent the third group, and the secretary-treasurer, ex-officio. Vacancies may be filled by the chairman from the group represented.

The Executive Committee shall carry on the activities of the commission between commission meetings. Other committees may be appointed by the chairman.

ARTICLE X.—FINANCING.

A. The expenses of representatives to attend commission meetings shall be a responsibility of the respective appointing organization.

B. Other organizational expenses, such as those for clerical service, meeting space, and office work, shall be divided equally between the three major groups (nursing, medicine, and hospitals).

C. Other finances may be promoted and cared for as may be recommended by this commission and approved by the four appointing organizations from time to time.

ARTICLE XI.—RELATIONSHIP OF THE COMMISSION TO APPOINTING ORGANIZATIONS.

A. The commission shall be a service group to the organizations represented. It shall be a sounding board for a constructive exchange of opinions. Actions of the commission are advisory to and not mandatory on the appointing organizations. The commission may originate actions for consideration by, or may receive actions for consideration from the appointing organizations. The Texas Joint Commission will keep in touch with the National Joint Commission for the Improvement of the Care of the Patient, ask for help and advice as necessary, make suggestions and recommendations, and submit an annual report to the National Commission.

B. The failure of an appointing organization to approve or disapprove a commission conclusion within a period of three months shall be accepted as approval of the conclusion, and an extension of three months will be granted on request.

C. Such items as are unanimously approved by the commission and deemed suitable for publication by all four presidents of the appointing organizations may be released by the Texas Joint Commission to the public through professional and other media.

ARTICLE XII.—AMENDMENTS.

These rules may be amended without previous notice by unanimous vote, or by a two-thirds vote, if the amendment has been presented to the membership of the commission at least two weeks in advance of the meeting at which the vote is taken.

ARTICLE XIII.—EFFECTIVE DATE.

These rules and/or amendments shall become effective when approved by the commission and appointing organizations.

ARTICLE XIV.—RULES OF ORDER.

Deliberations of all meetings of the commission shall be governed by Robert's Rules of Order, Revised.

It is believed by members of the Committee on Nursing Care that this organization can and will be of great benefit in helping to solve the serious nursing shortage, in effecting beneficial changes in the training program of three categories of nurses, and in materially improving the care of patients throughout the state.

Recommendations

The Committee on Nursing Care wishes to make the following recommendations:

1. That the House of Delegates endorse Dr. Renger's stand in participating in the formation of a vocational nurses' organization.

2. That the Texas Medical Association, through its Council on Medical Jurisprudence, work for three proposed changes in the vocational nurse law: (1) an increase in the renewal fee from $1 to $2, (2) a reduction in the number of members of the board from six to three members who must be present during an examination, and (3) a change in the dates of the fiscal year to permit use of funds for a full year; and that through the Council on Medical Jurisprudence the Association oppose any efforts at reopening or changing the waiver clause in the vocational nurse law.

3. That the Association stimulate and assist in establishing nurse recruitment programs in high schools, patterned after the Michigan plan.

4. That the House of Delegates endorse the Texas Joint Commission for the Improvement of the Care of the Patient and authorize the Board of Trustees to participate in paying the Association's pro rata part of the expenses of that organization as provided for in its by-laws.

Respectfully submitted,

A. C. SCOTT, JR., Chairman,
C. FORREST JORNS,
R. H. BELL,
NEIL BUIE, JR.,
R. D. HOLT,
G. E. BRERETON,
JOSEPH F. MCVEIGH,
TRUMAN G. BLOCKER,
J. L. STOWE.

Vice-Speaker Hardwicke: This report will be referred to the Reference Committee on Medical Service and Public Relations. The next report is that of the State Council on National Emergency Medical Service, Dr. Woods of Dallas.

REPORT OF STATE COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

Dr. Ozro T. Woods: As all of you know there has been a considerable change in the whole philosophy and intent of civil defense in the country. The simple plans this Council made, which were approved by this House of Delegates, are that the responsibility lies in the communities and that the leadership lies in the county medical societies. They have been confirmed throughout the country. We had a long meeting last night with Dr. Holle, the new state health officer, and we are very happy that Dr. Holle and the Council are in almost complete agreement about the general procedures and our plans and what we should do. It is up to this Council to get to work and it is our only recommendation that this committee, which is a large one, be reduced to five members and that Dr. Holle be a member of it.

Vice-Speaker Hardwicke: The report is referred to the Reference Committee on Medical Service and Public Relations. Next is the report of the Committee on Doctor Distribution. That is Dr. Chester U. Callan, Rotan.

Dr. Callan: Our report is printed and there is no supplemental report:

REPORT OF COMMITTEE ON DOCTOR DISTRIBUTION

The Committee on Doctor Distribution, created in May, 1952, by the House of Delegates of the Texas Medical Association, has completed the first phase of its program of work and has reported its findings relating to doctor distribution as viewed by the medical profession. This report was submitted and approved in Houston at the 1953 annual session of the Association.

The Committee is well into the second phase of the program originally outlined. This contemplates a direct survey of Texas communities to determine whether or not qualified representatives of these communities, in most cases chamber of commerce committees, believe doctor shortages

exist in those areas and then by actual on-the-spot survey either to confirm or dispel the question of such shortage. The Committee is well aware of the magnitude of this undertaking, and for that reason it conducted a pilot survey of ten counties of the Seventh Councilor District.

Working in cooperation with Dr. J. M. Coleman, Councilor of the Seventh District, a detailed analysis of community needs in the ten counties composing this medical district was completed in January, 1954. Twenty communities in the district with population over 800 were contacted directly asking whether the community itself believed there existed a need for additional doctors.

Each doctor in the district and all society officers were advised in advance of the purpose of the survey and the method by which it would be completed. All communities were provided with pamphlets prepared by this Committee advising the steps by which the community itself could assist in the problem of providing adequate medical care and the responsibilities of the community in keeping a doctor there.

The Committee is pleased to report that not one request for additional doctors was received. In the Committee's judgment this is clear proof that the number of doctors in this district is adequate and that physicians are located properly in various communities.

Since the Board of Trustees has secured the services of a trained field secretary, this survey can be completed in a period of several months and, if the pilot survey is any index, should bring to light much valuable materials.

Recommendation

The Committee on Doctor Distribution would like to recommend that the life of this Committee be prolonged for at least one more year to complete this survey and assemble the results.

Respectfully submitted,

CHESTER U. CALLAN, Chairman,
HARVEY RENGER,
TROY SHAFER,
ALLEN T. STEWART,
J. C. TERRELL.

Speaker Deaton: Dr. Callan's report is referred to the Reference Committee on Medical Service and Public Relations. Next is the report of the State Chairman of the American Medical Education Foundation, Dr. Thorn.

Dr. S. W. Thorn, Houston: The complete report is found printed:

REPORT OF STATE CHAIRMAN OF AMERICAN MEDICAL EDUCATION FOUNDATION

The purpose of this Committee for the American Medical Education Foundation, created in Texas in 1953, is to provide an instrument through which individual physicians, state and county medical societies, and interested lay groups can make contributions in support of medical education. This need for support for medical education has come about as a result of the radical changes in our national economy and the increased demands made upon the medical schools to expand their enrollments and to adapt their curriculums to the ever-changing science of modern medicine.

The Committee consists of a Chairman for the state and local chairmen from each component society who direct the campaign for funds at the county level. In 1953, there were seventy-three physicians who accepted appointments to this Committee and directed the campaign in their local medical societies.

The Committee is pleased to report that in 1953 there was a marked increase both in the total number of doctors participating in this program and also in the total amount of money raised for the American Medical Education Foundation from Texas. In 1953, 202 doctors contributed a total of $8,903.28. This compares favorably with the 1952 totals when only 27 doctors in Texas participated in this work and contributed a total of only $1,065. In 1953, one Texas physician, Dr. Stuart Wallace of Houston, received from the American Medical Education Foundation the Award of Merit, given to each doctor who contributes $1,000 or more. The Woman's Auxiliary to the Texas Medical Association and Mrs. George Turner of El Paso also will receive this award.

In addition to the 202 Texas doctors who contributed through the American Medical Education Foundation, many doctors contributed funds directly to the medical schools. Baylor University College of Medicine, Houston, reports contributions of $11,800 by 148 doctors. Tulane University reports 1,332 doctor-contributors, many of whom, the Committee believes, are Texas doctors. The University of Texas did not report the number or amount of direct contributions during 1953.

During 1953, the Foundation contributed a total of $73,540 to the three Texas medical schools. This amount represents an increase over 1952 of $5,738. Of this total amount Southwestern Medical School of the University of Texas in Dallas received $23,595; Baylor University College of Medicine in Houston, $22,490; and the University of Texas School of Medicine at Galveston, $27,455. From a comparison of these figures, it is apparent at once that Texas schools have benefited in excess of $64,000 more than has been contributed from the state to the American Medical Education Foundation.

The Committee feels that the prospects for 1954 are much better than in 1953. Many doctors had never heard of the American Medical Education Foundation prior to this first campaign. Many doctors who did not contribute in 1953 will wish to take a part in this work during 1954. This is reflected in the report of contributions from Texas for January, when 61 doctors contributed $1,343. With proper cooperation from members of the State Association, 1954 will be a more successful year and Texas can match more nearly the amount of money its schools are receiving.

Audio-Digest Foundation

At the national meeting of state Foundation chairmen in Chicago this past January, a nonprofit subsidiary foundation of the American Medical Education Foundation was announced. It is known as the Audio-Digest Foundation, which has as its purpose the national distribution of tape recordings of the latest medical information. The basic service is the weekly issuance of a one-hour recording for general practitioners. On it are recorded twenty to thirty abstracts of the best in current literature embracing all medical fields. Articles are screened by a board of medical editors headed by Dr. Edward C. Rosenow, Jr., Pasadena, Calif., editor-in-chief. As a corollary service, Audio-Digest offers semimonthly digests in the fields of surgery, internal medicine, and obstetrics and gynecology. The third service is lectures and panel discussions on one-hour reels for individual or group purchase. Many of these lectures are illustrated by film strips made from the speaker's own slides. This service will be available to physicians for $3.75 for each one-hour tape recording. The profit derived from this service will be turned over to the American Medical Education Foundation for its use in assisting the medical schools to meet their basic educational needs.

Recommendations

The Committee recommends that each and every member of the Texas Medical Association actively support the American Medical Education Foundation in 1954.

The Committee recommends for consideration the services of the Audio-Digest Foundation.

The Committee further recommends that the president of each county medical society appoint a local chairman to serve on this Committee.

Respectfully submitted,
S. W. THORN, Chairman.

Speaker Deaton: Dr. Thorn's report is referred to the Reference Committee on Reports of Officers and Committees. Next, if they are ready, we will have the report of the Committee for Liaison with Workmen's Compensation Insurance Companies.

Dr. Sam N. Key, Jr., Austin: Mr. Speaker, our Committee does not have a complete report at this time.

Speaker Deaton: Thank you. Next are the Appointees to Cooperate with the Board of Nurse Examiners.

Dr. A. C. Scott, Temple: Gentlemen, you will find that incorporated in the report of the Committee on Nursing Care.

Speaker Deaton: Now we have a Joint Commission for the Improvement of Care of the Patient. Who has that report?

Dr. A. C. Scott, Temple: That is incorporated in the report of the Committee on Nursing Care. The Joint Commission was set up through stipulation of the American Hospital Association and American Medical Association and American Nursing Association, and the American Medical Association recommended that each constituent state organization set up a similar commission. The initial steps have been taken in this state, and Dr. Turner has appointed four of us (Dr. G. E. Brereton of Dallas, Dr. Truman Blocker of Galveston, Dr. Joseph F. McVeigh of Fort Worth, and me) to represent the Texas Medical Association. At this meeting you will be given the opportunity after the reference committees have gone over this thing to determine whether or not you want this organization to cooperate in the proceedings of that Joint Commission.

Speaker Deaton: We come now to the reports of special delegates. Dr. T. C. Terrell was to give the report for the Texas Hospital Association, but he is not here, and the delegate to the Texas State Nutrition Council, Dr. Joe Nichols, is not in the room at this time. Are you ready with the report at this time, Dr. Callan, for the State Rural Health Council?

Dr. Chester U. Callan, Rotan: The report is printed:

REPORT OF SPECIAL DELEGATE TO STATE RURAL HEALTH COUNCIL

The Committee on Rural Health met with members of the State Rural Health Council on July 18, 1953. The results of the first survey, made by the Committee on Doctor Distribution, were presented and discussed with this group. The State Rural Health Council agreed that a definite plan should be made to improve health conditions in rural areas.

The Delegate, with several representatives of the Texas Medical Association, including Dr. F. J. L. Blasingame, Dr. Robert W. Kimbro, and Dr. Stephen B. Tucker, met with the State Rural Health Council on November 22, 1953, at College Station. Ways and means of improving health conditions in rural areas were discussed. The possibility of getting the Extension Service of Texas Agricultural and Mechanical College to hire a field worker for formation of local health committees was discussed. The Extension Service was interested in this project, provided there was enough interest manifested by the doctors of Texas.

The past year has shown a marked change in the attitude of the Rural Health Council toward the Texas Medical Association, and the Delegate attributes this change to the increased interest shown in rural health problems by the doctors of Texas.

Respectfully submitted,
CHESTER U. CALLAN.

Speaker Deaton: This report is referred to the Reference Committee on Medical Service and Public Relations. The delegate to the Lone Star Medical Association, Dr. L. L. D. Tuttle of Houston. Dr. Tuttle does not seem to be here, but this report is printed and will be referred to the Reference Committee on Medical Service and Public Relations. (The report follows:)

REPORT OF SPECIAL DELEGATE TO LONE STAR STATE MEDICAL ASSOCIATION

The Lone Star State Medical Association met in Houston, June 2, 3, and 4, 1953. The total number of registrants as of June 2 was forty-four. The meeting was held at the Texas Southern University. There were some twenty-two scientific papers presented, and a business session was held.

The minutes show that the main address was made by the president-elect, Dr. P. W. Beal. Dr. J. L. Dickey was presented, and the fact that Dr. Dickey had been chosen as outstanding citizen of Taylor, Texas, for the year was indeed a source of gratification to the whole group.

The Lone Star State Medical Association went into extra session at Marlin December 6, 1953, at which time its members accepted the resignation of Dr. Beal. At this same meeting Dr. H. L. Williams of Marlin was made president. The records show that at that same meeting Dr. Howard O. Smith of Marlin addressed the group. The group has chosen Beaumont as its 1954 meeting place, this meeting to be held June 8, 9, and 10.

Respectfully submitted,
L. L. D. TUTTLE.

Speaker Deaton: The delegate to the Arkansas Medical Society is Dr. J. M. Travis of Jacksonville; do you have a report, Dr. Travis?

Dr. Travis: Mr. Speaker, the Arkansas association met on April 19 at Fort Smith. I had made preparations to attend, but on account of my health, I did not get to attend.

Speaker Deaton: The report of the Committee on Blood Banks is published and will be referred to the Reference Committee on Scientific Work. (The report follows:)

REPORT OF COMMITTEE ON BLOOD BANKS

The Committee on Blood Banks wishes to reemphasize certain segments of the report before the Executive Council in January, 1953, and to relate developments in the field of blood banking during the past year which potentially affect the entire state. In connection with one of these developments the Committee submitted a resolution to the Executive Council in January, 1954.

The Committee considers it fundamental that the relation between blood banking and the practice of medicine continually be emphasized. It must be accepted that the collection of blood from a donor is as much the practice of medicine as the infusion of a blood transfusion. Evaluation of the health of a donor to determine his eligibility for donation of blood is as much a medical function as the use of a local anesthetic, the puncture of veins, the withdrawal of a portion of the circulatory blood volume, and

the complications which these manipulations may precipitate, such as thrombosis, thrombophlebitis, reactions to the anesthetic, emotional disturbances, and even convulsions. Accordingly, it can be considered that the procurement of blood is as much a part of medicine as its dispensation and infusion. Yet, the medical profession naturally tends to be more concerned with the problems of the recipient, such as the indication for the transfusion, the quantities involved, the accuracy of the compatibility, and potential reactions and their management, thus tending to overlook the source of the blood.

Accordingly, the Committee wishes to urge that members of local medical societies and other interested parties continue to educate themselves on these points, particularly that blood banking matters should be under proper medical supervision. Conversely, it is hoped that all concerned with this question will continue to oppose the attitude that accepts blood without the knowledge or concern over its source, mode of processing, and therefore its integrity, purity, and general meaning.

The Committee, through three of its members, is aware of certain developments in blood banking in the state which should be brought to the attention of the Association. The Committee's report of January, 1953, emphasized the need for the integration of blood banks throughout the state in a system of exchange for blood and blood credits. For this purpose a central clearinghouse was discussed. Such a structure provides "credit forms" to all reciprocating banks, to be forwarded to the clearinghouse, for the proper exchange of blood and blood credits as their needs arise; records credits and debits; adjusts credits and debits at the end of each month; and directs the shipment of blood to cancel blood indebtedness at the end of each month. By these functions the clearinghouse integrates inter–blood bank transactions, authorizes blood shipments to cancel indebtedness, collects and pays processing fees, and maintains a perpetual inventory of blood available throughout the state. Such a clearinghouse program is considered effective and essential as a means of improving the availability of blood; minimizing the percentage of blood that is unused through becoming outdated or overage; and integrating blood banks by standardizing equipment and procedures, by insistence on accurate methods, by a continual automatic system of self-education, and by the development of habit patterns of cooperation and communication. A system is developed wherein most eligible donors throughout the state can be rapidly mobilized in times of peace or war for the care of casualties. Such a system is in a better position to lower the cost of blood to patients. Moreover, the success of such a program becomes an outstanding insurance against the encroachment in this field in this state by centralized governmental or quasigovernmental agencies.

The Committee wishes to mention that such a clearinghouse program is in the process of being launched under the sponsorship of the Texas Association of Blood Banks. Already the initiating fund is sufficiently advanced to indicate a beginning of this program by March or April. There is adequate indication of greater voluntary donations in support of the initial phase of this program. An agreement concerning the major features of the program has been reached by twelve of the larger blood banks in the state, extending from Amarillo to Houston and Galveston and from El Paso to Tyler. There is every indication that many other organizations will join the program.

Since the potentialities of this mechanism for the exchange and supply of blood for transfusions were thoroughly discussed at the January, 1953, Executive Council meeting and since the Council and the House of Delegates considered the question favorably, the Committee on Blood Banks requested by resolution before the January, 1954, Executive Council endorsement of such a clearinghouse program, and such endorsement was given.

Respectfully submitted,
E. E. MUIRHEAD, Chairman,
T. P. CHURCHILL,
TOM OLIVER,
C. B. SANDERS,
O. J. WOLLENMAN, JR.

FRATERNAL DELEGATES

Speaker Deaton: This brings us to the presentation of some fraternal delegates. The delegate from the Private Clinics and Hospitals Association of Texas, Dr. William T. Sadler of Merkel.

Dr. Sadler: I am happy to be here as a guest and I will file my report:

The 175 members of the Private Clinics and Hospitals Association appreciate the privilege of having one of its members present as a guest of the House of Delegates of the Texas Medical Association, and I am grateful to have received this assignment.

Our organization came into being by reason of the fact that there were certain peculiar problems which need to be considered. Its existence in no way limits our allegiance to the parent organization. The board of councilors has asked me to extend an invitation to this group to designate one of your members to be present at the state meeting of the Private Clinics and Hospitals Association on December 4 and 5 at Corpus Christi. We have no measures peculiar to our organization which we need to submit to the House of Delegates.

Speaker Deaton: This report will be referred to the Reference Committee on Medical Service and Public Relations. The fraternal delegate from the Texas Dental Association, Dr. Kenneth W. Thomas of San Antonio.

Dr. Thomas: I was speaking to one of your local members the other day and told him I had a little speech of about four lines to make to this body. He replied that the idea was all right but couldn't I cut it down to two. I have taken that into consideration, and I will come and go in practically the same breath. I come with greetings from the Texas Dental Association with best wishes for a fine convention and go with the hope that our two societies will enjoy the same cooperation and mutual understanding that they have in the past.

RESOLUTIONS AND AMENDMENTS

Speaker Deaton: That brings us to the reading of communications. Apparently we have no communications, so the next item of business is the reading of memorials and resolutions. If you have a resolution, this would be a good place to read it. Dr. E. P. Hall of Fort Worth is recognized.

Dr. Hall: This is a resolution opposing compulsory social security taxation and its extension:

Resolution: Extension of Compulsory Social Security

Whereas, the social security system is based on a completely compulsory principle that is contrary to the essential principles of individual liberty and freedom; and

Whereas, numerous federal court decisions have held that the social security tax is just another income tax, which creates no contractual or moral obligation for payment of benefits; and

Whereas, legislation is now pending which will force 6,500,000 persons, including physicians, into the system; and

Whereas, the Texas Medical Association, in April, 1953, stated its opposition to the extension of compulsory social security taxation; therefore, be it

RESOLVED: That the Texas Medical Association, through its House of Delegates, in regular session, assembled this second day of May, 1954, does hereby instruct its delegates to the American Medical Association to present to the House of Delegates of the American Medical Association at the annual session in 1954, a resolution requesting that that body state its unequivocal opposition to compulsory social security taxation and its extension; and be it further

RESOLVED: That a copy of this resolution be spread upon the minutes of this meeting and provided to each member of the Texas Medical Association who is a member of the House of Delegates of the American Medical Association.

Speaker Deaton: Inasmuch as Dr. Copeland's report has been referred to the Committee on Medical Service and Public Relations, Dr. Hall's resolution will be referred to the same committee. The chair will recognize Dr. Pickett.

Dr. B. E. Pickett, Carrizo Springs: I wish to submit herewith two resolutions. The first resolution pertains to reclassification of membership.

Resolution: Reclassification of Membership

Whereas, the American Medical Association is considering the various classifications of membership as set up in the constitution and by-laws of its various component state medical associations; and

Whereas, the American Medical Association is recommending to the component state medical associations types of classifications of membership in order that the American Medical Association can expedite its work with the various component state medical associations; now therefore be it

RESOLVED: That the House of Delegates request the Committee on Revision of the Constitution and By-Laws to study and reevaluate the classifications of membership as set forth in the Constitution and By-Laws of the Texas Medical Association so that, if possible, the classifications for membership in the Texas Medical Association will conform with the classifications as set up by the American Medical Association; be it further

RESOLVED: That the Committee on Revision of the Constitution and By-Laws consider making the changes in the classification of membership in the Texas Medical Association on the basis of the recommendation of the American Medical Association as attached hereto and made a part hereof.

(The recommendations mentioned in the resolution follow:)

January 11, 1954

"B. E. Pickett, Sr., M. D.
Carrizo Springs, Texas
Dear Dr. Pickett:

We appreciate very much your offer to do some spadework toward the simplification of membership classifications.

On the attached sheet, we have summarized the various classifications of membership in the Texas Medical Association, according to the information given in the copy of your Constitution and By-Laws, dated May 7, 1952, which we have on file.

On Sheet No. 2, we have indicated possible changes, cutting the number of types of membership to three, but preserving as much as possible the present rights and privileges given to these members.

We have indicated, for example, that both 'Active' and 'Inactive' members should simply be designated as 'Active.' The use of 'Inactive' for a classification of membership that includes the right to vote and hold office is rather unusual, and apt to be misleading. As far as we can see, members in this classification are actually those who could be exempted from the payment of A.M.A. dues because of retirement or financial hardship.

The 'Honorary' and 'Emeritus' members of your society could be combined, we believe, in a new classification called 'Life' members. All of these would be eligible to Active membership in the A.M.A., and those who are retired or who have attained the age of 70 could be exempted from the payment of A.M.A. dues. We are not sure of just what the differences are between 'Inactive' and 'Honorary' under your present constitution; if the differences are not too great, you may prefer to switch the 'Inactive' also to the new classification of 'Life.'

It would be well to get away from the use of the classification of 'Honorary' for active members, because it is so generally used to designate out-of-state men who are given a nominal, honorary membership, often simply because they have taken part in an annual meeting. Generally, it is the type of membership that does not include the right to vote and hold office.

Your 'Intern,' 'Resident,' and 'Military' members could be easily changed to a classification of 'Associate,' and they would then be given Associate Membership in the A.M.A., just as they now are. We have added the information that they would not have the right to vote or hold office, as this information should be specifically mentioned in your Constitution and By-Laws. We should like to call your attention to the fact that most states provide a type of active membership, rather than associate membership, for members who are temporarily serving in the Armed Forces. If it should be desired to give these physicians the privilege of voting and holding office, they could be changed to the Active classification, and made exempt from the payment of A.M.A. dues, regardless of whether they are required to pay full or partial dues in the state.

There is another matter relating to your membership that I should like to mention at this time. I wonder if it would be possible, in publishing your Annual Directory of Members, to arrange the list alphabetically by counties, and after each county indicate by number the district to which the county belongs. Under the present arrangement, which is by district and then alphabetically by name of member under the district, it is very difficult to ascertain whether a man is a member because one has to look through fifteen districts and locate the county before one can then refer to the section of the book containing the members for that particular county. If the present arrangement is continued, it would help to provide at least a complete alphabetical list by name, followed by a number or key to show the district under which the member's full address appears.

We are very grateful for your interest in these various problems of membership, and shall be glad to furnish any further information that will be of service to you.

Very truly yours,
FRANK V. CARGILL
Director of Records and Circulation
American Medical Association

Type of Membership	AMA Status	Texas
Active	Active	Only white physicians, licensed in Texas shall be members, except that white medical officers of the federal government and teachers in Class A schools who do not practice and are not required to be licensed, who are

		bona fide residents of Texas shall be eligible.
Honorary	Active	Those physicians of honorable standing who have contributed to the advance of medicine or, who may have, because of age or other laudable reasons, reached comparative inactivity in practice of medicine or completely retired; pay reduced dues.
Emeritus	Active	Any member of the Association who has rendered exceptional and distinguished service; pays no dues.
Inactive	Active	Members of county societies who have retired permanently and who are not eligible to Honorary membership; pay reduced dues.
Residency	Associate	County medical societies may elect to
Intern	Associate	intern or resident membership physicians who are serving internships or residencies in hospitals as a part of their educational qualifications and who are not in private practice, provided they meet the other requirements in the constitution and pay the annual dues of $4.00.
Military	Associate	Members who are at the time serving the Armed forces, including the Coast Guard, the membership ending with discharge. Military members will be required to pay a yearly fee of $1.00 to cover Medical Defense."

Speaker Deaton: This resolution will be referred to the Reference Committee on Amendments to the Constitution and By-Laws. All right, Dr. Pickett.

Dr. Pickett: This next resolution is one directing attention to the proper method of correcting unethical conduct:

Resolution: Correction of Unethical Conduct

Whereas, numerous articles concerning ghost surgery, fee splitting, and other types of unethical and unprofessional conduct have appeared in national publications and articles in daily papers; and

Whereas, said articles are of such a nature as to lead the public to believe that said fee splitting, ghost surgery, and other types of unethical conduct are prevalent within the ranks of organized medicine; and

Whereas, it is the opinion of the House of Delegates that said articles do not reflect the true facts and are having a detrimental effect upon the members of the medical profession; and

Whereas, the Texas Medical Association and its component county societies have provided public grievance committees to consider matters of this nature when brought to their attention; and

Whereas, under Chapter XIV of the By-Laws of the Texas Medical Association it is provided:

"Sec. 1. The Principles of Medical Ethics of the American Medical Association, as at present published, or as hereafter amended, shall govern the conduct of the members of this Association in their relationship to each other and the public.

"Sec. 2. In consultation, the dictates of humanity shall be the governing principle, but it shall be considered unprofessional and unethical for a physician to enter into any business relations with a practitioner of sectarian medicine or a cultist, which would tend to commend such limited practices or establish them in the confidence of the public, or bring reproach upon the good name of the medical profession.

"Sec. 3. It shall be considered unprofessional and unethical to engage in the practice commonly known as fee splitting, in any of its forms as defined by the Board of Councilors"; and

Whereas, adequate means are provided under the Constitution and By-Laws of the Texas Medical Association and its component county societies to conduct investigations and suspend or revoke the membership of any of its members who are guilty of such practices; and

Whereas, it is the desire of this House of Delegates of the Texas Medical Association to eliminate any of the unethical practices mentioned above when the information is furnished to the Texas Medical Association or any of its component county societies; now therefore be it

RESOLVED: That this House of Delegates go on record as being in full accord with the By-Laws of the Texas Medical Association and its component county societies and is desirous that said By-Laws be strictly enforced concerning fee splitting, ghost surgery, or any other type of unethical conduct; and be it further

RESOLVED: That copies of this resolution be sent to each hospital administrator in Texas and to the secretaries of the component county societies in order that they may be fully informed concerning the By-Laws relative to ghost surgery and fee splitting; and be it further

RESOLVED: That the delegates to the American Medical Association from Texas introduce a similar type of resolution in the House of Delegates of the American Medical Association calling upon the House of Delegates of the American Medical Association to recommend to its component state medical associations the enforcement of the code of ethics of the American Medical Association concerning fee splitting, ghost surgery, and other types of unethical conduct of its members in order that the public might be informed of the avenues open to them to file charges or complaints against any physician who is guilty of fee splitting, ghost surgery, and other types of unethical practices.

Dr. Pickett: This resolution was passed unanimously by the LaSalle-Frio-Dimmit Society. The first resolution was by request of the Department of Records and Circulation of the American Medical Association, Mr. Frank Cargill, directing head.

Speaker Deaton: It has been suggested that this last resolution should be referred to the Board of Councilors as a reference committee. Is there anyone else who has a resolution?

Dr. Homer E. Prince, Houston: Mr. Speaker, this is an amendment for Article X, Section 4 of the Constitution and By-Laws:

Amendment: Probationary Membership

BE IT RESOLVED: That Chapter X, Section 4 of the By-Laws of the Texas Medical Association be amended and they are hereby amended so that the same shall hereafter read as follows:

"Sec. 4. Each component county society shall judge of the qualifications of its own members, but it shall have all due regard for the fact that only through a component county society may a physician become a member of the Texas Medical Association and of the American Medical Association, and shall consider that all white, legally registered physicians within its jurisdiction holding the degree of Doctor of Medicine, and all white medical officers of the Army or Navy or of the Federal Government, or teachers in "Class A" medical schools of this State who do not

practice medicine and who are not required to register under the Medical Practice Act of Texas, who are at the time bona fide residents of the State, who do not hold themselves out as practitioners of sectarian medicine and who shall subscribe to the Principles of Ethics of the American Medical Association, are entitled to membership.

"Component county societies shall have the right to provide a probationary period for applicants seeking membership in their county society, provided that the probationary period shall be determined by the individual component county societies but under no circumstances shall the probationary period exceed twenty-four months. New members accepted on a probationary basis may have all the privileges of regular membership in the society, including the right to vote. However, at the end of the probationary period, as provided in the Constitution and By-Laws of the component county society, the member shall again be considered by the board of censors of said component county society and elected by the county society before his membership can become permanent."

Speaker Deaton: This resolution is referred to the Reference Committee on Amendments to Constitution and By-Laws. The chair will recognize Dr. C. F. Jorns of Harris County.

Dr. Jorns, Houston: This is a resolution which pertains to the National Blood Foundation:

Resolution: National Blood Foundation

Whereas, it appears that the Blood Bank Committee of the American Medical Association has made a report to the AMA Board of Trustees in which it is proposed that the AMA join with certain other national organizations, to wit, American National Red Cross, American Association of Blood Banks, American Hospital Association, the American Society of Clinical Pathologists, and others to be determined, in the formation of a National Blood Foundation; and

Whereas, the purposes of this organization, among others are:

To develop ways and means to make blood and its derivatives available to all persons in the United States;

To stimulate and advise on areas of research in the collection, preservation, and use of blood and its derivatives;

To collect, study, and disseminate information on blood and blood derivatives;

To establish a national blood clearing house to expedite the exchange of blood credits;

To serve upon invitation, for arbitration of disputes arising in the collection and use of blood and its derivatives; all of which purposes are laudable but are probably being performed in whole or part by the American Association of Blood Banks and other organizations nationally interested in blood banking; and

Whereas, certain other proposed purposes of the National Blood Foundation do not relate to medical aspects of blood banking but propose to regulate on a national basis, administrative policies, personnel qualifications, and to set up standards for the approval and accreditation of approved banks in addition to the present licensing procedure for blood banks now administered by the United States Public Health Service; and

Whereas, it is believed that regulation of administrative policies and practices of blood banks on a national basis would achieve no useful purposes, but would take away from the local county medical society the determination of the kind and type of blood banking service desired in the local community and would subject any local blood bank to national regimentation in order to obtain approval and accreditation of the National Blood Foundation; therefore be it

RESOLVED: That the Texas delegates to the American Medical Association be instructed to request the American Medical Association to reexamine its position and viewpoint concerning the National Blood Foundation to the end that the AMA should approve, foster, and support a program related to the medical operation of blood banking that will provide for coordination of blood bank activities in times of national disaster or emergencies, but will oppose a program that would take from a local county medical society the local determination of the need for and type of blood banking program that shall serve the community, including any attempt at regimentation of blood banking activity at the local level which would interfere with free enterprise.

This resolution is not to be construed as opposing proper accreditation by the American Medical Association of blood bank facilities.

Speaker Deaton: This resolution is referred to the Reference Committee on Scientific Work. The chair will recognize Dr. R. R. Ross, Austin:

Dr. Ross: Mr. Speaker, this is a proposed amendment to the By-Laws:

Amendment: Committee on Maternal Mortality

1. Amend Chapter VIII, Section 3, Subsection b to form a standing Committee on Maternal Mortality.

2. Amend Chapter VIII, setting up a new Section 17 after Section 16, the proposed Section 17 to read as follows: "The Maternal Mortality Committee shall consist of six members, each with a five year term of office, with one term expiring each year. Succession in office shall be on nomination by the President-Elect at the time of election of officers and shall not require confirmation by the House. Tenure of office is not limited. Three members of the Committee are to be appointed from each of the obstetrical departments of the three medical schools in Texas. An ex-officio member of this Committee will be the director of the Division of Child and Maternal Health of the Texas State Department of Health. A second ex-officio member is to be appointed by the president of the Texas Association of Obstetricians and Gynecologists. A third ex-officio member is to be appointed by the president of the Texas Academy of General Practice. The duties of the Maternal Mortality Committee are to conduct a continuous survey of maternal deaths in the State of Texas in an effort to reduce the preventable deaths in Texas by eliminating all possible hazards in pregnancy and childbirth."

3. Amend Chapter XI, setting up new Section 3 following Section 2, the proposed Section 3 to read as follows: "District Maternal Mortality Committees will be elected by each of fifteen district medical societies at their annual meetings. Each District Committee will consist of three members, each with a three year term of office, with one term expiring each year. The duty of the District Maternal Mortality Committee is to investigate every maternal death in the district in accordance with the type method of case study specified by the state Maternal Mortality Committee. The reports on each death will be forwarded to the state Maternal Mortality Committee. The state Maternal Mortality Committee will anonymously study and review each maternal death report and will make and return constructive recommendations back to the District Committee."

Speaker Deaton: This resolution will be referred to the Reference Committee on Amendments to Constitution and By-Laws. We recognize Dr. Cox of Wichita Falls.

Dr. E. Aubrey Cox: Mr. Speaker, I have a resolution:

Resolution: Fluoridation of Water Supplies

Whereas, fluoridation of municipal water supplies has been proven beyond doubt to be beneficial in the reduction of dental caries and has been approved and recommended by the American Dental Association and other nationally recognized dental organizations; and

Whereas, the Council on Pharmacy and Chemistry of the American Medical Association has stated that chronic ingestion of water containing one part per million of fluoride does not have a harmful effect on any organ or structure of the human body; and

Whereas, the American Medical Association, United States Public Health Service, National Research Council, Commission on Chronic Illness, and many other national health organizations have endorsed the principle of fluoridation; therefore be it

RESOLVED: That the House of Delegates of the Texas Medical Association endorse the fluoridation of community water supplies.

Speaker Deaton: The resolution on fluoridation of water will be referred to the Reference Committee on Medical Service and Public Relations. Are there any other resolutions to be presented?

Dr. Alvis Greer, Houston: This is a resolution opposing H. R. 6949, H. R. 8356, and S. 3114:

Resolution: Federal Reinsurance of Health Policies

Whereas, some 91,000,000 Americans are holders of health insurance policies purchased on a voluntary basis; and

Whereas, private commercial and nonprofit insurance companies are now writing major medical expense coverage and have consistently shown a willingness to expand coverage as public demand develops, and sound insurance principles indicate; and

Whereas, the principle of reinsurance is already employed in the insurance field and is no magic formula for selling protection to the unwilling buyer, nor does it reduce the cost of insurance or make insurance available to any class of risk or geographic area not now within the capabilities of voluntary insurers to reach; and

Whereas, it has been abundantly illustrated and made a matter of United States Supreme Court record that the government has the right to regulate that which it subsidizes and the bills H. R. 6949, H. R. 8356, and S. 3114 place extensive regulatory authority in the hands of the federal government; and

Whereas, it is our opinion that H. R. 6949, H. R. 8356, and S. 3114 would not accomplish the desired results; therefore be it

RESOLVED: That the House of Delegates of the Texas Medical Association in business session assembled this second day of May, 1954, does hereby go on record as opposing the enactment of H. R. 6949, H. R. 8356, and S. 3114; and be it further

RESOLVED: That a copy of this resolution be spread upon the minutes of this meeting and copies forwarded to the Secretary of Health, Education, and Welfare; the President of the United States; all members of the Congress of the United States; the chairmen of the Democratic and Republican Parties.

Speaker Deaton: This resolution is referred to the Reference Committee on Medical Service and Public Relations. Dr. York of Harris County has a resolution.

Dr. Byron P. York, Houston: I have the following resolution:

Resolution: Gamma Globulin

Whereas, the national policy for the control and distribution of gamma globulin is now limited to one national philanthropic organization and is not generally available to those engaged in the practice of medicine except for specific purposes and with specific limitations; and

Whereas, a number of physicians have used gamma globulin for several years as an aid in the management of certain infectious complications of allergic disorders, frequently recurring respiratory infection, particularly in children, and for other nonspecific conditions; and

Whereas, it is believed that the public interest would be better served by a more liberal distribution of gamma globulin; now therefore be it

RESOLVED: That the Texas Medical Association in session on May 2, 1954, go on record as instructing its delegates to the American Medical Association that the American Medical Association recommend that the national policies relative to the distribution of gamma globulin be reevaluated; that the National Foundation for Infantile Paralysis be requested to discontinue the purchase of gamma globulin produced by the commercial houses; and that this gamma globulin be released for normal distribution.

Speaker Deaton: The resolution will be referred to the Reference Committee on Scientific Work.

Dr. Tom Kennerly, Houston: This is a resolution opposing the "waiver of premiums" provision (Section 106 and Sections 221 and 222) of H. R. 7199:

Resolution: Waiver of Premiums

Whereas, Section 106 of H. R. 7199 establishes a "waiver of premiums" for individuals with extended total disability who are included in the social security system; and

Whereas, This provision would become an entering wedge for the regimentation of the Medical profession by creating the mechanism for the adoption of a federal cash permanent and total disability benefit program; and

Whereas, Sections 221 and 222 place the final authority for determining the disability of the patient in the hands of the Secretary of Health, Education, and Welfare; therefore be it

RESOLVED: That the House of Delegates of the Texas Medical Association in business session assembled this second day of May, 1954, go on record as opposing Sections 106, 221, and 222 of H. R. 7199; and be it further

RESOLVED: That a copy of this resolution be spread upon the minutes of this meeting and a copy forwarded to the Secretary of Health, Education, and Welfare; the President of the United States; all members of the Congress of the United States; the chairmen of the Democratic and Republican Parties.

Speaker Deaton: This resolution is referred to the Reference Committee on Medical Service and Public Relations.

Dr. Clement C. Boehler, El Paso: We have a resolution here to change the Constitution and By-Laws in one respect:

Amendment: Deletion of "White" for Membership

Whereas, the first sentence in Article I, Section 2 of the Constitution and By-Laws of the Texas State Medical Association reads: "The purpose of this Association shall be to federate and to bring into one compact organization the entire medical profession of the State of Texas . . ."; and

Whereas, the inclusion of the word "white" as a requisite for membership in the Texas Medical Association in Section 3, Article II, defeats the stated purpose of this Association and further creates an injustice to the Negro doctors of the state; now therefore be it

RESOLVED: That Section 3, Article II, of the Constitution of the Texas Medical Association be amended to delete the word "white" so that the first portion of the sentence of the section shall read as follows: "Only physicians, holding the degree of Doctor of Medicine and legally registered to practice medicine in Texas. . . ."

Speaker Deaton: This resolution is referred to the Reference Committee on Amendments to the Constitution and By-Laws. Inasmuch as it involves a constitutional change, it will have to lay over, but the committee can bring in its report and recommendation and it can be discussed at that time. Is there any unfinished business to come before the House of Delegates? Are there some committee reports left over? I see Dr. Tate Miller of Dallas is here, and he will give us a report of the Committee on Negro Medical Facilities.

REPORT OF COMMITTEE ON NEGRO MEDICAL FACILITIES

Dr. Miller: Since there is no actual concrete thing to be done to improve Negro facilities as long as we intentionally keep them out of organized medicine, our efforts have been directed wholly toward this end. The chairman of the Committee has visited all of the southern states within the last four months to learn what they have done, what they plan to do, and what the consequences up to now have been.

It is brought out that the only nation in the world that discriminates against the Negroes is the United States of America. The only portion of the United States of America that still discriminates is the South. The only part of the South that still discriminates is made up of seven states. In earlier years I had an ambition to be present when Texas was the first to take a broadminded realistic attitude toward that problem. My ambition now is to keep Texas from being the very last. There are seven states which have not yet taken the word "white" out of the requirements.

I won't go into the methods of each state, but I will say that Louisiana has not made the step; Alabama has; Florida has, and with three years' experience the doctors there state that they are very happy with the situation. Georgia of the Old South has taken it, and if there is a South of the South, in the State of Georgia, it is the City of Macon, where the doctors took it upon themselves, instead of selecting the Negroes one at a time, to admit the whole thirteen colored doctors into the society. Their executive secretary expressed to me and to the audience there that it was the most constructive thing they had done and had contributed much to the understanding of the doctors and had contributed materially to the health program in their section of the country. Kentucky has. The Carolinas—I understand one of the Carolinas has taken the word "white" out and both of them have the matter underfoot. Tennessee has the motion under way but has not reached any conclusion. Missouri has gone even to the extent of putting no possible limitation, socially or otherwise. The bugbear of social contacts has been in existence there and none of them from the state, from the ladies' auxiliary, from the president, has found an objectionable feature.

I hope very much that eventually we will think as progressively as the other forty-one states in the United States have done. One individual I met on my tour attended an international convention, held primarily for cussing Russia for her inconsiderate treatment of the masses, and Russia came back and said, "What is your United States in certain sections still doing to the Negro?" I hope that we can soon get from under the desecrating situation that exists in our own southern states towards the profession of medicine.

Speaker Deaton: I will refer Dr. Miller's report to the Reference Committee on Amendments to Constitution and By-Laws. Is there any new business? This about brings us to the end of the morning session. Dr. Bob Homan, who usually presides where I am standing, is ill and unable to attend this session. I think we should give him a big wish for an early recovery.

Dr. B. E. Pickett, Carrizo Springs: I move that this House of Delegates send Dr. Homan a telegram or authorize our Executive Secretary to do so. (Thereupon said motion was seconded and unanimously carried.)

Speaker Deaton: It has been moved and seconded that we recess and we will now recess until 8 this evening.

(The morning session ended at 1 p. m.)

Sunday, May 2, 1954

MINUTES OF THE HOUSE OF DELEGATES

SECOND MEETING

(The House of Delegates reconvened Sunday, May 2, 1954, at 8 p. m. with a quorum present.)

Speaker Deaton: The first item in the order of business for this session is the report of the reference committees. First we have the Reference Committee on Reports of Officers and Committees, and Dr. E. P. Hall of Fort Worth is chairman of that committee.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF OFFICERS AND COMMITTEES

Address of President

Dr. Hall: The address of Dr. George Turner was read. We of the Reference Committee recommend that the House of Delegates commend him on his address and compliment him for the excellent work he has done as President of the Association for the year 1953.

Dr. Turner's reference to the fact that hospitals and/or incorporate institutions are at times actively engaged in the practice of medicine has been considered. The Reference Committee recommends that the Texas Medical Association go on record as condemning such infringement and also that the special Committee on Infringements on Private Practice consider this problem for further investigation and recommendation.

Dr. Turner's recommendation that the policy of the Medical Students' Day program be permanently established as an annual affair is recommended by the Reference Committee.

Our President's recommendation that the meeting of the county medical society presidents and secretaries be made an annual event in conjunction with the January Executive Council meeting is heartily endorsed by the Reference Committee. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Executive Secretary

Dr. Hall: The reports of the Executive Secretary have been read, and the Reference Committee recommends acceptance of such reports. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Board of Councilors

Dr. Hall: The report of the Board of Councilors has been studied, and we recommend acceptance of this report. There is one recommendation which states that the Board of Councilors strongly recommends that county society members, especially officers, familiarize themselves with those portions of the Association's Constitution and By-Laws and of the Principles of Medical Ethics of the American Medical Association dealing with the individual conduct and obligations of members and the responsibilities and action of county medical societies. This recommendation is made because many questions submitted to the Board of Councilors for ruling are clearly answered in these two publications and the matter could be handled on a local or county level. We approve the adoption of this recommendation. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Delegates to American Medical Association

Dr. Hall: The report of the delegates to the American Medical Association was carefully read and studied, and the Reference Committee wishes to commend them for a job well done in presenting the mandates of the Texas Medical Association and bringing them to a successful and effective conclusion. The House of Delegates should recognize that the actions of our delegates have given them a position of influence in the AMA House in excess of their numerical strength. We recommend the acceptance of their report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Executive Council

Dr. Hall: The report of the Executive Council was studied and we recommend acceptance of this report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Medical History

Dr. Hall: The report of the Committee on Medical History as presented by Dr. Felix P. Miller of El Paso was read with interest. We commend Dr. Miller for his long years of work on behalf of the Texas Medical Association and his interest in medical history, and we recommend the acceptance of his report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on General Arrangements for the Annual Session

Dr. Hall: The report and supplementary report of the Committee on General Arrangements were studied, and we recommend the acceptance of both reports.

The Reference Committee suggests that in the future the House of Delegates be provided with tables and chairs, where feasible, for the use of the elected delegates and that chair seating space be provided for visitors and alternate delegates behind the seated delegates. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of State Chairman of American Medical Education Foundation

Dr. Hall: The report of the State Chairman of the American Medical Education Foundation was studied, and we recognize the fact that a great deal of progress has been made in this endeavor during the last twelve months. The Reference Committee approves the recommendations of this committee which are:

1. "The Committee recommends that each and every member of the Texas Medical Association actively support the American Medical Educational Foundation in 1954."

2. "The Committee recommends for consideration the services of the Audio-Digest Foundation."

3. "The Committee further recommends that the president of each county medical society appoint a local chairman to serve on this Committee." (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Dr. Hall: I move the adoption of the report of this Reference Committee as a whole. (Thereupon said motion was seconded by Dr. James D. Murphy, Fort Worth, and the same was duly carried and the report adopted.)

Speaker Deaton: The Reference Committee on Resolutions and Memorials; I understand that it had no assignment. The next is the Reference Committee on Finance, Dr. E. W. Jones of Wellington.

REPORT OF REFERENCE COMMITTEE ON FINANCE

Dr. Jones: The Reference Committee on Finance submits the following report for consideration:

Report of Treasurer

Dr. Jones: We have examined the report of the Treasurer in detail and do not find any corrections or suggestions for any changes in regard to same; we recommend that this report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Board of Trustees

Dr. Jones: The report of the Board of Trustees was read and each paragraph studied separately.

Especially do we want to commend the Board's cooperation with the Blue Cross and Blue Shield in publishing of the new directory of members. We feel that this directory will be of much value to members in many ways.

We wish to commend the Board and its action in regard to the student delegates to the American Medical Association. We feel that this is a move in the right direction in creating good public relations with the doctors of tomorrow.

Also in their cooperation with the Committee on Public Relations, we commend the Trustees in their stand in helping to finance the Medical Students' Day as we feel that this also furthers good public relations.

We further commend the support given by the Board of Trustees to the essay contest sponsored by the Association of American Physicians and Surgeons and we recommend its continuance, feeling that it will do much good as stated above.

The sending of the TEXAS STATE JOURNAL OF MEDICINE to all the seniors in the three medical schools, acquainting them with the workings of the State Medical Association and all of its committees and councils, is a good step in the direction for preparing them to be workers in the Association as soon as they graduate.

Cooperation with and wholehearted support of the efforts of the Committees on Rural Health, Doctor Distribution, and Public Relations should be continued.

We especially commend the action of the Board of Trustees in employing a business manager of the Association. We feel that this will implement and increase the efficiency of the business of the Association in no small way. Also, the employment of a field man will be of much benefit in contacting the members in the local societies and acquaint-

ing them with the many different facilities of the Association, also acquainting them with the duties they should perform in regard to endowment and contributions to our Library fund.

We have examined the budget as set up by the Trustees for 1954. We feel that they have adequately taken care of all of the items to our knowledge and that sufficient funds have been allocated for each.

The supplemental report was reviewed and discussed, particularly in regard to all the questions submitted, and we feel that the debts incurred in the construction of the headquarters building have been taken care of in a good business-like manner, and we recommend the adoption of the supplemental report together with the original report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Library Endowment

Dr. Jones: This report should stir the minds of all of us as doctors that we need and will ever need a good library and that, to follow the example of one of our former presidents, Dr. L. H. Reeves, many should be willing and anxious to aid and assist by donating their libraries or should be in the future.

The recommendation to the Woman's Auxiliary is well taken, and we urge that all delegates carry back to their medical societies a message for publicity in the need of funds for this committee. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Dr. Jones: Mr. Speaker, I move that the report as a whole be adopted. (Thereupon said motion was seconded and the same was duly carried.)

Speaker Deaton: That brings us to the Reference Committee on Amendments to the Constitution and By-Laws. They had an awful lot of work to do and are still working. We will pass on at this time to the report of the Reference Committee on Scientific Work, Dr. A. C. Scott of Temple.

REPORT OF REFERENCE COMMITTEE ON SCIENTIFIC WORK

Dr. Scott: This is a report of the Reference Committee on Scientific Work:

Report of Council on Scientific Work

Dr. Scott: The Reference Committee has reviewed the report of the Council on Scientific Work, excepting that portion pertaining to changes in the Constitution and By-Laws. This Committee wishes to commend the council for its zealous efforts in preparing the scientific and general programs and its work in attempting to bring before the entire medical profession a pleasing program.

This Reference Committee recommends that the House of Delegates request the Council on Scientific Work to make every effort in the future to set the meeting dates of the annual session at a time which conflicts with the fewest possible meetings of large national organizations; and that if the council finds it impossible to avoid such conflicts, the council alternate meeting dates from one year to the next so that such conflicts will not always be with the meeting dates of the same national organizations. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Cancer

Dr. Scott: No report was received from the Committee on Cancer.

Report of Committee on Tuberculosis

Dr. Scott: The report of the Committee on Tuberculosis was considered. This Reference Committee recommends the adoption of the original report, but it doubts the wisdom of this Association giving its endorsement to the Texas Tuberculosis Association's "Searchlight on Tuberculosis" without further enlightenment on the nature and extent of that endeavor. This Reference Committee does not recommend the adoption of this addition to the report but does recommend the adoption of the original report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Mental Health

Dr. Scott: The report of the Committee on Mental Health and its activities was reviewed, and this report is approved by this Reference Committee. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Public Health

Dr. Scott: No report was received from the Committee on Public Health.

Report of Committee on Scientific Exhibits

Dr. Scott: The Reference Committee wishes to compliment the Committee on Scientific Exhibits and its zealous efforts to produce a fine presentation this year, and we recommend that the House of Delegates commend this committee for its continuing excellent work. (Upon motion made, seconded, and carried, the above porton of the report was adopted.)

Report of Committee on Study of Alcoholism

Dr. Scott: No report was received from the Committee on the Study of Alcoholism.

Speaker Deaton: The Committee on the Study of Alcoholism has been abolished.

Report of Committee on Blood Banks

Dr. Scott: The Reference Committee has reviewed the report of the Committee on Blood Banks, and it approves the report as written. This Reference Committee particularly wishes to emphasize a statement contained in this report: "It is fundamental that the relationship between blood banks and the practice of medicine continually be emphasized." (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Resolution: National Blood Foundation

Dr. Scott: In connection with the report of the Committee on Blood Banks the Reference Committee considered the resolution of Dr. C. F. Jorns, representative of Harris County Medical Society, and recommends that the House of Delegates adopt this resolution as presented. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Resolution: Gamma Globulin

Dr. Scott: The Reference Committee considered the resolution presented by Dr. Byron P. York, a delegate of Harris County Medical Society, relative to the control and distribution of gamma globulin and recommends that one phrase of the resolution be deleted and that the resolution be changed to read: "RESOLVED: That the Texas Medical Association, on May 2, 1954, go on record as instructing its delegates to the American Medical Association to request that the

American Medical Association recommend that the national policies relating to the distribution of gamma globulin be reevaluated and that gamma globulin be released for normal distribution." (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Dr. Scott: Mr. Speaker, I might say that this report was signed by the members of the Reference Committee who were present, being C. F. Jorns, John L. Otto, C. C. Boehler, G. V. Edgar, and A. C. Scott, Jr., chairman. I move the adoption of the report as a whole. (Thereupon said motion being duly seconded, the same was carried and the report was adopted.)

Speaker Deaton: Next is the Board of Councilors as a Reference Committee, Dr. Baker, chairman.

REPORT OF BOARD OF COUNCILORS AS REFERENCE COMMITTEE

Resolution: Correction of Unethical Conduct

Dr. R. G. Baker, Fort Worth: This is the report of the Board of Councilors as a Reference Committee on a resolution presented by Dr. Pickett directing attention to the proper method of correcting unethical conduct:

It is the opinion of the Board that the resolution simply sets out existing rules and agencies to regulate unethical conduct and that certain provisions could provide material for adverse publicity and poor public relations in the hands of unfriendly individuals outside of the profession. Because of these possibilities and the lack of any apparent need for it, the Board felt that the resolution should not be approved.

I move the adoption of this report. (Thereupon said motion was seconded and duly carried, and the report was adopted.)

SUPPLEMENTARY REPORT OF BOARD OF COUNCILORS

Dr. Baker: The Board of Councilors wishes to submit the following addition to the By-Laws at the end of Section 2, Chapter IV: "When appointed, the term of office of the Vice-Councilor shall correspond to the current term of office of the Councilor of his district unless previously relieved by action of the Board of Councilors."

Speaker Deaton: This supplementary report will be referred to the Reference Committee on Amendments to the Constitution and By-Laws.

The House is now ready to receive the report of the Reference Committee on Amendments to the Constitution and By-Laws, Dr. Jack Kerr, chairman.

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO CONSTITUTION AND BY-LAWS

Dr. Kerr: Mr. Speaker, our report is not yet complete, but we have considered and are ready to report at this time on some matters.

Report of Committee on Revision of Constitution and By-Laws

Dr. Kerr: That portion of the report of the Committee on Revision of Constitution and By-Laws relating to an increase in the number of Trustees from five to seven, for changing the term of office for Trustees from five to three years, and for dividing the state into trustee districts to assure geographical representation by the Trustees was considered by the Reference Committee.

Changes in the Constitution encompassing these provisions and which were presented to this House at its 1953 session and recorded in the transactions of the House on page 425 of the June, 1953, JOURNAL, are as follows:

"BE IT RESOLVED: That Article III of the Constitution of the Texas Medical Association be amended so that, as amended, said article shall provide as follows:

" 'Sec. 1. The officers of this Association shall be a President, a President-Elect, a Vice-President, a Secretary, a Treasurer, seven Trustees, a Councilor for each councilor district, a Speaker, and Vice-Speaker of the House of Delegates.

" 'Sec. 2. The President shall automatically assume office at the expiration of his term as President-Elect. The President-Elect, Vice-President, Speaker, and Vice-Speaker of the House of Delegates shall be elected for terms of one year each. The Secretary, Treasurer, and Councilors shall be elected for terms of three years each. All officers shall serve until their successors are elected and installed.

" 'Sec. 3. The officers of this Association shall be elected by the House of Delegates on the morning of the last day of the annual session, and no person shall be elected to any such office who is not in attendance on that annual session, and who has not been a member of the Association for the preceding two years.'

"BE IT FURTHER RESOLVED: That Article IV of the Constitution of the Texas Medical Association be amended so that, as amended, said article shall provide as follows:

" 'Sec. 1. The business affairs of the Association shall be managed by a Board of Trustees, comprising seven members, elected in accordance with this Constitution and By-Laws. All funds of the Association shall be subject to the exclusive control of the Board of Trustees, except as otherwise provided in this Constitution and By-Laws. The Board of Trustees shall decide all questions not specifically delegated to other authorities by this Constitution and By-Laws. It shall in general serve as a board of directors, within the meaning of the corporate laws of the State of Texas.'

"BE IT FURTHER RESOLVED: That Article IX of the Constitution of the Texas Medical Association be amended so that as amended, said article shall provide as follows:

" 'Sec. 1. The House of Delegates shall divide the state into appropriate trustee districts.

" 'Sec. 2. The House of Delegates shall divide the state into appropriate councilor districts.

" 'Sec. 3. The House of Delegates shall provide for the organization and chartering of such district societies as will promote the best interests of the profession. Such societies shall be composed only of members of component county societies of their respective councilor districts and shall be exclusively scientific and educational in character.' "

The changes in the By-Laws are not ready for presentation at this time. The necessity of their consideration by this House of Delegates will be dependent upon your decision on the above constitutional changes. The above changes in the Constitution were looked upon favorably by the Reference Committee with the exception of the change as proposed in Section 3 of Article III, which states that the officers of this Association shall be elected by the House of Delegates on the morning of the last day. This section as submitted is in conflict with the proposed change submitted by the Council on Scientific Work dealing with the time of the election of officers. The Reference Committee approves these changes with the above exception.

I move the adoption of this report with the exception of Section 3 of Article III.

Speaker Deaton: That has to do with the division of the state into trustee districts; is that correct?

Dr. Kerr: It has to do with the increase in the number of Trustees from five to seven; changing the term of office of Trustees from five to three years; and dividing the state into districts to assure geographical representation by the Trustees.

Speaker Deaton: The Committee has recommended approval of this change. It was proposed last year and has laid over for the customary year. It has been moved and seconded and now it's open for discussion.

Dr. H. T. Jackson, Fort Worth: I have no objection to raising the Trustees from five to seven, but I would like to call the attention of the House to the fact that when we need leadership, we need it badly. Let's get it wherever we can find it, and let's not control it by making it come from some isolated area. We tried this on a national level in another organization, and it did not work. We now try to follow it in general principle, but not an iron-fast rule, and we find that much better. I think we would make a grave mistake if we had to confine our leadership to certain districts.

Dr. A. C. Scott, Temple: I would like to raise a point of order. We are considering amending our Constitution here, and we don't know all we are voting on. For instance, we are voting on a change in districts, and yet, as I understand it, there are a great many other things that concern this not in the Reference Committee's report, that will be brought in later, and that have to do with the By-Laws and certain changes in them. I don't think it is quite fair to ask us to vote on something when we are taking it out of context, so to speak, and don't know exactly what we are voting on. I grant you, some of us do know something about the redistricting proposition, but I would like to know what the whole story is before I make up my mind as to how I want to vote. I will tell you now, I am against the redistricting, but I don't think it is fair to ask us to vote on this thing when we don't know the whole Committee's report.

Speaker Deaton: The changes in the By-Laws will follow and conform to this change in the Constitution.

Dr. Kerr: That was our idea. Our thought was if the House does not act favorably upon the constitutional changes, there was no point in having a secretary write for an hour and a half on the proposed changes in the By-Laws which will have to be made. You will read in the committee reports that the permanent committee recommended changes in the By-Laws to conform with these constitutional changes, if the constitutional changes are adopted. There is no point in writing up the By-Laws if this is not voted on favorably by the House.

Dr. Scott: The only information we have is that the Trustees are entitled to redistrict the state as they see fit; is that right?

Dr. Kerr: No, our understanding about it is what was printed in the committee report, which you have and which I read. That's all the Reference Committee knows, Dr. Scott. These are the constitutional changes as submitted to us which will, as we interpret them, increase the Trustees from five to seven, change the term of office of the Trustees from five years to three years, and divide the state into trustee districts.

Dr. Scott: I take it that I was out of order on my point of order, since it was not maintained, so am I now in order in speaking against the motion?

Speaker Deaton: Go ahead.

Dr. Scott: I think this is a very serious matter. I am not opposed to having more Trustees. There is such a thing as getting a board that is too big and unwieldy and not workable, but probably seven is not too big.

I am opposed to districting the state and saying that a man must come from District 1 and another must come from District 3 and so on. It is a totally different proposition from having councilors and delegates from various districts. We do need districts and subdivisions for the minor offices of the organization. I have watched this organization a long time; we have had some fine officers all up and down the line, and in my opinion we have had some fine Trustees, but there is such a thing as having an area where we don't have a man who has had a lot of experience in this organization and who is qualified on that basis to serve as a Trustee.

I grant that there are a lot of doctors in West Texas and a lot in South Texas and Central Texas and other parts of Texas that are just as bright and capable as any other man, but to my mind, a man who will be Trustee should be a man who has had long experience in this organization. He should be a man who has shown by his endeavors that he has a tremendous amount of energy and a tremendous amount of capability for work and clear thinking.

You are putting this huge organization into the hands of five men largely to control, and we have been very fortunate in the past in having excellent top-notch men. It could, however, conceivably occur that in one or two districts we might not have a man who had those qualifications of long experience and training in this organization, and I think it would be a grievous mistake just to reach out and pick a man because he comes from a given district. I think we will do ourselves irreparable harm if we do it on that basis in the future.

I grant you, there will be times it might seem unfair; there might be two men from North Texas or two men from Central Texas or from West Texas or from somewhere else, but as the preceding speaker, Dr. Jackson, said, I think we should pick the best men wherever they come from and up to this time this body has exercised excellent judgment. It has not been a political matter, but if you get the Trustees based off into districts, it will really become political to my mind, and I think it will become a grievous mistake.

Dr. Andrew Tomb, Victoria: I would like to speak against this change. In the first place, when we elect a man to this Board of Trustees, it means just exactly what it says. He is one of our Trustees—he is elected to the highest deliberative body that we have in the Texas Medical Association. As such, the selection of this man is based on his integrity, his enthusiasm for the Medical Association, his business acumen, and those types of considerations, and certainly not where he lives.

Another point of interest is that since this is a deliberative body and since major business problems arise, many of which cannot be resolved in a period of one or two or three years, a long term of years in which a man can become completely familiar with what he has to deal with is likewise important. If we sheer off a year or two of a man's term, we likewise sheer off a year or two of his efficiency. I feel definitely the man who is elected to the Board of Trustees should be chosen on these considerations instead of where he lives. I am against this measure.

Dr. E. A. Rowley, Amarillo: I don't know why we are making this change. Is it something that the Board has done or failed to do, or is it something that the people who wanted to change this did or did not do—did we disappoint somebody? I want you to understand that the more people we disappoint, the more money you have after they leave.

We don't try to disappoint anybody and make anybody mad, but if it becomes necessary, we can. You already have the state districted and the councilors represent the districts. I see no reason why it should be redistricted again. I see no reason why you should increase to seven members; five is plenty. You have a good Board; there is not a man on that Board that would not quit if you did not like him. I think in a few years you would have all your Trustees elected from the cities and nobody would be elected again from out in the sticks. I am against this change and hope you don't do it.

Dr. L. C. Powell, Beaumont: There are always two sides to every subject. This project originated in the Jefferson County Medical Society, and since that time it has been approved unanimously by District 10 and District 15. Under the terms of the change, the present Trustees will continue on until their terms expire. The only conflict that the Reference Committee had was on the time of election of officers, and members of the House of Delegates who were here last year will remember that after Dr. May Owen presented her resolution to the effect that the Council on Scientific Work wanted to change the election of officers to the time when the House of Delegates had finished its work, I arose and spoke to the point that we were willing to have our election of officers correspond with the time that the other officers were elected. That is in the record in the June, 1953, issue of the JOURNAL.

Texas is a large state. I have some maps there that show even dividing it into trustee districts, how large an area each district covers. Someone said this afternoon that no other state had ever found it necessary to do such a thing. Where is there another state in the United States that is nearly as large as Texas? Our problem is different. We are six times and more the size of New York. We have to face Texas problems with Texas people and the Texas House of Delegates.

It has been my observation that the councilors, year after year, have functioned well, not only locally but as state officers. They are elected by the House of Delegates and we have had no trouble even in the smaller districts in finding someone capable of acting as a councilor. I have confidence enough in the House of Delegates and the doctors of Texas to believe that any of those districts have several men who have spent years of service in the House of Delegates and who are willing and able to function well on the Board of Trustees.

About the idea of raising from five to seven members, we have had five Trustees for many, many years, and in the meanwhile, the Texas Medical Association has grown and grown and grown. The Executive Secretary reported today that we had about the largest membership we have ever had. Now, this change is based not only on a geographic distribution, but also on a doctor population.

This afternoon when the reference committee was considering this item, someone said supposing some calamity should strike one broad area like the Panhandle—some dust storms and droughts; if the doctors moved away, there would be one Trustee representing but a very few people. But the Board of Councilors has the power to change the councilor district boundaries when they are approved by the House of Delegates. It is just a change of the By-Laws and can be done at any session. If the trustee district consists of several councilor districts on a doctor population basis, when the councilors adjust their district, the trustee district would automatically take care of itself.

The main reason that this proposition has impressed me is that I am an East Texas boy. I was born and raised on the banks of the Sabine River. I have consulted many of the oldtimers and have looked in the Texas history written by Dr. Pat Nixon, and we can't find any record in the 101 years that the Texas Medical Association has been in existence that an East Texas doctor from the Arkansas boundary to the Gulf of Mexico has served on the Board of Trustees.

Now, I am talking not only as an East Texas man, but I believe in fairness to the whole state. Dr. Rowley is retiring from the Board of Trustees, and he has made us a wonderful Trustee. We have no complaint about the present Board of Trustees. They have done a good job, but unless someone is elected from there this session, the vast Panhandle area will not be represented on the Board. The changes are designed to meet our present needs.

Dr. John L. Matthews, San Antonio: There are apparently those among us who believe the number of the Trustees should be expanded in order to share the burden and the responsibilities of the trusteeship. Certainly the responsibility of these five men is tremendous, and this body may believe that a larger group might possibly administer our affairs even more efficiently and wisely. The thought of making our Trustees representative of certain fixed geographic areas seems to us in Bexar County the wrong way to accomplish this expansion. I prefer to think that these five Trustees represent our entire membership of nearly 7,000 rather than that each member shall speak for 1,000 of that membership. If expansion is indicated, wouldn't it be better to increase the number to be elected from the state as a whole rather than to specify that each Trustee shall represent a certain geographic area?

If it is still the wish of this body that representation shall be strictly geographic, isn't it illogical that one Trustee should represent the southeast and the northeast corners of this great state, whereas another shall represent the interests of those residing in Erath County out in near West Texas, and Galveston County on the Gulf Coast. It is true that the amendment to the By-Laws has not yet been presented to this body this evening, but the report as printed indicates that those are the contemplated boundaries of the trustee districts.

Dr. E. A. Rowley, Amarillo: I just wanted to answer Dr. Powell about the people up in the Panhandle. The people up there don't blow away that easily, Doctor. We have had about 50,000 people that blew in up there instead of away in the last few years, and if you fellows get that chronic malaria out of your system, you could be elected.

Dr. Truman Terrell, Fort Worth: Being a has-been, I still want to express my opinion in regard to this proposition. I think it will be a mistake to district your state. If you want to increase your number of Trustees, that is all right, but don't limit them to any particular part of the state. Pick the man that you want and see that he does a job.

Dr. Ridings E. Lee, Dallas: We have lived in the United States that has been governed for a number of years by people from districts—from states. We have lived in a state that has been governed by people coming from separate districts of our state. We have had good government most of the time.

I feel that so far as this organization is concerned, it is only fair that representation on this Board be by districts. Certainly the qualifications of a good Trustee are that he be honest and stable and that he have an adequate knowledge of the business interests of this organization. With as many men as we find in any district, I feel that there must be one man available at all times in any district to be represented who would be capable of carrying on the duties of a Trustee.

I think if we omit personalities and think of this as a democratic organization, we cannot do other than district this thing for our Trustees the same as we district it for our councilors. I am sure that this is not the most perfect way that could be designed to govern the business and financial interests of this organization, but I do feel that this amendment gives us the best solution that we have at hand.

Dr. J. M. Coleman, Austin: I feel that this is a dangerous resolution and I am opposing it purely on my personal feelings about it and not through the direction of my district. I am fearful in this situation that we might create a sectionalism within the medical society.

Now, we have our delegates who represent our counties, and the county with five members and the county with fifty members have the same number of delegates, so that there is representation geographically from that angle. Then we have our councilor districts which are divided into the areas of service of councilors. This problem that has been brought up about counties shifting from councilor district to councilor district is not as simple as it sounds. It has been done, yes, but it amounts only to a shift of one county or two counties with maybe four or five doctors who want to attend another medical society.

We are faced with the problem that whenever we divide on the number of doctors in a district, we have inequities. We have two districts here with 600 doctors; we have four districts there with 800 to 900 doctors; and we have one district with 1,000 doctors. For the district with the 1,000 doctors, the doctor is proportionately less represented on the pure mathematics of the thing, but the changes that occur from year to year as our population changes in the state may rapidly produce a condition where the representation is more distorted than ever before. Those of you who have followed the fights for redistricting in the State Senate and the House of Representatives recognize the terrific problems tied to breaking down the districts or changing the district lines once they are formed. It is not like a councilor district. It is more extensive and deeper than that, and I am fearful that if the medical society does approve this amendment, we will create an opportunity for sectionalism which may split the society.

There has been no complaint about our Board of Trustees. Those men, to my mind, have contributed a tremendous amount to the effectiveness of this society. What they have done with your funds in reducing the indebtedness; the hours they have spent on the various tasks have been almost more than we could ask from individuals of our society. Therefore, I feel that the plan which has been in existence has produced top-flight Boards of Trustees, and I am in favor of seeing them continue that way.

Dr. James D. Murphy, Fort Worth: I move that this portion of the report be tabled. (Seconded by Dr. J. M. Coleman, Austin.)

Speaker Deaton: The motion has been made to table, and it is not debatable. The motion has been made by Dr. Kerr favorable to the changes you heard discussed, and now Dr. Murphy moves the tabling of that motion. Are you ready for the question—we will have to have a standing vote. The motion to table is lost.

Now, all those in favor of the motion by Dr. Kerr will please stand so that we may count you. There are 43 votes in favor of the motion. Now, those please stand who are opposed—I count 64 noes. A two-thirds vote is necessary for the adoption of a motion to change the Constitution and By-Laws, and so the motion for redistricting fails. Dr. Kerr, will you proceed?

Dr. Kerr: We have only one other portion of the report ready for consideration by the House at this time; it has to do with the honorary and the inactive membership.

The following amendments to the Constitution and By-Laws were proposed by the Board of Councilors to the House of Delegates at the 1953 annual meeting and published on pages 431 and 432 of the June, 1953, JOURNAL:

"Amend Article II, Section 1, paragraph 1, beginning with line 10, to read as follows: '. . . provided that the House of Delegates, upon nomination of component county societies, may elect to honorary membership those physician members of honorable standing who have contributed notably to the advance of ethical medicine, and who may have, because of age or other laudable reasons, reached a point of inactivity or comparative inactivity in the practice of medicine, or who have been members of organized medicine for a period of fifty years or longer; and when so nominated and elected said honorary members shall be entitled to all of the privileges of membership as set out in this Constitution and By-Laws; provided that county society secretaries shall include all such honorary members in their respective annual reports, with such notation thereon as will at once declare their status.

" 'It is also provided that county societies may elect to military membership those members who are at the time serving with the Armed Forces of our country, including the Coast Guard, and such similar services in time of war, such membership to terminate with their discharge from service.'

"Amend Article II, Section 1, paragraph 3, to read as follows: 'It is also provided that county societies may nominate for inactive membership those physician members who have retired from the active practice of medicine. The House of Delegates, upon nomination of component county societies, may elect those physician members to inactive membership; when so nominated and elected said inactive member shall be entitled to all of the privileges of membership as set out in this Constitution and By-Laws; provided that county society secretaries shall include all such inactive members in their respective annual reports, with such notation thereon as will at once declare their status.'

"Amend Article XI, Section 2, to read as follows: 'The House of Delegates shall provide for an equal per capita assessment of component county societies, and for the proper distribution of the amount so raised into the several funds of the Association, as established by the Board of Trustees or the House of Delegates; provided that no assessment shall be made upon honorary members, inactive members, or members emeritus of the Texas Medical Association elected in accordance with this Constitution and By-Laws.'

"Amend Chapter I, Section 3, to read as follows: 'Members of whatsoever classification who are under sentence of suspension or expulsion from a component county society, or whose names have been dropped from its roll of members, shall be allowed all the privileges of membership, including subscription or right to subscribe to the TEXAS STATE JOURNAL OF MEDICINE, pending decision or appeal. Any member dropped from the rolls of a component county society for non-payment of dues, or any honorary or inactive member dropped for cause, is to be considered as coming within the provisions of this section.' The rest of the section will remain unchanged.

"Amend Chapter X, Section 5, to read as follows: 'Component county societies may nominate for honorary membership in the Texas Medical Association, physician members of good professional and moral standing in their respective jurisdictions who have rendered extraordinary service to the cause of ethical medicine, and who have for good

and sufficient reason withdrawn partially or entirely from the practice of medicine or who have been members of organized medicine for fifty years or longer in accordance with Section 1 of Article II of the Constitution of the Association; and when elected by the House of Delegates to the State Association the said honorary member shall be carried on the rolls of their respective county societies and reported in the annual reports of the county societies, as provided herein.'

"Amend Chapter X, Section 5, by the addition at the end of the following sentence: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to honorary status shall be refunded the originally paid dues in full.'

"Amend Chapter X, Section 7, to read as follows: 'County medical societies may nominate for inactive membership those physician members who have retired from the active practice of medicine. The House of Delegates, upon nomination of component county societies, may elect those physicians to inactive membership in the Association. When so nominated and elected, the inactive members shall be entitled to all of the privileges of membership. County society secretaries shall include all such inactive members in their respective annual reports with such notation thereon as will at once declare their status.'

"Amend Chapter X, Section 7, by the addition at the end of the following sentence: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to inactive status shall be refunded the originally paid dues in full.'

"Amend Chapter X, Section 8, to read as follows: 'County medical societies may elect to military membership those members who are on temporary duty in the Armed Forces of our country.'

"Amend Chapter X, Section 8, by the addition at the end of the following sentences: 'Physician members who have paid state dues to cover another type of membership for the year in which they are elected to military status shall be refunded the originally paid dues in full provided that such election occurs within the first six months of the membership year. One-half of the originally paid dues shall be refunded provided that such election to military membership occurs after the first six months of the membership year.'

"Amend Chapter XIII, Section 4, to read as follows: 'Military members, as provided for in the Constitution and these By-Laws of the Texas Medical Association, shall pay no dues but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.'

"Amend Chapter XIII, Section 5, to read as follows: 'Honorary members, as provided for in the Constitution and these By-Laws of the Texas Medical Association, shall pay no dues, but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.'

"Amend Chapter XIII, Section 6, to read as follows: 'Inactive members, as provided for in the Constitution and these By-Laws, shall pay no dues, but may subscribe to the TEXAS STATE JOURNAL OF MEDICINE.'"

The Reference Committee on Amendments to the Constitution and By-Laws recommends the adoption of the amendments dealing with honorary, inactive, and military members as submitted by the Board of Councilors.

I move the adoption of this portion of our report.

Speaker Deaton: Is there any discussion of this portion of the report? (Thereupon said motion was seconded and the same was duly carried.)

Dr. Kerr: That is all we have ready for you tonight.

Speaker Deaton: The Reference Committee on Medical Service and Public Relations—are they ready to report?

REPORT OF REFERENCE COMMITTEE ON MEDICAL SERVICE AND PUBLIC RELATIONS

Dr. Van Goodall, Clifton: Our Reference Committee first wishes to congratulate all of the councils and committees whose work came before us this afternoon for the good work obviously done all through the year. We also wish to thank those interested parties who came in at 2 o'clock and were not seen until 6:30. We commend you for your tenacity; maybe next year we will have less things to get off the agenda and you will not have to wait so long.

Report of Council on Medical Defense

Dr. Goodall: The report as published and the supplemental report of the Council on Medical Defense presented May 2 have been approved by the Reference Committee. I move that this part of the report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

This does not require a vote, but I might mention that the Reference Committee requested Mr. Overton to write for the JOURNAL an explanatory article which would be brought to the attention of the individual physicians concerning the details of this issue. To refresh your memory, that was the good work done by the Council on Medical Defense in regard to the proposed changes in our insurance set-up. We thought that each member should have full knowledge of this matter.

Report of Council on Medical Jurisprudence

Dr. Goodall: Next is the report of the Council on Medical Jurisprudence: As a supplement to the section entitled "Veterans' Care" in the report of the Council on Medical Jurisprudence, this Reference Committee recommends that the program of the AMA and the material available through that program for education of the physicians and the public be brought forcibly to the attention of each county society. I move that this report and the supplementary report be accepted as presented. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Council on Medical Economics

Dr. Goodall: The report of the Council on Medical Economics as published and the supplementary report submitted May 2 are accepted as presented. I move that this report and the supplementary report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Council on Medical Education and Hospitals

Dr. Goodall: The report of the Council on Medical Education and Hospitals and the supplementary report made May 2 are accepted as presented. I move this report and the supplementary report be accepted as presented. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Public Relations

Dr. Goodall: The report of the Committee on Public Relations is accepted as published. I move this report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of State Council on National Emergency Medical Service

Dr. Goodall: The report of the Council on Emergency Medical Service recommending that the Council be reduced to five members and that Dr. Henry A. Holle be made one of them is accepted. I move this report be accepted as presented. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Nursing Care

Dr. Goodall: The report of the Committee on Nursing Care is accepted as printed. I move this report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Doctor Distribution

Dr. Goodall: The report of the Committee on Doctor Distribution is accepted as printed. I move this report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Delegate from Private Clinics and Hospitals Association of Texas

Dr. Goodall: The report of the delegate from the Private Clinics and Hospitals Association of Texas is accepted as presented. I move this report be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

President's Address

Dr. Goodall: The address of the President, Dr. George Turner, has a paragraph referring to health insurance in which he states: "In several references to health insurance through the year, I stated that in my judgment, the minor costs of medical care such as an illness requiring only a few home visits by the doctor or a few visits to his office are no more than a part of the normal cost of living and should be optionally included in his health insurance protection. I, therefore, suggest that this House go on record as approving a $50 deductible clause in health insurance policies." The Reference Committee recommends that this recommendation be referred to the Council on Medical Economics for further study and recommendations. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

In the paragraph referring to the utilization of television by county medical societies in which Dr. Turner states: "The utilization of television by county medical societies has come to rank along with the press in importance as a modality of presenting the picture of American medicine and furthering health education. I would like to recommend in this connection that a policy outlining regulations regarding physicians appearing on TV be formulated for the guidance of county medical societies." The Committee wishes to add a supplementary recommendation that the Committee on Public Relations be instructed to formulate a policy outlining regulations regarding physicians appearing on television for the guidance of county medical societies in formulating their own group of regulations peculiar to their localities.

So far as the Committee understands, virtually all of the larger towns and cities have adopted a press, radio, and television code. We all know that in each constituent society there is a public relations representative, and it was our suggestion that each individual county public relations committee and/or their regulatory code handle the situation. I move that this portion be accepted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

This Reference Committee accepts the remaining recommendations referring to the dissemination of information for training technical assistants and to our support of the public health service. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Resolution: Fluoridation of Water Supplies

Dr. Goodall: The resolution presented by Dr. E. Aubrey Cox, Wichita Falls, pertaining to fluoridation of municipal water supplies presents a controversial issue pertaining to public health. It is recommended by the Reference Committee that this resolution be referred to the Committee on Public Health for further study.

In other words, it was our feeling that within the one or two or three hours that we had allotted to us this afternoon, and with good strong evidence on both sides, we should not make a recommendation to the House. In view of the fact it is of such a controversial nature, not only in Texas, but elsewhere, we thought that the Committee on Public Health should go over the situation and report to us one year from today. I move that this portion of our report be accepted. (Thereupon said motion was seconded.)

Speaker Deaton: The motion is that this be referred to the Committee on Public Health for further study. Is there any discussion?

Dr. Joe D. Nichols, Atlanta: Mr. Speaker, I have no voting rights, but I am on the Council on Medical Defense. May I speak?

Speaker Deaton: Do you want to hear Dr. Nichols? (Thereupon, being put to a vote, Dr. Nichols was given the privilege of the floor.)

Dr. Nichols: Last year, as most of you know, I introduced a resolution asking the Texas Medical Association to condemn the fluoridation of water. That was a pretty strong resolution, as I well know. I went before the Reference Committee on Scientific Work, which came out with a recommendation asking you to pass a resolution asking the Texas Medical Association not to condemn or endorse the fluoridation of public water until such time as its value could be proved or disapproved. That was a resolution presented by the chairman of the reference committee, Dr. A. C. Scott, and I seconded the motion and it passed unanimously.

That was sort of a half victory. The truth is that the public fluoridation of water is one of the gravest threats this nation faces. Four years ago, I would have voted for it because I had been told by good authority it was all right. That was before I knew anything about it. I decided to study the matter. Fluoridation is wrong. The people of Texas, the common ordinary citizens, look to us to guide them on such things, and I say to you that its safety has not been proved and its value has not been proved. I challenge you to go home and pick up your Sallman's "Pharmacology" and study your pharmacology on fluorine. I promise you that sodium fluoride and sodium soda fluoride, the two most toxic salts of fluorine, are deadly poison.

The people who are for it—first of all, the man who is for it is a man that you have heard of, Oscar Ewing, who is also in favor of socialized medicine and a left-winger of the first order. I don't know whether you want him to trap you or not, but you almost got trapped last year.

I pray you will defer it for this year and next year you will kill it. I want you to go home and study your pharmacology, not calcium fluoride, not the fluoride that occurs

naturally in the water in West Texas. That is an entirely different thing, but sodium fluoride is rat poison. The naturally occurring fluorides that occur out in West Texas are chiefly calcium fluoride which is insoluble and relatively nontoxic. It also occurs with other salts of fluoride. They say people in West Texas have been drinking fluoridated water all their lives and it didn't hurt anybody, so what's wrong with it. There is a vast difference between the relatively nontoxic and insoluble fluorides and the kind of stuff they are trying to put into your water. Sodium fluoride and sodium soda fluoride are very, very toxic. I challenge you as doctors to look up the subject. I think if you will do that, next year when this thing comes up again, you will kill it.

Dr. Alvis Greer, Houston: I don't believe I can exactly concur with Dr. Nichols. I have read Sallman. When Sallman wrote most of his books, we knew little about the use of sodium fluoride or salts in water. Of course, if taken in excessive amounts, there is no doubt about it, fluoride is toxic, but in my opinion a small concentration or 1 part in 1,000,000 is not. I carried on experiments for three years on my ranch with sodium fluoride with fifteen thoroughbred mares. The average mare would drink about 10 gallons of water in twenty-four hours. We apportioned that much water to these mares and gave sodium fluoride in the water in the concentration of 1 to 1,000,000, and I noticed absolutely no toxicity. We were experimenting with mineral mixtures at that time attempting to find the amount of various trace minerals that cattle and horses need per day just the same as you write prescriptions.

It is a mistake to say that fluoridation has not been used because it has in many places in the country. For instance, Evanston, Ill., has used it without any bad effects. I want to know from Dr. Nichols what date and what volume of Sallman's he got this information from. Personally, I think it is too important for us to throw it by the board. I think the thing to do is to refer this to committee for sober thought rather than emotional action.

Dr. E. Aubrey Cox, Wichita Falls: I presented this petition this morning. I think the statements Dr. Nichols has made have all been pretty well refuted. Of course, about this cry of rat poison, you realize if you take a teaspoon of poison or add a teaspoon to a million gallons of water, there is a lot of difference. The amount you would get in one drop of sodium fluoride is distributed in 16 gallons of water, which takes on an average of over a month to be consumed.

Dr. James H. Harris, Marshall: We have been fluoridating the water in Marshall for five or six years. I practice pediatrics there and see the children, and I know what is going on in the school health program and the dental program. I know it has reduced the incidence of dental caries. My own children drink the water. There have been absolutely no signs of any toxic effect on any population group in Marshall. At the National Conference on Rural Health I had an opportunity to talk to a man from the New York State Health Department, and later he sent me a packet of information. They are very enthusiastic about fluoridation in New York State. So, Joe, I wanted to say that those of us who are using it do not concur in your belief.

Speaker Deaton: The motion before the House is to refer this to a committee for further study. Those in favor of referring it to the Committee on Public Health will say aye—the motion is adopted and the proposal is so referred.

Dr. Goodall: I believe the House can see that your Committee rightly recognized that this was a controversial issue.

Resolution: Extension of Compulsory Social Security

Dr. Goodall: The Reference Committee approves the acceptance of the resolution opposing compulsory social security taxation and its extension presented by Dr. E. P. Hall, Fort Worth. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Delegates to American Medical Association

Dr. Goodall: The Reference Committee recommends the adoption of the resolution presented by Dr. J. B. Copeland for the Delegates to the AMA concerning the American Osteopathic Association. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Resolution: Federal Reinsurance of Health Policies

Dr. Goodall: This Reference Committee recommends that the resolution opposing H. R. 6949, H. R. 8356, and S. 3114, presented by Dr. Alvis E. Greer be adopted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Resolution: Waiver of Premiums

Dr. Goodall: The Committee recommends the acceptance of the resolution opposing "waiver of premiums" provisions in Section 106 and Sections 221 and 222 of H. R. 7199, presented by Dr. Tom Kennerly, Harris County Medical Society. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Mr. Speaker, that completes the reports and resolutions submitted to us up to this date, and I move that our entire report be accepted. (Thereupon said motion was seconded and the same was duly carried and said report was adopted.)

SUPPLEMENTARY REPORT OF COMMITTEE ON MENTAL HEALTH

Dr. David Wade, Austin: I have a supplementary report of the Committee on Mental Health. Dr. Hamilton Ford of Galveston, the chairman of this Committee, has asked that I read this report.

On April 13, 1954, the chairman of this Committee, in official capacity as a member of the Advisory Committee to the Board for Texas State Hospitals and Special Schools, attended a called meeting of this committee at which thirty-one representatives of state and community organizations were present. The meeting was held at the Austin State School.

The organizational representatives present were there at the invitation of Robert L. Sutherland, Ph. D., chairman of the advisory committee, and for the purpose of assisting to formulate plans for a statewide campaign to help better conditions in the Texas state mental hospitals, special schools, and tuberculosis hospitals.

Representatives of the central office staff of the Board for Texas State Hospitals and Special Schools presented in their reports the urgent needs of these institutions, the standards of which are far below the large majority of the remaining states in the nation.

Because of the proximity of the purposes of these institutions and the Texas Medical Association in the ultimate relief of individual suffering of both the patient and his loved ones, the Committee on Mental Health respectfully presents this resolution to the House of Delegates of the Texas Medical Association:

Whereas, conditions in the Texas state mental hospitals, special schools, and tuberculosis hospitals are far below the standards which are necessary to the comfort, health, and happiness of the individuals received there for treatment and education; and

Whereas, the Texas Medical Association represents the profession most dedicated to the welfare of the sick of both mind and body; therefore be it

RESOLVED: That the Texas Medical Association lend its efforts on both state and local levels toward the ultimate success of the statewide campaign to help better conditions in the aforementioned institutions; specifically, that it will give official and other necessary support to the Texas Neuropsychiatric Association, which is to conduct an educational program within the state hospitals. When completed by the latter organization, the details of this program will be submitted for approval.

Speaker Deaton: This report will be referred to the Reference Committee on Scientific work and will come up later for adoption.

Now, there is a notation on your program for a meeting of the House of Delegates tomorrow night. So far as I know, the only remaining business that we have with regard to the committee work is the completion of Dr. Kerr's committee report and this little matter that came up here a moment ago. The Board of Councilors and the Trustees and scientific sections may bring up matters on the last day, but others may not.

Dr. Van D. Goodall, Clifton: As I recall, Mr. Speaker, we did not complete all of the committee reports this morning. I recollect distinctly that Dr. Terrell's report on the infringements of medical practice was not completed and two or three others were not completed.

Speaker Deaton: Yes, I know. We will call on Dr. Terrell for his report at this time, if he will give it to us.

Dr. Truman Terrell, Fort Worth: This Committee reported to the Executive Council in January, and I move that this be accepted as our report.

(The report follows:)

REPORT OF COMMITTEE ON INFRINGEMENTS ON PRIVATE PRACTICE OF MEDICINE

Before the meeting of the Committee on Infringements on Private Practice of Medicine the deans of the three medical schools; the director of the M. D. Anderson Hospital and the presidents of the Dallas, Harris, and Galveston Counties Medical Societies were asked to notify their membership that anyone who desired may appear before this Committee with complaints or information of infringement on private practice by the faculty of these institutions.

Representatives of the Southwestern Medical School, Universiy of Texas Medical Branch in Galveston, and M. D. Anderson Hospital of Houston appeared before the Committee. No representative from Baylor University was present. No individuals or representatives of Harris, Dallas, or Galveston Counties Medical Societies were present. The representative of the various institutions was asked to explain as to their manner of handling the salaries and time given to teaching, research, and private practice.

The policy of the Board of Regents of the University of Texas shall be to request a written letter of referral from the referring physician.

We are led to believe that all groups have worked out their local differences satisfactorily.

Respectfully submitted,
TRUMAN C. TERRELL, Chairman,
LARIED S. OATES,
C. F. CRAIN,
NEIL D. BUIE,
ROBERT A. JOHNSTON,
JOE D. NICHOLS.

Speaker Deaton: I will refer that report to the Committee on Medical Service and Public Relations. I believe we can complete our business on Wednesday without a meeting tomorrow evening; I suggest that we meet at 8 o'clock in the morning.

Dr. James D. Murphy, Fort Worth: I move that we recess as suggested. (Thereupon said motion was seconded and the same was duly carried. The meeting was recessed at 10:15 p. m.)

Monday, May 3, 1954

MINUTES OF MEMORIAL SERVICES AND FIRST GENERAL MEETING

(The eighty-seventh annual session of the Texas Medical Association was called to order for the opening exercises by Dr. George Turner of El Paso, President, at 8:45 a. m., Monday, May 3, 1954, in the Municipal Auditorium, San Antonio.)

MEMORIAL SERVICES

(The Rev. George Mauze, D. D., pastor of the First Presbyterian Church of San Antonio, gave the opening prayer, which was followed by a vocal solo, "Twenty-Third Psalm" by Malotte, by Morris Whitehead of San Antonio.)

(A memorial address for deceased members of the Woman's Auxiliary was given by Mrs. G. V. Brindley, Temple, chairman of the Committee on Memorial Services of the Auxiliary. Her address will be published as part of the transactions of the Auxiliary in the July issue of the JOURNAL. The Rev. E. J. Gregory, superintendent of the Mexican Baptist Orphans Home of Texas, San Antonio, then delivered the memorial address for deceased physicians, which appears in the original articles section of this JOURNAL.

(The names of physicians and Auxiliary members who were memorialized were printed in a program distributed to those present for the services. The physicians paid tribute follow:)

Deceased Members of Texas Medical Association, 1953-1954

Dr. James H. Agnew (Hon.), Houston
Dr. Lewis G. Aide, Bellmead
Dr. J. A. Allison (Hon.), Grapevine
Dr. C. C. Anderson (Hon.), Venus
Dr. Nicholas Andronis, Galveston
Dr. Ernest King Armistead, El Paso
Dr. B. M. Avent (Hon.), Rosebud
Dr. Joseph Knox Bates, Pittsburg
Dr. C. R. Berry, Houston
Dr. C. W. Boring, Port Arthur
Dr. Albert H. Braden, Sr., Houston
Dr. Joseph Hyal Brown, Fort Worth
Dr. Charles B. Buck (Hon.), Mercedes
Dr. J. S. Buie, Mertens
Dr. George Lawson Carlisle, Dallas
Dr. Carl C. Carrico (Hon.), Houston
Dr. Edward H. Cary (Emer.), Dallas
Dr. Harry Walton Cochran (Hon.), Dallas
Dr. Randall Elias Cromeans, Mexia
Dr. John R. Dale, Diboll
Dr. Alfred W. Davisson (Hon.), Corpus Christi

Dr. Howard R. Dudgeon, Sr., Waco
Dr. Joseph C. A. Eckhardt, Austin
Dr. George W. Edgerton, Corpus Christi
Dr. A. J. Evans, Mineral Wells
Dr. George Clayton Farish, Houston
Dr. M. A. Forbes (Hon.), San Antonio
Dr. C. C. Garrett, Fort Worth
Dr. James P. Gill, San Antonio
Dr. George E. Glover, Sr. (Hon.), Tivoli
Dr. M. L. Graves (Emer.), Houston
Dr. L. L. Handly, Houston
Dr. C. M. Hendricks (Hon.), El Paso
Dr. William R. Houston (Hon.), Austin
Dr. J. M. Jackson, Port Arthur
Dr. Berry L. Jenkins (Hon.), Clarendon
Dr. John B. Jenkins, Waxahachie
Dr. Harold D. Kearby, Houston
Dr. John T. Lawson, Bowie
Dr. Erwin Richard Lochte, Sr., San Antonio
Dr. Victor Melton Longmire, Temple
Dr. Edgar W. Loomis, Dallas
Dr. John E. McClung, Corsicana
Dr. Robert G. McCorkle, San Antonio
Dr. Joe H. McCracken (Hon.), Mineral Wells
Dr. Alex G. Marshall, El Paso
Dr. T. W. Martin, Port Arthur
Dr. Walter E. Martin, Dallas
Dr. Edmund Dumas Mills, Beaumont
Dr. Rufus D. Moore, Jr., Houston
Dr. J. D. Motheral (Hon.), Katy
Dr. J. F. Pattison (Hon.), Big Lake
Dr. P. M. Payne (Hon.), Asherton
Dr. Lee T. Pruit, Beaumont
Dr. M. A. Ramsdell, San Antonio
Dr. Robert L. Ramsdell, Norman, Okla., formerly Dallas
Dr. Farley S. Reasonover, Grand Prairie
Dr. L. M. Reaves, Dallas
Dr. J. A. Riebel, Kingsville
Dr. F. L. Robbins (Hon.), Baytown
Dr. W. L. Robinson, Texarkana
Dr. C. H. Rulfs (Hon.), San Augustine
Dr. John G. Schilling, Houston
Dr. Joseph A. Seay, Wichita Falls
Dr. Jerome H. Smith, San Angelo
Dr. J. L. Spivey (Hon.), Wichita Falls
Dr. Merle B. Stokes, Houston
Dr. Martin E. Taber (Hon.), Dallas
Dr. William Thomas (Hon.), Terrell
Dr. G. F. Thornhill, Austin
Dr. Michael M. Walker (Hon.), Wichita Falls
Dr. LeRoy T. Waller, Commerce
Dr. Cleburne M. Williamson, Corpus Christi
Dr. Louis E. Williford, Houston
Dr. Samuel A. Woolsey (Hon.), Austin

Deceased Texas Physicians, Not Members of Texas Medical Association, 1953-1954

Dr. Robert Perry Addison, Dallas
Dr. A. A. Bailey, Beaumont
Dr. Sidney L. Bailey, Center
Dr. T. R. Bassett, Mount Pleasant
Dr. Alex J. Black, Kerrville
Dr. Leonard Fredric Bland, Dallas
Dr. O. C. Bowmer, Corsicana
Dr. Harry Arthur Briggs, Albany
Dr. Robert L. Brown, Pearsall
Dr. Thomas B. Busbee, Rising Star
Dr. John F. Campbell, O'Donnell
Dr. Eugene R. Chapman, Los Angeles, Calif., formerly San Antonio
Dr. Floyd E. Clark, Cisco
Dr. Leonard James Collins, Jr., Sherman
Dr. Thomas C. Dobbins, Denton
Dr. Richard Christopher Elliott, San Diego
Dr. Robert E. Forrester, Moran
Dr. James Luther Fowler, Kerrville
Dr. William R. Fowler, Hamilton
Dr. James L. Gammill, Haslet
Dr. T. N. Goodson, San Antonio
Dr. J. L. Guest, Plainview
Dr. Thomas C. Hairston, Columbus
Dr. William P. Harrison, Teague
Dr. R. C. Hartman, Alamo
Dr. A. L. Hatcher, Amarillo
Dr. Angelo Hillman, Brownwood
Dr. Erly Earnest Johnson, Montague
Dr. Leonce J. Kosminsky, Texarkana
Dr. John Thomas Mantooth, Melissa
Dr. William Norman Marshall, Florence
Dr. Ernest C. Mead, Gainesville
Dr. Garnett Miller, Moody
Dr. J. E. Moffett, Silsbee
Dr. John Jay Moore, San Antonio
Dr. George L. Morgan, Hankamer
Dr. William W. Nesbit, Galveston
Dr. James R. Nichols, Austin
Dr. Jack C. Perry, Abilene
Dr. Barney Bertrand Prestridge, Donna
Dr. Alfred L. Ridings, Washington, D. C., formerly Sherman
Dr. Aaron Lamar Roberts, Fort Worth
Dr. E. B. Rogers, El Paso
Dr. Robin R. Shepperd, Bisbee, Ariz., formerly Crockett
Dr. Bernard F. Smith, San Antonio
Dr. F. B. Stafford, Trenton
Dr. George S. True, Big Spring
Dr. William Thomas Webb, Breckenridge
Dr. Walter E. Whitfield, Edna
Dr. Paul A. Woodard, Bryan
Dr. John R. Worley, Dallas
Dr. John T. Wylie, Dallas

GENERAL MEETING

Dr. Turner: Before continuing with the program of the morning, I should like to present some of the distinguished persons seated on the platform who will not otherwise be introduced. They will stand and be recognized as I call their names:

Dr. F. J. L. Blasingame of Wharton, a member of the American Medical Association Board of Trustees, a former member of the Texas Medical Association Board of Trustees, and President-Elect of the Texas Medical Association.

Mrs. Mark H. Latimer of Houston, an active member of the Harris County Auxiliary and now President-Elect of the Woman's Auxiliary to the Texas Medical Association.

Dr. Merton M. Minter of San Antonio, a past chairman of the Board of Trustees of the Texas Medical Association and now president of the host society, Bexar County Medical Society.

Mrs. John C. Parsons of San Antonio, president of the Woman's Auxiliary to the Bexar County Medical Society

and chairman of the Convention Committee for the State Auxiliary.

We had expected to have Mrs. Leo J. Schaefer of Salina, Kan., President of the Woman's Auxiliary to the American Medical Association, with us this morning. Because of the illness of Dr. Schaefer, she could not be present. She asked that the President-Elect of the Auxiliary to the AMA represent her, and I am glad to present Mrs. George Turner.

Mrs. George D. Feldner of New Orleans, President of the Woman's Auxiliary to the Southern Medical Association, has been meeting with the Texas Auxiliary. We had hoped to present her this morning, but she found it necessary to leave San Antonio to meet other engagements.

Dr. L. Bonham Jones of San Antonio, a member of the Council on Scientific Work and chairman of the Committee on General Arrangements for this annual session.

Dr. B. F. Stout of San Antonio, an active member of the Texas Medical Association for thirty-five years and chairman of the Committee on Memorial Services which arranged our services for this morning.

I am happy to be able to present also Mr. C. P. Loranz of Birmingham, Ala., for many years the secretary-manager of the Southern Medical Association. With him is his assistant, Mr. Robert Butts.

Now Mrs. Edward W. Coyle of San Antonio, President of the Woman's Auxiliary to the Texas Medical Association, will tell us of some of the activities of that group.

Address of Auxiliary President

Mrs. Coyle: Like the little boy who fell in the molasses barrel and came up with his favorite "lickings" on the tip of his tongue and then solemnly prayed, "Oh, Lord, give me a tongue equal to my opportunity," I would like to be able to tell you just how much we appreciate your guidance and material assistance, and how great have been the accomplishments throughout Texas as we have served as an Auxiliary to your organization.

With "Knowledge, Judgment, and Action in Health Leadership" as a guiding theme, special emphasis was placed on friendliness as a basis for full acceptance of our privileges and responsibilities as individual citizens as well as doctors' wives.

Dr. Turner suggested, among other program channels, that we encourage attendance at medical society meetings. Larger auxiliaries prepared dinners before meetings, and smaller groups, particularly where several towns are included in a county group, prepared for dinners together and then had separate meetings. In those groups, we know that attendance has increased.

Self education included many excellent programs and surveys. Our bimonthly *News Letter* is probably our most far-reaching medium for information and better relations. We are indebted to our editor for securing, coordinating, and writing; to the Texas Medical staff; and to you, the Texas Medical Association, who make possible its publication and mailing to our 4,731 members. We have encouraged the reading of *The Journal of the American Medical Association* and the TEXAS STATE JOURNAL OF MEDICINE, especially the legislative information, the monthly message from your President, the PR Diagnotes page, and the Auxiliary Section.

"Public Relations in '53 means Community Service for you and for me," proved true in every community. We have emphasized that we are representing you, the medical profession, in all that we do—whether we are answering the telephone, dealing with the grocer or others who serve us, chatting across the bridge table or on the golf course, or working on a specific project or program.

In health education, many of you assisted by giving *Today's Health* to patients and by having it in your reception rooms. We have placed it in libraries and other places and are responsible for its being used as an official textbook in some schools. Programs and community service projects included those on radio and television on such subjects as "Healthy Living" and "Focus on Health" presented in weekly series. There were health booths and exhibits at fairs and stock shows; physical examinations among our members and families numbering more than 9,000; medical journals sent to Korea; maintenance of a "coke" machine in a county hospital which netted sufficient funds for two oxygen tents and other equipment; parentcraft classes for expectant parents; motion picture films shown to many groups, including those detained at juvenile homes. These are but a few of the different interesting and worthwhile endeavors which do not include the thousands of hours cooperating with such agencies as Red Cross, polio, and Community Chest.

We are proud of our new handbook, and again, we are indebted to you, for its cost was taken out of our Special Fund—your gift to us. We are grateful to the Texas Medical Association staff, the Committee on Public Relations, the public relations counsel—Syers, Pickle, and Winn. This book was sent to every officer, committee chairman, council woman, and county president, with instructions that it be passed on with records and suggestions to their successors.

Essays totaling 860 were written in Texas high schools on the subject of "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care." County societies gave $2,800 in awards, and auxiliaries and participants appreciate the increase in those given by you. The first place winner, Milton Copeland of Wichita Falls, plans to be with us today.

Nurse recruitment was promoted through films, speakers, brochures, social affairs complimenting future nurses and their mothers, hospital tours, and contests. One group was responsible for the creating of a community council for nurse recruitment. Thirty-two gift and loan scholarships totaling over $6,000 were made, with 210 new recruits. There are 40 Future Nurses clubs, including one male club. One auxiliary, in cooperation with a camera club and nursing and other organizations, made a color, sound film.

Mental health was stressed, and we cooperated with the Texas Society for Mental Health in making a survey of the facilities, resources, and needs of the handicapped child.

In civil defense, we cooperated with the State Defense and Disaster Relief Headquarters. Our members worked in blood donor programs; gave printed suggestions on "what to do in emergencies"; taught first aid; and presented television programs called "Nurse, Please."

We appreciate the guidance of your Council on Medical Jurisprudence and your legal adviser. Information, including the *Washington Letter,* is sent to our county presidents, and in auxiliaries there were study groups, speakers, open meetings, "poll tax and vote" campaigns, and communications to legislators.

We have three funds. From our Memorial Fund, primarily for needy widows of doctors, we gave $450 as "love gifts." Our Student Loan Fund is for junior and senior medical students, interns, and residents. Our five loans totaled over $1,200. Your building fund was given $1,000 through our Library Committee, and we added $340 to a fund for rare books, transactions, and other materials for the Library.

We placed much emphasis on the importance of the American Medical Education Foundation fund, realizing that we would not want the teaching standards, the num-

ber of teachers, or facilities to be reduced, nor would we want them to receive government aid for operating costs.

When all sized auxiliaries do the magnificent work that has been done this year, collectively and individually, and when a group of three members writes that they are necessarily circumscribed in their activities; that they feel they form a nucleus of informed members who can work on an individual basis for better community health and public relations; that through organization they can keep in touch with other communities over the state and be ready to grow when the opportunity presents itself; that though they do not meet regularly, they did present a cancer film and more films are planned—then we believe that we have lived up to the challenge of working as an *auxiliary*.

Thanks are insufficient for your thoughtfulness and generosity in assigning a member of the staff to work with us. It has meant better planning and better results—in an efficient and gracious association. For this executive secretary, your other gifts, and many courtesies, we are sincerely grateful.

(Dr. Turner concluded the morning session with the President's Address, which is published in the Original Articles section of this JOURNAL. The meeting was concluded shortly before 10 a. m., at which time meetings of various specialty societies and of the Woman's Auxiliary were held.)

Tuesday and Wednesday, May 4 and 5, 1954

GENERAL SCIENTIFIC MEETINGS

(Scientific meetings of the Texas Medical Association were held Tuesday morning and afternoon, May 4, and Wednesday morning, May 5, in two general sections, Section A—Medical and Section B—Surgical, at the Municipal Auditorium, San Antonio. For these meetings the guest speakers were as follows: Dr. Simeon T. Cantril, Seattle, Wash.; Dr. George T. Harrell, Jr., Gainesville, Fla.; Dr. Harold D. Palmer, Denver, Colo.; Mr. William Alan Richardson, Rutherford, N. J.; and Dr. E. Stewart Taylor, Denver, Colo. Dr. Robert L. Sanders, Memphis, Tenn., was unable to be present because of illness.)

Scientific Exhibit Awards

(Announcement was made before each of the two sections of the awards to scientific exhibits as follows:)

A special Committee on Scientific Exhibit Awards appointed by the President inspected all the scientific exhibits and evaluated them on the basis of subject matter, the exhibitor's interpretation of the display, neatness, teaching value, unusualness, simplicity, and self-explanation. The committee agreed that the certificate of merit for the best exhibit by an individual should be awarded to "Kissing Bug Bite; Its Relationship to Chagas' Disease" by Drs. E. N. Walsh and T. L. Shields of Fort Worth and the certificate for the best exhibit by an institution should go to "Diagnosis and Treatment of Leprosy" by the United States Public Health Service Hospital, Carville, La., and the Texas State Department of Health, Dr. Fred C. Kluth, Corpus Christi. It was recommended that honorable mention go to two exhibits, "Tumors of Infants and Children" by Dr. Luke W. Able, Houston, and "Bronchogenic Carcinoma Simulating Benign Pulmonary Disease" by Dr. G. V. Brindley, Jr., Scott and White Clinic, Temple.

Wednesday, May 5, 1954

MINUTES OF THE HOUSE OF DELEGATES

THIRD MEETING

(The House of Delegates reconvened at 8 a. m., Wednesday, May 5, 1954, in the North Terrace of the Gunter Hotel, San Antonio, with the Speaker, Dr. Hobart O. Deaton, Fort Worth, presiding. A quorum was declared present.)

Speaker Deaton: The introduction of new business today requires the unanimous consent of the House unless it is introduced by the Board of Trustees, the Board of Councilors, or a scientific section. Now, we bogged down in Dr. Kerr's report the other night and will have to finish with that. Dr. Kerr, are you ready?

SECOND REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO CONSTITUTION AND BY-LAWS

Resolution: Reclassification of Membership

Dr. Jack G. Kerr, Dallas: Dr. B. E. Pickett submitted, on behalf of the Director of Records and Classification of the American Medical Association, a resolution calling on the House of Delegates to "request the Constitution and By-Laws Committee to study and reevaluate the classifications of membership as set forth in the Constitution and By-Laws of the Texas Medical Association so that, if possible, the classifications for membership in the Texas Medical Association will conform with the classifications as set up by the American Medical Association," and to "consider making the changes in the classification of membership in the Texas Medical Association on the basis of the recommendation of the American Medical Association."

This Reference Committee recommends that this resolution be submitted to the Committee on Revision of the Constitution and By-Laws for its consideration and subsequent report, and I so move. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Supplementary Report of Board of Councilors

Dr. Kerr: The following proposed addition to the By-Laws submitted by the Board of Councilors would be added at the end of Section 2, Chapter IV: "When appointed, the term of office of the Vice-Councilor shall correspond to the current term of office of the Councilor of his district unless previously relieved by action of the Board of Councilors."

The Reference Committee recommends the approval of this addition. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Amendment: Probationary Membership

Dr. Kerr: Dr. Homer E. Prince, Houston, introduced an amendment to Chapter X, Section 4, of the By-Laws to provide for probationary membership.

The Reference Committee recommends approval of this amendment as presented, and I so move. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Negro Medical Facilities

Dr. Kerr: By majority vote the Reference Committee approves the report Dr. Tate Miller gave for the Committee

on Negro Medical Facilities and commends him on the thoroughness of his work through the years.

Speaker Deaton: Dr. Miller made no specific recommendations in his report. You may continue with your report, Dr. Kerr.

Amendment: Deletion of "White" for Membership

Dr. Kerr: Dr. Clement C. Boehler, El Paso, introduced an amendment eliminating the word "white" from Article II, Section 3, of the Constitution as a requisite for membership in the Association.

By majority vote, your Reference Committee approves the intent of this proposed amendment. Inasmuch as this is a change in the Constitution and will need to lay over for a year, the Committee suggests that it be referred to the Committee on Revision of the Constitution and By-Laws, and I so move.

Speaker Deaton: This does not require a motion, and unless there is some question in particular at this time, the Chair will refer this to the Committee on Revision of Constitution and By-Laws. There is no point in discussing it at this time because any action we take will amount to nothing. It will be discussed at the proper time next year when it comes up.

Report of Council on Scientific Work

Dr. Kerr: The Council on Scientific Work of which Dr. May Owen of Fort Worth is chairman, last year presented amendments which would permit the election of officers at a meeting of the House of Delegates other than on the last day of the session. These have been published, pages 407 and 430-431 of the June, 1953, JOURNAL and were called to the attention of the House this year by the Council and also the Committee on Revision of the Constitution and By-Laws. These amendments, subject to final action by the House at this time, would change Article III, Section 3, of the Constitution and Chapter VII, Section 1, of the By-Laws.

The Reference Committee approves the amendments and recommends their adoption. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Address of President

Dr. Kerr: The Reference Committee does not interpret the last paragraph of Dr. George Turner's presidential address as being in conflict with the proposal of the Council on Scientific Work which was approved. The council's proposal does not necessarily preclude the possibility of a meeting of the House of Delegates on the last day of a convention should circumstances as enumerated by Dr. Turner be present. The Committee is sympathetic with the intent of the Council on Scientific Work to increase attendance at the scientific sessions of the last day.

Report of Committee on Revision of Constitution and By-Laws

Dr. Kerr: The Committee on Revision of the Constitution and By-Laws presented an amendment to simplify the seating of alternate delegates as a substitute for an amendment tabled last year. It would amend Section 6, Chapter VI, of the By-Laws.

The Reference Committee approves this amendment, and I recommend its adoption. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

In its report to the House of Delegates in 1952, the special Committee on Blood Banks recommended that a "permanent committee" be established to continue activity in the field of blood banking. The Reference Committee on Scientific Work, to which the report was referred, concurred in the recommendation, which then was adopted by the House of Delegates. To implement these recommendations, the Committee on Revision of the Constitution and By-Laws offered amendments to Chapter II, Section 3, and Chapter VIII of the By-Laws, the latter by the addition of a new Section 17.

The Reference Committee approves this change, and I move its adoption. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Amendment: Committee on Maternal Mortality

Dr. Kerr: Dr. R. R. Ross of Austin submitted a proposed amendment to Chapter VIII, Section 3, Subsection b, to form a standing state committee on maternal mortality.

Also, he would amend Chapter XI, setting up a new Section 3 to provide for district maternal mortality committees.

The Reference Committee thinks that the creation of a standing committee should be considered by the Reference Committee on Scientific Work and suggests that this amendment be referred there for study and subsequent report, and I so move. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Mr. Speaker, that concludes the report of my Committee, and I move the adoption of this report as a whole. (Thereupon said motion was seconded and the same was duly carried, and said report was adopted.)

Speaker Deaton: If Dr. Scott is ready, we will have the supplementary report of the Reference Committee on Scientific Work.

SECOND REPORT OF REFERENCE COMMITTEE ON SCIENTIFIC WORK

Supplementary Report of Committee on Mental Health

Dr. A. C. Scott, Jr., Temple: The Reference Committee on Scientific Work approves the resolution by Dr. Hamilton Ford and his Committee on Mental Health concerning the statewide campaign to help better conditions in the Texas state mental hospitals, special schools, and tuberculosis hospitals and recommends its adoption by the House of Delegates. (Upon motion made, seconded, and carried, the above report was adopted.)

Amendment: Committee on Maternal Mortality

Dr. Scott: This Reference Committee on Scientific Work has considered the resolution referred to it by the Reference Committee on Amendments to the Constitution and By-Laws relative to the establishment of a standing committee on maternal mortality, which resolution was introduced by Dr. R. R. Ross of Austin in the form of a change of the Constitution and By-Laws.

After a discussion and hearing from the sponsor of the resolution and four other delegate advocates of the resolution who appeared, and after much discussion concerning the nature of such a committee, the probable additional and exceptional demands for work that would be placed upon the office force of the Association in carrying on the work of the committee in organizing and setting up machinery for the district maternal mortality committees provided for in the resolution and other mandates of such Constitution and By-Laws changes, and with the approval of those advocates who appeared before this Reference Committee, your Reference Committee on Scientific Work recommends that no change be made in the Constitution and/or By-Laws relative to this matter; but your Reference Committee further recommends:

1. That this House approve the principle of a continuing survey of maternal deaths in the state of Texas in an effort to reduce the preventable deaths in Texas by eliminating all possible hazards in pregnancy and childbirth.

2. That the House approve the establishment of a special committee of the Texas Medical Association on maternal mortality, which committee shall (a) study problems connected with maternal mortality and (b) work with district councilors and county medical society officers in fostering the establishment of similar district maternal mortality committees to carry out efforts of the special committee to reduce maternal mortality.

3. That the House instruct the President to appoint a special Committee on Maternal Mortality consisting of nine members of the Association of which three shall be from the obstetrical departments of each of the three medical schools of this state, and appoint three ex-officio members consisting of a representative from the Texas Association of Obstetricians and Gynecologists, a representative of the Texas Academy of General Practice, and the director of the Division of Child and Maternal Health of the Texas State Department of Health.

4. That the House of Delegates instruct said Committee on Maternal Mortality (a) that it shall not call upon the state office of the Association to set up the proposed district committees or for other detail work, but that such work shall be done by the committee itself in collaboration with the councilors of the various districts and the county society officers in said districts; (b) that the Committee on Maternal Mortality shall investigate maternal deaths in the various districts and make and return to each district committee a report of its findings and constructive recommendations when appropriate.

Speaker Deaton: As I understand, Dr. Scott, you propose no amendment?

Dr. Scott: That is correct. We propose that no change be made in the Constitution and By-Laws and that no standing committee be appointed but instead a special committee be appointed which requires no change of the Constitution and By-Laws. I move the adoption of this portion of the report. (Thereupon said motion was seconded, and the same was duly carried.)

That completes our report, and I move the adoption of the report as a whole. (Thereupon said motion was seconded and carried, and the report was duly adopted.)

SECOND REPORT OF BOARD OF COUNCILORS AS REFERENCE COMMITTEE

Dr. R. G. Baker, Fort Worth: The Board of Councilors has a report as a Reference Committee.

Supplementary Report of Executive Secretary

Dr. Baker: On the morning of the opening session, each of you was furnished with a list of nominations for inactive and honorary membership. This report was held up until now to permit of additions or deletions as they might be called for. It is upon those nominations that the Board of Councilors reports at this time as a Reference Committee.

The Board of Councilors approves for emeritus membership Dr. Oscar M. Marchman, Sr., Dallas, whose nomination must be held over for a year before final action can be taken.

It approves for honorary membership those listed by the Executive Secretary plus the following:

District 5:
Bexar County Medical Society—
Dr. C. W. Taylor, San Antonio.

District 6:
Webb-Zapata-Jim Hogg Counties Medical Society—
Dr. A. T. Cook, Laredo.

District 9:
Harris County Medical Society—
Dr. F. J. Slataper, Houston.

District 15:
Harrison County Medical Society—
Dr. G. P. Rains, Marshall.

Also, Dr. A. L. Thomas of Ennis requested that his name be struck from the list of proposed honorary members, and the Board of Councilors followed his wishes.

The nominations for inactive membership are approved as presented with two additions:

District 2:
Andrews-Ector-Midland Counties Medical Society—
Dr. James H. Chapple, Odessa.

District 7:
Travis County Medical Society—
Dr. Scott T. McGuire, Austin.

The Board of Councilors moves the election of these members for inactive, honorary, and emeritus membership as designated. (Thereupon said motion was seconded, and the same was duly carried.)

Speaker Deaton: Dr. Van Goodall of Clifton has an additional report for the Reference Committee on Medical Service and Public Relations.

SECOND REPORT OF REFERENCE COMMITTEE ON MEDICAL SERVICE AND PUBLIC RELATIONS

Report of Committee on Rural Health

Dr. Goodall: The Reference Committee on Medical Service and Public Relations approved the report of the Committee on Rural Health, and I move that it be adopted. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Delegate to State Rural Health Council

Dr. Goodall: The Reference Committee on Medical Service and Public Relations read and accepted the report of the Delegate to the State Rural Health Council. I move its adoption. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Delegate to Lone Star State Medical Association

Dr. Goodall: The report of the Delegate to the Lone Star State Medical Association was read and approved. I move its adoption. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Report of Committee on Infringements on Private Practice

Dr. Goodall: The Reference Committee read the report submitted by Dr. Terrell and his Committee on Infringements on the Private Practice of Medicine, which committee was appointed by the President, Dr. George Turner, at the suggestion last year of the Reference Committee on Medical Service and Public Relations. This report was submitted to the Executive Council at the meeting in Austin in January, and no additions have been made since that date. The Committee wishes to approve this report and might suggest to the future officers that a committee of this type might be continued. I move the adoption of this report. (Upon motion made, seconded, and carried, the above portion of the report was adopted.)

Mr. Speaker, I move that the entire report be adopted. (The motion was seconded and duly carried.)

Election of Officers

Speaker Deaton: Is there any further business? All right, the Chair will entertain nominations for the election of President-Elect.

PRESIDENT-ELECT

Dr. John L. Matthews, San Antonio: It is my distinct honor to nominate for this highest office in our Association a physician worthy of our confidence, who will reflect credit on himself and on our organization.

His life has been characterized by unselfish and devoted service—to his country, to his church, to his community, and to his profession.

He is a modest man, and it is not from him that one would know of his accomplishments and his honors, as, for example, his enviable war record—five years' distinguished service in responsible assignments, a colonelcy in the Army Medical Corps, and decoration for gallantry before the enemy in the Battle of the Bulge.

Not alone have his professional colleagues looked to him for leadership. His church, one of the larger congregations in the state, has relied heavily on him, in his post as chairman of its board and for several years its lay leader.

With all the demands of his busy general practice, he has served faithfully the indigent of his community as staff member and chief of gynecology in the county hospital, which he has headed as its president.

In the organized activities of our profession, he has also been a leader. His years of conscientious service were recognized, on his return from war, by election to the presidency of his county medical society. The respect and confidence which he earned there inevitably led to his election as councilor of his district, which he has represented with distinction these past five years. He is president-elect of his chapter of the Texas Academy of General Practice and a past president of the International Medical Assembly of Southwest Texas.

Mr. Speaker, on behalf of the Bexar County Medical Society, I take great pleasure in nominating for President-Elect, Dr. J. Layton Cochran of San Antonio.

(Thereupon said nomination was seconded by several, and upon motion by Dr. R. G. Baker, Fort Worth, duly seconded and carried, Dr. Cochran was unanimously elected by acclamation.)

(Upon nominations duly made and seconded and motions made, seconded, and carried the following officers were elected by acclamation:

VICE-PRESIDENT

Dr. J. C. Terrell, Stephenville.

SPEAKER OF THE HOUSE OF DELEGATES

Dr. Hobart O. Deaton, Fort Worth, succeeding himself.

VICE-SPEAKER OF THE HOUSE OF DELEGATES

Dr. Charles P. Hardwicke, Austin, succeeding himself.

TRUSTEE

Dr. Troy A. Shafer, Harlingen, succeeding Dr. E. A. Rowley, Amarillo.

COUNCILORS

District 2, Dr. R. B. G. Cowper, Big Spring, succeeding himself.

District 5, Dr. John J. Hinchey, San Antonio, to fill the unexpired term of Dr. J. L. Cochran, San Antonio, the newly elected President-Elect.

District 7, Dr. David Wade, Austin, succeeding Dr. J. M. Coleman, Austin.

District 8, Dr. James H. Wooten, Jr., Columbus, succeeding himself.

District 9, Dr. J. T. Billups, Houston, succeeding himself.

DELEGATES TO AMERICAN MEDICAL ASSOCIATION

Dr. A. C. Scott, Jr., Temple, succeeding himself.

Dr. John K. Glen, Houston, succeeding himself.)

(The next position to be filled was Delegate to the American Medical Association succeeding Dr. Robert B. Homan, Jr., El Paso.)

Dr. A. C. Scott, Jr., Temple: As you all know, our beloved Bob Homan is sick in El Paso and has been unable to attend this meeting. This is the first meeting I know of he has ever failed to attend. I am sure he would have been here if it had been humanly possible.

Bob Homan has done not only an outstanding job in this House, but since you elected him as a Delegate to the AMA, he has done an outstanding job up there. He is held in the highest esteem by the House of Delegates of the American Medical Association, and his voice carries well and far on all things that are good and everybody listens to him.

He has had much opportunity in the House of Delegates up there to serve on various important committees, reference committees and other committees, and he is actually a valuable man in the House of Delegates of the American Medical Association. I think you have done yourselves honor in the past by electing him as a delegate.

I would certainly like to see Dr. Robert Homan go back to the House of Delegates of the American Medical Association. I am equally convinced that it is our duty as members of this House at all times to abide by our Constitution and By-Laws. Therefore, since our By-Laws specifically state that no person shall be elected to office who is not in attendance on the annual session at which the election is held, I am first going to place in nomination the name of our Bob Homan to succeed himself and immediately withdraw his name from nomination and in his place nominate one of our outstanding members who has served us so well and excellently on our Board of Trustees and who this year retires from the Board of Trustees. I nominate Dr. E. A. Rowley of Amarillo as Delegate to the American Medical Association.

Dr. B. E. Pickett, Carrizo Springs: I cannot pass this opportunity without paying tribute to Bob Homan. When I was chairman of the Texas Delegation, he worked with me for many years. It is not known to you, but it is known to me and to others who worked in the House of Delegates of the AMA that twice he has been selected for the office of Vice-Speaker of the House and because of unfortunate circumstances, it was not possible for him to be elected, which would have meant that ultimately he would be Speaker of the House of Delegates of the American Medical Association.

Bob Homan carries with him an influence at the national level that few men have been able to develop in the years that he has been there serving. It grieves us, of course, to know of his illness, but in view of that, I want to second the nomination of Dr. Rowley. I assure you in doing that, that while my heart is with Bob, I am paying this tribute in seconding the nomination of his friend, Dr. Rowley.

Dr. E. A. Rowley, Amarillo: I regret very much that Dr. Homan cannot be here. It is unusual for a fellow to electioneer for himself, but I will assure you that if I am elected, I will resign and the President will appoint Dr. Bob Homan delegate to the AMA.

(Thereupon, upon motion duly made, seconded, and unanimously carried, Dr. Rowley was elected as Delegate to the AMA.) *

(Upon nomination and second and motion duly made, seconded, and carried, the following officials were elected by acclamation:

DELEGATE DESIGNATE TO AMERICAN MEDICAL ASSOCIATION

Dr. James H. Wooten, Jr., Columbus, succeeding himself.

ALTERNATE DELEGATES TO AMERICAN MEDICAL ASSOCIATION

Dr. John L. Otto, Galveston, succeeding himself.

Dr. Robert W. Kimbro, Cleburne, succeeding himself.

Dr. L. C. Heare, Port Arthur, succeeding himself.)

Dr. R. G. Baker, Fort Worth: Mr. Speaker, we do not provide an Alternate Designate to Dr. James Wooten, Jr. Are we due to provide an Alternate Delegate Designate, or does that just stand open?

Speaker Deaton: I don't know that I am an authority to answer that question.

Dr. B. E. Pickett, Carrizo Springs: It is not necessary for Dr. Wooten to have an alternate, although he may if it is the wish of this House. Formerly if a man was a delegate to the AMA, his alternate must serve in his place in the event it was impossible for him to serve. The Constitution and By-Laws of the AMA has been so changed that at this time any alternate delegate attending the session of the AMA may be selected by the delegation from Texas to sit instead of the one that cannot be present.

Dr. James D. Murphy, Fort Worth: I move that one be elected.

Dr. James H. Wooten, Jr., Columbus: I would like to move that an alternate delegate be elected, and I would further move that that fine young gentleman from Fort Worth, Dr. L. H. Reeves, be placed in nomination as my alternate. (Upon motion duly seconded and carried, Dr. Reeves was unanimously elected as Alternate Delegate Designate to the American Medical Association.)

Speaker Deaton: The chair now recognizes Dr. Blasingame.

Dr. F. J. L. Blasingame, Wharton: Initially I should like to pledge to the House that when Dr. Rowley has been disposed of one way or another, I shall nominate Bob Homan to the office of Delegate to the American Medical Association, if that vacancy occurs during my term of office. I can assure that everything that has been said about Bob Homan can be underlined and italicized. He has done a great job for us.

It now falls to my pleasure and responsibility to place in nomination the names of men to fill certain vacancies that occur on the councils and to announce appointments to the standing committees. (Thereupon, the following nominations were confirmed:

Election of Council Members

Dr. John H. Wootters, Houston, Council on Medical Defense, succeeding himself.

Dr. Sam Key, Jr., Austin, Council on Medical Jurisprudence, succeeding Dr. G. W. Cleveland, Austin.†

Dr. Charles D. Reece, Houston, Council on Scientific Work, succeeding Dr. George W. Waldron, Houston.‡

Dr. Gail Medford, Lufkin, Council on Medical Economics, succeeding Dr. H. H. Cartwright, Breckenridge.

Dr. John L. Matthews, San Antonio, already a member, chairman of the Council on Medical Education and Hospitals, succeeding Dr. M. O. Rouse, Dallas, resigned.

Dr. S. W. Thorn, Houston, Council on Medical Education and Hospitals, succeeding Dr. R. Lee Clark, Jr., Houston.

Dr. John S. Chapman, Dallas, Council on Medical Education and Hospitals, succeeding Dr. M. O. Rouse, Dallas, resigned.§

Appointment of Standing Committee Members

Dr. Charles Phillips, Temple, Committee on Cancer, succeeding himself.

Dr. R. Lee Clark, Jr., Houston, Committee on Cancer, succeeding Dr. John H. Wootters, Houston, resigned.

Dr. Felix P. Miller, El Paso, Committee on Medical History, succeeding himself.

Dr. William D. Seybold, Houston, Committee on Tuberculosis, succeeding Dr. Ernest E. Holt, College Station.

Dr. Jack G. Kerr, Dallas, Committee on Library Endowment, succeeding Dr. August J. Streit, Amarillo.

Dr. Andrew S. Tomb, Victoria, Committee on Mental Health, succeeding Dr. Edgar S. Ezell, Fort Worth.

Dr. M. O. Rouse, Dallas, Committee on Public Health, succeeding Dr. Guy A. Tittle, Dallas.

Dr. H. H. Latson, Amarillo, Committee on Public Health, succeeding himself.)

Appointment of Section Secretaries

Dr. Blasingame: While it is not necessary that the House take any action on these, there are certain scientific section vacancies which must be filled. To serve as secretaries, I would like to make these appointments: Section on General Practice, Dr. John M. Smith, San Antonio; Section on Internal Medicine, Dr. Mavis P. Kelsey, Houston; Section on Surgery, Dr. Norman Duren, Beaumont; Section on Obstetrics and Gynecology, Dr. Dennis M. Voulgaris, Wharton; Section on Eye, Ear, Nose, and Throat, Dr. Robert Marion Johnson, Houston; Section on Radiology, Dr. David H. Allen, Wichita Falls; Section on Public Health, Dr. Luther P. Walter, Austin; Section on Clinical Pathology, Dr. John H. Childers, Galveston; Section on Pediatrics, Dr. B. H. Williams, Temple.

Presentation of General Practitioner

Speaker Deaton: At this time the House of Delegates would be delighted to present the General Practitioner of the Year. I will ask Dr. Tenery to do this for us.

Dr. R. Mayo Tenery, Waxahachie: I present to you Dr. A. L. Thomas of Ennis, whom you have elected General Practitioner of the Year.

Dr. Thomas: Last July my county society gave me a big party at the Country Club in Ennis and presented me with a fifty-year pin which I am very proud to wear. Now, you have done me this honor.

I heard of a fellow in Ennis who was somewhat of a wag and he said that people talked about the Lord smiling on them, but he said, He just laughed out loud on me. That's the way I feel about this. I thank you all very much for this honor.

*EDITOR'S NOTE: *Dr. Rowley resigned as Delegate to the American Medical Association on May 7, 1954, and Dr. Robert B. Homan, Jr., El Paso, was appointed to succeed him.*

†EDITOR'S NOTE: *Dr. Key resigned as a member of the Council on Medical Jurisprudence on May 28, 1954, and Dr. G. W. Cleveland, Austin, was appointed to succeed him.*

‡EDITOR'S NOTE: *Dr. Reece resigned as a member of the Council on Scientific Work on May 11, 1954, and Dr. John C. Kennedy, Houston, was appointed his successor.*

§EDITOR'S NOTE: *Dr. Chapman resigned as a member of the Council on Medical Education and Hospitals and Dr. G. N. Aagaard, Dallas, was appointed May 13, 1954, to succeed him.*

Selection of Place for 1956 Annual Session

Speaker Deaton: The next item of business is the selection of the time and place of the 1956 annual session. Gentlemen, we are receptive to invitations.

Dr. John L. Otto, Galveston: On behalf of the Galveston County Medical Society, I would like to invite this group to meet in Galveston at the 1956 annual session. I might add that since your last visit there, Galveston has expanded its facilities somewhat, and I think we have sufficient facilities to accommodate the whole group this year.

Dr. J. T. Billups, Houston: I move we accept the invitation and that the 1956 session be held at Galveston. (Thereupon said motion was seconded and duly carried.)

Dr. Truman Terrell, Fort Worth: I think this body owes the members of the Bexar County Medical Society and the committees in Bexar County a vote of thanks for putting on the meeting that they have, and also we should extend our thanks to the hotels and others for the fine hospitality extended to us. I make that as a motion. (Thereupon said motion was duly seconded and carried.)

Dr. Van D. Goodall, Clifton: I move we adjourn. (The motion was seconded and carried, and the meeting adjourned at 10 a. m.)

Wednesday, May 5, 1954

MINUTES OF GENERAL MEETING LUNCHEON

(The General Meeting Luncheon of the Texas Medical Association was held Wednesday, May 5, 1954, at 12:30 p. m., in the Grand Ballroom of the Gunter Hotel, San Antonio, with Dr. George Turner, El Paso, President, presiding.

(Dr. Turner presented Dr. A. L. Thomas of Ennis, General Practitioner of the Year, who made a few brief remarks, and introduced distinguished guests. Then Dr. S. W. Thorn, Houston, chairman for Texas of the American Medical Education Foundation, announced awards on behalf of the board of trustees of the foundation to the Woman's Auxiliary to the Texas Medical Association, to Mrs. George Turner of El Paso, and to Dr. Stuart Wallace of Houston. Dr. Turner then presented Dr. Hobart O. Deaton, Fort Worth, Speaker of the House of Delegates.)

Address of Speaker of House

Speaker Deaton: The grand total registration for this meeting was 2,114. That includes doctors, Auxiliary, visitors, and exhibitors.

Now, for the House of Delegates. The House of Delegates, as you know, is the legislative body of the Texas Medical Association. It is composed of your elected representatives. We have had three sessions. The first was held Sunday morning, the second Sunday evening, and the final session this morning.

As many of you already know, all reports of officers and the various councils and committees, as well as resolutions and new business, are referred to reference committees for detailed consideration and study. Before these reference committees the proponents and opponents of any given measure may appear and plead their cause. Except in some controversial matters, the recommendations of the committees are usually accepted.

Some of these committees have a terrific amount of work to do. I wish to express my personal gratitude and also the appreciation of the House of Delegates for the wonderful work of these reference committees.

I also wish to commend the central office at Austin for the valuable assistance and cooperation in preparing for these sessions, and especially the young ladies of the headquarters staff who worked many hours of the day and night, typing countless pages of reports and recommendations. I would not forget the faithful reporter, Mr. Henry Beck, who records blow-by-blow all that takes place during the sessions. This account is usually found in the Organization Section of the June JOURNAL. Take some time out and read it and see what your officers and delegates are doing for you. I believe you will see that the profession of medicine today has many grave concerns besides the reporting of interesting cases and the further use of new antibiotics.

To give you a few high spots of our sessions, almost everything was discussed from the extension of social security to the fluoridation of water in Fort Worth and Marshall. There appears to be unified opposition to the extension of social security, and resolutions were enacted to implement this opposition and instruct the delegates to the AMA.

Dr. J. B. Copeland of San Antonio, who is chairman of the Council on Medical Jurisprudence, is doing a fine work, and you would do well to keep up with what his committee is doing and support them.

The problem of veterans' care came up. The stand of the American Medical Association was endorsed, and the House of Delegates recommends that material for the education of physicians and the public be brought forcibly to the attention of each county society.

The House also instructed its delegates to the AMA to request that the national policies relating to the distribution of gamma globulin be reevaluated and that gamma globulin be released for normal use.

The report of the Board of Trustees indicated that your State Association is in a sound financial condition.

The constitutional amendment introduced last year providing for a division of the state into seven trustee districts and increasing the number of Trustees from five to seven was voted down by your House of Delegates. Various other amendments to the Constitution and By-Laws were acted upon, but nothing particularly controversial was involved

A resolution was introduced by Dr. Hamilton Ford, chairman of the Committee on Mental Health, urging that we give our efforts to the statewide campaign to help better conditions in our state tuberculosis hospitals and in the Texas mental hospitals and special schools. This resolution was adopted.

After the completion of some unfinished business this morning, the House of Delegates took up the business of electing officers. No candidate had opposition, and every officer was unanimously elected by acclamation.

Your President-Elect has already been introduced, Dr. J. Layton Cochran of San Antonio. The Vice-President, Dr. J. C. Terrell of Stephenville. For Speaker of the House, your humble servant was reelected to succeed himself. For Vice-Speaker of the House, Dr. Charles P. Hardwicke of Austin was reelected.

One Trustee was to be elected this year, and Dr. Troy Shafer of Harlingen was elected to that post. Some councilors were elected. From the Second District, Dr. R. B. G. Cowper of Big Spring was reelected. From the Fifth District, Dr. John J. Hinchey of San Antonio was elected to replace Dr. Cochran, who can't hold so many offices at one time. For the Seventh District, Dr. David Wade of Austin was elected. For the Eighth District, Dr. James H. Wooten Jr., of Columbus was reelected. For the Ninth District, Dr.

J. T. Billups of Houston was reelected. For the Tenth District, Dr. L. C. Heare of Port Arthur was reelected.

For your AMA Delegates, Dr. A. C. Scott, Jr., of Temple and Dr. John K. Glen of Houston were reelected. Then the House of Delegates came to a knotty problem. As some of you know, to be elected to an office, you have to be present at the meeting. My friend Dr. Robert B. Homan of El Paso was not able to be here. So Dr. E. A. Rowley was elected in Dr. Homan's place, and your Speaker was instructed to liquidate Dr. Rowley in the morning at sun-up so the President can appoint Dr. Homan in his usual job when he recovers from his illness.

AMA Delegate Designate Dr. James H. Wooten, Jr., was reelected. An Alternate Delegate Designate was Dr. L. H. Reeves of Fort Worth. Three Alternate Delegates to the AMA were reelected: Dr. John L. Otto of Galveston, Dr. R. W. Kimbro of Cleburne, and Dr. L. C. Heare.

The selection of a place for the 1956 meeting was taken up, and the invitation of Galveston was accepted. As you know, the 1955 session will be held in Fort Worth. The dates are starting Saturday, April 23, and continuing through Wednesday, April 27.

(The incoming President, Dr. F. J. L. Blasingame, Wharton, then presented an address on "Medical Leadership," which appears in the Original Articles section of this JOURNAL.)

(Mr. Roger Fleming, Washington, D. C., secretary-treasurer of the American Farm Bureau Federation and guest of the Association, then delivered an address, "Let's Get Together," which is published as an Original Article in this JOURNAL.)

Presentation of Gavel

Dr. Turner: Dr. Blasingame, it is a great pleasure to present to you this gavel, representing the authority of the Texas Medical Association. I know that you will make an outstanding President and that the Texas Medical Association will accomplish much under your regime. With the cooperation of your officers, the county medical societies, and every individual member, I am sure great accomplishments will be yours in 1954-1955. I congratulate you and wish for you the very best for your year.

Dr. Blasingame: Thank you, Dr. Turner. I accept this gavel in humility but with courage and in the hope that we shall come through this year with an effective program.

One of the first duties that comes to a President of the Texas Medical Association is to congratulate a President just past, who is now a past president, and to congratulate him on joining that distinguished group. I so do, Dr. Turner, now congratulate you on a job well done and express again on behalf of all our membership our appreciation for the many efforts which you have extended in our behalf. I should like also to give you tangible evidence in the form of a past president's certificate, which I hope you will frame and study and appreciate for many, many years to come. In addition, I want to present to you, as is customary, a medallion which on occasions is worn about the neck of our past presidents. Again it gives me a great deal of pleasure to present this to you in behalf of our Association. May you wear it proudly for many years.

Dr. Turner: Thank you, Dr. Blasingame.

Dr. Blasingame: May I again express to the members of the Bexar County Medical Society our appreciation for the innumerable courtesies extended to us. You have made us feel welcome here, and we are grateful to you. To those of you here, may I as your President wish you a safe trip home, a productive year in the efforts of the Texas Medical Association as well as in your personal affairs, and now I declare the 1954 session of the Texas Medical Association adjourned.

(Thereupon said session was adjourned at 3 p. m.)

TECHNICAL EXHIBITS AT ANNUAL SESSION

Listed below are the technical exhibitors and their representatives at the recent annual session in San Antonio.

Abbott Laboratories, North Chicago—Clifton C. Bowen, Cecil Cain, William C. Wright, R. G. Boothman, William M. Lacy.

Alcon Laboratories, Inc., Fort Worth—Harold C. Johnson.

A. S. Aloe Company, St. Louis—Charlie C. Haynie, M. Charles Smith, Ralph Williams.

American Medical Education Foundation, Chicago—Mrs. J. L. Pettis.

Audio-Digest Foundation, Glendale, Calif.—Dr. Edward C. Rosenow, Jr.

Baby Development Clinic, Chicago—Mrs. Cline, Paul D. LaHue.

Baker Laboratories, Inc., Cleveland—Harry Dahl.

Ballard Surgical Supply Company, San Antonio—John S. Ballard, Charles Thompson.

Borden Company, New York—E. J. Bryant, Carroll W. Shoaf.

George A. Breon and Company, New York—C. W. Vogelsang, Martin White, Harry T. Moseley.

Brown Schools for Exceptional Children, Austin and San Marcos—Lyndon L. Brown, Nova Lee Dearing, H. R. Gipson.

Carnation Company, Los Angeles—Don C. Earnest, James J. Ortasic.

Charles Pharmacy, San Antonio—B. Allen Anderson, Charles Herrara, M. G. Ortega, Eva Cruz.

Ciba Pharmaceutical Products, Inc., Summit, N. J.—Royce H. Bates, L. C. Scheh, H. W. Seay, Jr.

Coca-Cola Bottling Company—Mrs. Dorothy Coggeshall.

Curtis Surgical Supply Company, Waco—Tom Curtis, Henry Lachele.

Cutter Laboratories, Berkeley, Calif.—Tom Bloomer, Jack Downing, Jay Hamilton, Farley B. Hornbeak.

Eaton Laboratories, Inc., Norwich, N. Y.—J. C. Payne, H. B. Walton.

First Texas Chemical Manufacturing Company, Dallas—Gordon Cunningham, Bob Foster.

C. B. Fleet Company, Inc., Lynchburg, Va.—Mike Hill, S. J. Reynolds.

General Electric Company, X-Ray Department, Dallas—T. M. Devine, T. P. Dunn, H. O. McKenzie, Lewis Shook, Raymond W. Crawford.

Gilbert X-Ray Company of Texas, Dallas—G. O. Clason, H. L. Lair, Pen Dell Pittman, Jr., Raymond W. Crawford, Pen Dell Pittman.

Graham Laboratories, Dallas—Paula Whitten.

Group Hospital Service, Inc., and Group Medical and Surgical Service, Dallas—Bob Hawthorne, W. R. McBee, Ralph Webb, Roy Wilmesmeier, Dick Post.

Harrower Laboratory, Inc., Jersey City—J. A. Castille, Jr., J. S. Lathrop.

Hedgecock Artificial Limb Company, Dallas—Ed Latimer.

H. J. Heinz Company, Pittsburgh—C. O. Denham, S. A. Wyatt, Mrs. C. O. Denham, V. W. Blackburn.

Karmac Company, Dallas—D. S. McCrary, Pat Neff.

R. P. Kincheloe Company, Dallas—J. E. Heath, I. B. Schaefer, Mrs. I. B. Schaefer.

Eli Lilly and Company, Indianapolis—E. G. Burchfiel, E. T. McDaniel, C. L. Munford, D. P. Ward, Woodfin Ray.

J. B. Lippincott Company, Philadelphia—J. L. Rosecrants.

P. Lorillard Company, New York—A. J. Bass, Jr., J. M. Vaughn, L. A. Wernert, T. E. Zoda.

J. A. Majors Company, Dallas—Jack McClendon, L. B. Shaver.

Mead Johnson and Company, Evansville, Ind.—Fred Bowles.

Medcalf and Thomas, Fort Worth—Jack McCarty.

Medical Plastics Laboratory, Gatesville—A. C. Hays.

Medical Protective Company, Fort Wayne, Ind.—L. Gayle Nelson, R. F. Reiman.

Miles Reproducer Company, Inc., New York—Dr. J. M. Kuhlik, Mrs. H. B. Kuhlik.

Mission Pharmacal Company, San Antonio—Bailey Adams, Jr., Ted Chapin, Wally Walsdorf.

Murray Agency, Corpus Christi—Don Murray.

C. V. Mosby Company, St. Louis—Mrs. S. G. Cooke.

Pendleton and Arto, Inc., Houston—M. Pat Daley.

Pfizer Laboratories, Brooklyn—H. J. Dahl, Robert Tucker, Dave Walker.

Physicians and Surgeons Supply Company, San Antonio—J. M. Guerrero, B. B. Hunter, Mrs. C. W. Naftzger, A. G. Pierce, E. W. Bickett.

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.—H. H. Koch, C. W. Lewis, F. W. Uzzell, Judith Myerson.

Richards Manufacturing Company, Memphis—Clint G. Johnson.

A. H. Robins Company, Inc., Richmond, Va.—Pete Moses, A. F. Sexton, C. D. Wheeler.

Schering Corporation, Bloomfield, N. J.—Frank Hopwood, Harold L. Sturman.

G. D. Searle and Company, Chicago—J. S. Garrett, Frank McPherson, George R. Stannus.

Sommer Drug Stores Company, San Antonio—John C. Burkholder, Dorothy A. Flowers, L. A. Saldana, Bea Tomlison, W. C. Vaughn, C. W. White.

SoundScriber of San Antonio, Inc., San Antonio—C. S. Hunt, Ted Shields, B. Woodard.

Noa Spears Company, San Antonio—Hugh Cheek, Charles S. Dupont, Noa Spears, Jr., Ray Thompson, Lloyd L. Stryker, Noa Spears.

Taylor Laboratories, Inc., Houston—Tom H. Coulter, Chip Taylor, Bob Watson.

Terrell Supply Company, Fort Worth—Dan Bodiford, O. Coffman, H. M. Land.

Texas Pharmacal Company, San Antonio—A. R. Clark, Ray C. Council, John Cummins.

United Medical Equipment Company, Kansas City—H. C. Culli, Gene Lipsky, Murray Roth.

U. S. Vitamin Corporation, New York—Bill Hasewinkle, Bill Patterson.

VanPelt and Brown, Richmond, Va.—George F. Schindler.

Varick Pharmacal Company, Inc., New York—R. J. Bose.

Walden Industries, Inc., New York—Harold Sobelman, Emanuel Gassman.

William A. Webster Company, Memphis, Tenn.—J. R. Renner, William A. Webster, Jr.

Westinghouse Electric Corporation, Baltimore—L. W. Kent, J. F. Pirozzolo, W. A. Ross.

Westwood Pharmaceuticals, Buffalo, N. Y.—J. Smiser Davis, R. R. Johnson.

Wilson X-Ray and Surgical Company, Austin—R. T. Wilson, Jr., Dick Roberts, Mrs. R. T. Wilson, Jr., Ray Reid.

Winthrop-Stearns, Inc., New York—R. J. P. Foitik, M. E. Moodie.

EXECUTIVE COUNCIL TO MEET SEPTEMBER 5

September 5 has been designated as the date for the next meeting of the Executive Council of the Texas Medical Association by the President, Dr. F. J. L. Blasingame of Wharton. The meeting will be held at the Association building in Austin and will be preceded on September 4 by meetings of such councils and committees as may be called. Members are urged to make their own hotel reservations in Austin at their earliest convenience.

AMERICAN MEDICAL ASSOCIATION

WAIVER OF 1950 DUES DEADLINE NEAR

July 1 is the last date by which payment of 1954 American Medical Association dues will permit reinstatement of members who failed to pay dues in 1950 and were suspended for such delinquency. It will be remembered that former active members of the AMA have been expected to pay dues for 1950 before being accepted for membership in good standing. A resolution adopted by the House of Delegates in St. Louis last December permitted waiver of the 1950 dues for physicians paying their 1954 annual dues by July 1 this year. The dues should be paid through the county medical society secretary and forwarded through the state organization to the AMA, reaching Chicago by the July 1 deadline.

COUNTY SOCIETIES

Baylor-Knox-Haskell Counties Society

March 9, 1954

Baylor-Knox-Haskell Counties Society met in Munday on March 9. R. G. Baker, Fort Worth, Thirteenth District Councilor, spoke to members before they heard "Diet in Disease," a telephone broadcast from the Texas Medical Association headquarters, Austin,

Cherokee County Society

March 23, 1954

Cherokee County Medical Society was honored by the Woman's Auxiliary with a dinner and program on Doctor's Day, March 23, at Jacksonville.

Hardy Kemp, Baylor University College of Medicine, Houston, was principal speaker. Lewis Waters, Ph.D., Southwestern Medical School of the University of Texas, Dallas, was a special guest.

J. M. Travis, Jacksonville; T. H. Cobble, Rusk; C. L. Newburn, Jacksonville; and J. N. Bone, Jacksonville, were given special mention for having practiced medicine in Cherokee County for the longest number of years.

DeWitt County Society

March 17, 1954

DeWitt County Medical Society heard Sam J. Greer, San Antonio, speak on chest conditions at the March 17 meeting in Cuero.

Eastland-Callahan-Stephen-Shackelford-Throckmorton Counties Society

March 16, 1954

Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Medical Society held a dinner meeting March 16 in Ranger.

R. G. Baker, Fort Worth, Thirteenth District Councilor, spoke to the society, and William B. Sealey and John A. Wiggins, Fort Worth, presented the scientific program.

AUXILIARY SECTION

MRS. TURNER NATIONAL PRESIDENT

"Leadership in Community Health" is the emphasis which Mrs. George Turner of El Paso, incoming President of the Woman's Auxiliary to the American Medical Association, expects to encourage during the forthcoming year. Mrs. Turner, President of the Texas Auxiliary in 1946-1947 and charter member and former president of the El Paso County Auxiliary, is being installed in the highest office of the national medical auxiliary in San Francisco, where the medical profession is convening June 21-25.

Only a month ago, Mrs. Turner was with her pathologist-radiologist husband in San Antonio as he presided over the annual session of the Texas Medical Association as its President. Long active in the State Auxiliary, she has been Corresponding Secretary, Historian, Council Woman, and chairman of several committees as well as President. At San Antonio she was named an honorary life president. On the national level she was Secretary two years, Treasurer three years, and First Vice-President before being named President-Elect in 1953.

A native of Iredell, Mrs. Turner specialized in home economics and education at the Southwest Texas Normal School at San Marcos and at George Peabody College for Teachers at Nashville. Prior to her marriage to Dr. Turner in 1918, she taught in public school and college. In El Paso, where she has reared two daughters, Mrs. Turner has been active

MRS. GEORGE TURNER

in Methodist, parent-teacher, PEO, Chamber of Commerce, and Woman's Club programs.

Embarking upon her year as President of the 66,000-member Woman's Auxiliary to the American Medical Association, Mrs. Turner hopes Auxiliary members will be especially active this year in the areas of mental health, safety, and juvenile delinquency. Relative to these topics and to many others, she suggests establishment of speakers bureaus and sponsorship of health forums as tools for making accessible to other groups the information readily available to the Auxiliary. She stresses the necessity of Auxiliary members keeping themselves informed if they hope to be qualified health leaders and urges that they read the official periodicals, literature, and letters sent to them.

"The appreciation of the public is not based on excellent medical care alone, but is in ratio to our devotion to the welfare of the community through health education and community health service," Mrs. Turner points out. "It is in this unobtrusive, daily relationship between the doctor and his patients and the doctor's wife and her contacts that confidence in our sincerity and ability as leaders in community health is established."

That Mrs. Turner has established for herself an enviable record of leadership in community health and worth-while projects of other nature is evident in the list of achievements she has chalked up in her home city. The successive offices she has held in the medical auxiliary at every level is further proof of her ability to envision what can be done, to set about doing it, and to inspire others to join in the doing.

Texas a Part of the Whole

The Woman's Auxiliary to the American Medical Association was organized in 1922 as the outgrowth of state and county auxiliaries then in existence. Through the efforts of Mrs. Samuel Clark Red of Houston, President of the Texas Auxiliary, and the cooperation of Dr. Edward H. Cary of Dallas, a resolution advocating a Woman's Auxiliary to the AMA was adopted May 26, 1922, by the AMA House of Delegates in St. Louis. Twenty-four women from nine states attended the organizational meeting. Ten years later, thirty-eight states and the District of Columbia had auxiliaries with a membership of 13,351. Today there are 66,000 members.

A Texas brag—the first gavel used by the National Auxiliary was made from an oleander branch from a tree in Galveston. The greatest brag for the state is that four Texas women have been elected President of the Auxiliary to the AMA—the fourth being Mrs. George Turner of El Paso, who will serve for the 1954-1955 term.

Texas ranks high in her scale of activities as compared with other states in the nation. For example, Texas ranked first in the nation in subscriptions to the *Bulletin* of the national organization during 1953. In the same year Texas ranked only behind California and Pennsylvania in membership. Texas was second, following Pennsylvania, in subscriptions to *Today's Health*.

From time to time Texas has joined the National Auxiliary in alerting its members and the public to the hazards of some of the currently proposed medical legislation, and doctors' wives joined the American Medical Association in launching a national education campaign to defeat the compulsory health insurance program in Congress. Recently the Auxiliary has been active in fostering the aims of the American Medical Education Foundation, which seeks to raise funds privately for the operation of medical schools to forestall federal subsidization from grants for operating expenses.

Perhaps the most outstanding accomplishment of the Auxiliary nationally has been in connection with health education and the furthering of health measures. Promotion of the distribution of *Today's Health,* the previously mentioned authentic health periodical for the laity; nurse recruitment; giving and applying scholarship funds; annual physical check-ups; civil defense projects; and emphasis on mental

health are playing important roles in Auxiliary activities.

The doctor's wife attempts individually and through her affiliation with the Woman's Auxiliary to fulfill the objectives of assisting the American Medical Association in its program for the advancement of medicine and public health, to serve as a leader in health education, to cultivate friendly relations among physicians' families, and to promote mutual understanding between the public and the doctor.

DEATHS

W. E. WHITFIELD

Dr. Walter Eugene Whitfield, Edna, Texas, died on February 20, 1954, in a Victoria hospital of coronary occlusion.

The son of Daniel and Elizabeth (Prigmore) Whitfield, Dr. Whitfield was born on June 9, 1888, in Dallas County. He attended the Garland and Dallas public schools and old Polytechnic College, Fort Worth. He received his medical education at the Southwestern University Medical College, Dallas, being graduated in 1911, and served an internship at St. Paul's Hospital, Dallas. Dr. Whitfield was associated with Drs. H. G. Wolcott, J. B. Smoot, and W. B. Carroll in Dallas until 1917, when he decided to become a country doctor and moved to Ganado. He moved later to Edna, practicing general medicine and surgery there until a few months before his death, when he became ill.

DR. W. E. WHITFIELD

Dr. Whitfield was a member of the Texas and American Medical Associations through the Dallas and Wharton-Jackson-Matagorda-Fort Bend Counties Medical Societies almost continuously during his career. He had been city health officer for Ganado, and during World War II he was county doctor for Selective Service. He also had served as physician for local construction companies and insurance companies. He was a member of Theta Kappa Psi medical fraternity, the school board at Edna, Masonic Lodge—being a thirty-second degree Mason, Rotary Club, Chamber of Commerce, and the Methodist Church. Dr. Whitfield was a big sportsman, favoring hunting, and for some years he piloted his own airplane. He enjoyed making fine furniture in his spare time.

He and the former Miss Cordelia Magness were married on September 4, 1910, in Lovington, N. Mex. She survives; as do two daughters, Mrs. H. M. Hargrove, Jr., Liberty, and Mrs. Gene C. Traylor, Victoria; one brother, George Whitfield, Plano; four grandchildren; and two great-grandchildren.

E. C. MEAD

Dr. Ernest C. Mead, Gainesville, Texas, died on February 1, 1954, at his home of carcinoma of the parotid gland.

The son of C. S. and Frances Mead, Dr. Mead was born on July 9, 1884, in South Boston, Ind., and he attended public schools there. He was graduated from Valparaiso University, Valparaiso, Ind., and attended the old Chicago College of Medicine and Surgery, now Loyola University School of Medicine. He then taught school in South Boston for three years and served as principal of the Greenfield, Ind., public school for one year. He was graduated from Chicago College of Medicine and Surgery with honors in 1913. Beginning his career in Campbellsburg, Ind., he was a general practitioner until 1919. He then did postgraduate work at Chicago Eye, Ear, Nose and Throat Hospital and came to Gainesville in 1921 as a specialist. He was certified by the American Board of Otolaryngology in 1926. He took additional work at the University of Vienna, Austria, in 1927. He practiced in Gainesville until his retirement in 1945.

A member of the Texas Medical Association and the American Medical Association through Cooke County Society from 1922 until the time of his retirement, Dr. Mead was a fellow of the American College of Surgeons.

Dr. Mead had served as a member of the District Board of Draft Examiners in an advisory capacity and was an examiner for the Civil Aeronautic Authority for twenty years. An ardent sports fan, he did much to promote football at Gainesville High School. He was a Presbyterian and for a number of years a member of the school board.

He and the former Miss Ada Bundy were married on June 23, 1911, in New Philadelphia, Ind. She survives, as do a son, Bruce Mead, Albuquerque; two daughters, Mrs. Dorothy Morgan, Gainesville, and Mrs. Margaret Gilbert, Dallas; and six grandchildren.

E. HARRIS

Dr. Earl Harris, Fort Worth, Texas, died February 17, 1954, of cancer. He had been hospitalized with Parkinson's disease since 1949.

Dr. Harris was born October 6, 1887, in Quitman, the son of Benjamin and Nancy (Peden) Harris. He received a degree in pharmacy from Tulane University, New Orleans, in 1910. He was graduated from Tulane University of Louisiana School of Medicine as a doctor of medicine in 1921 and interned at Charity Hospital, New Orleans. He did his residency at Marine Hospital, Memphis. Dr. Harris practiced in Fort Worth from 1924 until 1949.

A member of the Texas and American Medical Associations through Tarrant County Medical Society continuously since 1924, Dr. Harris was elected an honorary member in 1949. He was a member of Theta Kappa Psi medical fraternity and Alpha Omega Alpha, honorary medical fraternity.

Dr. Harris is survived by his wife, two sisters, and two brothers.

MEMBERSHIP
TEXAS MEDICAL ASSOCIATION
JUNE, 1954

The membership list which follows is compiled from names sent by county society secretaries to the state office. The names are listed by county societies within the fifteen districts. The number after each county listed below indicates the district in which the county is located.

President's Page

SCIENTIFIC INTERCHANGE—1955

Plans are well under way for an outstanding program at our annual meeting in Fort Worth next April 24-27.

The Council on Scientific Work, with the enthusiastic backing of the Advisory Committee to the President, held a meeting in Austin on May 30 with officers of the Association's scientific sections and representatives from almost all of the specialty societies present. At this meeting, and also subsequently by mail, an invitation was extended from the Texas Medical Association to all medical specialty societies in the state to join in an annual meeting which will be integrated to offer one of the finest scientific programs available anywhere. A number of specialty societies, some of which have and some of which have not met in conjunction with the Association in previous years, have already expressed their desire to participate in the 1955 annual session. Other specialty groups, although blocked by by-law provisions or other reasons from accepting the proposal, have pledged the cooperation of individual members in making our annual session a success.

The exchange of guest speakers among the specialty groups, the sections, and the Association's general assemblies and the teaching of concentrated refresher courses were discussed. Such sharing of speaker-talent with an underwriting of speaker expenses jointly by the Association and the specialty groups was approved by most of the physicians present.

A guest list totaling between twenty and thirty distinguished out-of-state speakers is being developed and will be released soon.

It is estimated that about fifteen specialty groups will hold their annual or semiannual meetings during the April 24-27 period in Fort Worth next spring and that there will be varying degrees of integration of the general and specialty meetings.

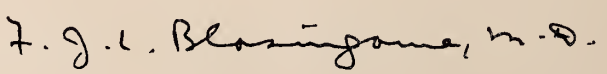
Societies of physicians who specialize in specific phases of medical practice, the general practice group, and the postgraduate assemblies

which have been developed more or less on a regional basis have been created to fill real needs. Such organizations should be encouraged so long as they assist physicians to improve themselves. Nevertheless, no member of our profession and no group of physicians should lose sight of the prime importance of professionwide organizations which, through the years, have catered to our basic scientific and economic needs and have served as organizations to speak for medicine in affairs requiring an authoritative voice.

American medicine must give serious consideration to a program of convergence of our professional interests and efforts. In Texas, this program is obviously needed. No trend as solidly entrenched as that toward subdivision and divergence in medical organizations can be reversed overnight. Texas physicians will continue to be plagued with too many meetings and demands of many medical groups. However, with the cooperative spirit displayed as plans for the 1955 annual session of the Texas Medical Association get under way, it appears possible that within a few years the majority of statewide medical societies in Texas will be meeting at the same period and providing such splendid opportunities for scientific interchange, discussion of socio-economic problems, and fellowship that the number of other meetings can be reduced considerably and more of a spirit of oneness be regenerated through the healthy and sound expansion of the annual session of our Association.

Through a strong, integrated scientific program and through other means, the Texas Medical Association is in a peculiarly favorable position to lead the way back from this divergence which threatens to damage our profession and to encourage a convergence of interests and efforts by means of which the various segments of the medical fraternity can help each other and thereby strengthen the entire profession.

Your thoughtful consideration of this proposed integration of our efforts is suggested. One practical way each member of our Association can assist is to plan to attend our 1955 annual session next April and to encourage other physicians to do likewise.



PR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: The Texas delegation, already high in AMA's esteem, strengthened that position at this year's annual meeting, San Francisco, June 21-25. The delegation opened a hospitality room—Texas style. Trick was to secure donation of all refreshments served in the room, modeled after Judge Roy Bean's Court and complete with two longhorn steer heads shipped from Texas for the occasion. Refreshments furnished were primarily from Texas firms—Duncan Coffee Company donated enough coffee for 3,000 people. Preliminary report had it that the Texas Room was one of the most successful state affairs ever sponsored at an AMA annual meeting.

The Texas Medical Association's survey of doctor distribution is proceeding methodically, with excellent results thus far. Nearing completion is a survey of Councilor District 8. Results—good, in that there were no requests received within the first three weeks. No actual shortage has been turned up, and at the same time, favorable lay reaction has resulted in several communities.

FROM OVER THE STATE: Another step in sound internal relations taken by the Dallas County Medical Society was a letter to the graduating students at Southwestern Medical School. Directed from the society president, Dr. Frank Selecman, the letter states in part:

"The physician cannot stand alone in the community.

"The key organization, the foundation of all medical organizations and the unit through which every physician works, is the county medical society.

"Within a few days you will be eligible to affiliate with the recognized medical profession. Let me urge you to do so at your earliest convenience, in whatever community you locate."

New members entering that group are given a concise orientation program on policies, mechanics, and aims of the county society.

An example of wholly successful projects which may be sponsored by medical societies in small to medium size communities is the recent series of public panel discussions held in Palestine. Three meetings, held at monthly intervals, consisted of the showing of one or more films issued by the American Cancer Society followed by a discussion by members of the local hospital staff and a question period which lasted for well over an hour in each case. Almost 150 persons attended. As a result of the success, a film on cancer of the lung was shown to the five civic clubs in Palestine. Each showing was attended by a member of the hospital staff. Word of these programs spread through the county, and invitations have been received from five rural school PTA groups.

El Paso County Medical Society had gratifying success with its series of health forums sponsored jointly with the El Paso Herald-Post. Lay attendance was high, and the question and answer session following each discussion was extremely popular.

ON THE NATIONAL FRONT: The Florida Medical Association has published "A Positive Public Relations Program" in brochure form. Highly complete, the booklet contains a check list designed to help each society evaluate its own program. The five-point program includes the following: (1) medical care for all, (2) paying for medical care, (3) information and education, (4) working with others, and (5) medical society's unity. County societies that wish to explore this very sound program may write directly to the Florida Medical Association, Box 1018, Florida Theatre Building, Jacksonville 1.

TIP OF THE MONTH

The patient who cannot find a parking place near the doctor's office or who receives a parking ticket because the doctor was late in seeing her, often complains loudly about doctors. Consequently, many physicians and medical societies are making special parking arrangements for the convenience of such persons. It makes good public relations sense.

VISITATION PROGRAM BEGUN

A marked improvement in the two-way communication of information between county medical societies and the state association is forecast during the coming year with the inauguration of a visitation program which has been approved by Dr. F. J. L. Blasingame, the President, and his Advisory Committee.

The program has been designed to increase visitations to county medical societies by officers of the Texas Medical Association and by representatives of its central office in Austin. Dr. Blasingame has promised that an officer or a staff member will meet at least once during the year with each of the 116 county medical societies, or at least all of them willing to extend invitations.

The visits will be made primarily by the President, the President-Elect, the Vice-President, the Legal Counsel, the Public Relations Counsel, the Executive Secretary, and the Assistant Executive Secretary, with periodic assistance by other officers. The central office staff will coordinate the program, handling all correspondence with the county medical societies and scheduling guest appearances.

It is gratifying that officers of many county societies have responded so quickly and enthusiastically to this proposal. Letters were written in June to the presidents of the county societies informing them that state officers and staff would appreciate an opportunity to meet with the membership on any stipulated date during the coming year. Responses were received in the return mail from seven societies. Invitations continue to arrive daily.

Though most county societies "adjourn" for the summer, several guest appearances already have been scheduled. The visitation program was initiated officially on June 29 when the President and a representative of the central office traveled to Brownwood to meet with the Brown-Comanche-Mills-San Saba Counties Medical Society.

At these meetings, state officers and staff members will seek to gain firsthand informa-

REMEMBER TO VOTE ON JULY 24

tion on problems confronting the county societies. They will survey informally the membership on several important national and state issues to make certain that the programs and policies of the Texas Medical Association represent the thinking of the majority. At the same time, they will report on current activities, programs, and problems which are vital to organized medicine.

Through this new program, the state association will make a determined effort to aid county medical societies to strengthen their membership, attendance, programs, and prestige. The objective is to help each society to become in its community the most potent force in health and medical activities.

The program has definite merit. It is hoped that all county medical societies in Texas will exhibit the same degree of enthusiasm as those groups which responded so promptly to Dr. Blasingame's letter.

ANNUAL SESSION PAPERS WANTED

Members of the Texas Medical Association who talked loudly of insufficient opportunity on the 1954 annual session program to present their essays will have no such excuse come 1955. In addition to some new flourishes such as concentrated refresher courses each day, the session next spring will return to the plan of separate programs for the scientific sections of the organization. Even though there will be an imposing array of out-of-state guests to appear on these section programs as well as before general assemblies and as faculty for the previously mentioned courses, perhaps ten papers per section will be expected from local talent.

Officers of the sections are expected to have tentative plans for speakers and topics worked out by September 1, although no program will be closed until January. Physicians interested in contributing papers should write as promptly as possible to the appropriate officers, suggesting subjects and outlining briefly their proposed development. Names and mailing addresses of the section officers follow:

GENERAL PRACTICE

Dr. Van D. Goodall, Clifton, chairman.
Dr. John M. Smith, 205 Camden, San Antonio, secretary.

INTERNAL MEDICINE

Dr. John R. Winston, Farmers State Bank Building, Temple, chairman.
Dr. Mavis P. Kelsey, Hermann Professional Building, Houston, secretary.

SURGERY

Dr. Robert F. Short, Jr., Medical Arts Building, Dallas, chairman.
Dr. Norman Duren, Goodhue Building, Beaumont, secretary.

OBSTETRICS AND GYNECOLOGY

Dr. S. Foster Moore, 401 W. Summit, San Antonio, chairman.
Dr. Dennis M. Voulgaris, Wharton, secretary.

EYE, EAR, NOSE, AND THROAT

Dr. Oliver W. Suehs, 120 W. Seventh, Austin, chairman.
Dr. Robert Marion Johnson, Hermann Professional Building, Houston, secretary.

RADIOLOGY

Dr. Delphin von Briesen, First National Bank Building, El Paso, chairman.
Dr. David H. Allen, 1600 Eighth, Wichita Falls, secretary.

PUBLIC HEALTH

Dr. Austin E. Hill, 1300 Capitol, Houston, chairman.
Dr. L. P. Walter, 3212 Meredith, Austin, secretary.

CLINICAL PATHOLOGY

Dr. J. L. Goforth, Box 1074, Dallas, chairman.
Dr. John H. Childers, 815 Strand, Galveston, secretary.

PEDIATRICS

Dr. Robert A. Gardner, 4041 Ellalee Lane, Houston, chairman.
Dr. B. H. Williams, Scott and White Clinic, Temple, secretary.

Next February or March will be too late. Even if it seems like a hot and uncomfortable time to begin worrying about writing a paper, now is the time to put in a bid for a spot on that program the last week in April, 1955.

FOUR LICENSES REVOKED

The Texas State Board of Medical Examiners has announced cancellation of the licenses of the following: Winton L. Welsh, D. O., Mesquite; James E. Sherman, M. D., Brownsville; J. G. Dickie, D. O., San Antonio; and Fred W. B. Rockett, M. D., San Antonio.

PROBLEMS IN BLOOD TRANSFUSION
I. Relationship of the Physician to Problems of Blood Banking

JARRETT E. WILLIAMS, M. D., Abilene, Texas

FOR four years I have been associated with a community hospital blood bank in a relatively small city serving a wide territory in West Texas. From its inception, there have been both successful and disheartening experiences upon which I shall feel free to draw in this discussion. Although this bank has many imperfections, I can state freely that no other type of bank could possibly have satisfied our needs and that our community would resist any effort to change its essential structure or operative policy. The success of this blood bank testifies to the philosophy that any community large enough to need a blood bank can operate a blood bank as an independent unit through its recognized medical organizations and do so successfully, under normal circumstances at least, without constantly seeking outside aid, provided such a bank has the basic interest and support of the medical profession. It seems appropriate to note that more than half of the blood used in civilian hospitals in this country is contributed through community or hospital blood banks such as ours.

GROWTH OF BLOOD BANKING

The phenomenal growth of blood banking in the past fifteen years challenges the imagination. Its growth has been one of mushrooming, devoid of careful planning and thought, by virtue of its rapid growth. Experience has shown that when the demand was sufficient, blood banks were established in spite of the lack of materials or personnel—yes, sometime even in the face of professional indolence. Contrary to a conception popular with the medical profession, all too frequently the physician was not the prime mover in the establishment of blood banks, nor has he always continued to play the dominant role in blood banking. I like to think of blood banking as one of the great advances of medical services and hence believe that it should not be disassociated from close professional contacts, which contacts the profession should not be allowed to shirk or waive.

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

Throughout the early history of blood transfusions as applied to human beings, the physician has by necessity been the principal agent. A source of compatible blood had to be obtained in advance; permission had to be secured from donor and patient; and the actual transfusing of whole blood often was done under the personal supervision and watchful eye of the physician. However great was this time-consuming chore, it had its own reward reflected in the close personal physician-patient relationship. The physician's every wish was a respected command to a grateful patient and his family. The community responded with offers of blood donations. This was generous and "neighborly." Transfusion service had been developed by trial and error, but nevertheless it was the physician who held the reins for the moment.

The first blood bank for the storage of whole blood was established in 1936, and there followed a tremendous increase in the therapeutic use of whole blood with the consequent growth in the number of blood banks.[2] With the general establishment of blood banks the quality of technical procedures improved. New and safer tests of compatibility were developed, and new and better blood bank facilities became available. The influence of and the participation by the physician began to wane. And here for the first time we see the physician willingly giving up his dominant role in blood transfusions.

With this surrender, however justified it may have been, the clinician also surrendered much of his interest in blood banking and transfusions. The failure of the clinician to maintain interest, participation, and responsibility in this medical service often carried with it another penalty—the failure to be alert to and cognizant of problems arising in the service. Much of this recognition requires some hematologic knowledge and clinical judgment, but, of necessity, it has been delegated on many occasions to technical staffs, well trained to be sure, but not clinicians. It is to the credit of the nonmedical personnel of thousands of blood banks that in spite of the lack of the physician's intense interest in blood banking, these workers have developed high skills in the art and

science of blood banking. This high skill has been attained without any common method of training, control, or even evaluation. Perhaps pride in their work and pride in the institutions they represent exert the greatest effect for excellence. Perhaps, too, the blood banking personnel has a far greater interest in the welfare of people than we have recognized and an esprit de corps of which the medical profession itself could well be proud.

Nevertheless, it is my opinion that blood banking, being a medical service, always should be maintained as an arm of the medical profession. It seems appropriate, therefore, for all physicians to be aware of simple standards for donors and recipients. It seems appropriate, too, that all physicians should be aware of the administrative, technical, and procurement problems connected with blood banking and be willing to give some time and thought to meet them.

RECOMMENDATIONS

In this connection it does not seem out of place to raise a voice against a growing abuse of blood transfusions. I refer particularly to the ill advised or needless transfusions—the giving of transfusions on the score that they will do no harm and may do some good. The striking increase in the number of transfusions with the establishment of a blood bank in a community is a fine tribute to the success of blood banking. However, the great increase in the number of transfusions is due in part at least to the ease of getting blood and implies that blood often is given without thoughtful consideration. Physicians should recall that a decade ago compatibility was judged on the basis of the four primary blood groups in the A-B-O system presented by Landsteiner. However, Landsteiner and Wiener later demonstrated the Rh factor as a cause of hemolytic reactions even when blood grouping might otherwise be correct.[2] Other speakers will present the modern methods of compatibility testing, but even with these we cannot say that any transfusion may not introduce some vulnerability. We may reasonably expect a new Landsteiner or Wiener to demonstrate a now unknown factor potentially dangerous even in the face of presently known compatibility tests. With this constantly in mind the reckless use of whole blood would be abandoned and the number of transfusions reduced to a necessary minimum.

The administrative problems in blood banking usually may be settled in advance by simple sound rules. First of all, the establishment of a blood bank should have the complete endorsement of the local county medical society and the local hospitals. Records, filing, and indexing must be as accurate as humanly possible. Minimum requirements should equal or exceed those of the National Institute of Health. The procurement of blood must be on the basis of a replacement or a penalty fee.

It is the procurement problem that generally plagues the community bank, which problem can be minimized or aggravated by the efforts of the physician. I cannot share the attitude of any who feel that it is the sole responsibility of the blood bank to obtain the kind and quantity of blood needed. If one wishes to become sentimental concerning this, it is easy to point to the ancient traditions and attitudes concerning blood. It seems inconceivable that the profession would willingly lose this easy and natural bridge to patients and patients' families. I am astonished sometimes to hear a busy surgeon or internist deny all knowledge of how his blood bank works, how an inventory is maintained, how blood is secured. Suffice it that all the blood needed is available.

Those who have been active in blood banking have learned by experience to welcome and appreciate the utmost cooperation of the clinician but seldom to expect it. In general, it does not arise apparently from unwillingness to help but rather inability to recognize the responsibility. In our blood bank we place the responsibility on the recipient and his physician, where we think it belongs. We place it there, first, because it is the most effective means of replacement and, second, because it maintains the physician in a dominant role in blood banking. It is a responsibility we will not allow him to waive.

Too often in the past we have been confronted by the patient who says he made no plans for replacement because his physician had not discussed it with him. The shop-worn excuse of the busy doctor is not impressive. We do not permit him this indolence. When the physician is discussing his fee, the anesthesia, the room in the hospital, he can also emphasize the need to replace blood. The staffs of blood banks need the assistance of the physicians in initiating the discussion concerning replacement. After this the blood bank personnel follow simple plans of interviewing the patient or patient's family, stressing the need for replacement instead of purchasing blood, allaying any fears concerning the giving of blood, glorifying the giving of blood as something more than a common donation. If the physician makes the entree, we can usually do the rest with a well trained staff. We are constantly alert to the need of educating the public in blood donations, and we find that people generally respond when approached properly.

In some parts of the country where the replacement problem is most acute an effort has been made to solve it with the purchase of blood through the medium of private or commercial nonprofit banks. This tends to put blood in the same category as a

manufactured medicine. That this has created new problems I need only point to a recent article on hospitalization insurance coverage of blood transfusion cost[1] which reads in part as follows:

> The legend at the bottom of your stationery, "Give a Pint and Save a Life" prompts me to call to your attention that we and other insurance companies have recently had some objections from blood banks in other cities to any practice of paying for blood used in transfusions. The objection arises from the philosophy that a blood bank can only serve the community adequately if people have an incentive for replacing the blood which has been transfused. Apparently some blood banks have found that the community spirit which prompts a voluntary donation of blood deteriorates rapidly when people learn that monetary considerations attach to the blood used, and that the supply of blood available for transfusions in the community decreased rapidly. As a matter of fact, we and other companies have been asked by some larger city blood banks to reconsider our practice of paying for the cost of the blood used in transfusions, in order that there will again be the community incentive for persons engaged in industry and insured under group plans to voluntarily contribute through organized donor clubs.

Now the physician has a stake in this. Why has this situation developed? It has come about either by invitation or assent of the medical profession, which has said in effect, "I don't care where you get the blood, just get it."

I do think it makes an important difference. If this service can be prostituted to a dollar and cent item, so can any other medical service. This is a life-saving service presenting an unusual appeal and opportunity for fine public relationship. Friends and relatives of patients represent a rotating cross segment of our population which in peacetime, at least, can present a continuous flow of blood into our banks. This segment represents thousands who can "get in the habit" of donating blood when needed. There is no better agency for getting our entire population into the act than the American Association of Blood Banks, since it reaches intimately into every nook and cranny of the nation through the community blood banks. It can present a far more personal appeal, for its appeal in each case is for an immediate need for a given person. This segment just mentioned represents that part of the population not ordinarily donating blood to Red Cross or commercial banks, leaving the latter group for mass blood collection or major disaster needs. Indeed, I wager that if given the challenge, the member banks of the American Association of Blood Banks can flood this country with blood collected under ideal circumstances cheaper than any other agency, and with enormous good will. But the habit of giving as replacements needs to be maintained, and the physician needs to stake out and work this natural claim so that the service will not run afoul and become cheapened by commercialism or sensationalism.

II. Techniques in Modern Blood Banking

O. J. WOLLENMAN, JR., M. D., Fort Worth, Texas

SINCE the establishment of the first blood bank in the United States, the past eighteen years have witnessed the creation of a new medical specialty. The multitude of problems in grouping, crossmatching, preserving, and dispensing of blood experienced by the founders are still the plague of the blood bank specialist. Since these early days the comparatively simple identity of blood groups has been expanded into subgroups, Rh types, and numerous other factors. The discovery of Rh antigens has added to the safety of blood transfusions and is of equal value to a new field of research in immunology and genetics. Although this discovery has increased an understanding of some diseases, still the hard-earned experience of the founders forms the basic principles of modern technical methods.

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

The technical methods evolved by research and experience and tested by phenomenal numbers of successful blood transfusions have as a goal one fundamental principle. This principle is the restoration of deficient blood volume with blood which will survive a normal or near normal span of time without detriment to the recipient.

The restoration of blood volume should not be considered a simple or harmless procedure. It can be a two-edged sword, in fact, more crippling or lethal than some surgical procedures. It has been stated that "the mortality rate from transfusion is higher than that of appendicitis or of ether anesthesia."[1] In contrast to many transfusions, surgical procedures are performed only after considerable deliberation and consultation. It has been estimated that the mortality rate from transfusions is approximately 1 in 1,000 to 1 in 3,000 recipients.[1,2] Disability incurred from

transfused blood such as pyrogenic and allergic reactions, emboli, thrombophlebitis, circulatory overload, and transmission of disease cannot be accurately evaluated. The Korean study of hepatitis presented a 3.6 per cent incidence of hepatitis in whole blood transfusions and 21.9 per cent in plasma or blood and plasma.[7] The administration of blood should be weighed in the balance of thoughtful evaluation and critical judgment. Although technical methods have been developed to a phenomenal degree, there always exist the errors due to the personal equation, which usually is responsible for lethal transfusions. Unfortunately, these errors are due to ABO incompatibility resulting in the most serious of hemolytic reactions. The human errors of failure to distinguish between recipients of similar names, inaccurate records, and misinterpretation of labels account for a greater number of serious transfusion reactions than all other causes combined.[4]

The life of a blood recipient is entrusted to the skill and judgment of a laboratory technician or a nurse trained in blood bank techniques. It cannot be overemphasized that careful selection, prolonged training, and close supervision of these persons are mandatory. A blood bank, no matter how small, must have as a director a physician who has the interest and has taken the time and energy to inform himself of technical and administrative problems. He must have intimate knowledge of hospital organization and the confidence of the staff. Usually the director's duties are not sufficient for a full-time position, but, no matter how small a bank, the responsibility is great.

The selection of donors should be based on rigid adherence to established standards conceived to produce a satisfactory unit of blood and guard the health and welfare of the donor. It is imperative that an accurate medical history be obtained from a prospective donor. Since a complete physical examination is neither feasible nor frequently informative in excluding a transmissible disease, strict adherence to an accurate medical history is paramount.

Blood must be collected under absolutely sterile technique. Bacterial contamination of blood may occur from four sources: the skin or blood of the donor; imperfect seal in the bottle cap; unsterile bottles or donor equipment; and introduction of air and airborne organisms during the phlebotomy. The incidence of bacterial contamination is not known. Thirty-eight (2.24 per cent) bacterial contaminations, most frequently nonpathogenic, were isolated from 1,697 pints of blood in one series.[3] The detection of bacterial contamination in stored blood is difficult. These bacterial contaminants that produce hemolysis are detected by gross inspection of the unit of blood. Unfortunately, there are lethal bacterial contaminations that produce no gross hemolysis and survive and proliferate at storage temperature. Six instances of cold growing gram-negative rod contaminations in 3,000 units have been reported.[9] There have been several recently reported incidences of fatal transfusions traced to such bacterial contaminations.[2, 3, 9] Stevens and others[9] suggested that "examination of a stained smear of every blood should be made immediately preceding its administration." This procedure is open to question, for, if applied to small samples, it too is subject to error and in addition may in itself lead to contamination. Careful meticulous sterile technique in collection, disposable donor sets and containers, and prompt and proper refrigeration are at present the only satisfactory safeguards. As yet prophylactic antibiotic introduced in each unit has not proved satisfactory.

GROUPING (ABO)

The recommended procedure for grouping utilizes a fresh, potent anti-A and anti-B serum free of contaminants and at room temperature. Errors may occur if weak, deteriorated, or contaminated serum are used and if the temperature of the test is elevated. The A and B isoagglutinins are weakened by increased temperature. As a safeguard against these factors and the ever prevalent human error, a confirmation grouping test is recommended. The unknown inactivated serum of the donor is tested with freshly prepared 2 per cent saline suspension of group A and group B cells. Identified group A and AB blood is further identified as A_1 or A_1B and A_2 or A_2B.

TYPING (Rh)

Landsteiner and Wiener[6] in 1940 reported an agglutinable factor or antigen in human blood which was designated the Rh factor. Subsequent detection of unknown antibodies within the Rh type resulted in an Rh genetic pattern which not only proved of extreme importance in the crossmatching of blood but also in parental genetic studies and in the understanding of erythroblastosis fetalis.

Two systems of nomenclature have been devised to identify the Rh antigenic factors, namely, the Rh system and the CDE system:

Rh System	*CDE System*
Rho	D
rh′	C
rh″	E
Hro	d
hr′	c
hr″	e

The policy recommended by the American Association of Blood Banks and followed by most blood

banks is to determine eight Rh types as recorded in table 1.

TABLE 1.—*Rh Determinations Recommended by American Association of Blood Banks.*

Cell Type	(Anti-D) Anti-Rho	(Anti-C) Anti-rh'	(Anti-E) Anti-rh"	Approximate % in White Persons
rh (cde)	—	—	—	15.0
rh' (Cde)	—	+	—	1.0
rh" (cdE)	—	—	+	0.7
rh'rh" (CdE)	—	+	+	0.02
Rho (cDe)	+	—	—	1.5
Rho' (CDe)	+	+	—	54.0
Rho" (cDE)	+	—	+	14.5
Rho' Rho" (CDE)	+	+	+	13.2

The red cells possess antigens, each of which when exposed to the specific antiserum results in agglutination, thereby identifying the Rh antigen or type present in the red cells. These antigens, termed agglutinogens, are capable of inducing in susceptible persons, not possessing these specific agglutinogens, the formation of antibodies specific for these antigens or agglutinogens. Serums containing these antibodies are used for diagnostic purposes. These produced antibodies are of great importance in transfusion reactions and, of course, in Rh-negative pregnant mothers.

It soon became evident that certain Rh antibodies could not be demonstrated by routine methods. The usual saline suspension of red cells did not always agglutinate in specific antiserums. The addition of albumin or high protein solutions to the cells resulted in clumping. The terms blocking antibodies, incomplete antibodies, univalent antibodies, and others were applied to these antibodies that were not demonstrable as saline agglutinins.

An additional method of detection of weak Rh agglutinins was introduced by Coombs[5] in 1945. An antihuman serum was prepared by injecting human serum or plasma into animals. The antibody produced was designated antihuman globulin, antiglobulin, or Coombs' serum. Certain antibodies when subjected to their specific antigens will not cause visible agglutination, but when antiglobulin or Coombs' serum under proper condition is exposed to the antigen, visible agglutination results in the presence of the specific antibody.

There are two types of Coombs' tests: a direct and an indirect. The direct Coombs' test is devised to demonstrate a substance fixed to the red cells of certain patients suffering from acquired hemolytic anemia and in anemia or jaundice of the newborn. Occasionally a direct Coombs' test in hemolytic transfusion reactions will demonstrate a fixed antibody on the recipient's red cells.

The indirect Coombs' test demonstrates antibodies in the serum or plasma. Cells of known antigenic structure are incubated with serum containing unknown antibodies and then subjected to Coombs' serum, resulting in specific identifiable agglutination. The indirect technique is also utilized in testing unknown cell antigens with known antiserums. The indirect Coombs' test is of great importance in certain transfusion cases.

It is imperative that one adheres to the recommended procedure prescribed by the processor of the testing serum. It cannot be overemphasized that the processor's direction be followed exactly. Not only does this apply to Rh testing serum but to Coombs' serum or antiglobulin serum utilized in demonstrating blocking (incomplete) antibodies.

Experience has demonstrated that there exist variations in the D antigen of some persons. The red cells of some persons fail to agglutinate in the presence of potent anti-D serum but when subsequently tested with Coombs' serum (antihuman globulin) will agglutinate. These cells possess a factor termed D^u. Studies of Caucasian blood have demonstrated the rarity of the D^u factor among cells which lack C or E factors. The screening tests must employ antiserums not only of D, but also of E and C. Most D^u cells will be identified among cells containing the factors of C and E. Thus most D^u persons should be considered as Rh-positive donors and Rh-negative recipients.

There are numerous other blood factors which on occasion must be identified. The average hospital blood bank will not encounter these rare factors as a cause of incompatibility in a frequency requiring the procurement of specific antiserum. The fundamental studies employing high protein and Coombs' serum are imperative procedures which will demonstrate these remote factors but not identify them. Identity of the antigenic factors requires specific antiserum.

The identity of Rh factors, as previously stated, has been instrumental in reducing transfusion reactions. By the same token it has expanded our knowledge of blood factors and agglutinogens to recognize more than 50,000 varieties of blood.[11]

CROSSMATCHING

The discovery of blocking antibodies has necessitated the discarding of the time honored saline method of crossmatching of blood. The blocking antibody will not agglutinate cells unless the protein concentration is more than 3 per cent. Optimal agglutination is observed at 15 to 20 per cent protein concentration. Saline type crossmatching fails to demonstrate in a fairly high percentage of cases incompatibilities that may be lethal. Saline crossmatching should be performed but paralleled with high protein crossmatching. Occasionally there are demonstrated in recipient's serum antibodies which are not

demonstrated at 37 C. in high protein preparations. Although ABO compatibility may exist, agglutination in the major match may occur, usually indicating the recipient has been immunized to Rh or Hr agglutinogens on the donor's cells. The recipient's Rh should be carefully checked and a corresponding donor Rh pattern crossmatched.

Agglutination on the minor side where ABO compatibility has been established indicates Rh, Hr, or other immunized antibodies in the donor's serum.

Recipients of recent or multiple transfusions, a history of previous transfusion reactions, or women who are pregnant or recently pregnant require, in addition to the saline and high protein crossmatch, an indirect Coombs' test. Such persons may have developed antibodies which are not detected by saline or high protein crossmatch but may be quite obvious in the indirect Coombs' test.

CONCLUSION

The technical problems of modern day blood banking are ever increasing as our knowledge expands. The widespread administration of blood has been instrumental in the discovery of the large number of immunologically distinct blood factors and in broadening the horizons of genetics. At the same time, this increased use of blood has been responsible for an alarming number of deaths and innumerable sensitizing reactions. Deaths from transfusions probably will remain at a constant ratio to the number of transfusions administered as it is based on the human error which cannot be erased as long as one man's life is entrusted to the hands of another.

Improvement in 1953 Mortality Rates

The year 1953 was the sixth in succession in which the death rate in the United States was less than 10 per 1,000 population, statisticians of the Metropolitan Life Insurance Company report. The rate for 1953 was 9.6 per 1,000.

The outstanding feature of the year's health record, the statisticians state, was the large reduction in mortality from tuberculosis. The death rate from this disease was less than 13 per 100,000 population and may show a decline of close to a fourth from the previous year. As recently as 1949 the rate was double the 1953 figure.

Infant mortality was at a new minimum, the rate being estimated at 28 per 1,000 live births. The maternal mortality rate declined to less than 6 per 1,000 live births, the lowest in the country's history and 50 per cent less than five years ago.

The death rate from poliomyelitis was about 1 per 100,000 population in 1953, and the total number of cases was nearly 40 per cent less than in 1952.

Despite the high prevalence of acute respiratory diseases early in 1953, the death rate from these conditions showed only a moderate increase over 1952. There was a small increase in mortality from chronic diseases of the heart, kidneys, and arteries and from cancer, the result to a large extent of the rising proportion of older persons in the population, the statisticians say. The death rate from diabetes showed little change.

Some progress in controlling accidents is noted. Despite a continued increase in the number of cars and in automobile mileage, the death rate from motor vehicle accidents showed no appreciable change in 1953. The death rate for occupational accidents showed a slight decline, as did that for home accidents. The suicide and homicide rates were appreciably lower than in 1952.

POISON IVY TREATMENT

Hydrocortisone has been used in the treatment of dermatitis from contact with poison ivy or poison oak by Dr. Leon Goldman and Dr. Robert H. Preston, Cincinnati. The doctors reported in the April 17 *Journal of the American Medical Association* that hydrocortisone in tablet or ointment form was given to 47 persons suffering from reactions with "much improvement" resulting in 36 of the cases. The doctors stated that they found hydrocortisone 66 to 100 per cent more effective in such cases than other hormone drugs which have been used. Treatment should begin as soon as possible after contact with the plants, the doctors stated. They added that side reactions to the drug were mild.

Blood Banks

The American Association of Blood Banks will hold its seventh annual meeting at the Shoreham Hotel, Washington, D. C., September 13-15. The meeting will include scientific programs, exhibits, and a special course for technologists. Additional information can be obtained from the office of the secretary, 3500 Gaston Avenue, Dallas.

III. Minor Incompatible Blood Transfusions and Acquired Hemolytic Anemia

E. E. MUIRHEAD, M. D., Dallas, Texas
With the Assistance of Margaret Groves

THE interaction of erythrocytic antigens and their corresponding isoantibodies constitutes the basis for an incompatibility of blood. The antibodies may occur naturally (as in the ABO system) or they may be induced by prior blood transfusions, injections of blood, or incompatibilities between the child and mother during pregnancy (as in the Rh, MNS, Kell, Lewis, Duffy, and other systems).[15] In the test tube or on a slide the incompatibility is demonstrated mainly by the agglutination of red blood cells.* In the body the incompatibility is attended by an increased rate of destruction of the affected red blood cells.[12] The rate of hemolysis may be mild, thus approximating the normal survival of red blood cells (110 to 130 days), or it may be characterized by the destruction of the transfused red cells within a few hours or in a few days. Between these extremes of erythrocytic destruction various increased rates of destruction of transfused red cells as induced by isoantibodies may occur.

The adverse clinical responses to incompatible blood vary markedly, apparently as a consequence of the variations in the rates of destruction of the transfused red cells. The variations in the rate of erythrocytic destruction, on the other hand, appear to depend in part on the titer of the involved isoantibodies. Incompatible blood transfusions may be classified arbitrarily into the major and minor types, according to the adversities which they evoke in the recipient.

MAJOR INCOMPATIBLE BLOOD TRANSFUSION

The major incompatible blood transfusion is considered to exist when the rate of destruction of red blood cells by isoantibodies is sufficiently rapid to cause hemoglobinemia and hemoglobinuria. Under these conditions the conscious patient has a reaction characterized by a chill and fever (temperature elevation of 2 to 6 degrees F., average 4 degrees F.) and generalized signs and symptoms. Thirty per cent of these patients develop a hemorrhagic state, and 80 to 90 per cent develop some degree of acute renal failure.[13] The emphasis on hemoglobinuria rests on the high likelihood of serious complications when it occurs.

MINOR INCOMPATIBLE BLOOD TRANSFUSION

The minor incompatibility was emphasized by Wiener[17] under the designation of "minor hemolytic transfusion reactions." The main adversity in Wiener's cases consisted of febrile reactions. Two-thirds of the 22 patients developed jaundice after the transfusions, and in some the infused blood failed to yield the expected rise in the hemoglobin concentration. Wiener[18, 19] also emphasized under the term "inapparent hemolysis" the least evident of the minor incompatibilities of blood.[17] The latter transfusions were unassociated with clinical signs of adversity and occurred even though the original crossmatch of the blood was satisfactory. The abnormality was identified mainly by the increased rate of destruction of the red blood cells within the recipient's circulation as indicated by the Ashby technique.[1] The rate of hemolysis under these conditions may be associated with the removal of all transfused red blood cells within 20 to 60 days as compared to the expected normal of 120 days $\pm$ 10.

Since certain of Wiener's cases may now be considered of major proportions, it seems preferable to define a minor incompatibility more stringently. The minor incompatible blood transfusion may be considered to result from increased rates of destruction of red blood cells due to isoantibodies in association with which no readily detectable hemoglobinuria or renal failure develops. The patient may experience a reaction characterized by a chill, fever, and generalized complaints. Conversely, there may be no immediate adverse response as in Wiener's category of "inapparent hemolysis." Although hemoglobinuria is not evident, hemoglobinemia may be demonstrated and the serum bilirubin may be elevated within three to six hours.[12]

Mollison[12] has pointed out that under certain conditions the transfused incompatible red cells become coated with incomplete antibodies while they are destroyed more rapidly than normal, even though no

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

**Erythrocytic agglutination may be demonstrated by different procedures: (1) with a saline suspension of red blood cells ("saline agglutinin"); (2) in a colloid medium as concentrated albumin (albumin or colloid type of incomplete antibody); (3) with the Coombs antiglobulin test (direct or indirect).*

reaction results. Under these conditions, blood taken from the patient shows a positive direct Coombs' antiglobulin test. This direct Coombs' test, however, results from the coating of the donor's red cells since the antibodies do not attach themselves to the recipient's cells. This combination of increased rates of destruction of red cells plus a positive direct Coombs' test makes the circumstances of the incompatibility resemble those of acquired hemolytic anemia.

ACQUIRED HEMOLYTIC ANEMIA

There are two types of acquired hemolytic anemia, the idiopathic variety and that which is secondary or symptomatic to a series of other diseases outstanding among which are malignant lymphomas, collagen diseases, and various types of granulomas. Since the original demonstration by Boorman, Dodd, and Loutit,[3] experience has indicated an almost universal encounter of a positive direct Coombs' test in the idiopathic form of acquired hemolytic anemia. In the secondary form of acquired hemolytic anemia this test has been reported positive in half of the cases.[5] In addition, it is not uncommon to encounter a positive indirect Coombs' test in the acquired hemolytic anemias when the patient's serum is incubated with the erythrocytes of others.[20] Thus, these tests have assumed a central position in the characterization of acquired hemolytic anemia.

The factor causing the positive direct Coombs' test in acquired hemolytic anemia can be eluted from the erythrocytes[9, 10] and demonstrated to attach itself to erythrocytes from other persons, thus causing a positive Coombs' test in these secondarily coated erythrocytes. Since the factor involved appears to be a globulin it has been considered to be an antibody and this disease has been termed "auto-immune hemolytic disease."[21]

It is apparent from these considerations that minor incompatible blood transfusions may be associated with elevated rates of destruction of transfused red cells (the hemolytic state) plus the occurrence of positive direct and indirect Coombs' tests. Under these circumstances the direct Coombs' test seems to result from the coating of the transfused red cells with its corresponding incomplete antibody. Also in the acquired hemolytic anemias there are increased rates of destruction of the patient's red cells, which at the same time are coated with globulins that act like incomplete antibodies and give rise to a positive direct Coombs' test. Similarities between these two conditions are evident.

PRESENT STUDY

The present discussion is based on observations on 12 patients. These patients had a "refractory anemia" associated with various diseases (table 1). Among the diseases were included carcinoma, bone marrow failure, chronic uremia, idiopathic thrombocytopenia, cirrhosis, disseminated lupus erythematosus, and familial telangiectasia. All patients received multiple blood transfusions which at times caused chills and fever without overt hemoglobinuria. Since these patients received multiple blood transfusions an attempt was made to determine whether or not the reactions resulted from minor incompatibilities.

TABLE 1.—*Race, Sex, Age, and Clinical Diagnosis for 12 Cases of Probable Minor Incompatible Blood Transfusion.*

Case*	Race	Sex	Age (yr.)	Diagnosis
1	W	M	60	Refractory anemia (aregenerative)
2	W	M	60	Carcinoma, prostate
3	N	F	18	Carcinoma, pharynx, myelofibrosis
4	W	F	49	Disseminated lupus erythematosus
5	N	F	33	Aplastic anemia
6	W	F	42	Diabetes mellitus, chronic pyelonephritis
7	W	F	34	Familial telangiectasia
8	W	F	48	Aplastic anemia

11	W	M	43	Cirrhosis
12	N	F	55	Chronic uremia

**The numerical arrangement is the same in this table and tables 2 and 3.*

Methods

The Coombs' tests[4] were performed with the use of at least two and frequently three of the Coombs' antiglobulin serums as available on the market. These serums were tested in this laboratory against red cells that had been coated lightly and heavily with known incomplete antibodies, and their reactions were considered satisfactory. In the direct Coombs' test the red cells were suspended in saline solution (2 per cent) and washed three times with abundant quantities of saline at room temperature. After the third wash the test tube was turned up and allowed to drain. To the erythrocytes suspended in the remaining saline solution two drops of the human antiglobulin Coombs' serum were added. The mixture was allowed to stand for thirty minutes after which it was centrifuged for one minute at 500 to 1,000 rpm. The button of cells was shaken lightly into the supernatant and was evaluated for gross agglutination as follows: A solid button represented a 4+ reaction, a few large clumps were considered as 3+, multiple scattered clumps were 2+, and a definitely granular suspension with fine clumps was 1+. All grossly detectable degrees of agglutination were checked microscopically and the clumps of erythrocytes were demonstrated to be stable. A smooth or fairly smooth gross suspension which microscopically yielded scattered clumps was designated ± and was not included in these results.

The indirect Coombs' test was conducted by in-

cubating erythrocytes from different persons of the same ABO and main Rh blood types with the serum of the patient at 37 C. for one hour, then treating the red cells as in the direct Coombs' test. In some instances type O blood of the same general Rh type was used for these tests.

Eluates of red cells were prepared according to an adaption of the Landsteiner-Miller procedure[11] as follows: From 15 to 20 cc. of defibrinated blood were centrifuged, the serum was removed, and the erythrocytes were washed four times with abundant saline solution. A final 50 per cent suspension of erythrocytes in saline was heated to 56 C. for six to eight minutes while constantly agitated. The saline was then separated while warm. These eluates in the saline solution did not produce direct agglutination when incubated with a group of human red blood cells. The ability of the eluates to produce agglutination by means of the indirect Coombs' test was tested with the same red blood cells which were used in the tests against the serum as described earlier.

Survival of the red blood cells transfused into 8 of these patients was determined by the Ashby technique as described by Kaplan and Zuelzer.[8] In all of these instances type O blood was given to persons of type A, B, or AB. In procuring blood for this purpose only the red cells that gave negative indirect Coombs' test results in the crossmatch were used.

Results

The patients reported in this discussion received from more than 10 to more than 50 blood transfusions.

Direct Coombs' Test.—In table 2 the characteristics of the direct Coombs' test are given for the same patients listed in table 1. It will be noted that 10 of the 12 patients (cases 1, 3-7, 9-12) had a positive direct Coombs' test when first observed; that an additional example became positive within two to three months (case 2); and that the final patient had a positive test within six months (case 8). The degree of agglutination in the positive direct Coombs' test was usually at the level of 2+ to 3+. In 11 of these patients the direct Coombs' test became negative within two to six months, usually after three months. This phenomenon is strengthened by the fact that many appraisals of the direct Coombs' tests were conducted during this interval (table 2).

TABLE 2.—*Results of Direct Coombs' Test Applied to Circulating Red Blood Cells of 12 Cases of Probable Minor Incompatible Blood Transfusion.*

Case	Month of Observation 1	2-3	6	No. Tests (Positive/Total)
1	3+	+	Neg.	6/19
2	Neg.	2+	Neg.	1/4
3	1+			1/5
	Neg.			
4	+	+	Neg.	7/14
5	2+	3+	Neg.	5/7
6	+	+		4/4
7	2+	+	Neg.	3/5
8	Neg.		2+	2/4
9	+	+		2/2
10	3+	Neg.		3/4
11	3+	Neg.		2/5
12	2+	Neg.		2/3

The positive direct Coombs' test was a transient phenomenon either in the absence of transfusions or in association with transfusions crossmatched by means of the indirect Coombs' test.

Indirect Coombs' Test with Use of Patient's Serum.—Table 3 reveals the incidence of positive indirect Coombs' tests when a panel of red blood cells of the same ABO type or of type O and the same general Rh type was tested against the patient's serum. In none of the cases was there a 100 per cent positive result indicating that the serum, by means of the indirect Coombs' test, showed a specificity.* The specificity varied considerably and was partly dependent on the number of cells used in the panel. In general it varied between 30 and 80 per cent.

TABLE 3.—*Incidence of Positive Indirect Coombs' Tests Against Various Panels of Erythrocytes as Applied to Serum from 12 Patients with Probable Minor Incompatible Blood Transfusions and to Eluate from Red Cells at the Time the Direct Coombs' Test Was Positive.*

Case	Serum Incidence (Positive/Total Tests)	Eluate Incidence (Positive/Total Tests)
1	32/39	26/34
2	15/23	10 Neg.
3	7/10	Not tested
4	65/80	10 Neg.
5	3/10	4/10
6	Crossmatch satisfactory	
7	11/15	4/15
8	21/40	21/40
9	7/12	8/10
10	3/10	3/10
11	8/10	7/10
12	14/19	13/19

The presence of a specificity in the serum against a panel of erythrocytes by means of the indirect Coombs' test suggests the presence of incomplete antibodies.

Indirect Coombs' Test Using Eluate from Patient's Red Cells.—Eluates were prepared from the red cells at the time that the direct Coombs' test showed a 2+ to 3+ degree of agglutination. It is shown in table 3 that the eluates showed various specificities against the panel of erythrocytes. The specificity varied between 30 and 80 per cent. In 7 of the cases

*By specificity is meant that with red cells representing a sample of the population the serum gave positive results with some but not others. The percentage of positives is the specificity.

the specificity of the eluate was comparable to the specificity of the serum when measured against the same erythrocytes. In 1 case there was a disparity between the two and in 2 cases the eluates were negative.

These observations tend to indicate that the cause for the positive direct Coombs' test was an antibody which had an activity comparable to the activity encountered in the serum.

Survival of Transfused Red Cells.—Ten red blood survival curves were obtained in 8 of these patients (cases 1-6, 11, 12). In all instances the transfused blood was of type O and the indirect Coombs' test for these red cells was negative. In all instances the curve described in the survival measurements indicated an increased rate of destruction of the transfused red cells (fig. 1). If one projects the first main

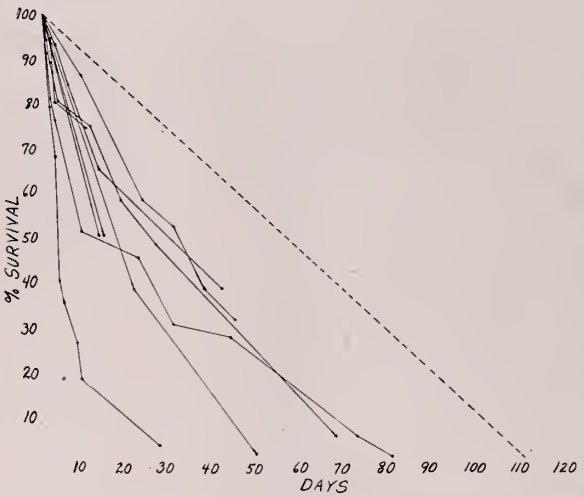

FIG. 1. The Ashby red blood cell survival curves as obtained after transfusion of the appropriate O or MN blood into 8 of the patients represented in tables 1, 2, and 3. The straight dotted line indicates the expected normal disappearance curve for transfused red cells. It is apparent that a shortened survival was depicted in all instances tested.

drop in the concentration of the surviving red cells to the base line, in accordance with Dornhorst's suggestion,[6] and considers this as the average survival of the red cells, the average survival for the 8 cases consisted of the following number of days: 8, 10, 30, 38, 40, and 60. Thus, in most of these cases there was indication for a substantial shortening of the period during which the transfused red cells remained in the circulation.

Reactions to Blood.—All of these patients gave a history of varying degrees of reactions in the past following transfusions, including chills and fever. Upon using blood yielding a negative indirect Coombs' test the reactions were markedly diminished or eradicated, even though the survival of the transfused red cells was still reduced.

Summary of Results.—The following abnormalities encountered in these patients can be emphasized: (1) a positive direct Coombs' test; (2) fluctuations in the direct Coombs' test with a tendency for the test to become negative after two to three months when no transfusions were given or when stringently crossmatched transfusions were given; (3) a specificity of the serum as indicated by the use of the indirect Coombs' test with a panel of red cells; (4) retainment of the serum specificity after the direct Coombs' test became negative; (5) a specificity of the eluates obtained at the time the direct Coombs' test was positive which was comparable to the specificity of the serum; (6) the disappearance or amelioration of reactions following blood transfusions as the direct Coombs' test became negative; and (7) the demonstration that transfused blood, even with a negative indirect Coombs' test, showed a decreased survival within the recipient.

Exemplary Case

CASE 5 (tables 1, 2, 3, 4).—A 33 year old Negro woman had been hospitalized for normal pregnancies on three occasions during the five years before the present admission. Each time she was moderately anemic but otherwise normal. On this admission she had severe menorrhagia and severe anemia. Following transfusion of 6 liters of blood a vaginal hysterectomy was performed. Later the patient was found to have a prominent pancytopenia (table 4) and a palpable spleen. Two bone marrow preparations appeared slightly hypocellular and showed evidence of degeneration and necrosis of bone marrow cells including the megakaryocytes. In addition, increased numbers of plasma and mast cells and abundant hemosiderin were seen in the smear of the bone marrow. The direct Coombs' test was positive. One additional liter of blood was given, but within fourteen days the hemoglobin concentration dropped to 4.8 Gm. per 100 cc. At this time the serum bilirubin determination indicated a minute reading of 0.2 mg. per 100 cc. and a total reading of 3.8 mg. per 100 cc., and the stool urobilinogen output per twenty-four hours, as obtained by a four day collection, was 240 units. The hemolytic index was 152 (normal 10-20). The reticulocyte count remained near 0.5 per cent. The direct Coombs' test remained positive for two additional months. A red cell survival study

TABLE 4.—*Data from a Case of Aplastic Anemia (Case 5).*

three months after the operation, when the direct Coombs' test was negative, yielded evidence for an increased rate of erythrocytic destruction (approximately 1.6 per cent per day). The indirect Coombs' test as applied to the patient's serum gave 3 positive results of 10, while at the same time the same cells applied to an eluate from the red cells gave 4 positive results of 10. Although the patient remained pancytopenic, the direct Coombs' test became negative. The final diagnosis was that of aplastic anemia.

COMMENT

The similarities between certain minor incompatible blood transfusions and acquired hemolytic anemia result from the fact that each condition consists of a hemolytic state in which the direct and indirect Coombs' (antiglobulin) tests may be positive. The cases reviewed in the present discussion are considered more likely as examples of minor incompatible blood transfusions for the following reasons: (1) the positive direct Coombs' test became negative when blood transfusions were discontinued or when blood subjected to the indirect Coombs' crossmatch was used; (2) the serum specificity against a panel of red cells demonstrated by the indirect Coombs' test indicated the presence of incomplete antibodies of the isoimmune type (against specific antigens in other persons' red cells; (3) the eluate specificity obtained by the indirect Coombs' test was frequently comparable to that of the serum, although not always identical to it, thus indicating coating of the red cells with specific isoimmune antibodies; and (4) the disappearance or amelioration of the reactions to blood when red cells yielding a negative indirect Coombs' test were used and while the direct Coombs' test became negative suggested that the reactions were related to the action of the antibodies. Moreover, these findings were encountered within a background of diseases known to cause a "refractory anemia" for which multiple blood transfusions had been given.

There is no problem in differentiating minor incompatible blood transfusions and acquired hemolytic anemia when a hemolytic state associated with positive Coombs' test is encountered in a patient who has received no blood transfusions within three to four months. This circumstance has been well illustrated, as in the cases reported by Young and co-workers.[20, 21] The difficulty arises under two circumstances: (1) in patients known to have acquired hemolytic anemia but who, in addition, have received multiple blood transfusions within three months and (2) in patients with a previously undiagnosed anemia who are found to have a hemolytic state associated with positive Coombs' tests and are known to have received multiple blood transfusions recently. If the patients in the second group are found to have a disease capable of causing a "refractory anemia," the possibility of minor incompatibilities should be considered. The greatest diagnostic difficulties occur when the two conditions are suspected of occurring concomitantly and an attempt is made to determine which is the more prominent at the time of observation.

Attempts to differentiate these two hemolytic states is not always evident in reports in the literature. Thus, one is concerned about reports purporting the development of "autoimmune" or "acquired" hemolytic anemia in association with aplastic anemia, sickle cell anemia, Cooley's anemia, paroxysmal nocturnal hemoglobinuria, idiopathic thrombocytopenia, congenital spherocytic anemia, malignant neoplastic diseases, and other conditions in which multiple blood transfusions represented a feature of the management. Such analyses often depend greatly on the presence of a positive direct Coombs' test without reference to its relation to the schedule of blood transfusions.

It follows that the diagnosis and management of minor incompatible blood transfusions have practical bearings on the care of patients. Its appreciation may prevent unnecessary splenectomies, and its identification may improve the value of blood transfusions.

The value of a blood transfusion for an anemic state is directly related to the duration of stay of the red blood cells within the recipient's circulation. In the most efficient transfusions the red cells remain in the circulation for an average of 60 days[7] and a segment remains for 120 days ($\pm$ 10). Over a prolonged course of transfusion therapy considerable doubt can be raised concerning the value of red cells that survive for eight to twenty days only. Eventually the products of hemolysis may be harmful.[2, 14, 16] On the other hand, transfusions can be considered helpful in certain cases even though their efficiency is distinctly below the expected normal, as when all of the red blood cells disappear from the circulation within forty to eighty days and the average survival is in the range of twenty to forty days.

The survival of the red blood cells in the presently recorded cases was less than the expected normal, even under the best circumstances for this institution, and indicated an inefficiency of the transfusions. This shortened survival of transfused erythrocytes was obtained usually at a time when the direct Coombs' test was negative. In accordance with prevailing definitions in the literature this finding would be considered indicative of a secondary or symptomatic acquired hemolytic anemia associated with a negative direct Coombs' test. The term "secondary or symptomatic" is used since each patient had a distinct "primary" disease. In the light of the other observations already discussed, particularly the references to the Coombs' test and the reactions to blood, it is theo-

retically possible that the shortened survival of other persons' red cells within these patients resulted from "hidden" or "occult" antibodies, that is, antibodies which are not detected by presently utilized techniques. The fundamental question of whether the patient's own red cells survive normally in their natural environment remains to be demonstrated but is being pursued.

The identification of minor erythrocytic incompatibilities can be greatly strengthened by the identification of specific antibodies,[15] either in the serum or from the erythrocytic eluates. Unfortunately this was not always possible in the cases recorded herein. This deficiency in the data is not considered to detract crucially from the points discussed but does constitute a failure to supply the ultimate proof of the premises considered.

Identification of the specific incomplete antibodies involved in minor incompatibilities may be a complex and difficult task since there is the possibility of multiple antibodies being concerned, and their titers in the serum may be low and variable. The process involved in the development of the positive direct Coombs' test under these circumstances consists of the removal of the antibodies from the serum as they coat the transfused red cells. It is fortunate, however, that even when specific identification is not possible, one has available the indirect Coombs' test as the most efficient method for the establishment of an adequate crossmatch.*

The potential role of minor incompatibilities is emphasized by the multiple sources of antibodies as indicated by the many red cell antigens. The minor incompatibility is theoretically possible for any one or any combination of red cell antigens. The list of known antigens continues to grow and includes the following antigens and their subgroups: ABO, Rh, MNS, P, Kell, Lewis, Lutheran, Duffy, Kidd, Levay, and more recently u, f, Tj, and He. It is likely that minor incompatibilities are more common than ordinarily considered.

**A negative indirect Coombs' test (donor's cells incubated in recipient's serum) does not preclude a minor incompatibility as the recipient at that moment may be in the negative phase of antibody titer or "hidden" antibodies may be present. It does minimize or decrease the intensity of this possibility.*

COST OF MEDICAL DIPLOMA

Medical college training in America costs approximately $9,200 today, according to a recent report in the *Journal of Medical Education*. This average does not include the cost of premedical training, internship, and residency training, or the cost of setting up in practice.

The study, which was conducted by John M. Stalnaker and Sara Counts of the Association of American Medical Colleges, was based on answers to 6,251 questionnaires from students at twenty-six medical schools in the United States. One-third of the students who answered expected to be in debt when they are graduated from medical school. About half of the students are single and living away from home, and most of the money for their medical education comes from parents. The married students who answered this questionnaire reported that most of their medical education is paid for by their wives.

Six civil defense survival secrets will double your chance of living through an atomic attack. They are: (1) Take cover in a basement, subway, ditch or doorway; (2) drop flat; (3) bury your face in your arms; (4) stay put for a few minutes after the explosion; (5) don't take chances later with exposed food or water; and (6) don't start rumors that might cause panic and cost you your life.

ANTIBODIES AS CAUSES OF HUMAN DISEASE

HAROLD D. PALMER, M.D., Denver, Colorado

IT is an apparent paradox that antibodies should become important in the role of causative agents of human disease. They always have been important in exactly the opposite role, namely, as a part of the body defense mechanism against disease.

The history of this subject yields some startling revelations. Widal, Abrami, and Brule[19, 20] very early in this century, concisely defined the entity of acquired hemolytic anemia and presented evidence that the disease was due to antibodies (hemolysin). Methods of easy confirmation of this work were not available at that time, and as a result this report was all but forgotten. In 1922 Bedson[2] produced an antithrombocyte serum, and when this antibody was injected into animals of the same species, it produced a disease, including purpura, thrombocytopenia, and megakaryocytic hyperplasia of the marrow, which satisfactorily duplicated idiopathic thrombocytopenic purpura in the human being. In 1925 Bedson and Johnson[3] extended this work. These reports were also laid aside.

During the forties Cavelti and Cavelti[5, 6, 7] reported the production of autoantibodies in rats against homologous tissues. In rats infected with Streptococcus hemolyticus, they were able by injecting an antigen made up of connective tissues and heart muscle to produce an antibody which was active against heart tissues. When this serum was administered to normal rats, there developed in the myocardium lesions which were not unlike those of human rheumatic fever. These authors accomplished similar results with combined Streptococcus and kidney antigen and were able to produce a disease simulating glomerulonephritis. This caused a bit more of a stir, and soon people in important positions, including Karl Meyer, William Kerr, David Seegal, Robert Loeb, and Lester Evans, became interested and encouraged the Caveltis to continue their work. However, it can be said with accuracy that medicine in general had ignored these developments.

In the meantime (1939 and 1940) Levine[16] discovered an antibody in the blood of a woman who had delivered a stillborn baby, and Weiner[22] produced an antibody in rabbits by injecting Rhesus blood. The two, who were students of Landsteiner, soon developed the fact that the antibody from the woman and the antibody from the rabbits had the same specificity, and from this beginning came the development of our knowledge of the Rh-Hr blood system. These events, with the subsequent developments which are well known to all doctors, gave a tremendous impetus to the study of the role of antibodies as causes of human disease.

In 1947 R. R. A. Coombs[9] developed what is now known as the Coombs' test. It is a test for coating or blocking type antibodies. It actually tests for human globulin. When human globulin is coated on red blood cells in antibody form, this serum detects it by causing the cells to agglutinate. Second only to the discovery of Rh-Hr system, this event has been the most significant development in the entire study of the relationship of antibodies to the etiology of human disease. Soon this test was being applied to a number of diseases which had the potential of being caused by antibodies. Many workers reported within a short time that the Coombs' test was regularly positive in acquired hemolytic anemia. This became such a regular finding that it was not long until Evans and others[12, 13] suggested that the name of the disease should be changed to immunohemolytic anemia.

Now we come to the significant role which American physicians have played in the further development of knowledge of this subject. Evans and others[13] of Stanford University in January, 1951, and Harrington and his co-workers[14] at Washington University in St. Louis in July, 1951, reported some significant observations. Evans suggested a spectrum-like relationship between acquired hemolytic anemia and idiopathic thrombocytopenic purpura. He demonstrated that a significant number of patients with acquired hemolytic anemia also had thrombocytopenia and that a small number of the latter actually had accompanying thrombocytopenic purpura. Further, he demonstrated that certain patients who presented themselves with the picture of idiopathic thrombocytopenic purpura without anemia revealed red cell sensitization as demonstrated by the Coombs' test. Harrington's work complemented that of Evans completely. He demonstrated that of 10 cases of idiopathic thrombocytopenic purpura, 8 had a plasma "factor" which was transferrable and that when whole blood or plasma in regular transfusion volume was transfused into normal persons, thrombocytopenia developed, in some cases being accompanied by prolongation of the bleeding time and delay in clot retraction. In a few cases hemorrhagic manifestations in the skin and from the gastrointestinal tract developed. The thrombopenia and the other manifestations were transient as one would expect with passive transfer.

From the Children's Hospital.

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

This substance in the plasma has been called a thrombopenic factor, but subsequently it has been shown by Stefanini and others[17] to be present in the gamma globulins and to behave like an antibody. These same workers working in Boston extended Harrington's work and presented studies of 1 person in particular whose blood or plasma, when transfused, regularly caused the full picture of thrombocytopenic purpura in volunteers.

Subsequently, Stefanini,[18] Harrington,[15] and others have developed evidence of platelet types. Stefanini and his group[18] showed that a coating antibody specific for thrombocytes was present in certain cases of idiopathic thrombocytopenic purpura and that the Coombs' test could be applied to platelets. It may be said then, that there is now considerable evidence that each human individual is of a platelet type in the same manner that he is of an ABO, MN, and Rh-Hr type.

THROMBOCYTOPENIC PURPURA

The theory of the individualized platelet type explains, as Harrington[15] has suggested, the two types of congenital thrombocytopenic purpura. In one type the mother has purpura with the full picture of idiopathic thrombocytopenic purpura and the baby is born showing thrombocytopenia with or without purpura. This is the common form and is an example of passive transfer of the antibody from an affected mother; if the baby is brought successfully through the first ten or fifteen days of life, his problem, because he is passively immunized, resolves itself. In the other type the mother does not have idiopathic thrombocytopenic purpura, but the baby in utero has a platelet type which differs from that of the mother. The mother becomes actively isoimmunized in a manner identical pathogenetically with erythroblastosis fetalis. In this instance, the return of the antibody passively to the baby results in thrombocytopenia with or without purpura, and the course of the illness in the baby follows the same course as the other form of passive transfer noted previously. This theory is extremely interesting and deserves active study whereever the opportunity presents itself.

In our laboratory, Dr. Osmun H. Hull has confirmed the presence of a coating antibody on platelets in 4 cases of thrombocytopenic purpura. He has developed a technique which permits him to obtain a satisfactory and sufficient platelet suspension from 10 cc. of whole blood. I should like to emphasize the fact that coated platelets react sharply with Coombs' serum. Positive and negative results are definite and decisive. Dr. Hull also found that the serum of the patients with idiopathic thrombocytopenic purpura clumped platelets from blood donors on the 5 samples which were used. He also was unable to demonstrate an antibody in the serum or a positive Coombs' reaction in the platelets of 3 patients with Henoch-Schönlein purpura.

Not all cases of purpura are due to antibodies. Purpura occurring during the course of infections may or may not be thrombocytopenic and may or may not be associated with antibodies. Purpura from toxic causes has the same possibilities. Toxic agents which injure the bone marrow and cause amegakaryocytic thrombocytopenia are not associated with antibodies. On the other hand, Sedormid and quinidine purpura are both associated with antibodies, and Ackroyd[1] has shown that the presence of the drug is necessary to complete the reaction in demonstrating the antibody. The major group associated with antibodies encompasses most of the cases of classic idiopathic thrombocytopenic purpura.

There remains splenomegalic or secondary thrombocytopenic purpura. The term splenomegalic purpura is preferred by many because it is descriptive and indicates that the enlarged spleen has a part in the pathogenesis, but it gives no suggestion of a mechanism. The mechanism by which purpura is produced in this group is not known, but it is true that splenomegaly from any cause may and often does result in thrombocytopenia with purpura, and this may or may not be accompanied by granulopenia and anemia. In most cases of splenomegalic purpura one is not able to demonstrate an antibody. Whether or not the slaughter house function of the spleen is accentuated when the spleen is enlarged or whether it influences adversely the production or release of platelets and blood cell elements from the bone marrow is unsettled. The term hypersplenism is applicable to this group. There is no other group in which this name can be used without some qualification.

A word about splenomegaly in idiopathic thrombocytopenic purpura. In spite of statements which recur in edition after edition of textbooks that up to 30 per cent of the patients with idiopathic thrombocytopenic purpura have splenomegaly, the spleen is not enlarged in this disease as a primary manifestation. I believe that the origin of the statement comes from the fact that about 30 per cent of the cases become chronic. These chronic cases require transfusions because of hemorrhage. After repeated transfusions, splenomegaly occurs because of hemosiderosis. Therefore, one can say that the spleen is not enlarged in idiopathic thrombocytopenic purpura except in those patients who have repeated transfusions. In a patient with purpura who has not had transfusions and who has splenomegaly one should consider the splenomegalic (secondary) form rather than idiopathic thrombocytopenic purpura until proved otherwise.

Ehrlich and Schwartz[11] at the Hektoen Institute studied 110 cases of purpura hemorrhagica. Thirteen of these patients had large spleens. All but 1 of these cases were of the secondary type. The large spleen which apparently was not secondary was in a 14 year old boy who also had lymphadenopathy. Eleven of the 13 patients had granulopenia. The course in the splenomegalic type as compared with the immuno variety is apt to be less dramatic and less emergent. Splenectomy improves the condition.

ACQUIRED HEMOLYTIC ANEMIA

In acquired hemolytic anemia the antibodies may be of the warm or of the cold type. Both may be present and occasionally an antibody with a wide range of temperature specificity is found. Each of these antibodies may coat red blood cells. One of the most interesting and most recent developments in the study of the specificity of the antibodies which coat the red cells in cases of acquired hemolytic anemia has been the findings by Dacie and others[10] of London that both autoantibodies and isoantibodies are frequently present, and autoantibodies with the specificity for Rh or Hr antigens frequently are concerned. He found "e" and "C" antibodies to be concerned in different cases. This is an unexpected development. He also found more than one antibody in a number of cases. In some of his cases the specificity of each antibody could not be determined. This information fits with a recent report by Weiner and others[23] that specificity of certain antibodies in acquired hemolytic anemia had been for the nucleus of the Rh-Hr antigen.

The difference between an *auto*antibody and an *iso*antibody is that the person who actively builds up the *iso*antibody does not have in his system the antigen which causes it to be built up. The *auto*antibody develops in those who do have that antigen. It is not unexpected to see *iso*antibodies develop in cases of acquired hemolytic anemia due to *auto*antibodies in patients who have had blood transfusions. But to find antibodies present which were *auto*specific for the patients' own Rh or Hr antigens was unexpected. The observation, however, lends support to Cavelti's findings of autospecific antibodies in rheumatic fever and glomerulonephritis in that it supplies an analogous situation.

Application of these methods to the study of granulopenia has not been extensive. However, the L-E factor is known to be present in gamma globulin,[4] has characteristics of an antibody, has undergone passive transfer to babies in utero,[4] and does act against leukocytes.

ADDITIONAL POSSIBILITIES

The group of additional diseases which are being studied for evidence of antibody causation includes most of the members of the collagen group and may be listed as glomerulonephritis, rheumatic fever, lupus erythematosus, polyarteritis nodosa, and related entities.

Are transfusions contributing to the problem? Realizing the tremendous number of antigens contained in whole blood—which now apparently includes a number of platelet types—can one expect to give multiple transfusions without causing *iso*antibodies to develop and perhaps complicate the course of the patient's illness? Certainly one cannot expect to match blood so that donor and recipient are antigenically the same. It is increasingly apparent that with the advent of the use of corticotropin and cortisone one can use transfusions less and less in diseases in which an immune mechanism is concerned. In many other situations, the information assembled concerning the development or occurrence of *iso*antibodies and *auto*antibodies in human disease may well be considered before elective transfusion therapy is practiced.

EVALUATION OF A CEREBRAL PALSY TREATMENT PROGRAM

RALPH HANNA, M. D.; WILLIAM G. WOLFE, Ph. D.; and SHELBY L. WALCH, M. A., Austin, Texas

FOR many years after spastic paralysis was first described by Little in 1861, it was generally held that the affected ones were mentally retarded and could benefit little by any treatment; consequently the only treatment these unfortunates received was directed toward their orthopedic problems. In recent years, however, studies have emphasized that a multiplicity of involvement of the disabling symptoms is possible.[16] This new concept of cerebral palsy has led to the establishment of treatment centers throughout the country. The rapid rise of these institutions makes it possible to evaluate the results of the therapy programs. This is an analysis of the Austin Cerebral Palsy Center, an out-patient treatment clinic.

To determine the progress made in the treatment of 100 consecutive clients of the center from its inception in 1947 to June 1, 1953, it was necessary to classify the disabilities upon entrance to the center and reevaluate these as the study progressed.

In analyzing each case, orthopedic involvement, speech involvement, mental status and educability, emotional status, and general physical condition were compared with the admission observation from time to time during the observation period.

Twenty-seven cases were eliminated from the study because of incompleteness of historical data or too short an attendance at the center to evaluate improvement in the conditions present; further, severely mentally retarded children were not accepted for therapy in view of the limitation of facilities. As a result of the location of the State Schools for the Deaf and the Blind in Austin, and as consequence of cooperation with them, the incidence of associated defects in the auditory and visual areas was higher than in other reported surveys.

RESULTS

All other published surveys of cerebral palsy patients show the male to be more commonly involved, the percentage varying from 52 to 55 per cent,[3] whereas in our study 32 out of 73 patients were males.

Orthopedic Involvement.—Severity of the orthopedic involvement was determined from the evaluations of examining physicians and physical therapists. The degree of involvement was recorded on the master chart in terms of a four-point scale: 0—no involvement, 1—mild, 2—moderate, and 3—severe.

The criteria were as follows:

Spastic type.
1. Mild contractures, slight difficulty with locomotion or use of hands.
2. Moderate contractures, increased difficulty in locomotion and hand use.
3. Severe contractures and extreme difficulty in locomotion and hand use to the point of complete inability to walk or use the hands for any practical purposes.

Athetoid type.
1. Slight difficulty in locomotion and gross hand use.
2. Moderate difficulty in locomotion and gross hand use.
3. Severe difficulty in locomotion and fine voluntary hand movements practically impossible.

Ataxic type.
1. Mild muscular incoordination, slight impairment of balance.
2. Moderate muscular incoordination, staggering.
3. Extreme muscular incoordination, very poor balance, frequent falls.

Other types (rigid, tremor, tension athetoid, flaccid atonic, and combinations of two or more types).
Criteria dependent upon the mixture of clinical signs present.

The type of manifestation in this analysis included 42 spastics, 12 athetoids, 3 ataxics, and 16 mixed types out of a total of 73 patients. These proportions are within the ranges reported in similar studies by

Burgenmeister and Blum,[4] Wolfe,[17] Pohl,[15] and Phelps.[13]

The degree of involvement of the patients is variable in all the studies compared. Sixty-six of our cases had orthopedic involvement; of this group only 2 had surgery, 18 had braces, and 54 had physiotherapy. In Wolfe's survey 18 per cent had surgery, but this variance is due to the fact that his series was of hospitalized cases and ours is an out-patient group.

Speech Involvement.—Severity of the speech involvement was determined from the speech therapist's examination, which included evaluation of peripheral speech mechanism, understandability, phonation, articulation, and rate. For the present study, however, it was not necessary to rate speech involvement in these different aspects, but in a more general way on a four-point scale:

0—No observable impairment of the patient's speech.
1—Mild impairment.
2—Moderate impairment.
3—Severe impairment or complete absence of speech.

Such a rating scale takes all of the previously mentioned evaluations into account, but is largely concerned with understandability. Speech and language problems not associated with cerebral palsy such as stuttering, "baby talk," and English language problems of children with a bilingual background were not included.

Speech therapy was given at the center by the speech therapist, and, as in the case of physical therapy, this was supplemented by work done at home. The patient or his parents were given instructions for the home therapy, and whenever possible the parent observed several therapy sessions at the center. Therapy at the center was both individual and group, there being appropriate groups for different age levels.

Out of 65 subjects, 7 showed no speech involvement, 9 slight, 22 moderate, and 27 severe speech involvement. The distribution of the 58 cases of speech involvement among the various types of cerebral palsy showed 23 spastic, 7 athetoid, 2 ataxic, and 16 in the mixed cases.

Mental Status.—Subjects of the study ranged in chronological age from 2½ to 30 years. Educational attainment included attendance in regular elementary schools, special room in a regular school, special school, high school, and university, and several patients with or working toward graduate degrees. Few of the subjects were considered uneducable. This is undoubtedly due to the fact that applicants with severe mental retardation are not usually accepted by the center. Some applicants with suspected retardation, however, are taken on a trial basis. Psychometric reports and other data with which to estimate the mental status were available for 63 cases. Of these, 28 patients were judged to have average or above average intelligence, 2 were rated as dull normal, 15 as borderline, and 18 as definitely retarded. In table 1 these findings, expressed in approximate percentages, are compared with those of Burgemeister and Blum.[4]

TABLE 1.—*Mental Status of Cerebral Palsy Patients.*

	Retarded (%)	Borderline (%)	Dull Normal (%)	Average or Above (%)
Present study	29	24	3	44
Burgemeister and Blum[4]	50	2	8	40

Emotional Status.—Notes on the behavior of the patients during speech and physical therapy periods such as desire for improvement, attitude toward the therapist, and cooperation; adjustment to peer groups at the center; occurrence of tantrums and other antisocial behavior; shyness; and extreme introversion were obtained from the case histories and from members of the staff. This, together with similar information from the psychometric reports and other personal information forms and from reports from the public schools and referring agency provided data from which the severity of personality problems could be estimated.

Each patient for whom sufficient information was available was rated 0, 1, 2, or 3 for adjustment. The criteria were as follows:

0—No observable problems or indication of maladjustment.
1—Mild antisocial behavior.
2—Behavior problems of sufficient severity to impede therapy.
3—Severe emotional problems.

One aspect of cerebral palsy that often has been neglected is that of adjustment. Several authors have mentioned the personal and social adjustment problems of individuals with cerebral palsy. Little[8] stated, "Physicians and others who have treated children suffering from cerebral palsy have long been aware that there are often strong and disturbing emotional reactions in the patient and his family, which interfere with successful medical treatment and the individual's general adjustment." He found that 21 out of 22 families studied showed marked evidence of emotional disturbance secondary to having a child with cerebral palsy.

Bice[2] reported that 7 per cent of the major problems encountered by the New Jersey State Crippled Children's Commission in a typical year involved behavior problems.

In the present study, for the group of 62 cases for

whom information concerning personal and social adjustment was available, 21 had severe emotional problems, 13 had behavior problems that impeded therapy, 1 had slight antisocial behavior, and 27 gave no indications of personality problems.

General Physical Condition.—Allied defects noted in this group were 12 cases of severely decreased vision, 13 of strabismus, 6 of nystagmus, 19 of marked hearing loss, and 1 of bile-stained enamel. Other disease processes did not seem to occur with unusual incidence.

Convulsive seizures were present in 15 of the 73 cases (13 grand mal and 2 petit mal type). Wolfe[17] reported 35 per cent and Benda 65 per cent with convulsions. Of the 15 in our series, 8 were in spastics, 3 in athetoids, and 4 in the other types. Six of those with convulsions had mild, 5 had moderate, and 4 had severe orthopedic involvement.

ETIOLOGY

Etiologically speaking the parity of the mother was of no significance. There were two families with multiple cases in the study. In one family 3 of 4 siblings with no discernible cause were affected; in one family, 2 children born after thirty-hour labors were cerebral palsied, but the third sibling, delivered by section, is normal.

In various studies differing percentages of instrumentation as a causative factor may be explained only on the basis of lack of sufficient historical information as to the indication for and type of instrument application. Comparison of some of the birth factors noted in various series of cerebral palsy patients is shown in table 2.

As possible etiologic factors, the prenatal or toxic processes included 1 case each of German measles, kernicterus, and maternal diabetes, and 3 cases of severe maternal toxemia.

TABLE 2.—*Birth Factors in Cerebral Palsy Patients.*

	Gen. Pop. (%)	This Study (%)	Wolfe[17] (%)	Benda[1] (%)	Pohl[15] (%)	Gustafson[6] (%)
Normal birth	11.5	34				
Precipitate birth	2.7	21	38	3.7	42	
Prolonged labor		22	14	22.0		
Premature birth		22*	42	37.0	36	30
Breech birth	3.6	5	10	5.6		9
Instrument delivery	8.5	15	24	8.0		19
Cesarean delivery		3				
Face presentation		1				

*This number included 4 who were 1 of twins. In 2 the other twin was alive and normal and in 2, death of the other twin occurred during the newborn period.

SUMMARY AND CONCLUSIONS

The various manifestations of cerebral palsy in this study are in general agreement with published data.

Almost all of the cases had orthopedic involvement. Four-fifths of these showed slight to considerable improvement under therapy.

Four-fifths of the patients had speech defects, and four-fifths of these showed slight to considerable improvement under our speech program.

About half showed slight to moderate mental retardation.

About half had personal social adjustment problems, and of these about two-thirds showed improvement while at the treatment center.

In view of our findings, we believe that the function of a cerebral palsy center is threefold: treatment, research, and training.

Prior to the initiation of treatment, finite diagnosis of the brain injury is essential. This demands neurologic, otologic, ophthalmologic, and general physical evaluation along with speech survey and a study of the mental and emotional status of each individual case. There is an acute need for the development of specialized methods of intelligence testing to overcome the inaccuracies obtained from present tests due to the physical handicaps of the palsied. Research into improved diagnostic and therapeutic methods is essential as is study that will lead to decreasing the number of brain injuries. The training function is of varied scope and nature. Education of the parent as to the disability of the cerebral palsied patient and teaching the parent to become the active therapist and to carry the treatments into the home is essential to gain maximum results. Job training and vocational guidance should begin in the early teens to aid in making the handicapped person self sufficient.

Training of psychologic workers to use play therapy or group therapy techniques is an essential for more rapid results in clearing emotional problems and in verifying intelligence testing.

Workshops, internships, and so forth should be developed for all concerned in care, treatment, and education. Well staffed centers should have programs for training all types of therapists. Postgraduate medical education should be expanded. Histories and progress records should be kept in good order. Constant evaluation of the patient and his progress under therapy should be done. Emotional and educational speech and physiotherapy progress must be frequently scrutinized at intervals and changed to meet the changing demands of the cerebral palsied child.

DIARRHEA IN SAN ANTONIO
Analysis of 1,000 Hospital Cases

SIDNEY R. KALISKI, M. D., San Antonio, Texas, and
LEO J. GEPPERT, Lt. Col., MC, USA, Fort Sam Houston, Texas

ALTHOUGH the disease process called diarrhea has been recognized and studied for centuries, knowledge of its complexities remains incomplete. So there is yet a challenge which perforce must stimulate the imagination and encourage a continuing endeavor to understand better such a significant and implacable enemy to infant life. In the quest for the necessary truths, experience may prove to be one of the lamps by which we can be guided, and a morsel of genuine history may be valuable. It has been, then, this concept which prompted us to report 1,000 hospitalized cases of diarrhea occurring endemically in this area.

Because of many factors, including semitropical climate and a large Latin-American population living under substandard conditions, the death rate from diarrhea in San Antonio remains ten times as high as comparative figures for the United States as a whole. Fourteen per cent of 10,000 infants delivered at Brooke Army Hospital from 1946 through 1951 were brought to the hospital's Pediatric Clinic at some time during the first six years because of diarrhea.

Diarrhea accounted for 2.6 per cent of 100,000 out-patient visits during this period; 22.5 per cent, or 590, of these patients required admission to the hospital, accounting for 9.7 per cent of 6,076 hospital admissions during the years 1946 through 1951. Although the case fatality rate was only 4.1 per cent, diarrhea accounted for 17.6 per cent of all pediatric deaths at Brooke Army Hospital. This study was undertaken to summarize some of the factors responsible for this persistently high morbidity and mortality. During the same period, 3,509 cases of diarrhea were reported to the City Health Department in San Antonio. Of these patients 842 died, a case fatality rate of 24 per cent. There is little variation from year to year, the number of deaths varying from a low of 90 in 1947 to a high of 150 in 1949. That the cases reported are chiefly hospital cases is evident from the fact that 2,630 patients with diarrhea were seen in the Out-Patient Clinic at Brooke Army Hospital during this period, and 590 of these patients were admitted to the hospital. During 1949, 1950, and 1951, 414 patients were studied at the Santa Rosa Hospital.

TABLE 1.—*Incidence of Diarrhea by Month.*

Month	San Antonio % Deaths	Santa Rosa Hospital % Admissions	Brooke Army Hospital % Admissions	Brooke Army Hospital % Deaths
Jan.	6.8	3.3	11.0	7.7
Feb.	5.6	1.4	6.0	7.7
March	6.0	1.4	3.0	7.7
April	9.6	9.0	5.0	3.8
May	19.0	24.2	8.0	23.2
June	13.0	14.7	7.0	7.7
July	12.9	10.4	8.0	15.4
Aug.	6.0	5 7	7.0	3.8
Sept.	2.6	5.2	7.0	7.7
Oct.	3.6	9.5	8.0	7.7
Nov.	6.0	10.0	13.0	3.8
Dec.	8.9	5.2	17.0	3.8

The study at Santa Rosa was initiated by Dr. Arild Hansen, and the results compiled by his staff for 1947 will be reported separately. The total number

COLLEGE OF PHYSICIANS

of cases included in the present study is 1,004, including the 590 in-patients at Brooke Army Hospital from 1946 through 1951 and 414 patients at Santa Rosa Hospital from 1949 through 1951.

ANALYSIS OF CASES

Seasonal Incidence.—Diarrhea is an endemic disease in San Antonio with cases and deaths being reported each month (table 1). There is a peak in May, June, and July, and, surprisingly, another in November, December, and January. The winter increase may be due partially to the epidemics of nausea and vomiting and diarrhea which occur at that time each year. The spring increase begins each year shortly after the Fiesta de San Jacinto although the gathering of huge crowds during this week may not have any direct influence. It may be postulated that, with the coming of warmer weather, windows are thrown open, doors are left ajar, and infants and children begin to spend more and more time outdoors. These environmental factors, coupled with a concomitant increase in the fly population, possibly could explain part of this seasonal spurt in the incidence of diarrhea.

Race.—It is apparent from table 2 that the majority of deaths occur in Latin-American infants. Brooke Army Hospital treats only the dependents of military personnel, and Latin-Americans make up only 15 per cent of patients registered in the Out-Patient Clinic. This group does not contribute an inordinate percentage of admissions for diarrhea but makes up 33 per cent of the deaths. It appears that the Latin-American infant has no monopoly on diarrhea but rather has a priority on death from diarrhea once contracted. The higher percentage of deaths in the first twenty-four hours (usually the first six hours) reflects the desperate condition which these infants are allowed to reach before they are brought for medical care.

TABLE 2.—*Incidence of Diarrhea by Race.*

	San Antonio			Santa Rosa Hospital			Brooke Army Hospital		
	Latin-American	Negro	White	Latin-American	Negro	White	Latin-American	Negro	White
% Clinic patients							15.0	3.0	82.0
% Diarrhea				82.3	3.1	14.6	20.0	3.5	66.5
% Diarrhea deaths	89.4	3.1	7.5	76.0	4.0	20.0	33.0	12.0	55.0

Age and Sex.—Age is of the utmost importance both as to incidence and to death from diarrhea (table 3), the relationship being geometrical. That age affects mortality more than morbidity is illustrated by the fact that the group less than 6 months of age comprises about two-thirds of all deaths from diarrhea, whereas only 5 to 8 per cent of deaths are in patients more than 1 year of age.

Of passing interest is the fact that 65 per cent of diarrhea patients were boys, but deaths were equally divided between the two sexes.

Prior Nutrition.—The quality of care the infant has received before he contracts diarrhea influences both morbidity and prognosis. Fifty-three per cent of all infants admitted for diarrhea were markedly underweight, and 80 per cent of the infants who died were at least 25 per cent underweight prior to the onset of illness. Poor nutritional status is indicated furthermore by anemia, 39 per cent of infants with diarrhea having less than 10 Gm. of hemoglobin per cubic millimeter of blood at the time of admission. Hemoglobin was less than 7 Gm. in 7 per cent.

Infection.—Aside from the possible importance of infection as an etiologic factor in the production of parenteral diarrhea, 13 per cent of infants had other infections, and an additional 8 per cent had some other type of disease, such as congenital anomalies.

Symptoms and Signs.—The onset was sudden with vomiting in about half the cases. Convulsions occurred in 7 per cent. Fifty-five per cent of the patients had between five and ten stools a day and 33 per cent more than ten stools a day. Temperature was more than 103 F. in 55 per cent of the patients and more than 105 F. in 14 per cent. Dehydration was moderate in 40 per cent and severe in 30 per cent at the time of admission. Carbon dioxide combining power was determined in 65 per cent of patients and was less than 20 volumes per cent in 16 per cent of these. It was less than 30 volumes per cent in 41 per cent of these patients. These determinations were not run on many of the sickest patients since emergency therapy took precedence over investigation. The white blood cell count was between 10,000 and 20,000 per cubic millimeter in 60 per cent of patients, values being lower in 31 per cent and higher in 9 per cent.

Etiology.—In this series, after the cases properly attributable to parenteral infection have been counted, and after the cases properly attributable to enteric infection with bacteria and parasites have been counted, there remains a significantly large segment (41 per cent) which must be allowed to fall into the slot, "gastroenteritis, cause undetermined" (table 4). Perhaps this disclosure should be regarded as a challenge, or at least an invitation, to evaluate minimal physical findings more meticulously so that parenteral infections can be assigned their true role with greater accuracy. Or it may be an incentive for more exhaustive investigation with better techniques in the

areas of virology, bacteriology, and parasitology. We definitely must not be satisfied with such a large proportion of cases in which, employing our present skills, the cause has not been determined.

Intense efforts were applied continuously to obtain positive cultures by direct rectal swabs cultured immediately on appropriate media according to the methods of Hardy. Refinements such as the feeding of stool to suckling mice have not increased the percentage of positive cultures. As tabulated it appears that only 41 per cent of patients have diarrhea of unknown cause. Actually, the percentage is higher since diarrhea due to parenteral infection may be coincidental and the pathogenicity of Pseudomonas and Proteus doubtful. Even the recovery of Shigella or Salmonella at a rate of this order of magnitude does not prove cause because of the high carrier rate in the San Antonio vicinity. The demonstration of blood and pus in the stool is just as indicative of shigellosis as the actual recovery of the organisms.

TABLE 3.—*Incidence of and Deaths from Diarrhea by Age.*

Age	Incidence		Deaths		
	Santa Rosa Hospital	Brooke Army Hospital	San Antonio	Santa Rosa Hospital	Brooke Army Hospital
1-3 mo.	23.0	22.0	31.0	32.0	44.0
3-6 mo.	30.0 } 75	22.2 } 64.7	32.0 } 92	32.0 } 92	29.0 } 95

1-3 yr.	23.0	25.0	6.0	4.0	2.5
>3 yr.	2.0	10.3	2.0	4.0	2.5

TABLE 4.—*Etiology of Diarrhea in 1,004 Hospitalized Patients.*

Causes	% of Cases
Bacterial	
Shigella (in order of frequency: paradysenteriae, Flexner II, sonnei, Flexner IV, Flexner III)	12.7
Salmonella (in order of frequency: typhimurium, schottmülleri, Poona, Panama, Orienberg, Illinois, Urbani, Thompson, London, Rubislaw)	5.3
Mixed Shigella and Salmonella	2.0
Other organisms predominant on culture considered possible pathogens (in order of frequency: Pseudomonas aeruginosa, Proteus morganii, Proteus mirabilis, Proteus vulgaris, Proteus aerogenes)	23.5
Parasitic	
Endamoeba histolytica	0.6
Giardia lamblia	0.6
Other causes	
Parenteral diarrhea (in order of frequency: otitis media, pyelitis, pneumonia)	11.6
Pancreatic fibrosis	2.5
Ulcerative colitis	0.2
Gastroenteritis, cause undetermined	41.0

We have been unable to recover a virus from any of these patients. In 1947 and again in 1949 there were observed at Brooke Army Hospital cases in which encephalitis as manifested by pleocytosis in the spinal fluid was the dominant feature of the disease. The onset was insidious. These patients had only a few stools each day, but their volume was so great that they often covered the bed. They were expelled with explosive force. Distention and vomiting were prominent features. The maintenance of water and electrolyte homeostasis was not a great problem to these children. Even though weight and serum electrolytes were maintained at normal levels, they became progressively more critically ill. Almost all of them had convulsions and stayed in a convulsive state from twenty-four to seventy-two hours. Although the mortality was 30 per cent, those who recovered seemed to be perfectly normal. No pathogenic organisms could be obtained on complete bacteriologic studies of stool and tissue. There were no significant autopsy findings.

In July, 1949, 20 per cent fecal suspensions were made on 11 patients with clinical syndrome of infant diarrhea. Each specimen was treated with 25 units of penicillin and 1,000 units of streptomycin per cubic centimeter, and 0.01 cc. was inoculated intracranially into two 3 day old suckling mice. The animals were observed for thirty days with no gross signs of disease. At the end of this period the animals were killed, the brains removed, and a suspension of this tissue reinoculated into litters of suckling mice, which were observed for a second thirty day period. No agent was isolated. Specimens from ileum, brain (cerebrum, cerebellum, and spinal cord), lung, and abdominal lymph nodes on 3 patients also were obtained at autopsy. Twenty per cent suspensions of these tissues were prepared in 10 per cent inactivated normal rabbit serum and inoculated intracerebrally in both mature and suckling mice. No virus was isolated despite attempts at successful passage.

Mortality.—The high fatality rate (table 5) at Santa Rosa Hospital for patients dying in less than twenty-four hours is due to the hopeless condition in which these patients are received. The relatively large number of deaths after more than seven days of hospitalization at Brooke Army Hospital can be attributed to the patients with a presumably virus diarrhea as previously described.

TABLE 5.—*Mortality from Diarrhea.*

Death	Santa Rosa Hospital		Brooke Army Hospital	
	No.	%	No.	%
<24 hr.	21	5.1	8	1.3
>24 hr.	13	3.1	16	2.7
1-7 days	10	2.4	3	0.5
>7 days	3	.72	13	2.2
Total	34	8.2	24	4.1

Hospital Stay.—The average hospital stay at the Santa Rosa Hospital was 9.6 days and at Brooke Army Hospital 10.1 days.

TREATMENT

The treatment of diarrhea remains nonspecific and its essence is the support of the homeostatic mech-

anism. Patients at the Santa Rosa Hospital were treated by fluid replacement according to the method of Darrow and those at Brooke Army Hospital according to the method of Hartmann. Potassium was used occasionally at Brooke Army Hospital when hypokalemia could be demonstrated. That potassium deficiency has not been a more pressing problem may be due to the fact that we have long been convinced that prolonged withholding of oral alimentation serves no good purpose once vomiting has ceased. Seldom has milk been deferred from the diet for more than twenty-four hours.

As newer antibiotics have been introduced, we have attempted to evaluate them in the treatment of diarrhea, and although we believe them of value, in the presence of acute parenteral infection or shigellosis we are unconvinced that their advent has altered the morbidity or the mortality of infantile diarrhea. The prime essential remains an interested and energetic physician, preferably a resident house physician well oriented on fluid electrolyte balance and the use of blood transfusions.

Agents used for various series during this study were sulfadiazine, streptomycin, Chloromycetin, penicillin, Aureomycin, Terramycin, aerosporin, streptomycin and glycuronolacton, and various substances designed to decrease intestinal motility. It has not been possible to conclude that any of them contributed significantly to the successful treatment of our cases. On the contrary, it would seem to be a fallacy to place any great degree of emphasis upon the usefulness of milligrams of this or teaspoonsful of that, whether it be antibiotic or chemotherapeutic substance, in the treatment of severe diarrhea. Instead, there should be a deemphasis upon any approach which does not place first things first. While no disparagement upon the use of antibiotics and/or chemotherapeutic agents is intended, we stress that if they are used, they must be integrated into a program of total care of the patient who has the diarrhea.

SUMMARY

Hospitalized cases of diarrhea in infants and young children totaling 1,004 have been analyzed as to incidence by month, race, age, and etiology. The relationship between age and mortality rate has been presented. The correlation between the age and nutritional status of the infant and between morbidity and mortality has been shown. The analysis has included, also, an account of symptoms, signs, and laboratory data. Basic concepts of treatment have been discussed.

CONCLUSION

Our study of slightly more than 1,000 patients with diarrhea, all of them sufficiently ill to require hospitalization, disclosed a startlingly large group (41 per cent) which could not be classified as to etiology in the usual concept of the word. It seems clear, however, that in its broader aspects, diarrhea in the general infant population is to a large extent a socioeconomic disease, whatever specific or nonspecific category it may otherwise occupy. Morbidity and mortality can be correlated with the infants' previous nutritional state, and prognosis is particularly unfavorable in Latin-American infants less than 1 year of age and in infants who, before the onset of their diarrhea, are grossly underweight.

Dr. Kaliski, 402 Fulton Avenue.
Dr. Geppert, Tokyo General Dispensary, Tokyo, Japan.

ABSTRACT OF DISCUSSION

Dr. J. M. COLEMAN, Austin: Diarrhea, a disease as old as history, still resists our efforts in medicine to bring about complete elucidation of its mysteries. That our knowledge is still inadequate is evidenced by our lack of agreement on the following points:

Terminology.—The terms diarrhea, dysentery, enteritis, gastroenteritis, and colitis are all applied to this disease. Failure to report etiology of any infection causes confusion, but equally confusing is the pattern of procedure which would lump all of the cases without investigation into a category called "virus." If progress is to be made, cases should be reported adequately, and health department study of outbreaks should yield results.

Etiology.—This paper has revealed our lack of information about etiology. The culture of these organisms is tedious, and it is absolutely necessary that there be complete clinical and laboratory cooperation. Direct anal smears and stool cultures without any period of drying out are essential. It is difficult to get to the bedside with a culture tube or plate before someone has poured "sulfa" drug into the patient. While the authors lament the percentage of negative cultures, I feel that they should be congratulated on the percentage of isolation of organisms. It speaks well for the control and cooperation within the group.

Therapy.—There are still almost as many therapies for diarrhea as physicians to prescribe them. Advances in understanding of fluid and mineral balance have been great, but there is still progress to be made. The elimination of castor oil from the regimen is in my opinion one of the greatest steps forward. I believe its use contributes more to the death rate than is realized, for there are still grandparents who grew up in that era which permitted its use. The drugstore shelves are still loaded with pink, white, and brown nostrums which serve usually to delay therapy until the patient is in poor straits.

The statistics which have been presented raise the question of whether it is proper to consider diarrhea as the same disease throughout the year. For example, the "summer complaint" was rampant in the city of San Antonio and among Latin-Americans, while the base showed no such peak. These cases are probably the true dysenteries and Salmonella infections.

The base study on the other hand presents a winter peak with a lower mortality. In Austin, we annually have a

winter peak that is troublesome, and it fits the description in the textbooks of what is called "winter vomiting disease." Cultures have yielded no results; the etiology is still unknown. I note that viruses were not isolated here so we should not call it virus. In many ways the outbreaks resemble toxin produced patterns such as occur in Staphylococcus toxin outbreaks. Whole families may come down in a matter of hours with vomiting and frequent stools. Further search for toxins is desirable.

An educational approach gives hope in this disease. The physician caring for children may render invaluable service by discussing early management of diarrhea with parents. I advise mothers that at the first evidence of diarrhea a starvation program should be initiated with elimination of all foods and drink except weak tea or carbonated beverages. If this program is complied with, no more than 5 to 10 per cent require further therapy. The problems are the cases home treated according to neighborhood consensus.

I cannot disagree with the idea of feeding as presented. As soon as vomiting is checked, patients tolerate food well with one exception. This exception, milk, is my one point of disagreement with the authors, for in my experience adequate management requires that milk be eliminated. I can give no reason for this. It is based on experience only. Time after time, the patient who is making excellent progress relapses immediately when milk is reintroduced.

In hospitalized cases, I advocate intravenous therapy on admission with glucose in distilled water. At the time of introduction of the needle, blood for carbon dioxide determination can be collected and the rehydration started. This permits time for planning the fluids to be used based upon the electrolyte needs.

CASE REPORTS

STRANGULATED LITTRÉ'S FEMORAL HERNIA

Case Report

L. GONZALEZ CIGARROA, M. D., and M. E. MALAKOFF, M. D.,
Laredo, Texas

ALEXIS LITTRÉ in 1700 described 2 cases of inguinal hernia wherein an intestinal diverticulum was the sole component of the sac. Later, Riecke suggested such a hernia be termed "Littré's hernia." Littré's hernia is not to be confused with a mixed Meckel's hernia in which the sac contains a Meckel's diverticulum plus intestine or other viscera and a Richter's hernia, which is a partial enterocele of the bowel wall incarcerated or strangulated in a hernial sac. In order to meet the criteria of the condition described by Littré, a Meckel's diverticulum must be the sole occupant of the sac at any of the various hernial orifices.

From 1912 to 1944 Fishback[2] recorded only 15 cases found in the literature of a true Littré hernia.

We wish to report a case of a strangulated Littré's femoral hernia.

CASE REPORT

E. E. P., a 73 year old white woman, was admitted to the Mercy Hospital, Laredo, on January 6, 1954, with a complaint of a mass in the right side of the groin, which one day previously had become tender.

The patient had noted the presence of this mass "for many years," but it had never been tender. In addition, she was a compensated arteriosclerotic heart disease patient on maintenance digitalis. Family history was noncontributory.

Physical examination revealed an elderly alert white woman not appearing acutely ill. Her blood pressure was 150/90, and she had a pulse rate of 76 and a respiratory rate of 20. The heart and lungs were negative except for a loud blowing systolic murmur heard over the entire precordium. Examination of the abdomen revealed a large, tense, tender, reddened mass in the right side of the groin over the region of the external inguinal ring with a diameter of 2 inches. It did not transmit light. The remainder of the abdomen was soft and flat. Rectal and pelvic examinations were negative.

Laboratory examinations revealed a slight leukocytosis and a negative urine. Electrocardiographic examination revealed marked myocardial damage with a bundle branch block, first degree.

Shortly after admission to the hospital the patient was prepared for surgery. Under general nasotracheal anesthesia an oblique incision was made over the mass and the dissection promptly revealed the presence of a femoral hernia. The sac was of a reddish hue, and when opened it was found to contain a moderate amount of dark sanguinous fluid and a gangrenous infarcted blind pouch of small intestine. The neck of the sac was incised, and a normal terminal ileum was delivered into the operative field. The infarcted diverticulum was resected, and rhe intestinal defect was closed with an "open" technique using interrupted gastrointestinal and cotton sutures. The small intestine then was returned to the peritoneal cavity and the sac dissected free, transfixed, and amputated. Femoral herniorrhaphy was effected and the wound closed without drainage. The patient withstood surgery well. Her postoperative course was smooth and uneventful with dismissal from the hospital on the eighth postoperative day.

DISCUSSION

It is important to point out that an exact preoperative diagnosis is unlikely. To meet the neces-

sary criteria of a hernia of Littré, the occupant of the sac must be singularly and solely a diverticulum of Meckel.

SUMMARY

A case of strangulated Littré's femoral hernia is presented.

SWIMMING POOL GRANULOMA

Report of a Case

J. B. RICHARDSON, M. D., and EVERETT R. SEALE, M. D.,
Houston, Texas

GRANULOMATOUS lesions rarely occur after a simple abrasion. However, there have been a few recent reports[1, 2, 3, 4, 5, 7, 9] of such lesions developing following abrasions sustained in and about swimming pools. We have observed the following case and consider it to be of sufficient general interest to record.

CASE REPORT

A. G., a 12 year old white boy, consulted us in November, 1953, concerning a lesion of his left elbow. While swimming six months previously, he had slipped on the concrete apron at the edge of a swimming pool and had abraded his elbow. The abrasion healed, but three weeks later there appeared a small growth which gradually increased in size. The lesion had caused little or no discomfort, and, according to the patient, there had been no enlargement of the regional lymph glands at any time.

Examination revealed a well nourished and apparently healthy young white boy. On the left elbow there was a superficial granulomatous lesion measuring 2 cm. in diameter composed of reddish-brown coalescing papules which were covered with a thick adherent scale (fig. 1). Adjacent to this lesion there was a small satellite papule which was similar to the larger one. Yellowish nodules were not discernible under diascopic pressure.

The patient's past history was not unusual although he had been in repeated contact with a relative suffering from active pulmonary tuberculosis. For this reason, roentgenograms of the chest were made both before and after the development of his skin condition. These examinations were consistently negative. A tuberculin patch test was applied at the time of initial observation of the patient, and it was strongly positive. He had not been tested previously.

The histopathologic findings on tissue removed for biopsy (fig. 2) were reported by Dr. Earl B. Ritchie, Galveston, as follows:

"The epidermis in addition to being intact throughout shows a marked acanthosis. Two large follicular orifices are plugged with dense hyperkeratotic and parakeratotic material. In the upper half of the dermis is a granulomatous reaction consisting of lymphocytic infiltration, histiocytes, epithelioid cells, giant cells both foreign body and Langhans' type, and numerous new vascular channels. One small well-defined area shows an intrinsic foreign body reaction surrounding a small epidermal inclusion. Aside from this, the remainder of the picture is that of a nonsuppurative, noncaseating granuloma in which the density of the lymphocytic infiltration almost completely obscures the epithelioid structure to some degree, but tuberculoid formation is apparent with typical Langhans' giant cells within these areas. No doubly refractive foreign particles were seen under polarized light and the Hotchkiss-McManus stain disclosed no fungus elements. The Ziehl-Neelsen stain for acid-fast bacilli was negative.

"The diagnosis is chronic granuloma possibly tuberculous."

Direct examination of scales from the lesion and cultures in Sabouraud's medium were negative for fungi. Cultures

FIG. 1. Swimming pool granuloma of the left elbow.

Presented before the Texas Dermatological Society, San Antonio, May 3, 1954.

(Dubose and Pizer) made from biopsy material were reported as negative.

The lesion was destroyed by curettage and electrodesiccation, and healing occurred with a soft, pliable scar.

COMMENT

A review of the literature reveals that several different types of granulomas have been recognized as complicating swimming pool injuries. Some of the lesions have resembled a form of cutaneous tuberculosis while others were of a nonspecific appearance. The cases recorded are summarized in table 1.

Hellerström,[3] in the initial report of this entity, described 6 cases with lesions of the lupus vulgaris type located on the bridge of the nose which developed subsequent to a swimming pool abrasion. The almost immediately developed the lupus vulgaris reaction in and around the original abrasion site. Also, tubercle bacilli were later isolated from one of the pools used by his patients.

More recently Brück[1] has observed a patient with a similar lupus vulgaris type of reaction. Tubercle bacilli were cultured, and animal inoculation was positive. Tolmach and Frank[9] were unable to demonstrate tubercle bacilli in their case and suggested silicates as a possible cause. However, repeated examinations with the polariscope in several reports, including our own, have failed to reveal the presence of refractive particles. Sulzberger and Baer,[8] in commenting on this case, mentioned the smegma bacillus as a possible causative agent. Symanski has produced tuberculoid lesions by inoculating smegma bacilli into the skin. Whether or not this has any etiologic significance in

TABLE 1.—*Summary of Reported Cases of Swimming Pool Granuloma.*

Author	No. Cases	Sex, Age (yr.)	Site	Diagnosis	Chest X-Ray	Tuberculin Reaction		T. B. Culture	Animal Inoculation
						Before Injury	After Injury		
Hellerström	6	M 12-29	Nose	Lupus vulgaris	Negative	Negative in 5, questionable in 1	Positive	Negative in 1	Negative in all
Brück	1	M 23	Midface	Lupus vulgaris	Negative	Questionable positive	Positive	Positive	Positive
Tolmach and Frank	1	M 19	Nose	Granuloma, possibly tuberculosis	Calcified areas hilar region	Unknown	Positive	Negative	Negative
Cleveland	4	2 M, 2 F 10-14	2 Chin 1 Nose 1 Finger	Consistent with tuberculosis cutis	Negative in 1	Unknown	Negative in 1	Not done	Not done
Rees and Bennett	9	6 M, 3 F 8-20	7 Knee 1 Finger 1 Ankle	Tuberculosis verrucosa cutis	Negative in 3, increased density in 1	Unknown	Positive in 6, negative in 2	Negative in 1	Negative in 4
Herlitz	80	77 Children 3 Adults	Elbow	Nonspecific granuloma	Unknown	24 Positive of 28 tested	26 Positive, 2 negative	20 Cultured, at 37C. all negative, at 31C. 3 positive	3 Negative in guinea pigs, positive in mice

clinical picture was similar in all instances; three to six weeks after the initial injury there appeared soft reddish-brown papules which soon coalesced and upon diascopic pressure had the distinctive color of lupus nodules. Although the microscopic picture was consistent with lupus vulgaris, guinea pig inoculations and pulmonary roentgen-ray examinations were negative. However, there was slight enlargement of the regional lymph nodes in 4 of his cases, and the tuberculin reaction was positive in all although the test had been negative in 5 of the patients prior to their injury. Hellerström considered this conversion of the tuberculin reaction as evidence in favor of his cases being tuberculous. He theorized that his patients passed rapidly through a primary tuberculous complex and the granulomas under question remains to be seen.

Cleveland[2] stressed the possibility of the contamination of public pools with bodily secretions from persons infected with incipient tuberculosis. In this connection, Rees[7] attempted to isolate tubercle bacilli from a public pool used by 8 of his 9 patients and was unsuccessful.

One of the most striking reports is that by Herlitz,[5] who observed 80 patients with nonspecific granulomas following swimming pool abrasions. Norden and Linell,[6] in an intensive study of his cases, were able in 3 instances to isolate acid-fast organisms indistinguishable from tubercle bacilli when the cultures were incubated at 31 C. The fact that this organism did not grow at 37C. and that it was pathogenic

for mice but not for guinea pigs resulted in the conclusion that the causative agent in their cases was probably a previously unrecognized Mycobacterium which differed biologically from the Mycobacterium tuberculosis. To substantiate further the idea that these

FIG. 2. Section of the lesion showing chronic granuloma. x 67.

lesions were produced by an infectious agent, it is their statement that no other cases occurred after the surfaces of the pool were tiled and the chlorine content of the water was increased.

Considering our case and those reviewed in the literature, it appears that this process is on an infectious basis, and it would seem worth while if, in the future, cultures were made upon several different types of media at varying temperatures. Others, as well as ourselves, have been unable to incriminate fungi in an etiologic role.

TREATMENT

There has been no uniformity as to the method of treatment employed in the recorded cases of swimming pool granuloma. Some have been treated as cutaneous tuberculosis with one or more of the following remedies employed: Finsen lamp, vitamin D_2, isoniazid, and para-aminosalicylic acid. In other cases the lesions have been treated with roentgen-ray, by surgical excision, or by curettage and electrodesiccation. We believe that the smaller lesion can be handled adequately by curettage and electrodesiccation or surgical excision.

SUMMARY

A granuloma of the elbow following a superficial swimming pool injury is reported.

The literature has been reviewed, and our case is similar to many which have been recorded.

ABSTRACT OF DISCUSSION

DR. MALCOLM W. HARRISON, Houston: This type of cutaneous granuloma obviously represents a new syndrome and should be recognized as such. Although of rare occurrence, the disease is nevertheless a public health problem because of the increasing popularity of both public and private swimming pools. There is a need for the accumulation of additional data to clarify the etiology of the disease.

We cannot contest the validity of the diagnosis of tuberculosis in the cases reported by Hellerström and Brück. These lesions should be considered as a separate group. The majority of the other reported lesions presented a different and more or less uniform morphologic appearance. The authors reporting these cases have had to consider the possibility of inoculation tuberculosis chiefly because of the histopathologic findings, but the evidence has not been conclusive.

For many years dermatologists have recognized two forms of inoculation tuberculosis of the skin, primary and secondary. Primary inoculation tuberculosis of the skin is analogous to the Ghon tubercle in the lung. The infections occur in young persons not previously infected with tuberculosis and are preceded by a negative tuberculin test which becomes positive six weeks to two months after the inoculation. These lesions are characterized by a primary focus and are always associated with a regional lymphadenopathy. In the secondary type of inoculation tuberculosis the patient has already had tuberculosis. The infection remains localized at the site of inoculation and may assume the picture of lupus vulgaris or a warty lesion called tuberculosis verrucosa cutis.

By comparison the lesions under consideration do not fulfill the requirements necessary for the diagnosis of the primary type of inoculation tuberculosis in spite of the fact that the infections occurred in young persons who would be ex-

pected to develop the primary complex. These lesions could be classified as a form of reinfection tuberculosis so far as the clinical appearance is concerned, but the histopathologic findings have not been uniformly typical of tuberculosis. If these granulomas are inoculation tuberculosis, they must represent a new form of the disease not previously recognized.

The sequence of events in the development of swimming pool granulomas, the morphology of the lesions, and the course of the infections follow a definite pattern in the majority of cases. This suggests a common etiology. Perhaps they are caused by some organism of the Mycobacterium group other than the Mycobacterium tuberculosis.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas, Houston, July 19-21, 1954. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

TEXAS ACADEMY OF GENERAL PRACTICE

The Texas Academy of General Practice will have its fifth annual assembly in Galveston, September 9-11. Physicians scheduled to speak are Dr. W. E. Kittridge and Dr. Arthur Neal Owens, New Orleans; Dr. Harold W. Lovell, New York City; Dr. H. Keith Fischer, Philadelphia; Dr. James L. Dennis, Galveston; Dr. William A. Sodeman, Columbia, Mo.; Dr. Philip Thorek, Chicago; Dr. M. Digby Leigh, Los Angeles; Dr. John G. Young, Dallas; and Dr. Ralph R. Braund, Memphis. John C. Krantz, Jr., Ph. D., Baltimore, will speak on pharmacology. All Texas Medical Association members are invited to attend.

Other than the scientific program there will be entertainment for the ladies, luncheons, and banquets. A door prize of a free trip to Mexico City for a doctor and his wife will be given.

University of Texas Medical Branch

The University of Texas Medical Branch, Galveston, was host to the Southern Society of Clinical Surgeons one day of the recent three-day Houston meeting.

Dr. Frank Fremont-Smith, director of the Josiah Macy, Jr., Foundation of New York City, was the featured speaker when 113 doctor of medicine degrees were conferred at the Medical Branch on June 4.

"Physiological Significance of Fibrillar Structures in Connective Tissues" was the subject of a May 11 seminar on which Dr. Isaac Costero, Instituto Nacional de Cardiologia, Mexico, D. F., spoke. Also on May 11, Dr. W. N. Powell, Temple, headed a clinical pathology conference.

A chapter of the Sigma Xi national scientific honor society has been established at the Medical Branch. Dean George Boyd, of the University of Georgia, Athens, conducted installation ceremonies.

On recommendation of a special committee, the Board of Regents of the Medical Branch has authorized the establishment of the James W. McLaughlin Fellowships for the investigation of infection and immunity. Funds will be available for predoctoral, postdoctoral, senior, and faculty fellowships.

PERSONALS

Dr. R. M. Moore, Galveston, was elected vice-president of the American Surgical Association at a late April meeting of the group.

Dr. T. G. Blocker, Jr., Galveston, was elected vice-president of the American Association of Plastic Surgeons recently.

Dr. G. V. Brindley, Temple, received a bronze medal for distinguished service for cancer control in Texas from the American Cancer Society in April.

Dr. Andrew S. Tomb, Victoria, recently spoke at a meeting of the Rhode Island Academy of General Practice in Providence.

Dr. Mavis P. Kelsy, Houston, is on a six-week trip to England, France, Switzerland, Holland, and Germany. He spoke to the Postgraduate School of Medicine, London, on June 10 on "Cancer of the Thyroid."

Speakers at the twenty-fourth annual meeting of the Texas X-Ray Technicians in San Antonio on April 23 included *Drs. Vincent Collins, Edward B. Singleton,* and *J. E. Martin,* Houston.

Dr. H. F. Connally has been named mayor of Waco.

Dr. C. C. Sheldon, was elected president of the new Sand Oaks Country Club, Greenville.

The *Alumni Bulletin* of the University of Texas Medical Branch, Galveston, lists as parents of new boys *Dr. and Mrs. M. L. Thornton,* San Antonio; *Dr. and Mrs. R. M. Adams,* Groves; and *Dr. and Mrs. C. R. Heare,* Stephenville. *Dr. and Mrs. H. F. Elmendorf, Jr.,* San Antonio, are the parents of twin boys.

BROOKE BIRTHDAY CELEBRATION

Thirty-two San Antonio physicians and one Houston physician, members of the visiting staff at Brooke Army Hospital, were invited to attend ceremonies on April 30 marking the seventy-third anniversary of the founding of the oldest unit at Brooke Army Medical Center.

The San Antonio physicians included Drs. John W. Winter, Thomas H. Diseker, C. Ferd Lehmann, J. Lewis Pipkin, Duncan O. Poth, William J. Block, Jr., W. W. Bondurant, Henry N. Leopold, David R. Sacks, Donald T. Dodge, and Alfred H. Hill.

Also included were Drs. S. Foster Moore, Jr., John L. Matthews, Wilfrid E. Muldoon, John J. Hinchey, Marion H. Morris, David R. Oliver, A. O. Severance, Sidney R. Kaliski, Dean B. Jones, Ervin F. Lyon, Jr., Albert W. Hartman, James W. Nixon, Ralph A. Munslow, Victor C. Tucker, Lawrence M. Shefts, Charles A. Hulse, William W. Sawtelle, James P. Aderhold, Albert N. Champion, Robert E. Parrish, and Dan A. Russell.

Dr. Hardy A. Kemp, Houston, was also invited.

LIBRARY SECTION

LECTURE SERIES

In cooperation with the Council on Medical Education and Hospitals of the Texas Medical Association, the Memorial Library now has available an additional service for Association members. With the purchase of the Audio-Digest Foundation's lecture series, the busy practitioner who is unable to attend many medical meetings can now hear programs by outstanding speakers. On-the-spot recordings at medical conventions, together with especially prepared lectures, will bring top medical names into the living room or office of the physician. Tapes by leading professors in the nation's seventy-nine medical schools will aid the physician in keeping abreast of advances of medicine. Many of the lectures are accompanied by slides to amplify the program.

The tapes will be loaned to any member of the Association for his own use or for group meetings. The only cost to the borrower is return mailing charges. The tapes may be secured on loan by writing the Memorial Library and stating the title (or titles) and date desired. The length of time and number of illustrations are noted in the listing. Additional titles will be listed as they are available.

TAPE RECORDINGS

Alvarez, Walter C.: Latest Trends in Therapeutics (26 min.).

Alvarez, Walter C.: The Neuroses (28 min.).

Boies, Lawrence R.: The Tonsil and Adenoid Controversy as Seen by the Laryngologist (20 min., 8 slides).

Boyd, Harold B.: Management of Hip Fractures in Aged (29 min.).

Boyd, Harold B.: Prevalent and Preventable Orthopedic Errors (29 min.).

Burch, George E.: Comments on the Low Salt Syndrome (25 min.).

Cattell, Richard B.: Diagnosis and Management of the Patient with Jaundice from Extra-Hepatic Diseases (21 min.).

Cattell, Richard B.: Management of Thyroid Disease (28 min.).

Dock, William: Present Status of Dietary vs. Endogenous Cholesterol in the Pathogenesis of Atheromatous Disease.

Dock, William: Uses and Abuses of Corticoid Steroids.

Dragstedt, Lester R.: New Light on the Physiology of Gastric Secretion and Its Relation to Peptic Ulcer (29 min.).

Dragstedt, Lester R.: Surgical Treatment of Gastric Ulcer, Duodenal Ulcer, and Gastrojejunal Ulcer (29 min.).

Erkenbeck, Col. Vernon J.: Recent Trends in Otolaryngology (23 min.).

Everett, Houston S.: Hematuria (28 min.).

Everett, Houston S.: Urological Obstruction Resulting from Gynecological Causes (23 min.).

Hayes, Maj. Gen. Silas B.: Traumatic Disease (29 min.).

Heck, Frank J.: Problem of Fever of Undetermined Origin (30 min.).

Wintrobe, Maxwell M.: Progress in Hematology and Laboratory Diagnosis (29 min.).

CONTRIBUTIONS TO THE LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Austin-Travis County Health Unit, Austin, 348 journals.

Dr. James H. Herrod, Austin, 400 journals.

Dr. J. Edward Johnson, Austin, 54 reprints, 1 journal.

Dr. L. H. Reeves, Fort Worth, 1 journal.

Dr. Henry Renfert, Austin, 11 books.

Dr. N. L. Schiller, Austin, 11 journals, 10 reprints.

MOTION PICTURES FOR LOAN

On Our Own

16 mm., sound, 14 minutes.

This film shows the latest steps in the rehabilitation of patients with advanced poliomyelitis as practiced at the New York Rehabilitation Institute. The training of the patient to meet the demands of daily living is shown. The early steps in instruction in ambulation, the proper method of learning to apply one's own braces, the methods of getting in and out of chairs, and the various types of crutch gaits are demonstrated; and instructions in climbing curbs, crossing streets, entering buses, and ascending stairs are shown. This film can be used for lay audiences as well as student nurses.

Dwarfism

16 mm., sound, 40 minutes.

By Dr. S. Z. Levine, this film presents a clinic on dwarfism. Dr. Levine divides dwarfism into various clinical types including skeletal, endocrine, visceral, primordial, miscellaneous, unclassified, and delayed adolescence (not true dwarfism). He presents a number of case histories along with excellent photographs of patients. The subject is handled in an unusually able manner and should prove excellent for medical students, interns, residents, and pediatricians, as well as for general practitioners.

BOOK NOTICES

[1]Physiological Cardiology

ARTHUR RUSKIN, M. D., F.A.C.P., *Associate Professor of Internal Medicine, University of Texas Medical Branch, Galveston. 370 pages. $8. Springfield, Ill., Charles C Thomas, 1953.*

In this small, attractive, well-bound volume is presented a study of the heart with reference to its function and dysfunction resulting from disease or anomaly of itself or related organs.

The material, well outlined in the table of contents, is

[1]*Henry Tucker, M. D., Nacogdoches.*

arranged into twelve chapters, the title of each a pathologic condition of the heart or dependent system. A logical scheme is followed wherein normal and abnormal function, biochemical changes, functional alterations in respiration or renal excretion, and metabolism as they affect the heart are presented serially.

A feature of particular clinical interest is the diligent effort throughout to acquire practical correlation of the physiologic, pathologic, biochemic, and biophysic phenomena as they relate to the dependent therapeutic considerations.

While no elaborate chapters on laboratory studies nor electrocardiography appear in the treatise, essential findings are described as relevant.

In the chapter on congestive heart failure appear interesting figures in explanation of the "Starling law," of "forward and backward," and of "high output failure" and "low output failure." Physiologic actions of drugs are described in therapeutic considerations, but, as seems proper in such a work, no recommendations for specific use of drugs appear. Vascular and myocardial insufficiency in experimental disease of and drug effects on the heart with coronary disease are described.

Emphasized in treating of congenital heart disease are details of catheter data as diagnostic essentials and results to be expected from surgical treatment.

Acute pulmonary arterial hypertension such as follows thrombosis or similar chronic hypertension as an associate of emphysema is well pictured as an etiologic factor in right hypertensive heart failure, cor pulmonale.

Other hypertensive syndromes, valvular disease, myocarditis, compression, and endocrine and metabolic diseases affecting or affected by heart disorder are described in special chapters.

Throughout controversial points are dismissed by use of the question mark. Bibliography is notable in that references are sharply relevant and sufficient without profusion.

In the hands of physicians who do not merely read but study, an approach toward rational treatment of heart disease will be acquired, and the hope of the author that the book be "useful and stimulating" in a measure fulfilled.

[2]Annual Review of Medicine, Volume 2

Edited by WINDSOR C. CUTTING, M. D., *Stanford University School of Medicine, and* HENRY W. NEWMAN, M. D., *Stanford University School of Medicine. 485 pages. $6. Stanford, Annual Reviews, Inc., 1951.*

This volume is comprised of nineteen separate reviews by a total of twenty-five distinguished authors. The subjects reviewed in this volume are infectious diseases, diseases of the gastrointestinal tract, diseases of the cardiovascular system, diseases of the urinary system, diseases of the reticuloendothelial system and hematology, nutrition and nutritional diseases, endocrinology, allergy, neoplastic diseases, diseases of the reproductive system, diseases of the nervous system, psychiatry, diseases of bones and joints, diseases of the respiratory system, diseases due to physical agents and trauma, anesthesia, radiology, radioactivity, diseases of the eye, laboratory aids to diagnosis and therapy, therapeutics, and toxicology.

The individual reviews are, in the main, excellent summaries, although some of these are confined to rather narrow phases of the topics under discussion. On the whole they are representative of the recent work in the respective fields. An important feature of each of these reviews is the rather full bibliography which is placed at the end of each section.

[2]*L. O. Dutton, M. D., El Paso.*

Of special interest is the last topic section, an annotated list of reviews in medicine. Here is listed in a convenient place important reviews that appeared between November, 1949, and January, 1951.

The wide variety of topics discussed, of course, places this volume in the category of a general review with wide appeal. The one feature which detracts from the volume's general usefulness, however, is that in some of the reviews, the subject matter is too strictly confined to the author's particular small field of research interest and would not be too valuable for the general medical reader. Nevertheless, on the whole, the volume can be recommended because of its many excellent features.

Biochemistry and Human Metabolism

BURNHAM S. WALKER, M. D., Ph. D., *Professor of Biochemistry, Boston University School of Medicine;* WILLIAM C. BOYD, Ph. D., *Professor of Immunochemistry, Boston University School of Medicine; and* ISAAC ASIMOV, Ph. D., *Assistant Professor of Biochemistry, Boston University School of Medicine. Foreword by* JOHN T. EDSALL, M. D., *Professor of Biological Chemistry, Harvard University. 812 pages. $9. Baltimore, Williams and Wilkins Company, 1952.*

[3]Pregnancy Wastage

Edited by EARL T. ENGLE, Ph. D., *College of Physicians and Surgeons, Columbia University. 266 pages. $8.50. Springfield, Ill., Charles C Thomas, 1953.*

This book presents a collection of papers and discussions given at a conference held in behalf of the National Committee of Maternal Health, Inc., under the sponsorship of the Committee on Human Reproduction of the National Research Council. It is superbly edited. The material represents an acceptable distillation of significant knowledge pertaining to present-day concepts of facts and factors influencing pregnancy wastage. In essence, the book presents a beautiful description of the anatomy and dissection of the problems which evolve from the aggregate of pregnancy wastage and a statistical evaluation of the methods employed to solve these problems. The value of the book resides primarily in the fact that so much information pertinent to pregnancy wastage is gathered in so compact and accessible a form. The appended bibliographies are fully as valuable as the text presentations themselves. The book is printed on slick paper and the format is pleasing and the type readable. Typographical errors are rare. The book is recommended to all students, workers, and practitioners interested in the problem of human pregnancy wastage.

[4]Sectional Radiography of the Chest

IRVING J. KANE, M. D., *Consultant in Chest Diseases, United States Naval Hospital, St. Albans, N. Y.; Attending Physician, Chest Diseases, Lincoln Hospital, New York; and Associate Physician, Diagnostic Roentgenology, Montefiore Hospital, New York. 154 pages. $7.59. New York, Springer Publishing Company, Inc., 1953.*

This book is a fine effort in evaluating sectional radiography of the chest as a diagnostic procedure. It develops the history of the procedure and the various mechanical means that have been developed to get the desired information together with the relative merits of each. This includes such details as arcing the tube, preliminary travel, exposure factors, and hand operated as versus motor driven planography.

Important considerations such as the making of a test

[3]*William F. McLean, M. D., Austin.*
[4]*Joe C. Rude, M. D., Austin.*

film cannot be stressed too much, nor can variation in density, for it is important to know whether one is trying to show up a solid vascular element, a tumor, or a thin walled cavity surrounded by aerated lung.

The importance of 1 to 4 mm. of aluminum filtration to cut down on radiation exposure cannot be overstressed to protect both personnel and the patient. The intelligent placement of the patient using a minimum object film distance gets a maximum amount of sharpness of the resulting image, and a target film distance of not less than 36 inches should be used. Other important factors are breathing control, for the image will not be sharp if respiratory motion is in progress, and the use of low milliamperage and high kilovoltage to avoid extreme contrast. The best results are obtained by use of the motor drive with which the x-ray exposure is automatically synchronized.

In the matter of positioning, the recumbent attitude is advocated because a patient cannot stay in position well for any length of time upright. The advantages of using interoposterior, postero-anterior, lateral, and oblique sections are discussed. The use of postero-anterior and lateral films of the chest as a preliminary to body section radiography to help in localization for sections cannot be stressed too much as an intelligent, economical approach to the subject. It is important to know the normal anatomy of the trachea, bronchi, node chains, node groups, and great and hilar vessels as well as the various lung segments, for without this knowledge one will be unable to recognize pathologic lesions.

Although the importance of sectional radiography cannot be denied in relation to the heart and great vessels and in the demonstration of primary and secondary tumors of the lungs, as well as of metastatic nodes and abscesses, one still feels that its most frequent use will be in the field of tuberculosis. In this condition it has many uses such as the identification of cavities of fibrosed and contracted segments which may or may not contain cavities, of the extent of nodes, and of the extent of adhesions, and the investigation of compressed lung segments in cases of thoracoplasty.

It of course has many other uses such as determining the cause of atelectatic portions of lung for which the physician is unable to account, detecting of foreign bodies, and especially studying the trachea and major bronchi as an adjunct to the usual methods. This method has been highly developed in the study of the larynx, but it is not covered in this book and one would like to suggest that it be added to the next edition.

[5]Atomic Energy in Industry

Minutes of Special Conference, October 16-17, 1952, New York City. $10. New York, National Industrial Conference Board, Inc., 1952.

Today there are literally hundreds of industrial uses for atomic by-products, and more are being found each day. The millions of dollars invested in the atomic powered submarine, for example, indicate that nuclear power is some day expected to furnish electrical power.

Radioactive tracers are used in determining the wear on piston rings, to improve motor oil, and in separation of different products which are shipped through a common pipe line. By making cutting tool tips in machine shops radioactive, it is possible to measure the amount of wear the tips receive when machining different metals.

Not only in industry, but in agriculture tracers have been proved invaluable. For example, tracers in fertilizers are used to compare the uptake of the various fertilizers by plants.

[5]*Clark Hickman, Physicist, Brackenridge Hospital, Austin.*

Atomic by-products likewise have been used successfully in medicine. Of all the isotopes used as tracers, I^{131}, radioactive iodine, is the most widely used; its objective is that of determining thyroid function. Second to iodine and its measurement of thyroid function is measurement of volumes of different body fluids of spaces, such as plasma, red cells, total blood, and total extracellular fluids. Another popular use of tagged atoms is in the finding of the amount of blood a patient undergoing surgery loses during the operation.

Although there are more than 800 known isotopes, a small number, only five, have proved valuable as therapeutic agents. Many uses are found for these five isotopes as therapeutic agents, however. The first paper on the use of P^{32}, radioactive phosphorus, in the treatment of disease appeared in 1936; the first paper on the treatment with radioiodine appeared in 1938. Radiophosphorus is used in treatment of polycythemia vera, chronic leukemia, and diseases of the skin, benign and malignant. Radioiodine is used in the treatment of toxic hyperthyroidism, cancer of the thyroid gland, and advanced heart diseases. Radiogold is used in treatment of advanced cancer with excessive fluid in chest or abdomen and of cancer of the prostate gland. Radiostrontium is used in treatment of diseases of the eye, benign and malignant. Co^{60}, radioactive cobalt, is used externally in treatment of deep-seated internal cancer.

Recurrent Dislocation of the Shoulder

JAMES A. DICKSON, M. D., *Chief, Department of Orthopedic Surgery, Cleveland Clinic and Cleveland Clinic Hospital;* ALFRED W. HUMPHRIES, M. D., *Department of Orthopedic Surgery, Cleveland Clinic and Cleveland Clinic Hospital; and* HARRY W. O'DELL, M. D. *Chief, Department of Orthopedic Surgery, Akron Clinic. 159 pages. $4.50. Baltimore, Williams and Wilkins Company, 1953.*

There has been a wealth of material written on the procedures proposed for the treatment of recurrent dislocation of the shoulder. In this monograph the authors review the more than fifty various procedures without drawing any conclusion as to the best treatment. It is an attempt to compile all the pertinent data and present them in a better treatment. The first three chapters review the phylogenesis, ontogenesis, and anatomy of the shoulder. The chapters are well illustrated.

Pathology of the Heart

Edited by S. E. GOULD, M. D., D. Sc., *Clinical Professor of Pathology, Wayne University College of Medicine, Detroit; Editor, American Journal of Clinical Pathology. 1024 pages. $25.50. Springfield, Ill., Charles C Thomas, 1953.*

Up to the present time there has been no adequate English book on the pathology of the heart. The editor, Dr. Gould, has shown wisdom in his choice of collaborators and subjects. The book is marked by careful editing and planning; care is taken to let the practical aspects of the subject predominate, so that pathologists and clinicians will find a comprehensive survey of the information. There is an adequate chapter on congenital malformations by Jesse E. Edwards, followed by chapters on degenerative diseases, vascular lesions of the heart, rheumatic disease, parasitic disease, nonrheumatic disease, injuries, and neoplasms. A concise history of the pathology of the heart and the development and embryology are particularly well illustrated. The bibliography is arranged chronologically at the end of each chapter. There is an author and subject index. The book should be welcomed by the pathologist, internist, and medical student.

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

1954 AMA Session in San Francisco

More than 12,000 physicians registered for the American Medical Association's one hundred and third annual meeting in San Francisco, June 21-25. Action was taken by the House of Delegates on fee splitting, the relationship between osteopathy and medicine, medical ethics, veterans' medical care, training of foreign medical graduates, and registration of hospitals.

The AMA House of Delegates took a firm stand against fee splitting, rebating, or payment of commissions. The American Medical Association has requested permission from the American Osteopathic Association for the AMA Committee for the Study of Relations between Osteopathy and Medicine to visit schools of osteopathy for such study. Action of this committee will be based on the action taken by the house of delegates of the American Osteopathic Association at its meeting this month.

The AMA House adopted two strong resolutions condemning the practice presently in use of treating nonservice connected disabilities under veterans' medical care. A resolution was adopted for the AMA to go all out to prevent the unscientific method of determination of service connected disabilities.

At the opening House session on Monday, Dr. William Wayne Babcock, Philadelphia, was elected to receive the 1954 Distinguished Service Award for his outstanding contributions to medicine and humanity. Dr. Babcock received the award from Dr. Walter B. Martin, then President, at the Tuesday evening inaugural ceremony.

President-Elect for the coming year is Dr. Elmer Hess, Erie, Pa. Dr. Hess was serving as a member of the House of Delegates and as Chairman of the Council of Medical Service at the time of his election. He will become President of the American Medical Association at the meeting in Atlantic City, June 6-10, 1955. At the opening session, speeches by Dr. Edward J. McCormick, Toledo, Ohio, then President, and Dr. Martin, then President-Elect, were heard.

Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association, was reelected to the Board of Trustees, and Dr. Charles T. Stone, Sr., Galveston, was reelected to the Council on Medical Education and Hospitals. Dr. Robert L. Novy, Detroit, was elected to fill the vacancy created on the Council on Medical Service by Dr. Hess' resignation following his election as President-Elect. Dr. Andrew Bunter, Cheyenne, Wyo., was selected a new member of the Council on Medical Education and Hospitals. Others officers were reelected.

AMA PAMPHLETS AVAILABLE

Four American Medical Association pamphlets dealing with medical quackery, selection of a family doctor, medical progress, and the drug evaluation program of the AMA Council on Pharmacy and Chemistry are now available in quantity for distribution to Association members at the central office. The leaflets, entitled "Quack," "Why Wait?" "Health Today," and "On Guard," are suitable for distribution at fairs and health meetings, in reception rooms, and as enclosures with statements.

COUNTY SOCIETIES

Bell County Society

April 7, 1954

(Reported by F. M. Hammond, Secretary)

Nocardiosis—Marjorie Williams and Miss Mary P. Clapp, Temple. Discussion—W. N. Powell, Temple.

Bell County Medical Society met at Temple on April 7 for a business session. The society approved the use of the Salk poliomyelitis vaccine in Bell County. Hanes H. Brindley, Temple, president, appointed J. F. McKenney, Jr., Temple; A. R. Kirkley, Belton; and M. L. McRoberts, Killeen, to a Red Cross disaster committee.

Elected to membership in the society were D. J. Lynch, Temple; William Symon, Temple; J. P. Graves, Temple; T. R. Sunbury, Bartlett; and M. B. Goodwin (military), Fort Belvoir, Va.

Brazoria County Society

April 29, 1954

(Reported by Carlos E. Fuste, Jr., Secretary)

Diagnosis and Treatment of Otitis, Media and Externa—Claude C. Cody, III, Houston.

Brazoria County Medical Society met on April 29 in Freeport and heard the scientific program as outlined above.

Ralph E. Gray, Lake Jackson, was elected as delegate to the Texas Medical Association convention, and J. Milton Laughlin, Sweeney, was elected alternate.

Dallas County Society

April 13, 1954

(Reported by Glenn D. Carlson, Secretary)

Symposium on Specific Treatment of Shock States—Ben J. Wilson, Morris J. Fogelman, Jerry A. Stirman, M. T. Jenkins, Dallas.

Dallas County Medical Society met on April 13 in the Baylor Hospital Auditorium and heard the above scientific program.

The following newly-elected members were introduced: William Lloyd Hall, Jerry M. Lewis, Stanley Lee Stevenson, Harold M. Mims, Claude Wade Greathouse, Jr., Grover C. Winslow, Jr., Bedford Shelmire, Jr., John William Morris, George A. Freeman, Eldon Grady Mills, Phillip E. Whittlesey, Jr., and Frances L. Tompkins.

Howard-Martin-Glasscock Counties Society

March 30, 1954

Problems in Diagnostic Radiology—Ralph S. Clayton, Dallas.

Howard-Martin-Glasscock Counties Medical Society met on March 30 in Big Spring and heard Dr. Clayton, Southwestern Medical School of the University of Texas, Dallas, present the above scientific program.

Lubbock-Crosby Counties Society

April 6, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Use of Radioactive Isotopes in Medicine—Julian Acker, Wichita Falls.

Dr. Acker spoke to the Lubbock-Crosby Counties Medical Society April 6 in Lubbock on the above topic. He included the diagnostic and therapeutic aspects of radioactive iodine, phosphorus, gold, and sodium in his presentation, and he outlined the requirements for establishing a radioactive treatment and diagnostic unit in a community the size of Lub-

bock. A discussion by Howard Hancock, John Selby, Harold Warshaw, O. R. Hand, A. G. Barsh, and William S. Croom, all of Lubbock, followed the speech.

A discussion of hospital insurance and of issues which are likely to be considered at the annual session of the Texas Medical Association composed the business part of the meeting.

May 4, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Clinical Recognition of Depressions — Richard K. O'Loughlin, Lubbock.

Lubbock-Crosby Counties Medical Society met on May 4 in Lubbock and heard the above program. A discussion by R. Q. Lewis, Frederick P. Kallina, O. R. Hand, Clyde Elkins, Roy G. Loveless, Charles E. Ratcliff, and Frank C. Goodwin followed.

Nueces County Society

April 13, 1954

(Reported by G. S. Ahern, Secretary)

Doctor in Court—Hubert Winston Smith, M.B.A., LL.B., M. D., Austin.

Nueces County Medical Society met on April 13 in Corpus Christi. An executive officer of the Naval Hospital discussed the joint meeting of Navy and civilian physicians which was scheduled for May 11 at the Naval Air Station.

Stephen Youngberg and George Hudson were elected to membership. The program was given as outlined above with a short question and answer period following the speech.

Polk-San Jacinto Counties Society

March 9, 1954

Modern Treatment of High Blood Pressure—Hugh Hanson, Houston.
Acute Respiratory Infections of Children—David Schrum, Houston.

The Polk-San Jacinto Counties Medical Society met at Corrigan on March 9 in the home of Dr. P. C. A. Singleton.

The scientific program as outlined above was presented after a dinner given by Dr. and Mrs. Singleton.

Tarrant County Society

April 20, 1954

(Reported by S. W. Wilson, Secretary)

Recent Advances in Treatment of Leprosy—Robert G. Cochrane, New York.

Tarrant County Medical Society met in Fort Worth on April 20 and heard Dr. Cochrane, medical technical adviser to American Leprosy Missions, Inc., speak on the above subject.

R. G. Baker, Councilor of the Thirteenth District, met with the society and reported on medical legislation.

Tribute was paid to J. L. Spivey, honorary member from Fort Worth, who died on April 19, and J. A. Allison, honorary member from Grapevine, who died on April 20.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

April 13, 1954

(Reported by S. E. Thompson, Secretary)

Psychiatry in General Practice—George A. Constant, Victoria.

Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society met April 13 at Edna and heard the above speech.

Wichita County Society

March 9, 1954

At the Wichita County Medical Society March 9 meeting in Wichita Falls, the society endorsed the use of Salk poliomyelitis vaccine in Wichita County. The society also endorsed fluoridation of city water and appointed a committee to give information to the city council or other citizens about fluoridation.

Miss Henrietta Brocksmith of the American Red Cross explained the part of doctors, nurses, and hospitals in disaster relief; and Col. Steve Marchand, civilian defense director, told the society the over-all civilian defense and disaster relief organization and asked doctors to sponsor a medically equipped bus.

DISTRICT SOCIETIES

Second District Society

April 15, 1954

(Reported by Francis Hood, Secretary)

Cardiac Disease—Samuel A. Shelburne, Dallas.
Injuries to Hand—Eugene P. Legg, Dallas.
Injuries to Genitourinary Tract—William L. Bush, Dallas.
Injuries to Eye—W. Maxwell Thomas, Dallas.

The Second District Medical Society met on April 15 in Sweetwater and heard the above scientific program. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, spoke at a banquet that evening.

Officers elected were John R. Mast, Midland, president; James W. Rainer, Odessa, vice-president; and M. J. Loring, Midland, secretary-treasurer.

Third District Society

April 13, 1954

(Reported by Mrs. Cassie Atherton, Executive Secretary)

More than 150 attended the Third District Medical Society meeting in Amarillo on April 13. In addition to the scientific program, there were fourteen technical exhibits and a social program planned by Potter County Medical Society, which was host.

M. C. Overton, Jr., Pampa, was installed as president; Marvin C. Schlecte, Plainview, is president-elect; and William R. Klingensmith, Amarillo, is secretary.

Guest speakers for the meeting were Maurice E. Snyder, Colorado Springs; Dumont Clark, Denver; William T. Foulk, Rochester, Minn.; Daniel Snydacker, Chicago; Luke W. Able, Houston; Mordant E. Peck, Denver; Joseph W. Kelso, Oklahoma City; and Edwin W. Cocke, Jr., Memphis. The scientific part of the meeting was divided into sections on eye, ear, nose, and throat; medicine; surgery; and obstetrics and gynecology.

The next meeting will be in Borger, April, 1955.

Fifteenth District Society

April 20, 1954

Newer Drugs and Treatment of Arterial Hypertension—M. S. Ragland, Gilmer.
  Discussion—D. C. Simmons, Kilgore.
Serious Otitis Media—W. B. Norman, Longview.
  Discussion—J. D. Roberts, Longview.
Are Cervical Polyps Important?—J. L. Goforth, Dallas.
Pediatric Techniques in General Practice—H. E. LeBus, Gladewater.
  Discussion—B. R. Clanton, Longview.
Modern Treatment of Hypertension—Richard Schneble, Texarkana.
  Discussion—Ben N. Wilson, Tyler.
Neuro-Surgical Treatment of Pain—Ira Jackson, Galveston.
Maxillo Facial Surgery—Sam Mack, Longview.
  Discussion—George W. Tate, Longview.
Control of the Diabetic at Surgery—M. H. Murphy, Marshall.
  Discussion—J. M. DeWare, Jefferson.

The Fifteenth District Medical Society met in Longview on April 20 and heard the program outlined above. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, was the speaker at a dinner held with the woman's auxiliary that day. R. L. Johnson, Mount Pleasant, was elected president of the district. Other officers elected were M. H. Murphy, Marshall, vice-president, and R. L. Hardman, Mount Pleasant, Secretary.

AUXILIARY SECTION

TRANSACTIONS

THIRTY-SIXTH ANNUAL SESSION

of the

WOMAN'S AUXILIARY

to the

TEXAS MEDICAL ASSOCIATION

SAN ANTONIO, TEXAS, MAY, 2, 3, 4, and 5, 1954

PRE-CONVENTION EXECUTIVE BOARD MEETING

The Executive Board of the Woman's Auxiliary to the Texas Medical Association met in luncheon and business session, Sunday, May 2, 1954, at 1:00 p. m. in the Minuet Room of the Menger Hotel, San Antonio, Texas, with the President, Mrs. Edward W. Coyle, San Antonio, presiding. Mrs. Scott C. Applewhite, San Antonio, was chairman of the luncheon.

The invocation was given by Mrs. S. H. Watson, Waxahachie, Past State President.

The address of welcome was given by Mrs. John C. Parsons, San Antonio, president of the Woman's Auxiliary to the Bexar County Medical Society and General Chairman for the Convention:

Address of Welcome

We have looked forward to your coming—almost ever since you were here the last time! We shall always love having you, not alone because of our families and community of interest in the lives and duties we share, but also because of your gracious acquiescence in whatever plans we make for you.

The air is still surcharged with our annual Fiesta just recently passed, but we have kept alive the spirit of old San Antonio for your pleasure. This year we have added a new bangle on our hospitality chain, the garden tea and tour of old homes. It is to be on the very site where our city's earliest hospitality came to flower—and remains to this day to shed its warmth and charm on its visitors—the King William Street area.

It is one of our greatest joys to be able to say our whole town is alerted for the opportunity to contribute to your happiness while you are among us. There have been many who have expressed their pleasure in doing their part to make your welcome warm and your stay enjoyable.

The response to the welcome was given by Mrs. O. N. Mayo, Brownwood, president of the Woman's Auxiliary to the Brown-Comanche-Mills-San Saba Counties Medical Society:

Response to Address of Welcome

Thank you, Mrs. Coyle, for the lovely introduction. Since I am a comparative newcomer among you, and since I appreciate fully the ideals and scope of the State Auxiliary, I am keenly aware of the honor which is mine at having been chosen to speak on behalf of this distinguished group.

Coming to San Antonio is always a delightful experience. Hundreds of years have gone into making this the most unique city in our land. Where on this earth is there a river so beautiful as yours?

Many things cause the city to glow in high color—its rich history, its art, its literature. These would be enough, but there is yet another inherent quality which is noticeable here today, its social graces, lingering probably from the time of those great ladies from the Canary Islands.

Your cordial welcome, as expressed in so many ways and through the entertainment you have provided makes us all the more aware of the privilege we share in meeting and knowing each other within the framework and fellowship of the Auxiliary.

We shall love being neighbors with the Alamo while guests in this gracious hotel. As busy as the occasion will be, we shall certainly want to recall for just a moment our debt to those heroes lying there, whose bravery became the cornerstone which would bring Texas under the American flag. From our silent prayer we shall renew our determination to do everything we can to protect the principles for which they gave their lives. How proud we are when we realize the part the Auxiliary can and *is* playing in the preservation of those principles!

Again, we are happy to be here. Long after we have returned home we shall have both serious and frivolous memories of the thirty-sixth annual convention of our State Auxiliary. But they all will be pleasant ones.

Introduction of Past Presidents

Mrs. S. F. Harrington, Dallas, a Past President, paid tribute to all Past Presidents and greeted the seventeen who were present. Her greeting was:

"One of the pleasures we all have been looking forward to

all year is that of being together in San Antonio. When we think of the reasons we have for feeling proud of our Past Presidents in Texas, one of the first things that comes to mind is their love and their devotion to our Auxiliary—to their love of our husbands' profession and their love and devotion to each other."

Mrs. Harrington paid tribute to Past Presidents now deceased and asked to send greetings to those Past Presidents who were unable to be present. She expressed the appreciation of all the Past Presidents for the treasured Texas Past President's pin, a gift to them last year by the Auxiliary.

The President-Elect, Mrs. Mark H. Latimer, Houston, then brought the following message:

Message from President-Elect

This is the last intimate meeting of the official auxiliary family for 1953-1954. It is a time to reflect on our progress, our accomplishments, and the good fortune we have enjoyed in our leadership.

Under capable direction we have progressed. Our work is being more closely coordinated with that of the Texas Medical Association. We have long since passed the stage of being merely a woman's club. We are a working organization with vital objectives and duties to the medical profession, our communities, our America.

The keynote of the year's activities has been "Knowledge, Judgment, Action."

Tangible evidences of striving for workable knowledge are the splendid Handbook and the rewritten Constitution and By-Laws. These represent months of sheer work.

As women we are learning more of the meaning of sound business judgment. This again is evidenced by the ever increasing number of calls made on us by the Texas Medical Association.

Action? We have learned its true meaning and been inspired by watching our President at work. We serve happily and well when motivated by such untiring devotion as exemplified in our leader.

Last year we passed a great milestone, 100 per cent organization, due to the vision and ability of Mrs. Robert F. Thompson. This year our President has done much to mature, strengthen, and encourage these new auxiliaries.

Yes, "Together We Have Progressed." Why? Because all have worked under the vigilant leadership of our own Anita Coyle.

The President introduced Mrs. George Turner, El Paso, a Past President of the Woman's Auxiliary to the Texas Medical Association, wife of the President of the Texas Medical Association, and President-Elect of the Woman's Auxiliary to the American Medical Association.

Officers, committee chairmen and members, Convention chairmen, council women, county presidents, and guests were introduced.

The President read a telegram from Mrs. Paul Brindley, Galveston, Recording Secretary, who was unable to attend the Convention. Mrs. Newton F. Walker, El Paso, was appointed to act as Recording Secretary pro tem.

The Chair, by general consent, appointed the following committees:

Committee for Reading and Approving Minutes of Executive Board Meeting: Mrs. R. C. Bellamy, Liberty; Mrs. L. A. Feller, Fredericksburg; and Mrs. H. S. Renshaw, Fort Worth.

Reference Committee: Mrs. R. T. Travis, Jacksonville, to serve in the absence of Mrs. Max Woodward, Sherman.

Mrs. George D. Feldner, New Orleans, La., President of the Woman's Auxiliary to the Southern Medical Association, brought greetings from her organization:

Address of Mrs. George Feldner

Bueños tardes, amigos! Howdy stranger! Hello you all!

In any language—Spanish, Texan, or Louisianan—this friendly welcome has the same depth of sincerity as your welcome to me from the moment I arrived in your wonderful BIG state, for every moment everywhere I turn this welcome and cordial friendship is prevalent.

It is exciting being here in your Texas and particularly so in the enchanting and historic city of San Antonio, which has given so much to the history of our country and whose Alamo is such a hallowed shrine in our nation. It is only fitting that the Lone Star State gave to both the National and Southern Auxiliaries their first presidents, and I cannot help but feel there is a close bond of friendship, a tie that binds my native City of New Orleans and your state a little closer, because it was in New Orleans that the Southern Auxiliary was organized thirty years ago.

I would like to pay tribute to the five fine leaders you have given to Southern Auxiliary, of whom we are proud: Mrs. E. H. Cary, Dallas; Mrs. S. A. Collom, Texarkana; Mrs. Frank N. Haggard, San Antonio; Mrs. O. M. Marchman, Dallas; and Mrs. L. S. Thompson, Dallas.

Also, I would like for you to know the members from Texas who are serving as members of Southern's official family, Mrs. R. T. Travis, historian, and Mrs. O. W. Robinson, councilor.

Last, but by no means least, Southern shares with you your lovely, charming Mrs. George Turner of El Paso, President-Elect of the National Auxiliary. We are just as proud of her as you are and wish for her a happy and fruitful presidency.

I bring greetings to you from both the Southern Medical Auxiliary and the Association and extend a cordial welcome to you and your husbands to attend Southern's convention in St. Louis, November 8-11.

If some of you are wondering whether you are members, I would like to remind you that when your husband joins the Southern Medical Association you automatically become a member. There are no dues in our auxiliary, the Association appropriating an amount each year for our expenses.

To those of you whose husbands are not members, a special invitation to come to our convention is extended. Meet with us and enjoy good fellowship and fun, with other doctors and their wives from all over the Southland. In Southern Auxiliary we play and have time to visit with each other, yet have just enough interests with our three projects to "keep our finger in the pie."

This year you have participated in the observance of Doctor's Day in a larger scope than before, which makes me happy. By sharing this mutual interest and honoring your doctors, you accomplish a dual purpose, getting "to know the other member better" and creating the kind of good public relations for the medical profession that money cannot buy. We are the only group of organized women in the country which honors its husbands by setting a day aside each year. Of course, you and I know that every day is "Doctor's Day" in our lives.

As I look around me I can see the wealth of material which can be contributed to Southern's Research and Romance of Medicine files from your wonderful state. Your very own Dr. and Mrs. George Turner truly exemplify the "Romance of Medicine" with their important offices in the state and national medical organizations. So, I urge you to

write about them and many others who have contributed to the profession and the auxiliary.

"Adios, mi amigos."

Recommendations

The following recommendations, with the approval of the Finance and Reference Committees, were adopted:

1. Upon motion of Mrs. John H. Wootters, Houston, Chairman of the Student Loan Fund Committee: That suitable application blanks for boys applying for the student loans be printed and that these blanks be placed in the offices of the deans of the three Texas medical schools.

2. Upon motion of Mrs. James C. Terrell, Stephenville, Chairman of the Nurse Recruitment Committee: That the film "When You Choose Nursing" be purchased at a cost of $35 and placed in the film library of the Texas Medical Library.

3. Upon motion of Mrs. H. Leslie Moore, Dallas, Chairman of the Finance Committee: (a) That $300 be given the American Medical Educational Foundation Fund in memory of the following past presidents of the Texas Medical Association who died this year: Drs. E. H. Cary, H. R. Dudgeon, and M. L. Graves. (Wives of these doctors are all Past Presidents and active members of the Auxiliary.) (b) That the Auxiliary supplement the gift to the American Medical Educational Foundation Fund so that the aforementioned $300 and the $2,773.35 given by the county auxiliaries will total at least $3,500, this amount to be taken from the Special Fund. (c) That $200 be given to our Memorial Fund in memory of the deceased Past Presidents of the Woman's Auxiliary to the Texas Medical Association.

4. Upon motion of Mrs. H. Leslie Moore, Dallas: That the vote on the proposed revised Constitution and By-Laws be taken Tuesday morning, May 4, as the first order of business.

There being no further business the meeting was adjourned.

MRS. NEWTON F. WALKER, El Paso,
Recording Secretary Pro Tem.

OPENING EXERCISES, MEMORIAL SERVICES, AND GENERAL MEETING

On Monday, May 3, 1954, at 8:45 a. m., the Woman's Auxiliary met in joint session with the Texas Medical Association for its Opening Exercises, Memorial Services and General Meeting in Room A of the Municipal Auditorium, San Antonio.

The detailed program, including the Auxiliary's report to the Texas Medical Association given by the President, Mrs. Edward W. Coyle, San Antonio, is printed with that of the Texas Medical Association in the June issue of the TEXAS STATE JOURNAL OF MEDICINE (pages 409-412) with the exception of the Memorial Address by Mrs. G. V. Brindley, Temple, Memorial Chairman, which follows:

Memorial Address

At this time we pause to pay loving tribute to the following members who have preceded us to the Great Beyond:

Mrs. W. H. Barnett, Abilene
Mrs. W. H. Brandau, Beaumont
Mrs. J. W. Cathcart, El Paso
Mrs. R. A. Dathe, Dallas
Mrs. I. D. Ellis, Troy
Mrs. W. J. Harlan, Bartlett
Mrs. P. S. Joseph, Alice
Mrs. Peter Keating, San Antonio
Mrs. Victor Keidel, Fredericksburg
Mrs. A. G. Marshall, El Paso
Mrs. R. H. McMeans, Houston
Mrs. V. B. McMillan, Overton
Mrs. Paul Ramey, Fort Worth
Mrs. L. B. Reppert, San Antonio
Mrs. Dalton Richardson, Austin
Mrs. A. E. Starnes, Hughes Springs
Mrs. W. O. Stephenson, Dallas
Mrs. A. T. Talley, Houston
Mrs. J. K. Webster, Athens

"Say not of her, 'She is Dead' or 'She is asleep,'
For well I know her eyes are closed only to keep
The vision of the world shut out
So that she may distinctly hear
The Wondrous voice of God
When He whispers in her ear."

—Flora Moon.

We come to the hour of this Memorial Service. It is a special day of remembrance, a heart's communion in song, meditation, and prayer, a day dedicated to our departed loved ones. We honor them in this sacred service, surrounded by loving friends and lovely flowers.

This is a day when we would recall through the mists our friends and the remembrance of many sweet and happy times spent together. We would take note of the wonderful influence they have left for good in this world. We are all better people because they have lived and touched our lives, and that influence, as it is passed on, will live till the end of time. These fine women, wherever they lived, went about doing good. Some of them have lived long and useful lives; others have been cut down in youth, but of none of them do we dare say, they left their work unfinished. These noble women have been the candle bearers for whatsoever things were true and of good report. They lighted the Candles of Service, Courage, Devotion, Faith, and Sacrifice. They have been to their husbands a helpmate, a sweetheart, a friend, and a steadfast guiding star, among all the tumult of life. They have met the cares and problems of life bravely, knowing that "All things work together for good to those who love the Lord." And, now they have gone to hear the Master say, "Well done, thou good and faithful servant, enter into the joys of thy Lord."

"When earth's last picture is painted, and the tubes are twisted and dried,
When the oldest colors have faded, and the youngest critic has died,
We shall rest, and, faith, we shall need it—lie down for an aeon or two,
Till the Master of All Good Workmen shall put us to work anew!

"And those that were good shall be happy: they shall sit in a golden chair;
They shall splash at a ten-league canvas with brushes of comets' hair;
They shall find real saints to draw from—Magdalene, Peter, and Paul;
They shall work for an age at a sitting and never be tired at all!

"And only The Master shall praise us, and only The Master shall blame;
And no one shall work for money, and no one shall work for fame,
But each for the joy of the working, and each, in his separate star,
Shall draw the Things as he sees It for the God of all Things as They are!"

—Rudyard Kipling: "L'Envoi."

FIRST BUSINESS SESSION

The Woman's Auxiliary to the Texas Medical Association met for the first general business session of the thirty-sixth annual convention, Monday, May 3, 1954, at 10:00 a. m. in the Minuet Room of the Menger Hotel, San Antonio, with the President, Mrs. Edward W. Coyle, San Antonio, presiding.

The invocation was given by the Rev. Hugh Robertson, D. D., San Antonio, pastor of the Alamo Heights Presbyterian Church.

The address of welcome was given by Mrs. John C. Parsons, San Antonio, president of the Woman's Auxiliary to the Bexar County Medical Society and General Chairman of the Convention:

Address of Welcome

We have anticipated with real pleasure your being here. Planning for the events before us had all the hum and buzz of a holiday home coming. And now that you are here we are excited.

We feel it a privilege to be your host auxiliary. Each one of us is carrying an Aladdin's lamp—you have only to let us know your wishes. We hope that you will not hurry away as soon as the meetings are over. Stay awhile. Rest and enjoy to the fullest this warm-hearted little *City of Mañana!*

The response to the welcome was given by Mrs. William Hibbitts, Texarkana, Past State President:

Response to Address of Welcome

We have so many happy memories of our past visits with you that we have been eagerly looking forward to this one. We have been your guests many times and, having sampled your hospitality, know that it is good.

Some of our members have come to this meeting as brides, anxious to share this new adventure with their husbands. These brides may still be startled by their new name and position in their communities, but they are proud to be eligible for membership in the medical auxiliary.

Others of our membership have come after solving many problems at home such as getting baby-sitters or grandparents to keep their children and their family pets. These young women have boundless energy and the enthusiasm to carry through all projects. After a year of activity, they want to be present to report the excellent work that their auxiliary has done.

Then the grandmothers come. We never let anything interfere with our visits, for we must renew old and cherished friendships and learn about the welfare of the Auxiliary, which we have worked so many years to build. Physically we may be slowing down a bit but our interest never wanes. We are here to give our support and to encourage our successors.

Today, we are all gathered together under one roof. We are grateful for another opportunity to enjoy and profit from the good things you have planned for us and to share with you in your beautiful city one more enriching experience.

The President led the Auxiliary in repeating in unison the Pledge of Loyalty to the Woman's Auxiliary to the American Medical Association and the Credo of a Doctor's Wife.

On the motion of Mrs. Scott C. Applewhite, San Antonio, the Convention program as printed and the following Convention rules were adopted:

1. When obtaining the floor, a member shall announce her name and the name of her auxiliary.

2. Reports of all officers except that of the President and Treasurer, and reports of committee chairman, council women, and county presidents excepting those presidents of auxiliaries with more than 100 members shall be limited to two minutes. Reports from those auxiliaries of over 100 membership shall be limited to three minutes.

3. A time keeper shall notify each speaker when the allotted time is up.

4. The President may require that a motion be in writing, signed by the mover and presented to the Recording Secretary.

5. Recommendations may be considered only when presented by the Reference Committee.

6. All visitors are welcome at the general meetings and are asked to register.

The President by general consent appointed the follow ing committees:

Committee for Reading and Approving Minutes: Mrs. R. C. Bellamy, Liberty; Mrs. L. A. Feller, Fredericksburg; and Mrs. H. S. Renshaw, Fort Worth.

Reference Committee: Mrs. R. T. Travis, Jacksonville, to serve in the absence of Mrs. Max Woodward, Sherman.

Time Keepers: Mrs. Andrew Tomb, Victoria, and Mrs. J. L. Jinkins, Galveston, assisted by the members of the Bexar County Auxiliary who served as pages and ushers.

The business was interrupted to allow the President to introduce Dr. George Turner, El Paso, President of the Texas Medical Association, who made the following address:

Address of Dr. George Turner

First, I wish to say that it has been indeed a pleasure to have had the privilege of working with you during the past year as President of the Texas Medical Association. On behalf of the doctors of TMA, I wish to express our gratitude for your accomplishments. The statement that our Woman's Auxiliary is the greatest contributing force of the Association in accomplishing the many and complex problems confronting organized medicine in Texas again has been shown abundantly. You are indeed our help and support in the preservation of our free enterprise system of medical care. Your work is of supreme value in all areas of public relations, and you have gone far to engender in the public mind a feeling of confidence, trust, and security that the undivided effort of the medical profession is focused on furnishing the best medical care for all people.

Your co-sponsorship of the AAPS essay contest in stimulating thinking and writing at the high school level on why freedom of thought and action on the part of the physician produces the best medical service has been outstanding. Through this expression of loyalty and devotion to the principles of freedom the real prize winner in this contest is the American people.

The work of the legislative committee has been greatly facilitated by the increased efficiency of the AMA Wash-

ington office. Information concerning the exact status of any pending national medical legislation can be had for the asking from this source at any time. At our Texas level your work among state legislators and other community leaders constitutes one of our best sources of information on pending state medical legislation. Proposed legislation to levy a 1.1 per cent tax on all gross Blue Cross and Blue Shield premiums collected is being made ready to introduce. It is estimated that this law would produce approximately $178,000 in tax money each year. This would, of course, discourage our voluntary health insurance program which is being operated on a non-profit basis.

Your work in the newer project of distributing material and participating in programs in the field of mental health is well worth-while. A long list of specific projects and most commendable accomplishments in each field could be detailed but I will mention only a few of them. I refer to your work in rural health, nurse recruitment, assisting in raising philanthropic funds for the American Medical Education Foundation, library endowment, student loan fund, *News Letter,* public relations projects, and many others.

These activities and achievements are proof that in the Woman's Auxiliary, the Texas Medical Association has a powerful ally. Its basic policies and its years of experience in meeting new and challenging issues will enable it to face the problems and responsibilities that may come as the result of changing economic and social conditions in the world. There is every reason to believe that the Auxiliary will continue to broaden its program of service and that its participation in the affairs of the future will far exceed that of the past. With increased interest and sincerity, the Woman's Auxiliary continuously strives to maintain the high ideals of the medical profession and to serve the purpose for which it was organized.

General officers and guests were introduced. In the absence of Mrs. Paul Brindley, Galveston, Recording Secretary, Mrs. Newton F. Walker, El Paso, was appointed to serve as Recording Secretary pro tem.

Recommendations

The following recommendations from the Executive Board were adopted:

1. Upon motion of Mrs. H. Leslie Moore, Dallas: That suitable application blanks for boys applying for student loans be printed and that these blanks be placed in the offices of the deans of the three Texas medical schools.

2. Upon motion of Mrs. Joseph Foster, Houston: That the film "When You Choose Nursing" be purchased at a cost of $35 and placed in the film library of the Texas Medical Association.

3. Upon motion of Mrs. Jacob F. Schultz, Houston: That $300 be given the American Medical Educational Foundation Fund in memory of the following past presidents of the Texas Medical Association who died this year: Drs. E. H. Cary, H. R. Dudgeon, and M. L. Graves.

4. Upon motion of Mrs. J. L. Jinkins, Galveston: That the Auxiliary supplement the gift to the American Medical Educational Foundation Fund so that the aforementioned $300 and the $2,773.35 given by the county auxiliaries will total at least $3,500, this amount to be taken from the Special Fund.

5. Upon motion of Mrs. Charles L. McGehee, San Antonio: That $200 be given to our Memorial Fund in memory of the deceased Past Presidents of the Woman's Auxiliary to the Texas Medical Association.

6. Upon motion of Mrs. A. H. Neighbors, Jr., Austin: That the vote on the proposed revised Constitution and By-Laws be taken Tuesday morning, May 4, as the first order of business.

Mrs. Travis Smith, Abilene, Historian, presented the following recommendation and upon her motion it was adopted: That for the awards the auxiliaries be regrouped according to membership, particularly the top membership groups.

Mrs. Newton F. Walker, El Paso, presented the following recommendation with the approval of the Reference Committee, and upon motion of Mrs. Scott C. Applewhite, San Antonio, it was unanimously adopted:

The members of the Woman's Auxiliary to the El Paso County Medical Society wish to present the name of Mrs. George Turner for your consideration as an Honorary Life President of the Woman's Auxiliary to the Texas Medical Association. Mrs. Turner has served the Auxiliary in many offices with continued loyalty and effort for over thirty years.

In 1936-1937 she was president of the Woman's Auxiliary to the El Paso County Medical Society. She continues her interest and activity in her county auxiliary. She has held many offices and chairmanships and is a charter member.

In 1946-1947 she was President of the Woman's Auxiliary to the Texas Medical Association. Prior to that she was Recording Secretary, Council Woman, and Chairman of the Finance Committee. Since then she has continued her service as an advisory officer. Her comprehensive understanding of all phases of auxiliary activity has been demonstrated in numerous original projects she has initiated for county and state organizations. Among them are county and state schools of instruction, outlines of program materials, organization study, and evaluation of auxiliary activities.

Mrs. Turner, who is now President-Elect of the Woman's Auxiliary to the American Medical Association, has served with equal distinction the national organization. She was Constitutional Secretary for two years, 1947-1949, and Treasurer for three years, 1949-1952, and as President-Elect was the presiding officer of the 1953 Conference of State Presidents and Presidents-Elect and National Committee Chairmen.

Whatever commendable remarks might be said, and truthfully, of her stature as an auxiliary officer would not exceed that which might be related of her warmth of affection, unselfish giving of self, her sense of humor, and loyalty.

The members of the Woman's Auxiliary to the El Paso County Medical Society take pride in presenting her name to you for your consideration.

Mrs. L. A. Feller, Fredericksburg, presented the following recommendation with the approval of the Reference Committee, and upon motion of Mrs. Mark H. Latimer, Houston, it was unanimously adopted:

The Woman's Auxiliary to the Kerr-Kendall-Gillespie-Bandera Counties Medical Society recommends that an Honorary Life Presidency be conferred upon Mrs. Sam E. Thompson of Kerrville by the 1954 annual Convention.

Mrs. Thompson is a charter member and four times president of the Kerr-Kendall-Gillespie-Bandera Counties Auxiliary. She has served as council woman and on many various state committees. In 1944-1945 she served with distinction as State President.

In 1952, Dr. and Mrs. Thompson presented a gift of $50,000 to the Texas Memorial Medical Library Association, and the large meeting room in the State Medical Association Library building in Austin has been named the Sam Thompson Room in their honor.

Recently Dr. and Mrs. Thompson gave their entire library, with the exception of a few personal volumes, to the Association's Memorial Library.

Since 1931 Mrs. Thompson has been an active and faithful member of the four-county auxiliary. She has served for many years and is at present chairman of the tuberculosis seal sale, one of the outstanding projects of the auxiliary.

Mrs. Thompson is known for her hospitality at "Steepside" in Kerrville. Her life has been one of love, service, and dedication to the Medical Auxiliary.

For her many outstanding traits of leadership, unselfish service, and dedication to duty, we recommend that she be accorded this honor.

The Reference Committee reporting on the recommendation of the Third Vice-President and Chairman of *Today's Health*, Mrs. Ralph B. Payne, Amarillo, that *Today's Health* be sent to all members of the Texas Legislature and to the Texas members of the United States Congress, suggested that this be considered on the county level rather than the state level and that the recommendation be passed on to the 1954-1955 administration. No action was taken.

The Reference Committee reporting on two recommendations presented by El Paso Auxiliary suggested that these be referred to the incoming Nurse Recruitment Committee for further study. No action was taken on these recommendations, which follow:

Whereas, Most girls begin to plan their careers during the first years of high school; and

Whereas, Specific information on nursing as a career or on the requirements of schools of nursing is difficult to obtain without writing many schools of nursing; and

Whereas, Most young girls will become interested in things which they know something about;

BE IT RESOLVED: That the Woman's Auxiliary to the Texas Medical Association consider the placing of brochures containing information on all the schools of nursing in Texas in the public high schools of Texas if this prove to be financially possible.

Whereas, One of the most difficult problems in recruiting students interested in nursing as a career is to convince the parents of the girls that nursing is a desirable career; and

Whereas, There is no literature available to present to parents showing the salaries paid to nurses, the hours of work, the possibilities for advancement, and the high respect in which a career of nursing is held by the community;

BE IT RESOLVED: That the Woman's Auxiliary to the Texas Medical Association develop attractive literature to cover this need and distribute it to auxiliaries to county medical societies in Texas.

Mrs. Thomas H. Sharp, San Antonio, Chairman of Registration, reported that as of 11:30 a. m., Monday, May 3, 375 had registered.

REPORTS OF COUNTY AUXILIARIES

The reports of county presidents were begun in the morning and concluded following luncheon. County presidents gave the highlights of the year's activities. The following are the reports which have been filed:

Andrews-Ector-Midland Counties

Andrews-Ector-Midland Counties Medical Auxiliary was organized at the beginning of the 1954 year. We now have 54 paid members and there are 6 more eligible for membership. Our dues of $5 covered our philanthropic donations ($80) as well as dues to the National and State Auxiliaries. We meet with the medical society once a month for dinner and have a meeting of our own afterward. Our programs this year included speakers on juvenile delinquency, medical legislation, medical missionary work in Africa, vocational rehabilitation, state legislature, hospital administration, and socialized medicine reports. We observed Doctor's Day and gave the doctors boutonnieres. Response to the AAPS essay contest was gratifying. The Midland doctors' wives have given engraved sterling silver pitchers, graduating in size, for the first, second, and third prizes. Nurse recruitment will be stressed this spring. We will be sending a student to nursing school this fall through the efforts of a fashion show using the doctors' wives as models. Our women work in all sorts of civic organizations and our relations with the community are good.

MRS. H. P. MCCRIMMON, Odessa.

Angelina County

The Woman's Auxiliary to Angelina County Medical Society has held three meetings this year. All were interesting and featured guest speakers.

All active members subscribe to *Today's Health.* We were interested in sponsoring the AAPS essay contest and had funds for prize money, but we were told that the students had so much other work to do that it would be impossible to allow them to enter the contest. We appreciate the *News Letter.* It is full of news that we need to know.

MRS. M. A. ESTEP, Lufkin.

Armstrong-Donley-Childress-Collingsworth-Hall Counties

The Hattie Hunt Auxiliary (Armstrong-Donley-Childress-Collingsworth-Hall Counties) increased its attendance record to almost 100 per cent this year. We feel that this was accomplished by printing a yearbook and having planned programs for each meeting. Members drive thirty miles to attend, often in bad weather, but in spite of this our programs have been successful. Book reviews, papers on nurse recruitment, legislative programs, and our answering roll call on assigned subjects proved interesting and stimulating.

A nurse recruitment drive began with dressing mannequins in a store window as student and graduate nurses and a poster urging students to study nursing. This was followed up by a coke party given for sixty local and rural pupils who had indicated they were interested in studying nursing. A movie was shown, "Girls in White," and a lecture given at St. Joseph's Hospital in Wellington. Mrs. F. H. Cariker of Childress donated the Cherry Ames books to the Childress school library.

Doctor's Day was observed in December with a Christmas dinner; each doctor was sent a red carnation to wear that day.

We are 100 per cent subscribers to *Today's Health* and have sold sixty-seven subscriptions.

Mrs. Carter Holcomb, Wellington, assisted at the school in an immunization program for the children of Collingsworth County.

We have been proud this year to have one of our members, Mrs. E. K. Jones of Wellington, to serve as council woman for District 3. Through her activities and interest, we have maintained an enthusiasm in auxiliary work in our area.

Officers will be elected at our April meeting, and our final project will be our annual picnic for the doctors and their families.

We think we have had a successful year—with only 18 members and a distance of thirty miles separating us.

MRS. DALE WATKINS, Wellington.

Atascosa County

The Woman's Auxiliary to the Atascosa County Medical Society has 6 members and had 2 meetings. The State President, Mrs. E. W. Coyle of San Antonio, and the district 5 council woman, Mrs. John L. Pridgen, San Antonio, visited at the last meeting. All members take part in civic affairs through church, schools, and women's clubs. Each member has undertaken to give a subscription to *Today's Health* to one of the schools in the county.

MRS. U. B. OGDEN, Pleasanton.

Bastrop-Lee Counties

The Woman's Auxiliary to the Bastrop-Lee Counties Medical Society has 11 members, an increase of 2 over last year. Meetings are held quarterly and most of the members take part in civic affairs. Two members work on health committees, and health examinations in the schools have been promoted. Funds and services have been given to Red Cross, polio, and cancer drives. Members read the State Auxiliary *News Letter* and the Auxiliary section in the JOURNAL.

MRS. ROBERT B. BURNS, Giddings.

Bell County

The Woman's Auxiliary to the Bell County Medical Society holds its regular meetings the second Friday of each month October through May at the City Federation Club House with a tea and social hour following.

A membership coffee was given in September for all new members and intern and resident wives. The membership committee and officers of the auxiliary were hostesses.

Our first meeting in October was a community service program showing the film "Your Doctor," with the home demonstration agent and PTA president and program chairman as invited guests.

A book review of *Forty Odd* was given by Mrs. A. R. Waggoner, special speech teacher at the Temple Elementary Schools, at the November meeting. Resident and intern wives were given special invitations to attend.

The December meeting was a luncheon–business meeting at the Stage Coach Inn, Salado, honoring our State President, Mrs. E. W. Coyle, San Antonio. Mrs. Milton Spark, Waco, council woman of District 12, was also a guest. Our auxiliary provided money, clothing, and food for a family of nine for Christmas.

The January meeting was held at the Temple High School Home Making Department with the junior and senior high school girls of Bell County invited to see the film "Girls in White." Refreshments were served and forty girls attended. The film also was shown later to the Negro high school girls with thirty present. Literature was distributed and radio publicity was obtained preceding this meeting.

An open meeting on preventive mental health was given in February by Mr. Charles F. Mitchell, acting director of the State Mental Health Division at Austin. A discussion period followed as to what were our local mental health problems. Also, a survey of Temple has been made concerning the number of handicapped children and what is being done in our community to aid them. A report has been sent to the State Auxiliary Mental Health Committee.

"The American Medical Education Foundation and Its Meaning" was the program topic for our March meeting. Dr. S. W. Thorn, Houston, Chairman of the Texas Medical Association Committee on the American Medical Education Foundation, was guest speaker. Each member was asked to contribute to the Foundation and allowed to bring a guest.

We observed Doctor's Day in April with a barbecue supper held at the country home of Dr. and Mrs. R. K. Harlan, Temple, honoring our husbands.

At our May meeting Judge J. K. Evetts of Belton will speak on juvenile delinquency. Reports from all committees and the historian as well as a report on the state convention will be given and officers will be installed.

Our special project for the year has been that of sponsoring volunteer workers to the Bell County Health Unit two days a month in the maternity clinic. We have provided cakes for three USO Saturday night dances. We also have a representative to the City Welfare board meetings. Twenty-two members have given service and a total of 270 hours on community projects, including United Fund, USO, McCloskey Volunteer Service, mobile x-ray unit, tuberculosis association, and the crippled children's society. Two members are serving with the Community Concert Association. The president of the City Federation of Women's Clubs is one of our members and we have sixteen members holding offices or on committees in the Federated Club. Eleven members are serving on PTA committees and another member is a Democratic council woman and a member of the Executive Board.

Six films have been shown at schools, and eye, hearing, and chest x-ray tests were promoted at the Catholic school.

MRS. R. N. BARTELS, Temple.

Bexar County

Bexar County Medical Auxiliary started the year with 385 members; at present we have 374. We have had 15 new members and 2 deaths this year.

Each regular monthly meeting has consisted of a business session, a program, and a coffee or luncheon. We feel that the programs have been enjoyed inasmuch as the average attendance has increased. The theme of the year was "Keep the Fires of Purpose Blazing." Committee activities include the following:

Membership.—This committee contacted each auxiliary member to obtain her correct address and the like. Each new member was introduced to the auxiliary. Parties for new members, one for the husbands and wives, one for the ladies only, were held. All eligible members have been invited to join and their names recorded.

Social.—We have had two auxiliary parties. One was a ranch party at Lost Valley Ranch, Bandera, honoring new members of the auxiliary and the medical society. We honored our doctors at a formal dinner-dance in December. When the International Medical Assembly met here in January this committee had charge of the ladies' entertainment. A style show was presented by Frost Bros. and was followed by luncheon. There were 153 guests.

Program and Yearbook.—The programs were planned around our projects. The programs "Demonstration by Children from the Sunshine Cottage, School for the Deaf," "Guidance Institute," "Safety in the Home," and "Juvenile Delinquency" were planned with the idea that we might be active in these projects next year.

The civic and philanthropic committee was broken down under subcommittees, each with a project, including

The Children's Shelter.—This children's home was the main project of the civic and philanthropic committee. Here we assumed the responsibility for the finances and personnel of the nursery (infants through 2 years of age). We also furnished supplies, clothing, and drugs, and volun-

teers did personal work such as baby sitting, feeding, dressing, bathing, and the like. Sixty auxiliary members spent approximately 800 hours on the project.

Mental Health.—Movies were made available to PTA groups and all other civic clubs. In January, we participated in the financial campaign of the Bexar County Mental Health Society and Guidance Institute. Forty members solicited for funds, with 300 hours given.

Geriatrics.—This was a new subcommittee. Twelve homes for the aged were visited and the Mathews Nursing Home was adopted by the auxiliary. There are about sixteen old folks at this home ranging in age from 69 to 100 who have no known living relatives. Christmas gifts were taken to these old folks; also, Easter gifts will be taken. Magazines, games, and clothing have been given and personal social visits made. Ten auxiliary members gave sixty hours to this project.

Community Services.—Six committee members gave approximately 100 hours of service in contacting the schools to promote interest in the essay contest and in notifying them of the movies and programs available on safety. This committee also furnished members for the health educational booth at the Live Stock Show.

This committee assisted in the collection of dolls for the Christmas Clearance Bureau of San Antonio. Our Auxiliary was asked to coordinate the collection of dolls from all the women's clubs. We collected approximately 300 new dolls.

Health Education.—The health education, community service, and civic and philanthropic committees sponsored a booth at the San Antonio Live Stock Exposition for ten days in February. This booth was donated by the Live Stock Commission; expenses of approximately $175 were paid by the medical society; seventy auxiliary women and thirty-three doctors gave 400 hours to manning this booth. Approximately 25,000 pieces of literature were distributed; it is impossible to estimate how many people visited the booth. We used the exhibit 'You and Your Body," which was furnished by the American Medical Association, as a successful eye-catcher.

Publicity.—We have had a very active publicity secretary. All meetings and activities have been reported to the local papers, the STATE JOURNAL OF MEDICINE, and the *News Letter.* To the local papers have gone 28 social notices, 12 news stories, 17 pictures, and 5 reports; and 450 clippings to date have gone to the Texas Medical Association.

Physical Examinations.—Members were urged by cards to have physical examinations. Numbers reported include doctors 83, wives 106, children 210, servants 51, total 450.

Legislative.—This committee of twenty-two members endeavored to disseminate among the auxiliary members information on legislative matters relative to the medical profession. A column in our monthly "Auxiliary News Letter" is devoted to legislative information. Our members were urged to pay their poll taxes and vote.

Publications.—Two members gave fifty hours to this committee. Letters were sent to all auxiliary and medical society members concerning *Today's Health.* A total of 950 copies of the magazine was distributed to laymen through the Live Stock Show Booth, City Federation of Clubs, and other channels.

Nurse Recruitment. — This committee consists of five members. They made brochures available to all high school libraries and councilors. They worked in cooperation with the Nurses Association of San Antonio in organizing Future Nurses of America clubs. They assisted in the distribution of nurse recruitment literature at the Live Stock Show booth. We have available $495.26 to be used by third or fourth year nursing students as a loan fund. Nursing schools have been notified of this.

Historian.—At the request of the State Medical Auxiliary Historian, a report on Bexar County Auxiliary activities for 1953-1954 has been mailed to Austin to be filed. A history of Bexar County Auxiliary has been prepared and will be placed in our book of publicity clippings.

Philanthropic Contributions.—Bexar County Auxiliary has contributed to the Library Fund, Memorial Fund, and Student Loan Fund, both as an organization and as individuals. We contributed to the American Medical Educational Foundation 100 per cent, the first auxiliary to contribute 100 per cent in the entire state!

President's News Letter. — There are many interested members who are unable regularly to attend auxiliary meetings because of other pressing obligations; to keep these members informed of projects and actions, we are sending a monthly letter of committee reports, social announcements, new members, births, deaths, and general news. An Addressograph has been purchased to be used for this letter and all notifications to members.

Bexar County Auxiliary will be hostess to the state convention in May. As local president, I will act as general chairman. Plans are now being made by our local convention chairmen.

Bexar County Auxiliary is proud to claim the Auxiliary's State President, Mrs. E. W. Coyle, as one of our most beloved members. Others in our Auxiliary have served the State Auxiliary in various capacities this year.

MRS. JOHN C. PARSONS, San Antonio.

Bosque County

The Woman's Auxiliary to the Bosque County Medical Society has 9 members. We have no regular meeting date but we have had five meetings with an average of 6 in attendance. Members are taking part in the civil defense program which is underway in this area. One of the members is county president of the tuberculosis association and several work each year in the Red Cross drive and also assist twice a year in two towns with the Red Cross blood bank. As members of the PTA, several members were active in the polio drive. Heart and cancer drives also were given funds and services. We have read the State Auxiliary *News Letter* and the Auxiliary section of the JOURNAL.

MRS. S. L. WITCHER, Clifton.

Bowie-Miller Counties

The Woman's Auxiliary to the Bowie-Miller Counties Medical Societies started its fall meetings in September with a luncheon meeting devoted to organizing the year's activities. We were fortunate at our October luncheon in having as guest speakers Mrs. A. A. Little (a member of our auxiliary), Arkansas State President, and Mrs. Mark H. Latimer, Houston, Texas State President-Elect.

In November, we were entertained by a drama group from one of the high schools and devoted the rest of the program to legislative discussion. We celebrated in December with a Christmas dinner party, and in January we met at luncheon with a program on dental health, presented by James Clark, D.D.S., a local dentist. Instead of a routine meeting in February, we gave a tea in the home of one of our members honoring prospective student nurses and their faculty advisors. We invited girls from the senior classes of the four high schools who were interested in nursing careers and also a graduate nurse from both local hospitals to talk informally with the girls about nursing.

In March on Doctor's Day we entertained our doctors

with a dinner party followed by bingo, with many attractive prizes donated by the local druggists. In April we plan to meet at luncheon at Red River Arsenal and the commanding officer will escort us on a tour of the arsenal, which is one of the largest in the nation. We feel that this tour will increase our consciousness of civil defense. In May we will install our new officers and hope to have our new District 15 council woman as speaker. We will end the year's activities in June with a family picnic and swimming party.

During the year, we have worked on an essay contest, mental health survey, publicity for the medical societies' radio program, and as individuals on numerous fund drives and at the Temple Memorial Crippled Children's Home. We have sent contributions to the Library and Student Loan Funds in both Texas and Arkansas and have contributed to the American Medical Education Foundation Fund.

MRS. CHARLES V. BINTLIFF, Texarkana.

Brazoria County . .

The Woman's Auxiliary to Brazoria County Medical Society has had a successful year with excellent cooperation among its 26 active and 8 associate members. We welcomed 5 new members to our group.

Nurse recruitment is our main project. We achieved our goal of raising $600 to defray expenses of the two nurses now using our loan fund. A talk and film shown to the Future Nurses Club at the local high school was received enthusiastically.

Our members worked hard to stimulate interest in the AAPS essay contest, with over sixty students participating despite apparent lack of interest by educators. Publicity in local papers will be given the winners.

We have been 100 per cent in donations to the AMEF fund and 100 per cent in subscriptions to *Today's Health*. Over half of our members subscribe to and read the *Bulletin*.

We have kept abreast of legislative affairs and gave particular attention to the Bricker Amendment.

Our doctors were honored with a lovely Valentine dance and a red carnation and remembrance card will be presented to each on Doctor's Day.

The civil defense program just now is being organized in our various communities and the auxiliary has offered its services. We continue active in public relations with publicity and service.

Our social meetings have been very successful, with an excellent mental health speaker and a promising book review to come. The high point of our year was the delightful meeting in El Campo with our State President, Mrs. E. W. Coyle, San Antonio, and our district auxiliary members.

MRS. ROBERT C. MILLER, Lake Jackson.

Brooks-Duval-Jim Wells Counties

The Woman's Auxiliary to the Brooks-Duval-Jim Wells Counties Medical Society has 10 members, an increase of 4 over last year. Meetings are held monthly on the last Thursday. A joint meeting of the auxiliary and the medical society was held in the form of a barbecue supper. Another supper was also held with great success. Members have been active in the civil defense program which is under way in this area. Members belong to various civic clubs and about eight have worked on health committees. Health talks have been sponsored and members have contributed funds and services to Red Cross, polio, cancer, crippled children and Community Chest. Members read the State Auxiliary *News Letter*, and the Auxiliary Section in the JOURNAL.

MRS. G. G. WYCHE, SR., Alice.

Brown-Comanche-Mills-San Saba Counties

The Woman's Auxiliary to the Brown-Comanche-Mills-San Saba Counties Medical Society has during the year 1953-1954 grown from a small newly organized group into one which is firmly established. As a result of its development, interest has grown to the extent that average attendance has increased 60 per cent over our first year of organization.

There are 24 members and a possibility of gaining several more before the new auxiliary year begins. Everyone who is eligible has been contacted.

The films "How to Catch a Cold" and "Here's Health the American Way" were shown at PTA meetings. Another activity connected with the high schools is that of nurse recruitment. A film, "Girls in White," was shown to junior and senior girls, accompanied by an informative talk on the subject by a registered nurse who appeared in uniform. Plans are under way for establishing a Future Nurses Club and nurses scholarships.

The AAPS essay contest was conducted in the high schools of the area. Prizes were given by the county medical society and in several cases smaller prizes were given in each town.

The civil defense program in Brown County is well organized and has the full cooperation of the medical society and the auxiliary. For years there has been an emergency unit in operation, giving assistance in time of flood, fire, and all other disasters. Courses are held from time to time to keep workers up to date on civil defense. Members of the auxiliary attend the workshops and are ready to assist in any emergency.

At each visit of the blood mobile to Brown County, the auxiliary has been asked to help. Lunch was served to the workers and members also assisted in various other ways.

Volunteers from the auxiliary served as assistants when the tuberculosis x-ray unit was in Brownwood and supported and worked with the various other drives conducted in the community such as the March of Dimes, the heart fund, the Red Cross, and others.

The program theme "Know Your Community" has been used with emphasis on our county health program and the Brown County School for the Physically Handicapped Child.

The social aspect of the auxiliary was certainly not neglected. In fact, each meeting was a social event in itself, since each one was held in the form of a dinner in the home of a member. Brownwood was host to the district meeting in October and special activities were planned for auxiliary members.

In November we were honored by a visit from Mrs. E. W. Coyle, San Antonio, President of the Woman's Auxiliary to the Texas Medical Association. Another social vent that was of special interest was a party given in honor of the doctors in the home of Mrs. O. N. Mayo, Brownwood, president of the auxiliary.

Our year has been a full one, but it has served also as an inspiration to strive for higher goals in the coming year.

MRS. O. N. MAYO, Brownwood.

Caldwell County

In a small town the doctors' wives play an important role in all civic projects. Those "who can and will" are called upon frequently. Because of the many demands put upon time, interests, and energy, we have not had as many meetings of the auxiliary. Instead, we have transacted business by telephone and the like and feel that we are contributing more in this way. We have 6 paid members, giving us a 100 per cent membership.

The president subscribes to the *Bulletin* and there have

been four subscriptions to *Today's Health*. Each member telephoned others in the community urging them to pay their poll taxes, and legislators have been contacted whenever requested.

All members participated in the Red Cross drive, and five members, four of whom are nurses and helped in that capacity, worked with the blood mobile. The auxiliary also had 100 per cent participation in the polio, heart, and tuberculosis chest x-ray drives and the Cancer Crusade.

Mrs. A. A. Ross served on the State Auxiliary's Public Relations Committee and as lay woman of District 7 of the Texas Division, American Cancer Society. In the latter capacity she has for the past three years had charge of public education in cancer control for District 7.

Members and their husbands have served with the Youth Canteen, as presidents and members of the Parents Band Club, with church youth fellowship groups, as members of the PTA, and also as a program leader for the church council women.

School nurses have given talks and shown films in the interest of nurse recruitment, and several girls have entered schools of nursing. Physical examinations reported numbered 29. One member made a talk on civil defense to the high school PTA. "The Warning Shadow," a film on lung cancer, was shown to members of home demonstration groups. An individual contribution of $2 was made to the American Medical Education Foundation.

MRS. A. A. ROSS, Lockhart.

Cameron-Willacy Counties

The main objective for this calendar year has been to promote good will, thereby obtaining the end result of "good work." We have endeavored to follow the program outlined by the State Auxiliary to the best of our ability, keeping in mind, however, that "it is better to do *one job well* than to do a poor job of many things." We concentrated our energies on nurse recruitment. Late last spring the film "Girls in White" was shown to the girls of five high schools in this bi-county area, reaching about 400 girls. In Harlingen, two doctors' daughters dressed as student nurses, and one doctor's son, as an intern, passed out candy pills and "took care of" the high school students and their guests of San Benito high school. Plans were discussed in each school regarding the formation of a Future Nurses Club there.

This fall, following the general pattern of our Harlingen Future Nurses Club organized last year, four new clubs were started. Los Fresnos has an active club under the leadership of the school nurse and has participated in many projects, including setting up first aid kits for each schoolroom, studying films on tuberculosis, assisting with the school immunization program, helping at the Well-Baby Clinic, and taking Red Cross first aid courses.

The Raymondville group was later organizing, but under the guidance of Mrs. Helen Goerger, president-elect of our auxiliary, and the school nurse, is now doing nurse-aid work at the hospital for its project. In Brownsville, the club, under the Public Health nurse, is doing volunteer work at the local hospital and also helping at the Public Health Unit.

The club at Rio Hondo was unable to continue due to lack of support by the superintendent of schools. (This is the only exception. All the other schools have been most receptive.) The Harlingen Club has continued its project of last year—volunteer hospital service—with many new girls participating.

Most of the clubs meet twice monthly, once for a business meeting and once for an informative program. We have had talks by Public Health nurses, Air Force nurses, hospital nurses, and nurse instructors, as well as programs on the different types of nursing schools, requirements for admission, and any scholarships available.

Each club member who gives twenty or more hours of volunteer service on any of the club projects is awarded a Future Nurses Club pin, furnished by the auxiliary. These pins will be awarded by our president at our "All Valley Meet" to be held on April 24, 1954, at Whalen Park. Plans for the day include games, talks (one by one of our student nurse loan fund recipients), entertainment, and food. This promises to be a most enjoyable event.

During our nurse recruiting we found so many worthy girls needing financial help that we made this known to our medical society, which responded most generously with donations with which we formed a student nurse loan fund. In addition, it also voted to give $150 each year out of its society treasury to this fund. We have at present two girls in nursing schools through loans from this fund.

MRS. JOHN A. WELTY, Harlingen.

Cass-Marion Counties

Again, our auxiliary has enjoyed a year of fellowship among its members, which has been our best reason for functioning. Since our auxiliary is composed of groups from five towns in two counties, we have used our meetings at times to become better acquainted and enjoy one another's company. We meet 6 times a year, rotating our meeting places from town to town. We have dinner with the doctors and then retire to a separate place for business.

We have made donations to the Library, Memorial, Student Loan, and American Education Foundation Funds. We have several young people in nurses training, have stressed physical examinations, and observed Doctor's Day.

All of our members are very active in all civic work of the various communities. Many are serving as chairmen of heart fund, Red Cross, March of Dimes, and cancer drives. All are active in PTA and church work.

All reports have been mailed as directed.

MRS. O. R. TAYLOR, Linden.

Cherokee County

The Cherokee County Medical Auxiliary has had a busy and successful year.

Attendance average at meetings is 86 per cent. *Today's Health* sales are 139 per cent. We have contributed to the Library, Memorial, and American Medical Educational Funds, with contributions to AMEF being secured by passing a "kitty" at each meeting.

Auxiliary member Mrs. W. E. Gebbertt of Rusk was chairman of county tubercular drive. More contributions were secured than during any previous drive. Individual members worked on establishing a "Well Baby Clinic" through the Lions Club. Members contributed hours and funds toward establishing a Youth Center in Jacksonville. The Center is in operation and very successful. Members worked on and contributed to heart, polio, tuberculosis, and cancer drives. Members have given magazines and reading material to the library at the state mental hospital at Rusk.

Our outstanding meeting was a joint meeting with the county medical society at the Rusk State Mental Hospital. The patients put on the program and we took as guests business men, civic leaders, and those whom we felt would be interested in the problems of our state mental hospitals.

Our public relations tea was a success, with a large number of guests attending. A health film and talk was given by Dr. J. C. Rucker, Jacksonville. On Doctor's Day, our

local radio station paid tribute to the doctors with talks and skits on medicine. Climaxing the day, the auxiliary honored the doctors with a dinner with Dr. Hardy Kemp of Baylor Medical School, Houston, as guest speaker.

Officers for 1954-1955 have been elected and will be installed in April.

MRS. COLLIER RUCKER, Jacksonville.

Clay-Montague-Wise Counties

The Clay-Montague-Wise Auxiliary is one year old at this report time. We feel that our year has been a successful one, although our activities have been, through necessity, based on the individual efforts of each member in her own community.

Members in each city have contributed their time or money to the appeals by the American Heart Association, March of Dimes, American Cancer Society, and the American Red Cross. The Decatur members have, through their Federated Clubs, presented a mental health program, sponsored a school immunization program, and presented a civil defense program and a program for improvement of racial relationships. The Bridgeport members helped to organize and sponsor several Cub Scout dens and promoted physical examinations of members in their Federated Clubs. The Bowie members have done much through their Federated Clubs to provide a Youth Center, have helped raise funds for a swimming pool, and two are members of the North Texas Area Council of Camp Fire Girls. The Nocona members arranged for the showing of the film "Self-Examination of the Breast" to approximately 150 women in the community, secured as a Federated Club program a talk on mental health by a local physician, and served on the board of directors of the Nocona Youth Center. The members in Bridgeport, Decatur, and Nocona sponsored the AAPS essay contest in their high schools.

Our September meeting was a barbecue dinner honoring our husbands, held at the country retreat of one of the Bowie members. At our other meetings we first have dinner with our husbands, then while the doctors hold their meeting, we adjourn to the home of one of the Bowie members for our business meeting. In this way we have become acquainted, not only with the members of our auxiliary, but with the doctors in the medical society, too.

MRS. J. W. MAJOR, Nocona.

Coleman County

The Woman's Auxiliary to the Coleman County Medical Society met this year for the first time in some while. Last year there were 6 members but now there are 8 and 1 new member. We meet for combined social and business meetings. Contributions were made to the American Medical Education Fund and to the Library Fund. Two subscriptions to *Today's Health* were obtained and one to the *Bulletin*. Next year we hope to be more active.

MRS. J. C. YOUNG, Coleman.

Comal County

The Comal County Medical Auxiliary held a luncheon meeting last summer to elect officers and meet Mrs. E. W. Coyle, State President, and Mrs. Charles McGehee, State Auxiliary Corresponding Secretary, both of San Antonio. Mrs. Coyle spoke regarding the aims and organizations of the Auxiliary. At that time it was resolved that this auxiliary would remain more or less inactive, with the members participating in civic activities as individuals rather than as a group. However, in May the medical auxiliary, in conjunction with the hospital auxiliary, acted as hostesses at the open house held in observance of National Hospital Day. We plan to meet again soon to elect officers and discuss plans for the coming year.

MRS. WILLIAM W. SULLIVAN, New Braunfels,
Secretary-Treasurer.

Cooke County

The Cooke County Medical Auxiliary has a roster of 13 members, 2 honorary members, and 6 associate members. We meet once a month with doctors for a social and business meeting.

Our projects for 1953-1954 were to provide cancer dressings to those who needed them, and to spread cheer and bring joy to those confined to the State Training School for Girls and the County Poor Farm. We again assisted with the tuberculosis x-ray drive, and members worked on the tuberculosis and Red Cross fund raising drives. The members who are also nurses assist the county health nurse in school health checks. The AAPS essay contest is being sponsored and prizes of $22.50 will be given.

Carnations were sent to our husbands on Doctor's Day and a dinner dance was given at Christmas time.

The mental health survey was made in Cooke County and, with the help from Tarrant County Auxiliary, great strides are being made with one family. Collectively our auxiliary cannot list too much activity, but each member is a worker in many related fields and I am proud to say they are a fine group of hard working women.

MRS. VINCENT C. CIRONE, Gainesville.

Coryell County

The Woman's Auxiliary to the Coryell County Medical Society has 5 members. Three meetings have been held with an average of 4 attending. One meeting was business, one a program, and one a social for the doctors and the members of the Bosque County Medical Society and Auxiliary. The various women's clubs of the city were invited to the program meeting when "Self-Examination of the Breast" was shown. The members have read the State Auxiliary *News Letter*.

MRS. O. W. LOWREY, Gatesville.

Dallas County

Meetings were held the first Wednesday of each month, with executive board meetings being held on the Tuesdays preceding. The average attendance at our general meetings has been 175. Identification cards were made for each individual member. Green ribbons attached to the cards were used to designate new members and white ribbons were used for hostesses. All committees in the social group have been most active.

Dues were collected for 583 active and associate members. In addition we have 1 honorary life member, 6 honorary members, and 18 members whose husbands are in military service. In August letters were sent out enclosing printed check drafts and suggesting that dues be paid prior to the first meeting. This resulted in 403 members paying dues in advance of the due date.

The auxiliary is affiliated with the City Federation of Women's Clubs, the Health Council of Social Agencies, the Health Museum Guild, and the City-County Hospital Auxiliary, and sends a representative to each meeting.

Public relations has been emphasized in auxiliary programs and work throughout the year. Members have been urged to participate in all religious and civic activities of the community as a means of building good public rela-

tions. Our PR committee chairman attended the AMA's Rural Health Conference held in Dallas in March.

We have a health service committee composed of a general chairman and five co-chairmen who serve in various city organizations. They have reported the following contributions and services: 170 hours work given at the West Dallas City Maternity Clinic, as well as clothing and $30 worth of canned goods; 35 hours spent assisting the school nurse at Thomas A. Edison School; $350 contributed for fans for patients and view boxes for physicians at Woodlawn Hospital and 140 periodicals donated, plus 20 hours service helping the physical therapist; and 3 gallons of cod liver oil and books, magazines, clothing, and volunteer service contributed to the city-county welfare agency.

A meeting of the health education committee chairmen was held in the summer. A letter was composed listing all the health services by the auxiliary. This was mailed to all school principals, PTA presidents, and Dad's Club presidents in Dallas and the Park Cities. Three speakers were placed directly and others were referred to the speakers bureau of the Dallas County Medical Society. We can report 1,766 physical examinations of members, their families, and servants. The executive board was 100 per cent in subscriptions to the *Bulletin* and *Today's Health*. Total *Today's Health* subscriptions received numbered 310, with the auxiliary donating 39 subscriptions to civic groups, schools, and hospitals. Members also staffed the *Today's Health* booths at the state dental convention, the Southern Clinical Society meeting, and the AMA's rural health meeting.

Notices were sent to the schools and PTA groups encouraging them to make trips to the Health Museum. Parentcraft classes for expectant fathers and mothers have been held weekly at the Museum under our group's sponsorship. The purpose of the series of fourteen classes is to teach the intelligent, practical preparation for parenthood. The weekly average attendance has been twelve, but in the past six weeks there has been a 50 per cent increase. The parentcraft committee has accomplished the following:

1. Provided books and teaching equipment.
2. Wrote letters to all obstetricians to inform them that this course of lessons is available for their patients.
3. Distributed 1,200 referral cards to the physicians.
4. Placed descriptive literature, approximately 850 leaflets, in waiting rooms.
5. Mailed "Prepared Parents" diplomas to all who completed the course.
6. Arranged for a television program to inform the public about the course.
7. Obtained special speakers.

Three films (two new ones and one other) have been shown to 1,200 people. In addition, the visual education committee has made eight appointments for March showings, and it is estimated that 1,000 persons will view the films at that time. In cooperation with the mental health committee, the films "Human Growth" and "The Story of Menstruation" have been shown once each week to the children of the Dallas County Juvenile Home. Also in the field of mental health, a survey of physically handicapped children under 18 years of age in Dallas County was made. School superintendents were contacted and reports secured from the school census. We learned that the schools have a special education department for the handicapped children and have facilities to accommodate 40 per cent more children than are enrolled this year. The private agencies which teach the blind, deaf, speech retarded, cerebral palsy, and crippled children filled out work sheets to assist in the survey.

We also made a survey of the facilities, both private and public, in the county for caring for the aged and are prepared to cooperate with the city in this matter.

Our voluntary placement committee was responsible for securing members who gave a total of 268 hours to the polio and heart fund drives. Poll tax receipts were sold in conjunction with the polio drive, and for three weeks during the heart fund drive members staffed a downtown booth where they ran a projector and oscillograph and distributed literature.

Gifts totalling $250 have been received for the State Library Fund. Our American Medical Education Foundation committee chairman mailed out 600 cards to members, and $200 for the AMEF was obtained. Also, $364 for the Memorial Fund had been received as of March 1.

The nurse recruitment committee has been very active since June of 1953. The following is a summary of its accomplishments during 1953-1954:

1. Established a coordinated plan in cooperation with all other groups interested in student nurse education.
2. Sponsored a contest to select the student nurse of Dallas in cooperation with the motion picture industry.
3. Promoted a "Student Nurse Recruitment Week" through proclamations issued by the mayors of Dallas and Grand Prairie. At this time there were ninety window displays in department and dress stores and in drug stores. Also, 3,600 brochures and posters were distributed and radio, television, and newspaper publicity was obtained.
4. Organized eleven Future Nurses Clubs in the high schools of Dallas, with an enrollment of 246 students.
5. Established the Edith Cavell scholarship fund, which at present has $378.88 in funds.
6. Sponsored a tea for the future nurses at hospitals.

The AAPS essay contest has received publicity both in the Dallas newspapers and throughout the county. Literature was sent to all county high schools, and the auxiliary voted to give $125 in prize money.

Our research chairman has obtained the biographies of four Dallas physicians who have done outstanding work in the medical world, and these will be mailed to the State Research Chairman.

All members were contacted and urged to write their representatives and senators on behalf of the Bricker Amendment. A paper on this amendment was read on guest day and pamphlets explaining its purpose handed to members and guests.

MRS. SIDNEY S. BAIRD, Dallas.

Dawson-Lynn-Terry-Gaines-Yoakum Counties

The Woman's Auxiliary to the Dawson-Lynn-Terry-Gaines-Yoakum Counties Medical Society has 14 members and meets alternately at Lamesa and Brownfield. There have been 9 meetings during the present term. Members have been urged to take part in civic affairs. Contributions were made to the Waco and San Angelo Tornado Disaster Funds.

MRS. F. E. SEALE, Lamesa.

Denton County

We have stressed public relations and nurse recruitment this year. Each member has donated her time and talents to all local drives and undertakings and, as a group, we assisted in and donated to the United Fund, Red Cross, Warm Springs Foundation, heart and cancer drives, patch tests for tuberculosis, blood bank, and the like.

We also sponsored the x-ray mobile unit. We made an award to the Negro Girl Scouts and a prize to the Negro school for its work for the tuberculosis drive.

Another scholarship was presented to the Kress Foundation School for Practical Nurses, and several talks, field trips, and films were arranged by the auxiliary for prospective nurses in the high schools of the county. I am proud to report excellent results with several actual recruits. We continue to place books in our public library and also *Today's Health.*

A guest luncheon and book review was given in March. Our annual benefit party, by which means we obtain the funds for our various projects, was held in April. This as always was quite successful.

The 1953-1954 year is being closed with our Doctor's Day celebration. We have an editorial in our local paper, boutonnieres for our husbands, and a picnic in the evening planned.

At the present our members are planning and looking forward with great enthusiasm to the District 14 meeting to be held in Denton this year.

MRS. HARRY FARBER, Denton.

Dewitt-Lavaca Counties

The Dewitt-Lavaca Counties Auxiliary is a small group. We have 24 members in 5 towns. Because of the long distance between our towns, frequent meetings are not held. We should meet quarterly, as stated in our constitution. We will have met 3 times this year.

Our Auxiliary has sponsored the AAPS essay contest, but only one town and two schools therein participated. We have stressed that old medical journals be sent to Korea for use in the schools there. Donations from the auxiliary have been made to the following: American Medical Edution Foundation, Library Fund, Memorial Fund, and Student Loan Fund.

Though the year has not shown remarkable movement, the group has moved onward and is together.

MRS. J. M. BUTTERY, Hallettsville.

Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties

The Woman's Auxiliary to the Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Medical Society meets bi-monthly throughout the year. There are 15 members, with an average attendance of 8 to 10. A combination business and social meeting is held followed by dinner with the husbands in the homes of various members.

Our programs included a film and lecture from the American Cancer Society, a book review, and a group discussion of the Bricker Amendment and other legislative matters. Nurse recruitment has been stressed in each town and supervisors from nearby hospitals have made talks in the schools.

MRS. CARROLL FORD, Breckenridge.

Ellis County

The Woman's Auxiliary to the Ellis County Medical Society in the past year has completed three major projects, as follows:

1. We have written and adopted a constitution and by-laws.

2. We have instituted regular quarterly luncheon meetings and an annual Doctor's Day dinner.

3. We have sponsored locally the AAPS essay contest, awarding prizes from the county level in the aggregate amount of $50.

MRS. B. C. WALLACE, JR., Waxahachie.

El Paso County

The Woman's Auxiliary to the El Paso County Medical Society planned and executed the year's work with our State President's theme in mind, "Knowledge, Judgment and Action in Health Leadership."

Initiating our year's work we presented a program on "Know Your AMA" by Dr. Robert Homan, El Paso, a member of the AMA's Council on Medical Service; "Know Your Auxiliary" by Mrs. George Turner, President-Elect of the Woman's Auxiliary to the AMA; and "Know Your Community" by Mrs. L. W. Breck, one of our past presidents and a member of both the board of governors of the El Paso General Hospital and the commission to rewrite the City Charter.

At our public relations meeting in November, representatives of fifty women's organizations were our guests at luncheon. Dr. H. D. Garrett, a dermatologist, gave a talk on cosmetics and the care of the skin, entitled, "The Basis of Glamour." The film "Scrub Game" was shown and five PTA groups and one Girl Scout Troop requested it for showing. Each guest received the AMA brochure for program chairmen of lay groups, "Better Health—A Project in Living."

In January the mental health committee presented a talk on personality development by one of our psychiatrists, Dr. George Schlenker. Our year was highlighted by the visit in February of our State President, Mrs. E. W. Coyle, and the district council woman, Mrs. Harold Lindley. Twenty-four of our members attended the District 1 meeting in Pecos.

The nurse recruitment committee has worked closely with the nurse recruitment committee of the Nurses Association. All local high schools have nurse clubs, one a boys' club in nursing. To these clubs we distribute paper nurses caps with "Future Nurse" printed on them and assisted with their programs. We have carried out the following projects: (1) At the annual Social Welfare Fair sponsored by the Central Council of Social Agencies, we had a walk-in trailer set up as a nurse recruitment center. Representatives from the nursing schools gave out information on all types of nursing. Members of the auxiliary and representatives of the Future Nurse Clubs acted as hostesses. (2) We are setting up a file of nursing scholarships and loan funds available in El Paso and have started a program to encourage other organizations to set aside money for this purpose. (3) We are developing literature beamed at the parents to convince them that nursing is a good career for girls. We feel this is so important that we are recommending that the State Auxiliary develop this type of literature. (4) We have compiled a brochure on schools of nursing designed to be used as reference material for girls interested in nursing to be kept in the offices of the school nurses in the high schools. We are giving one to each high school in El Paso County and one to the State Auxiliary with the recommendation that the State consider a similar project on the state level to be distributed through other auxiliaries to all Texas high schools. (5) On March 25 we will have a tea and program for members of Future Nurse Clubs and other interested students and their mothers. The brochures will be presented at that time and a skit, "Stars of Nursing" will be given by auxiliary members. A nurse scholarship of $125 was given in September.

Our legislative committee initiated an intense program in favor of the Bricker Resolution. Mimeographed material was given to the auxiliary, medical society, and dental aux-

iliary and Pro-America and Current Topics Clubs. Members responded to a request to wire Senator Lyndon Johnson.

The civil defense committee prepared a card file of our membership giving the various professional, domestic, technical, and business abilities and training of members, and this was presented to the local civil defense headquarters. Through the chairman a similar file of the membership of Young Matron's Auxiliary of the Woman's Club was presented to the civil defense headquarters. On February 1 the Auxiliary began a thirteen-week series of television programs, "Nurse, Please," originated by the Tarrant County Auxiliary. We have had many requests for the "Six Survival Secrets" which we offered viewers. One Boy Scout troop has requested them for study. One teacher is using the program as home work for her health class.

We have had excellent publicity in the local papers featuring meetings, special events, and projects, and monthly articles in the *Southwest Clubwoman* and the TEXAS STATE JOURNAL OF MEDICINE. The publicity chairman assisted the county medical society in preparing a history of the society and biographical sketches of pioneer doctors for the centennial editions in our newspapers. These editions carried a history of the auxiliary, a copy of which has been sent to the State Historian.

We sponsored the AAPS essay contest in eight high schools, public, private, and parochial. Eighty-seven papers were written. Local prizes totalled $120.

Three hundred and thirty-three physical examinations were reported. One hundred members of the Young Matron's Auxiliary of the Woman's Club were contacted and urged to have physical examinations.

Thirty-five members subscribe to the *Bulletin* and thirty subscriptions to *Today's Health* have been given.

The mental health committee conducted the survey with the State Auxiliary Mental Health Committee and the results were sent to the State Chairman. A student-centered safety program dealing with all aspects of safety was carried on during the year. We have made a preliminary health survey of El Paso County, with a copy being sent to the State Historian.

The public relations committee sent 153 letters during the summer to women's organizations of El Paso County. We have given eight talks, including two before Home Demonstration clubs, and shown seven films at five high schools. The film, "Know Your Doctor" which our medical society bought was shown to three PTA groups. The American Theater Wing Production, "Scattered Showers," was given by members at a PTA meeting and the Trans-Pecos teachers' convention.

Our members are active in all civic organizations and on all boards in the city. One of our members is president of the Young Matron's Auxiliary of the Woman's Club, one is Chairman-Director of the Woman's Department of the Chamber of Commerce, and one was Chairman of the Sun Queen's Court of the Sun Carnival Association. We have served the Lighthouse for the Blind; addressed envelopes for the Easter seal drive; manned booths in department stores and also collected nylon for the cancer society; filled bags for the Goodwill Industries; collected samples from doctors for El Paso General Hospital and clinics; and cooperated with the ministerial association in the "Go to Church" campaign. Members worked on the YMCA Building Fund Drive as well as on all fund campaigns. We contribute to the Red Cross, Community Chest, American Cancer Society, and the tuberculosis association. We have contributed to all state auxiliary funds including the American Medical Education Foundation. Auxiliary members furnished hospitality to delegates to the Southern Association of Student Councils when 800 students from fourteen states met in El Paso. The goodwill created has been rewarding.

One of our members was chosen El Paso's Woman of the Year. Five members were "Women of the Week" and two of our newest doctors' wives have been featured as "Arrivals of the Month."

We hope that by learning and by doing we have come to know our community better and that our community has come to know us.

MRS. NEWTON F. WALKER, El Paso.

Falls County

Due to the fact that the Woman's Auxiliary to the Falls County Medical Society has been inactive for several years and few meetings have been held, officers were not elected for 1953-1954 until October. However, I am pleased to report that since that date we have met regularly every month, have worked up several projects, and there is definitely a marked increase in enthusiasm among the members and a keen desire to accomplish something worth while.

In November a committee from the auxiliary attractively decorated a window for National Book Week illustrating *The Horse and Buggy Doctor,* by E. Hertzler, M. D.

In December we entertained the doctors at a delightful Christmas party, and again in January the auxiliary and medical society met for a social hour following their respective meetings.

In January a nominating committee was appointed, and new officers for 1954-1955 were voted on in February. The following were elected: president, Mrs. Clarence R. Miller (re-elected); vice-president, Mrs. Tom Glass; secretary, Mrs. Roy G. Giles; treasurer, Mrs. J. C. Hohf; reporter, Mrs. John B. Barnett; and historian, Mrs. Milton A. Davison, all of Marlin.

In March the nurse recruitment committee arranged for the auxiliary to entertain eighty-five members of the Marlin High School senior class at a tea at the Veterans Administration Hospital. A donation of $50 was sent to the American Medical Education Foundation.

More elaborate plans for next year are in the making. Now that we seem to be better organized, it is earnestly hoped that our concerted efforts will result in more activity in the different phases of the work outlined for the county auxiliaries.

MRS. CLARENCE R. MILLER, Marlin.

Fannin County

The Woman's Auxiliary to the Fannin County Medical Society voted to be members-at-large as there were only 3 members. All work as individuals in civic affairs.

MRS. L. E. MORGAN, Bonham.

Freestone County

The Freestone County Auxiliary was organized last year and is composed of 3 members, 2 in Teague and 1 in Fairfield. We are necessarily circumscribed in our activities. However, I feel that we form a nucleus of informed members who can work on an individual basis for better community health and public relations. Through organization we can keep in touch with other communities over the state and be ready to grow when the opportunity presents itself. Although we do not meet regularly, we did present one film on cancer this year to a group of club women, and more are planned. What we can do with *Today's Health* remains to be seen. I should be happy to hear what other small auxiliaries over the state are doing.

MRS. JACK R. COX, Teague.

Galveston County

A full and satisfying year is coming to a close with all our projects completed. We centered our attention on nurse recruitment by organizing seven Future Nurses Clubs throughout all high schools in Galveston County. We gave a $300 nurse scholarship by assessing each member $5. The sponsors of all clubs were auxiliary members, all of whom are registered nurses except one. The girls were taken on tours of various hospitals in our county and also in Houston. Some of them even visited the Anatomy Laboratory at the University of Texas School of Medicine.

We plan a style show in April to portray the different phases of nursing in honor of our Future Nurses Club members. We also feel it will be good public relations to have their mothers there as our guests. This phase of auxiliary work could not be done without the splendid cooperation of our members, the superintendents of our two schools of nursing, and the District Nurses Association.

Next, we quietly mentioned in September that we were converting the radio series "Healthy Living in Our County" into television programs, as requested by our school principals. This we did, on a one-program-a-month basis, which proved successful. We felt at this point we were putting into effect our own State President's slogan, "Knowledge, Judgment and Action in Health Leadership." Of course, the success of the television series fell mainly on our teachers. They have been wonderful. One program was a skit on "Johnny's Toothache." It was so good on television that we presented it at our open meeting in February, and members and guests both enjoyed it.

We were able to accomplish the AAPS essay contest this year. A parochial school student won it and will be presented her award at the April meeting of the county medical society. Fourteen high schools were contacted for this project. One of the essay chairmen agreed to take the project again next year because she realizes the need to inform young citizens of tomorrow of the dangers of socialism in medicine.

Civil defense is not completely organized in Galveston itself but is in outlying communities. Texas City has a chairman for all of Galveston County and, because of the industrial plants, is well organized in disaster preparedness. In our own community of Dickinson where I live we have sent out questionnaires to every family, and with the help of several other registered nurses I assumed chairmanship of the blood typing of all of our school children. This will be completed in April or May.

We contributed to the Memorial, Library, and Student Loan Funds. Our "birthday plan" of 10 cents for every year of your age worked out very well in obtaining individual donations to AMEF. Our auxiliary made a contribution to AMEF in honor of our husbands on our Doctor's Day program which was a dinner-dance in December.

At this time we have an active membership of 122 plus 20 junior members. We feel with this ratio of members we have accomplished a year full of success and happiness among ourselves.

MRS. ANDREW J. MAGLIOLO, Dickinson.

Gonzales County

The Woman's Auxiliary to the Gonzales County Medical Society has a membership of 4, an increase of 1 over last year. We have no regular meetings but all members work in civic affairs.

By personal contact in the high school we participated in the nurse recruitment program. Home nursing classes were taught, and funds and services were given to Red Cross, March of Dimes and heart drives. We served on the board of the Red Cross and as chairman of the chest survey. One hundred per cent of the doctors had physical examinations. Two *Today's Health* subscriptions were sold, and members read the State Auxiliary *News Letter.*

MRS. DAVID M. SHELBY, Gonzales.

Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson Counties

The Top O' Texas Medical Auxiliary has 38 members in a nine county area. Meetings are alternated between Pampa and Borger which are more centrally located. Some members drive as far as 150 miles to attend these monthly meetings. Except for the hostess town members, others travel from 54 to 65 miles each meeting Though handicapped by distance we have an active group.

This year we concentrated on three projects: Student Loan Fund, *Today's Health* and nurse recruitment. Public relations through community service was stressed.

Our auxiliary contributed $50 to the Student Loan Fund. Each member subscribed to *Today's Health.* In our nurse recruitment program over 250 contacts were made. Four films were shown and five talks were given. A book on nursing was placed in the Pampa High School library together with pamphlets and posters. In Hutchinson County all high school seniors were contacted, in Negro schools as well as others. Pamphlets were distributed to students and put in school libraries. Of the 250 girls attending films, eleven are planning on entering nurses training next fall.

As many members as possible plan to attend the District Medical Auxiliary meeting and luncheon at the Amarillo Country Club, April 13, to hear our State president, Mrs. E. W. Coyle, San Antonio.

MRS. W. C. BARKSDALE, Borger.

Grayson County

We have provided a rather diversified program this year trying to meet the interest of all our members and thereby creating more interest in all phases of Auxiliary work.

This year we added one new office to our Executive Board—that of president-elect—in order to acquaint the incoming president with her duties and responsibilities. We feel this will add a great deal to our over-all efficiency.

In November, we sponsored a style show and tea open to the public in an effort to raise money for the American Medical Educational Fund. We have also tried to interest other organizations in the project.

Throughout the year we have had programs or discussions on mental health, civil defense, nurse recruitment, AAPS essay contest, and such legislative measures as are of primary interest to the Auxiliary and medical profession.

We have assisted our doctors in every project in which they have been interested, such as: heart fund, diabetic control, camps for underprivileged children in our area, cancer fund, medical conventions, and others. Our doctors have given generously of their time to make health talks in our schools and social organizations.

In addition to honoring our husbands with a dinner-dance at Christmas time, we are sponsoring an official Doctor's Day in our county. The newspapers, pharmacies, and merchants all are participating.

At this time our auxiliary is attempting to organize a visiting nurse association. We realize this is quite an undertaking, but the need in our own county is so great that we are willing and anxious to try it. We feel that, with the cooperation of the doctors, the organization of such a

group will be one of the most beneficial things we could ever do for our community.

MRS. STANLEY L. CLAYTON, Denison.

Gregg County

At the first monthly meeting of our auxiliary, we were honored by a visit from our State President, Mrs. E. W. Coyle, San Antonio. Her visit with us was both pleasant and inspiring for our auxiliary.

This year, we have spent a large part of our time working on a new public relations venture, in the form of a television program. So far, we have presented only two programs, both films, with a five minute live program preceding our first one, but we have arranged for more time, beginning in May, during which we plan to present a series of programs. Most of our programs will be films, but we hope gradually to work up a few live programs also. Many members were rather dubious about the success of this kind of program, but after the first one was presented, we all felt that we could do it successfully.

We plan to work with other organizations in presenting some of these programs, particularly drives, such as cancer, heart, tuberculosis, crippled children, and others.

This year, we made our first loan from our Student Loan Fund to a nurse. We have more money available and hope to use it soon for another loan. This fund is available to girls entering any field of medicine.

Our annual linen shower for the Cerebral Palsy Center was successful, and the center was grateful for much needed linens.

This is our first year to sponsor the essay contest, and we only had one entry. We are discouraged about that, because we feel that we now know much more about how to handle it than when we began. This year's essay chairmen asked for the chairmanships for another year in order to be able to follow up the work they have already done. We expect much more next year.

Near the end of the year, we decided that there is a definite need of an information file on our members. Though we have a relatively small membership—65—we found that there is much talent and ability in the group that is not known. An example of this is that, almost too late, we found that one member had majored in radio in college, and had had experience in the radio field before her marriage. She proved a valuable asset in working up our TV programs.

We plan to make files on each member listing her professional training and experience, her major interests, and other facts that will aid the president in placing the right person on the right committee. Of course, we knew that Mrs. Mark Latimer, Houston, State President-Elect, is preparing a similar file of state members, but we did not realize what a nice idea it was for county organizations until we began to find women with talents and training that we had not known of previously.

We feel that our year has been successful in that we have made some ventures new to our auxiliary. In those, we have done little more than lay the groundwork on which to build in future years. If we can add one new activity each year and do a good job on that, we shall feel good.

MRS. RALPH C. CRAWFORD, Longview.

Grimes County

The Woman's Auxiliary to the Grimes County Medical Society has a membership of 7, the same as last year. Members are taking part in the civil defense program in this area. Financial aid and personal service have been given to the following: Red Cross, polio, tuberculosis, heart, cancer, and crippled children.

Members also have participated in health programs on cancer, heart, tuberculosis, first aid, safety, and home nursing. They have enjoyed the State Auxiliary *News Letter*. New officers are Mrs. H. L. Stewart, Navasota, president, and Mrs. E. T. Ketchum, Navasota, treasurer.

MRS. E. T. KETCHUM, Navasota.

Hardeman-Cottle-Foard-Motley Counties

The Woman's Auxiliary to the Hardeman-Cottle-Foard-Motley Counties Medical Society has 6 paid members. Since we live so far apart, we work as individuals and try to meet quarterly. We are glad to see the Auxiliary work progress.

MRS. C. C. PATE, Paducah.

Hardin-Tyler Counties

The first two meetings of our auxiliary were held in September and October, 1953, for the purpose of organization and electing officers. Officers elected included a president, vice-president, legislative chairman, and secretary-treasurer.

Meetings are held the third Tuesday evening at 7:30 p. m. We have held 9 meetings, with an average attendance of 4. At each meeting we allow our legislative chairman ten minutes in which to keep us posted on events taking place in Washington and elsewhere pertaining to the practice of medicine. The secretary of our auxiliary wrote letters to Senator Lyndon Johnson and Senator Price Daniels in regard to the Bricker Amendment and the legislature for physicians' retirement plans.

Members work with PTA and contribute to Red Cross, Easter seals, Christmas seals, heart and cancer funds. Six doctors, 6 wives, 4 children, and 2 servants have had physical examinations.

We voted on the dues for each member per year to be $5, with $3 to be used for worth-while projects. We contributed $5 to the AMEF Fund. Six members paid their dues for the year 1954 at our February meeting, and it was decided that the present officers should hold their respective offices until September, 1954.

We have planned a steak dinner for the doctors of the two counties to be held in May of this year.

All members voted to subscribe to *Today's Health* (ten subscriptions were bought with four being given to schools) and to try in the separate communities to establish better public relations with the medical profession and the communities.

MRS. JOHN H. TATE, Kountze.

Harris County

The Woman's Auxiliary to the Harris County Medical Society incorporated the themes of our National and State Presidents in planning and executing our year's work. Emphasis has been placed on membership and organization. A personal letter of welcome was sent by the president in September to each member to establish friendly relations and to create interest in the activities of the auxiliary. We have tried to make each member, regardless of service years, feel equally important to our organization.

Our auxiliary has 693 members. Of this number, 649 are regular members, 30 are chapter, 3 honorary, and 11 associate members. Ninety-six new members have been received into membership. New members, as they affiliated, were entertained at informal coffees by the visiting com-

mittee. Notes of welcome and taking them to meetings are projects of the courtesy committee. All new members will be honored at a tea in May. More than 50 per cent of the total membership are on various committees.

An auxiliary Newsletter has been mailed to each member to keep them informed. Handbooks for board members, to clarify obligations and supply information from predecessors' reports, were compiled and distributed by the president.

Mr. Robert A. Dedman, President of Facts Forum, Dalias, spoke on "America Is Worth Fighting For" at an open meeting followed by brunch in October. Invitations were extended to all local women's organizations.

The November meeting honored our State President, Mrs. E. W. Coyle, San Antonio, who made us conscious of "The Individual's Importance in the Community." Our chairman of nurse recruitment presented a progtam on "The Nursing Profession," highlighted with the recipient of our nurses scholarship, a student nurse and a director of education from each school of nursing—all as participating guests. New members and their husbands were honored at our Christmas dinner-dance in December.

"Feed the Kitty for AMEF" was the theme of the January program. Dr. Stanley W. Olson, Dean, Baylor University College of Medicine, spoke on "Medicine in Mid-Century"—an interesting resumé of advances in the medical field and causes of the tremendous cost of medical education. His talk seemed the perfect background for remarks of our State AMEF Chairman, Mrs. J. L. Jenkins of Galveston, and stimulated interest in and donations to this fund.

In February, Miss Jasmine L. Sadler as guest speaker spoke on "Torch Bearers of Tomorrow," which was a juvenile delinquency challenge to us. Doctor's Day, March 29, honored our doctors at a luncheon and program entitled "Laugh With Your Lady." Morris Frank, popular newspaper columnist, fulfilled the title in his witticism and pertinent remarks providing laughs for doctors with their ladies. For the first time, we honored a doctor, one of our members and a lecturer in pathology at Baylor University College of Medicine, Dr. Elizabeth Powell.

"Hobbies and Mental Health" was the topic of our speaker, Mrs. Norborne Powell, M. D., in April. Eighteen displays of varied handcrafts and collection hobbies were displayed by our members in such an expert fashion that the meeting has been considered our most outstanding and successful one this year.

Mrs. Mark H. Latimer, one of our members and incoming State President, will be honored at an executive board tea on May 12. Each auxiliary member will receive a personally written invitation, our custom this year for social events which has proven worth-while.

The Auxiliary has contributed to the Library, Memorial and Student Loan Funds. We reported 1,860 health examinations for our doctors, their families and servants, submitted a Mental Health Survey and nine articles with publicity items to the State Research Chairman, and compiled and submitted a thirty-five year history of our auxiliary.

Legislative activities include (1) monthly study groups for members; (2) twelve legislative talks at executive board and regular meetings; (3) 154 wires, calls, or letters to senators and legislators; (4) distribution of 3,580 pieces of literature; (5) endorsement for Bricker Amendment by securing signatures; (6) poll tax sales; and (7) co-sponsorship for two open meetings—one with the Harris County Medical Society for which we were commended for the attendance of 450 people.

Public relations has been stressed as one of our three point program. An outstanding project was the collecting, packing and shipping of 4,000 medical periodicals and 500 textbooks to the medical schools in South Korea. Our members, in assisting our medical society, each gave eight hours in the preparation for mailing of 10,650 "Focus On Health" programs. "Focus on Health," an important PR project, lists our medical society and woman's auxiliary with the organizations co-sponsoring with Houston Public Schools the thirteen weeks series of TV programs on health. Two auxiliary members for many months have been committee members in original planning for this program.

Sixty-eight auxiliary members, as a cancer hospital-bandage folding committee, devote one Friday morning each month to making bandages at the M. D. Anderson Hospital. As of April 30, 409 workers have given 375 hours to the making of 17,255 bandages and wrapping an additional 2,000. Children's Hospital receives our support through cooperating in sale of Pine Oaks tickets—an annual event in June the proceeds of which are given to Children's Hospital.

Since our auxiliary's organization, the Tuberculosis Hospital has received our continued interest and support. The adoption several years ago of a ward consisting of an average of 26 women patients has our concentrated attention at present. The auxiliary contributes no less than $250 to this work yearly; additional money, items needed, and gifts are solicited. Our chief objective is giving these patients that which is not supplied by the hospital and thus keeping them happy and contented.

We sponsored the AAPS essay contest with twelve schools participating and 109 essays submitted. The auxiliary financed the needed kit materials and through our medical society's generosity, $600 was awarded in prizes. This amount, however, did not include the all-Harris County prizes given.

Achievements in nurse recruitment, our most important public relations project, have been outstanding. A $300 auxiliary scholarship was awarded to a student nurse in August, and she has been in training this year at the Central College of Nursing. A scholarship was secured for another applicant through contacting another organization. Applications are being received for next year's scholarship now; to date, eleven applications have been received. The committee, with next year's nurse recruitment chairman, will become acquainted with all applicants at a coffee in May. Sixteen schools were given talks by a member with a student nurse; approximately 750 girls were actually contacted. The fifth, and last, Future Nurses Club was organized recently by the committee; each club has a member as its sponsor. We have appeared on one radio and two TV programs on nursing; originated a Student Award Day with the schools; distributed literature; and actively worked with the city nursing scholarship committee and with other organizations.

Today's Health subscriptions total 602 credits. Harris County Medical Society gave us 134 gift subscriptions, one year each, for schools and libraries. The auxiliary, and individual members, gave thirty-seven gift subscriptions to hospitals, beauty shops, women editors of newspapers, and various charity organizations. Fifty *Bulletin* subscriptions—100 per cent for Executive Board members—were secured.

American Medical Education Foundation, promoted for the first time by our auxiliary, shows $700 contributions, which is over 100 per cent. This committee assisted Harris County Medical Society with the preparation for mailing AMEF literature to 1,000 physicians. Civil defense activities were curtailed due to our local situation. Talks by committee chairman were given at meetings, and a list of nurses and typists was compiled from our membership file.

MRS. JACOB F. SCHULTZ, Houston.

East Harris County Chapter

We of the East Harris County Chapter are just completing the fourth year of our organization. We have 30 active members, including 3 new members, and are happy to report that we have had good attendance at our regular meetings.

Most of our meetings have been business meetings, with a Christmas tea and a cocktail party for the doctors included. At the business meetings programs on health and legislation as well as the prescribed ones on mental health, juvenile delinquency and safety were given. For our legislative program we had a particular treat in the person of our State Legislative Chairman, Mrs. John King Glen, Houston. She gave us all the facts concerning the Bricker Amendment as well as other related items such as the NATO Status of Forces Treaty.

We can report twenty-four subscriptions to *Today's Health* and thirty subscriptions to the *Bulletin*. This year, for the second time, we have placed *Today's Health* in all the public schools and in the public library.

For Doctor's Day, March 30, we hope to surprise our doctors by having each presented, at his place of business, a red carnation.

A good percentage of our auxiliary, working through other organizations, has devoted a considerable number of hours to the Red Cross, cancer, tuberculosis, geriatrics, welfare and other organizations. Quite a few, too, have worked with Future Nurses Club, and the auxiliary as a whole has cooperated and furnished means of transportation for these girls to do some visiting. In October, they took a tour of John Sealy Hospital in Galveston and in March they attended a tea sponsored by the University of Houston.

We again worked on the AAPS essay contest and received a fairly good response from the schools. Five schools participated and fifty-one essays were submitted. These are in the process of being judged at the present time.

We contributed to the American Medical Education Foundation, Library, Memorial, and Student Loan Funds.

MRS. H. O. SAPPINGTON, Baytown.

Harrison County

The Harrison County Medical Auxiliary meets the first Tuesday in each month, September through May. There were 16 active members this year with an average attendance of about 80 per cent. One eligible member was unable to be active because of illness, and another possible member has just moved to town and plans to be active next year.

This is the first time in many years that this auxiliary has had a yearbook. The advantages are obvious. Our attendance is up considerably due to the fact we now have a planned program and a definite time and place to meet. The group as a whole has shown more interest in all the phases of our work.

In December we had a Doctor's Day dinner honoring our husbands. Games were played and a raffle was held. The proceeds from the party helped to make our contributions to the Library, Memorial, Student Loan, and the American Medical Education Foundation Funds, the Red Cross, cancer, heart fund, and the Harrison County School for Exceptional Children.

Members of our group contributed to all the following and worked on all the drives of the Red Cross, heart, polio, cancer, Community Chest, tuberculosis, and crippled children. Letters were gotten out to all women's organizations concerning the open heart forum held in Marshall in February.

One of the most outstanding and interesting programs was given to our group by a mother and teacher in the Harrison County School for Exceptional Children. This school was one of the first of its kind in the country. There are now about 700, with many using this school as an example. Children with an IQ below 50 are accepted. The school thus is taking care of those who are trainable but not educable. As a result of this program another woman's organization in Marshall is underwriting transportation for those children who would not otherwise be able to attend.

In February Mrs. E. W. Coyle, San Antonio, our State President, was here for a luncheon meeting with us and gave an informative and enjoyable talk. We have had four social gatherings of doctors and wives. These were usually given to entertain a guest speaker of the county medical society.

Harrison County Medical Auxiliary offered its services for civil defense, but the county itself has not yet been successfully organized. Talks have been given to Camp Fire Girls' groups on nursing and several of these groups are observing at the hospital.

In March the hospital brought to our attention the grave deficit in the blood bank. We plan to try immediately to sponsor a drive to secure replacements and to try to set up some sort of permanent plan of replacement for the blood bank.

MRS. H. O. PADGETT, Marshall.

Hidalgo-Starr Counties

Our auxiliary is just beginning to get back on its feet this year. For several years the interest was not there and the ladies began to drop out quite steadily. In September our elected president resigned and since I was first vice-president I was asked to step up into her place.

This being my second year in any auxiliary it was all very new to me. However we all got busy to make our programs more interesting in order to get our members back. Throughout the year each town is responsible for one program, and this seems to be working in getting the ladies interested in coming.

In October Mrs. McMahon, who is from Hungary, gave us a good talk about her homeland. Since her talk, we as a group have written several messages to the wives of Hungary through the Radio Free Europe program. I believe every town has done an outstanding job in getting good programs. For the coming year we have a yearbook committee and we will have yearbooks. We also are planning a nurse recruitment program for the next year as well as a committee to work on *Today's Health* subscriptions.

This year I am somewhat ashamed of our report, but we did hold together and the interest is much better, and I believe next year we will be ready to start off in full swing.

MRS. J. F. FITCH, McAllen.

Howard-Martin-Glasscock Counties

The Woman's Auxiliary to the Permian Basin Medical Society has had an unusual year in that we were all "old auxiliary members" but were yet a new auxiliary. This was due to the division of the Odessa-Midland-Big Spring group. This division has made the work of the auxiliary somewhat simpler in that it has been concentrated, for the most part, in one area.

Since we are a small and a new group, and since most of our members are active in study clubs, PTA, and the like, we as an auxiliary decided to concentrate our efforts on a few things and to try to do them well. Our major project was the AAPS essay contest, and, thanks to the cooperation of both students and faculty, we consider it to be highly successful. The medical society donated $90 for prizes.

We have given subscriptions of *Today's Health* to the high school and junior high school. Several members have made personal subscriptions. We have contributed to the American Medical Education Foundation and to the Memorial Fund.

Our members have played a prominent part in various civic drives—the March of Dimes and the United Fund—and have helped plan and lead discussion programs on health topics in their study clubs.

Our auxiliary will continue to grow and improve. We have a long way to go before we become a "perfect auxiliary," if there is such a thing, but as time goes on we hope to do more and to be able to help our husbands in more and better ways.

MRS. MILTON W. TALBOT, JR., Big Spring.

Hunt-Rockwall-Rains-Delta Counties

Everyone in our auxiliary and medical society looks forward to "Reassembly Day" in October. We met this year in the home of Dr. and Mrs. J. W. Ward, Greenville, and had a program especially planned for the doctors' entertainment. We served dinner and gave a skit entitled "A Day in the Life of Marmaduke Snodgrass, M. D." Later in the month the Junior Pallas Club (Federated Women's Club) asked us to give this skit at one of their meetings.

Our November meeting was given an excellent write-up in the *Greenville Morning Herald.* Mrs. J. M. Spurlock gave a review of *Women In the Bible,* and tied it with health quotations from the Bible.

The Christmas dinner for the doctors was an enjoyable social hour. Dr. C. D. Savage, past county president, and Dr. John Vallancy, 1954 president, asked us if we could make it our project to get the doctors in this society to come to the county medical society meetings. In the past three years attendance had not been good. Our roll call for the January meeting was 'Why Our Husbands Do Not Attend County Medical Meetings." Since our interest has been aroused we have been told the attendance is greatly improved!

The film shown at our March meeting, "Here's Health, the American Way" was enjoyed by all who attended, and one of our delegates showed it at a Civic Federation meeting also.

Mrs. Fred Horton, a nurse at a local hospital, agreed to discuss "Nursing as a Vocation" with the high school seniors. Wolfe City entered the AAPS essay contest. Greenville High School was not interested in doing it this year since the material and title was the same as last year.

We have as an auxiliary contributed in time and money to such drives as the tuberculosis seal sale, heart campaign, and Red Cross. And in all things have enjoyed being "the doctors' wives."

MRS. C. D. SAVAGE, Greenville.

Jasper-Newton Counties

The Jasper-Newton Auxiliary has an enrollment of 10 active and 2 associate members. We have held 9 meetings, with every meeting being preceded by a dinner. We have had the following types of meetings:

Civil Defense: Film, "You Can Lick The Atom Bomb."

Juvenile Delinquency: Speaker, Mr. Ward Markley, County Attorney.

Personal Hygiene: Film, "What Every Woman Should Know."

Enjoyment: Book Review, *So Sure of Life,* by Mrs. Estell McLeod.

Medical Knowledge: Fractures, George G. Gill, M. D.

Our project for the year was to feed one underprivileged child at school for the entire term.

We have had a successful and fruitful year.

MRS. JOHN T. MOORE, Kirbyville.

Jefferson County

This has been a successful year for the Jefferson County Medical Auxiliary.

The membership consists of 175 paid members, 16 honorary members, and 15 new members.

This auxiliary has two chapters, each chapter holding its own meetings except for the first and last. This year our first joint meeting was held in Beaumont with Robert Akers, editor of the *Beaumont Enterprise* speaking on "Our Responsibility in Current Events." This year, too, we had a combined meeting when Mrs. E. W. Coyle, our State President, was guest.

Our Public Relations Day program was held in November, with guests from civic organizations in our city. That also was our mental health program, with Mr. John H. Lane, Jr., Field Representative for Texas Society for Mental Health, as speaker. In December we had a Christmas musicale with our own membership participating on the program.

The Port Arthur Chapter entertained their senior nurses and the Future Nurses Club with Christmas parties.

We enjoyed Mrs. Coyle's visit in January. One of our members sold poll tax receipts at this meeting. "Meeting Our Hospital Auxiliaries" was the theme of our next program, a panel discussion on the order of the television program, "What's My Line." Our own auxiliary members were on the panel. Hospital auxiliary members and presidents were special guests.

A "Medical Auxiliary Think-Nic" is planned for April, when we plan to have final reports for the year with each committee chairman submitting suggestions to the new chairman and officers.

As has been our custom for several years, both chapters collect sample drugs from our doctors' offices for the Out Patient Clinic of the Municipal Hospital in Beaumont.

The Auxiliary was 100 per cent in contributions to the AMEF, with a total of $215. We also made contributions to the Library and Memorial Funds on the State level, locally to polio, tuberculosis, and crippled children. Twenty-four members worked in a downtown station selling tuberculosis bangles and collected $181, which was the highest amount collected by such a team. One of our members was general chairman of this sale in the city. Another of our members serves as chairman of the Junior Red Cross. Port Arthur Chapter sponsors a Camp Fire Group, with an auxiliary member as leader.

We are sponsoring the AAPS essay contest with six schools participating and twenty-four entries. The medical society furnishes $100 for prizes, $50 for each chapter.

This year we have three $100 nurses scholarships and an award of $50 to the outstanding student nurse. We also sponsor two Future Nurses Clubs.

Our mental health committee headed by Mrs. Winston Cochran, who is past president of the Mental Health Society, in cooperation with the State Auxiliary, made a survey of physically handicapped children in our county, who number approximately 1,400.

The Port Arthur Chapter is 100 per cent in subscriptions to *Today's Health* and the *Bulletin.* Total subscriptions to *Today's Health* are 142, including 23 gift subscriptions to schools in the county. Total *Bulletin* subscriptions are 67.

One hundred and eight physicians, 127 wives, 280 children and 89 servants had physical examinations.

We entertained our doctors with an informal barbecue in March and on Doctor's Day served coffee and doughnuts at all hospitals in the morning. Port Arthur Chapter had boutonnieres for their doctors.

On October 3, 1953, we entertained the Tenth District in Port Arthur. Mrs. Mark Latimer, Houston, State President Elect, was our guest.

Our courtesy committee entertained new members with an informal get together and wrote notes to members who were ill or had illness or death in the family.

We have a wonderful new slate of officers and are looking forward to an exciting new year in auxiliary work.

MRS. S. V. GRANATA, Beaumont.

Johnson County

The Woman's Auxiliary to the Johnson County Medical Society was not as active during this year as hoped by the program committee. The committee chairmen for the various assignments did not perform their duties and many of the anticipated projects were necessarily dropped.

The annual silver tea for the benefit of the Johnson County polio fund was held in November and approximately $100 was collected.

Through our Coca Cola fund, the auxiliary purchased two open-end oxygen tents and apparatus for use in the Johnson County Memorial Hospital. The auxiliary members assisted the x-ray mobile unit by spending a full day acting as secretaries.

The program was specifically social this year to aid in interesting more members to participate actively in the auxiliary.

MRS. E. L. CLARK, Cleburne.

Kerr-Kendall-Gillespie-Bandera Counties

The Woman's Auxiliary to the Kerr-Kendall-Gillespie-Bandera Counties Medical Society submits the following report:

The present membership is 35, with an average attendance of 20 members. All members are notified of meetings by the telephone committee. Nine meetings were held on the first Friday of the month in the homes of auxiliary members. Each was a combination social and business meeting.

The sum of $70 was sent to the State Treasurer for dues, and $15 was contributed to the Library Fund. Recently Mrs. Sam E. Thompson, Kerrville, donated $50 to the Past Presidents' Fund to be used to purchase rare books.

Publicity reports were sent to all local newspapers and to the TEXAS STATE JOURNAL OF MEDICINE by our secretary.

Kerr County sponsored the tuberculosis seal sale. Patch tests given 1,610 school children in Kerr County; 352 x-rays of food handlers were paid for by the tuberculosis association; and the mobile x-ray unit with a total of 3,359 x-rays made, was sponsored.

Total subscriptions to *Today's Health* magazine was 72. Nine were gifts to schools from our auxiliary and 12 were gifts to the country schools from individual doctors.

Nurse recruitment was stressed and the main project was establishing the student nurse loan fund. Two young women chosen by a selective board entered the Baptist Memorial Hospital School of Nursing in San Antonio in September, 1953. The loan provides the entire tuition and will become a gift if upon graduation the nurses return to their respective communities and practice their profession for two years.

The outstanding social affair was the President's Day tea given in the home of Mrs. Sam Thompson. We were honored to have as our guests the State President, Mrs. E. W. Coyle; Past State President, Mrs. Frank Haggard; and council woman of District 5, Mrs. John L. Pridgen, all of San Antonio.

The end of our auxiliary year will be marked by an outdoor meeting and barbecue supper in June honoring the doctors of the four counties.

MRS. L. A. FELLER, Fredericksburg.

Lamar County

Our year opened auspiciously with the visit of the State President, Mrs. E. W. Coyle, San Antonio, for our first meeting in October. Her suggestions were helpful and timely, and her enthusiasm was contagious.

During the summer, eight of our members assisted with the registration of the mass chest x-ray in Lamar County. We also started plans for cooperating with the Lamar County Medical Society on a medical exhibit for the Lamar County Fair. In October, the exhibit was obtained through the AMA and was visited by 10,176 people. We felt it was especially worthwhile, because it reached many rural residents who ordinarily have little opportunity to see what modern medicine is accomplishing.

Our monthly meetings, held in the homes of our various members, have been three-fold in purpose. We have tried to combine business and education with a social hour.

In November, Dr. Donald Lewis, Paris physician and company surgeon for the Babcock-Wilcox plant in Paris, spoke on "Industrial Medicine in our Community."

In December, the Lamar County Medical Society gave its annual dinner party honoring the medical auxiliary at the Paris Golf Club. We expressed our appreciation by pinning a red carnation on each doctor that night.

At our March meeting Mrs. Perry Booth, counselor at Paris High School, discussed "The Guidance Program as an Aid to Mental Hygiene."

In April, Dr. W. W. Fitzpatrick, Paris physician who has been interested for many years in the health and adjustment problems of older people, will speak on geriatrics.

Under the leadership of Mrs. Malcolm Johnson, nurse recruitment chairman, two Future Nurses Clubs were formed in the Lamar County Medical District—one at Paris High School and one in Cooper. The auxiliary furnished refreshments for the club meetings at Paris High, and served tea for the joint meetings of the Paris and Cooper clubs. About sixty-four girls were contacted during the year. In April, a representative from St. Paul's Hospital in Dallas is coming to talk to the clubs, and in May the senior girls are to be taken to Dallas to see the nurses' training program at some of the Dallas hospitals.

Our auxiliary consists of 23 active members, 6 associate members, and 5 honorary members. Our group had their yearly physical examinations and reported that a representative number of their husbands, children, and servants had been examined as well. We contributed to the AMEF through gifts put in a "Pot of Gold" at each meeting.

Our members have been active in various civic organizations. One of our members, Mrs. O. W. Robinson of Paris, is district director of the Texas Division, American Cancer Society, and another, Mrs. W. W. Fitzpatrick, is co-chairman of the service committee of that organization. Our auxiliary has voted to sponsor a loan closet for the local cancer society and has already secured two wheelchairs.

We have contributed to the Auxiliary Memorial Library and Student Loan Funds, and have turned in fifteen subscriptions to *Today's Health.*

MRS. GEORGE S. WOODFIN, Paris.

Liberty-Chambers Counties

We have had our usual busy, informative year. Our monthly programs have consisted of monthly reports of pending federal legislation with special reports and discussions for self-education on such topics as the American Medical Education Foundation, which resulted in the first 100 per cent contribution reported in the state; mental health; public service as concerns the medical auxiliary; civil defense preparation in Texas; and polio facts relevant to our community.

Our special projects were as follows: *Bulletin* subscription 100 per cent; contribution of $2 per member to the Library, Student Loan, and Memorial Funds; a $5 contribution to the local tuberculosis seal drive; a luncheon for the State President; a Christmas luncheon for our auxiliary; Doctor's Day observance in the form of a supper for the doctors and their families; a public relations tea with a guest list of 500 entertained with a book review; and the showing of nursing film, "Keepers of The Lamp," to five of our county high schools.

In addition to our scheduled program our members are active participants in the local PTA, the numerous charity-fund drives; Boy and Girl Scouting; and the Red Cross blood drives; and we have members who serve on the various boards of the cancer, crippled children, muscular dystrophy, and similar foundations.

Our auxiliary includes two counties, and of our 14 members only 12 are able to participate actively in our yearly program.

MRS. O. W. HARRIS, Liberty.

Lubbock-Crosby Counties

We feel proud of the work of our auxiliary this year, although our total accomplishments will not be reflected in our statistical reports. It has been largely in a change of emphasis and in reorganization of responsibilities, and we feel that these changes will certainly improve and extend the influence of our auxiliary within the communities of the Lubbock-Crosby area.

We began by formation of an executive committee, and our business sessions at our luncheons have been more pointed and shortened by the executive committee having specific recommendations to present for consideration.

Some of the innovations have included the use of permanent and legible name tags worn at each luncheon. We found this helpful since our membership is largely new. Our membership chairman, Mrs. A. G. Barsh, has used double postcards to notify the membership and to make reservations for each luncheon instead of telephoning. This is not only time-saving but more effective in reaching out-of-town doctors' wives and those not easily accessible by phone, such as members at Reese Air Force Base. We believe this is the reason for our increased attendance from these groups as well as the Veterans Administration doctors' wives.

We have increased the number of our committee chairmen this year. Our geriatrics committee, Mrs. C. E. Payne, chairman, was new and did fine work in setting up a plan of visitation by teams of two doctors' wives to the Garrett Convalescent Home. Members visited, gave small gifts, ran errands, and invited some of the elderly people to dinner in their homes. We also instituted a "Project Finding Committee" to consider a permanent project for our auxiliary. We have found that many of the proposed projects for auxiliaries are already being done capably by other groups in our community. In the field of nurse recruitment, for example, the Lubbock Memorial Hospital Auxiliary which includes lay women has been active. So we have been considering several possibilities where we could make a real contribution without overlapping.

We also have had an active constitution committee which has written a new constitution and by-laws, and we are waiting to adopt it until the new state constitution is passed.

We have had a more concerted effort in public relations, having discovered to our sadness that the newspaper was not even aware we had monthly meetings. We asked the editor of the Woman's Page to speak to us and have seen to it that she had adequate news of our activities. We had an attractive yearbook this year.

We were privileged to have our county medical society president, Dr. Wallace Hess, speak to us on the work of our medical society. Because we discovered we were really uninformed about its work, we now have in our meetings a liaison member of the society's executive committee, Dr. Marie Shaw, so we can know how we can best cooperate.

This year we also have initiated a requirement for our officers and committee chairmen to submit written reports at the end of the year for our auxiliary archives. We are asking this year that they also include a list and time schedule of their duties and suggestions for more effective work of their committees. We are hoping to compile from these a handbook for our future officers.

This year for the first time we have included a president-elect in our slate of officers. We also had an informative program at each monthly meeting; and also for the first time, we contributed $100 to the American Medical Education Foundation and $25 each to the Memorial, Library, and Student Loan Funds. In January the county society and auxiliary together had a dinner and dance—a purely social affair—which we felt was a huge success, and we hope we have thereby begun a yearly tradition.

MRS. WILLIAM C. SMITH, Lubbock, First Vice-President.

McLennan County

Our main need this year was to get the interest of the members and increase our attendance. The program committee, with this in mind, decided on varied programs, some of which were sure to interest everyone.

The first meeting was a brief business meeting followed by a style show with auxiliary members as models. Guests were invited and our year began with a large meeting and good public relations. Other meetings were on: civil defense, gardening, a luncheon honoring the State President, mental health and a book review given by an auxiliary member, Mrs. C. G. Shellenberger.

Before anyone could catch their breath after the first meeting, we began work on a booth at the Heart-O-Texas Fair. The medical society gave us the space and we were to do the work. Never having done anything like this before we "rushed in where angels fear to tread" and started gathering things together. We did not hesitate to ask anyone for anything and much to our surprise everyone responded with a great deal of interest. With the exception of a very few who were physically unable, every member helped. Posters were made to be used as a backdrop in the booth, members were signed up to man the booth for a week, wires and letters were sent, and material was sorted and worked into the overall plan. The theme was mainly that of the free services offered the people of McLennan County by the medical society. In addition to the posters on the main theme, we used an exhibit from the AMA called "Food Facts and Fallacies," a showcase of old and new instruments, and, as a drawing attraction, we borrowed a skeleton

from Medical Plastics Laboratory in Gatesville. The skeleton proved to be the best eye-catcher we could have found because it attracted children as well as adults and brought forth numerous questions. To help man the booth the schools of nursing sent students in uniform and literature for distribution. The booth received excellent publicity and, I believe, gave the members a feeling of having done something along the line of public relations to help the doctors.

This year we have continued to sell subscriptions to *Today's Health*. At the time of this report we have credit for 1,921 copies. Some of these, as they were last year, are to schools where they are used in the health classes and others to individuals.

To help the tuberculosis association, the auxiliary gave one day to register people for the free x-rays. Then at Christmas we furnished the dinner for the patients at the tuberculosis hospital.

We have not dealt too much with nurse recruitment. However we do have a small fund set up to be used for small personal loans by students of both local schools.

This has been a full year and I feel that by each member having done some job, a new or renewed interest has been created. Our attendance, though still not what it should be, has increased. At least we can say that every member has done some one thing during the year.

MRS. ELDON B. FINE, Waco.

Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties

The Woman's Auxiliary to the Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Medical Society had 22 members last year and now has 23, 4 of whom are new members, and 3 associate members.

The second Friday of March, June, September, and December are our meeting dates. An average of 6 to 10 members are present usually.

In September Mrs. A. P. Utterback, Brackettville, president, spoke on mental health and socialized medicine. Mrs. Julia Dorian spoke on public relations in December. At the same meeting officers were elected and a discussion of the project was held. A polio film was shown and "Touring a Ceramic Shop" were on the program at one meeting. A social meeting with the doctors is held each meeting date.

MRS. A. P. UTTERBACK, Brackettville.

Nacogdoches County

The Nacogdoches County Medical Auxiliary has 16 active members. Nine meetings are held annually in the homes of the members, with an average attendance of 12 members.

The AAPS essay contest was sponsored locally by the Nacogdoches Medical Society. Our essay chairman placed package libraries in approximately eleven high schools. Four schools participated, turning in sixteen essays.

Our annual Silver Tea was held in November and the money contributed was used to complete payment on an air-conditioner placed in the doctors' obstetrics waiting room at City Memorial Hospital.

We have been active in selling *Today's Health* and fourteen subscriptions have been sold to date. We contributed to the Library Student Loan and Memorial Funds, and the Junior Chamber of Commerce's Christmas Cheer Fund. We have worked with the Red Cross and March of Dimes drive.

Activity has continued concerning legislative matters; thirty-six cards have been mailed to legislators.

We observe Doctor's Day on May 15 by giving a boutonniere to each doctor and placing floral sprays at the cemeteries.

MRS. EUGENE S. ROGERS, Nacogdoches,
Secretary-Treasurer.

Navarro County

Our programs have emphasized different phases of auxiliary work. We had three different programs with out-of-town participants. Mrs. E. W. Coyle, San Antonio, State Auxiliary President, and Mrs. Milton Spark, Waco, District 12 council woman, visited in October. Mrs. W. F. Armstrong, Fort Worth AMEF Committee member, reviewed *Medicine and Magic in Childbirth* for us. Dr. Robert Kimbro, Cleburne, chairman of the Board of Trustees of the Texas Medical Association, was our speaker for our Doctors' Day banquet.

Our chief achievement in public relations was in sponsoring the Navarro County Heart Fund Drive. We not only collected over $600 for the heart drive, but also distributed much instructive literature on heart disease. Our benefit coffees stimulated outside interest in our auxiliary. We showed the heart film "Be Your Age" to our own group and to a men's luncheon club. We remembered each aged person in our Twilight Home with a gaily wrapped Christmas gift.

Radio station KAND has continued its weekly health broadcasts from programs of the American Medical Association. Our members assumed a large portion of the clerical work connected with the chest survey done by the mobile x-ray unit. We were well represented by members active in Red Cross blood collection, the polio drive, PTA, and civil defense.

Our membership consists of all eligible wives in this county and numbers 25. Our average attendance at our monthly meetings is 16. We are 100 per cent subscribers to *Today's Health* and have a total subscription list of 62. Nine members take the *Bulletin*.

Our contributions to the Auxiliary Benevolent Funds are the following: Library, $16; Student Loan, $5; AMEF, $5; and Memorial, $284.40.

We had only one school to have entries in the AAPS essay contest. Copies of our yearbook and history were mailed to the State Historian. We plan to bring our scrapbook to the state meeting.

Our report on physical examinations in our families shows much progress over last year's. Our legislative chairman kept us informed on bills in Congress, and we wrote our legislators regarding the Bricker Amendment. The only work on nurse recruitment has been to assist the health nurse in showing the film "Keepers of the Lamp" to the high schools in the county.

MRS. PAUL H. MITCHELL, Corsicana.

Nolan-Fisher-Mitchell Counties

The Woman's Auxiliary to the Nolan-Fisher-Mitchell Counties Medical Society meet twice a year for a social meeting. All members participate in community activities, support all health work and drives, work in clubs, PTA, and other organizations. The Public Health unit distributes information, shows films, and the like.

MRS. T. D. YOUNG, Sweetwater.

Nueces County

To give an annual report of the activities of the Woman's Auxiliary to the Nueces County Medical Society for the year 1953-1954, it seems appropriate to begin with the ob-

ject of our organization: "The object of this organization shall be to bring into closer fellowship the families of members of the Nueces County Medical Society and to engage in any educational, philanthropic and social work upon which the body may decide." In pursuance of the first part of this object, the auxiliary has held five social meetings: a dinner which celebrated Doctor's Day, a covered dish luncheon, a picnic to which the doctors were invited, a morning coffee honoring the new members, and a Christmas open house which was shared by the doctors. There were also four luncheon meetings with the following programs: a movie and lecture on the American Cancer Society, speakers from the four local hospital auxiliaries, a regular business meeting, and a final meeting presenting the annual reports and installation of the new officers. In pursuance of the second part of our object, our auxiliary contributed the financial means for the completion of a three years education in nurse's training for one student and further paid the expenses for her graduation from the St. Joseph's Hospital in Fort Worth. The auxiliary was represented at a meeting of the National Tuberculosis Association by Mrs. George Schuster and Mrs. Rex House. Under the capable chairmanship of Mrs. J. V. Blair and Mrs. W. C. Triplett, the auxiliary furnished forty volunteers for registration for the tuberculosis x-ray program.

The auxiliary contributed $5 each to the Student Loan, Library, and Memorial Funds, and $20 to the American Medical Education Foundation.

There are 129 members, with only 3 wives of members of the Nueces County Society not members of the auxiliary.

Seventy-one subscriptions of *Today's Health* were purchased by auxiliary members. Many of these subscriptions were sent to libraries, schools, beauty shops, and hospitals.

The auxiliary was represented at the 1953 State Auxiliary Convention in Houston by Mrs. Harold E. Griffin and by our Sixth District council woman, Mrs. June Yates. The president and Mrs. Yates attended the Executive Board meeting of the State Auxiliary held in Austin in September, 1953.

At the July meeting of the Fifth and Sixth Medical Districts, members aided the doctors by taking complete charge of the registration of all delegates. The Nueces County Auxiliary was hostess to those auxiliary members of Districts 5 and 6 present at a luncheon and style show at the Corpus Christi Country Club. At this meeting it was our privilege to hear a talk by the President of the State Auxiliary, Mrs. E. W. Coyle of San Antonio.

The most outstanding work done by our auxiliary in the past year has been in the field of public relations. Since it was the feeling of the president and the executive board that the auxiliary can best help the doctors by creating good public relations in the community, a program was set up whereby fifty outstanding men and women who are leaders in Corpus Christi were invited to attend clinics where the doctors give their services in an effort to promote good health and thereby improve conditions in our city. Mrs. L. W. O. Janssen, as chairman of the public relations committee, assisted by Mrs. James Sharp, Mrs. King Gill, and Mrs. A. J. Ashmore formulated this program, and auxiliary members conducted lay people to the clinics. There they were able to see the organization of the clinics, the social service departments, the nursing care, the services of volunteers, and the doctors who were giving their valuable time and services to benefit the community welfare. The program was extended over a period of a week, with visitors going to the Driscoll Foundation Hospital, Crippled Children's Hospital, and Memorial Hospital. After the people were conducted through the clinics they were invited for coffee in the morning and tea in the afternoon at the home of some member of the auxiliary. This social period afterwards allowed an exchange of ideas between the visitors and the auxiliary members. It was felt this educational program was successful because the people who participated showed intense interest in the clinics and expressed amazement at how much service the doctors give to improve the community.

I wish to thank all the members of the executive board and the chairmen of all committees for their capable assistance which has made serving as president of this organization a pleasure.

MRS. SAM POWELL, Corpus Christi.

Orange County

The Woman's Auxiliary of the Orange County Medical Society has a roster of 20 paid members and 5 honorary members. The auxiliary's main project for the year was to sponsor a spastic center in connection with the polio therapeutic ward at Orange City Hospital. We are working to raise money for more equipment and also are encouraging parents with spastic children to show that these children can be made into useful citizens.

The auxiliary has several members active in the League of Women Voters and Mrs. O. C. Seastrunk is president of the Orange Women's Club. The Women's Club chose for their main theme "Mental Health," and two of our doctors have been guest speakers. The auxiliary has also had a mental health program this year.

The auxiliary and medical society jointly sponsored the AAPS essay contest, giving three prizes of $25, $15, and $10.

We furnished *Today's Health* subscriptions to each of the schools and these were greatly appreciated.

MRS. DAVID BENNETT, Orange.

Pecos-Jeff Davis-Presidio-Brewster Counties

The Auxiliary had charge of all preparations and management of the blood mobile when it was in Fort Stockton August 5, 1953. We were notified that of the towns having the blood mobile in the town for only one day, we ranked third in the state for having the most donors. This was our year's project.

The members of our auxiliary donated $10 to be sent to the State Memorial Fund.

All members as individuals give to needy families during the year. We do not have the Community Chest here. Heart, cancer, polio, and other drives are donated to on an individual basis. Members of the auxiliary help on each of these drives.

Mrs. John W. Pate of Sanderson is financing the education of one girl in nurse training school. We asked Mrs. Charles Honaker, registered nurse and supervisor at Memorial Hospital, Fort Stockton, to talk to the girls in an assembly at school on nurses' training. The doctors' wives have a party each Christmas for the nurses of Memorial Hospital.

We have had twelve members of our auxiliary, or members of their families, to have complete physical examinations.

In December we were hostesses to the doctors' wives who attended with their husbands the medical seminar in Fort Stockton. We arranged a luncheon, style show, and bridge party for the ladies during the day, and a cocktail party and dinner for the doctors and their wives that night.

We have 13 paid members, but, I am sorry to say, we have only four active members. Therefore, it is difficult to achieve much. Our main goal is to stay organized! With

so few active members we only have two offices, president, Mrs. Charles E. Oswalt, Jr., and secretary, Mrs. George Hoffman, both of Fort Stockton.

MRS. CHARLES E. OSWALT, JR., Fort Stockton.

Polk-San Jacinto Counties

The Woman's Auxiliary to the Polk-San Jacinto Counties Medical Society has 7 members. The members work as individuals in civic affairs.

MRS. T. L. GARDNER, Livingston.

Potter County

There were two outstanding results in the activities of the Woman's Auxiliary to the Potter County Medical Society: (1) Through complete cooperation with the county medical society, we were able to achieve 100 per cent paid membership—including new members and formerly delinquent members. This was accomplished by the collection of our dues from the doctors at the time they paid their society dues. (2) The mental health play "Scattered Showers" was performed by our own members at the regular March meeting of the auxiliary. It elicited enthusiastic response and resulted in numerous invitations for performance before lay groups, including a women's circle meeting at the First Presbyterian Church, a child study club, a regular meeting of the local mental health society, and an elementary school PTA meeting.

We participated in

1. sponsoring the AAPS essay contest in four high schools and receiving 35 entries, and awarding prizes in the amount of $200, the first prize being $100;

2. promoting a considerable increase in new subscriptions of *Today's Health* including gift subscriptions to three junior high school libraries;

3. observing Doctor's Day by decorating the dinner tables at the regular March county medical society meeting with flowers, a physician's bag of one of the first Panhandle practitioners, and also numerous amusing cartoons and anecdotes at individual places—producing a pleasant, informal, jocular atmosphere;

4. holding a Christmas tea in a private home as a strictly social function to which wives of doctors at the Veterans Administration hospital and the Amarillo Air Force Base and dentists' wives were invited as one of our public relations activities;

5. contributing to the Library, Memorial, and Student Loan Funds; and

6. giving, on an individual basis, numerous hours of volunteer service in community service.

Other programs on regular meeting days included talks on: juvenile delinquency, given by the former district attorney; religion and health, given by a specially qualified pastor; and life in Germany, given by a young lady with the Special Services Division of the United States Air Force.

This auxiliary was hostess auxiliary to the Panhandle District Meeting in April. A luncheon was held in the Amarillo Country Club, with excellent attendance and representation from many areas of District 3. Our State President, Mrs. E. W. Coyle, was an honored guest and the principal speaker. We feel that this was a most successful meeting because of her informative speech and the excellent response in attendance.

MRS. WILBERT E. SCOTT, Amarillo.

Red River County

The Woman's Auxiliary to the Red River County Medical Society was 4 members. Films and speakers were furnished for PTA meetings. The meetings are held on a social basis but we discuss ways in which to help in civic affairs. Members worked in Red Cross, polio, tuberculosis, heart, cancer, and crippled children drives and in church work.

MRS. J. L. WRIGHT, Clarksville.

Reeves-Ward-Winkler-Loving-Hudspeth-Culberson Counties

Our meetings are held in conjunction with those of the medical society on the third Thursday of each month. Members from Kermit, Monahans, and Pecos alternate being hosts for the meetings.

The highlight of this year's activity occurred on February 12, 1954, when the District 1 medical meeting was held in Pecos. We felt honored to have among our guests Mrs. George Turner of El Paso, National Auxiliary President-Elect, Mrs. E. W. Coyle of San Antonio, State Auxiliary President, and Mrs. Robert Thompson of El Paso, past State Auxiliary President. The business meeting was presided over by Mrs. Harold Lindley of Pecos, District 1 council woman who, in turn, introduced the main speaker, Mrs. Coyle. Much was learned of Auxiliary objectives and achievements from Mrs. Coyle and a congenial atmosphere was enjoyed by the entire group. Members from each town in our auxiliary did much to make this meeting a success.

"Angry Boy" was shown to junior and senior high school PTA groups as a project on mental health. A tea and film on nursing as a career are planned for interested high school girls on April 22. Members also have contributed much time and effort toward various community projects, including the Community Chest drive.

MRS. H. W. MARTIN, Pecos.

Runnels County

The Runnels County Medical Auxiliary has a total of 6 members. We have been inactive as a group. New officers are appointed every two years, election being in the odd years.

MRS. LLOYD DOWNING, Ballinger.

Rusk-Panola Counties

The Rusk-Panola Counties Medical Auxiliary has an enrollment of 18 active members who meet every third Tuesday of each month with their husbands for dinner either in Henderson or Carthage. After dinner the doctors withdraw for their meeting and the ladies to theirs.

Clearly the two outstanding programs this year which the auxiliary has presented have been the meeting for civil defense and the work done on the AAPS essay contests.

The program on civil defense was held at the first meeting in September, at which time two directors of civil defense from Smith County and the county judge of Rusk County were asked to be the guests of both the doctors and their wives. The film from the State Medical Library, "They Also Serve," was shown. Following the showing of the film, the guests were asked to speak. These talks were so stimulating that further work on civil defense was accomplished by setting up a program for defense by the county judge assisted by members of the medical auxiliary. Outstanding men throughout the county were appointed to fill pertinent places, and once a month meetings were held at the Rusk County Courthouse.

A great deal of interest has been shown in Rusk County in the fight against socialized medicine, and this year twenty-nine students of Henderson High School entered the essay contest. The local doctors contributed $100 toward the

prizes, and after the judges had selected the three outstanding essays, an auditorium program was arranged by the superintendent of schools, Mr. Earl Adams. At this time, a member of the press was present and the local radio cooperated with a direct broadcast. Pertinent parts of the essays were read by the contestants and the prizes awarded. The essays will be published in full by the local paper.

The superintendent of the local hospital is cooperating with a program of nurse recruitment and in the last summer enlisted the interest of fifteen young girls through the sponsorship of the superintendent of the senior department of the First Methodist Church of Henderson. The girls were given such work to do in departments of the hospital as wheeling patients outside, reading to children and elderly patients, taking care of the flowers, helping in the kitchen, carrying trays, and the like. This program has been the means of creating much interest in nursing.

MRS. JESSE E. ROSS, Henderson.

San Patricio-Aransas-Refugio Counties

The Woman's Auxiliary to the San Patricio-Aransas-Refugio Counties Medical Society has increased its membership from 5 members-at-large to 20 active members. We are minus 1 member of having 100 per cent. Subscription credits for twelve *Bulletins* and eight *Today's Health* have been gained.

Five students have entered nurses' training schools and four have entered vocational nurses schools. The highlight of our year was a visit on March 9 from Mrs. E. W. Coyle, State President, with the Kleberg-Kenedy Auxiliary as our guests.

MRS. J. L. PIERCE, JR., Sinton.

Smith County

Since its inception, the Woman's Auxiliary to the Smith County Medical Society has placed particular emphasis on fostering good fellowship among its members and their husbands. Along with "internal friendliness," public relations also is stressed. With these two objectives in mind, our opening meeting, an evening dinner meeting attended by our husbands and featuring Mrs. E. W. Coyle of San Antonio, State President, as special honor guest and speaker, and our April guest day tea, to which each auxiliary member brings several lay guests, were planned. Knowing each other, we learn that it is indeed only "the little things that create differences, that in the big things of life we are as one."

Feeling a strong need to familiarize ourselves with our state institutions, we based our programs for the year on "A Survey of State Institutions." Talks provided by well-qualified speakers each were followed by a lively question and answer period, revealing a strong desire on the part of our membership to be informed. We had one unscheduled called meeting at our nurses home, when it seemed that there was an urgent need for our women to learn much about the progress of our infant Texas Eastern School of Nursing, now in its third year. All our meetings have been well attended throughout the year. We have had a thirty-minute social period at each meeting, further advancing our objective of knowing each other.

We have attempted to give thought and attention to the many sober objectives of our parent organization. We have again sponsored the AAPS essay contest, offering the same prizes as last year. We are sponsoring a student nurse through our nurses loan fund. Our standing committee chairmen have performed their duties well. We also this year revised our constitution and by-laws which were in its original form of 1934 when our Auxiliary was chartered. Many of our members are active in a wide range of civic and community affairs and projects, and we are proud of their eagerness to accept responsibility. My year as president has been a satisfying and rewarding one.

Incoming officers of our auxiliary are: president, Mrs. E. H. Caldwell; vice-president, Mrs. R. E. G. Baldwin; recording secretary, Mrs. William Rowe; treasurer, Mrs. Albert McCulloh; and historian, Mrs. C. E. Willingham.

MRS. JESSE GOLDFEDER, Tyler.

Tarrant County

The Tarrant County Auxiliary accepted the State President's challenge in making her theme for the year, "Knowledge, Judgment and Action in Health Leadership," our guiding light for the year's work. We decided to cooperate in all lines of state endeavor, putting special emphasis on bettering public relations through community service and on the recruiting of nurses.

Our programs have been varied in an attempt to appeal to all interests and encourage attendance at the meetings. Some have been educational, some entertaining. For entertainment there have been a book review, *Forty Odd* by Mary Bard, and a travelogue, "Island Hopping in the Caribbean." To appeal to those who enjoy working with their hands we had programs at Christmastime on "Candle Making" and "Christmas Decorations," and for our May program we have planned "Corsage Making" with each member participating by working along with the demonstration. We had Dr. Mary Karriker, director of the Crippled Children's Center, speak on "Speech Therapy." We had two guest meetings, one at Christmas and a style show luncheon in March.

A summer series of television shows, "Help Yourself to Health," presented by the public relations committee, was sponsored by the auxiliary. These thirteen weekly shows gave information to housewives and mothers on recognizing danger signals, what to do until the doctor comes, first aid, and baby care. Graduate nurse members of our group demonstrated procedures as they were discussed. The medical society cooperated by providing doctors for discussions on polio and the services provided by the medical society. One program was a style show of uniforms worn in several fields of nursing and was given in the interest of nurse recruitment.

The public relations committee provided the program at our regular meeting in April and presented a talk by the director of the local Red Cross chapter entitled "Your Public Relations Are Showing," a discussion of individual public relations.

The nurse recruiting committee has worked with a local camera club in producing a film in sound and color to be used in interesting girls in the nursing profession. Hospital auxiliaries, the Red Cross, the medical society, and the District Graduate Nurses' Association provided the funds to be used and our committee furnished the technical information, arranged for locations for taking the pictures, and supervised the complete operation.

One full scholarship has been provided for a nursing student this year by the auxiliary. A benefit variety show was given by the doctors and wives to provide money for the scholarship fund in order that another student may begin training in August. About fifty of our group participated in the show. We also provided clothing for two student nurses receiving scholarship aid from other organizations.

The social service committee has worked with the Foun-

dation for Visually Handicapped Children, providing clerical help and the money for a record player to be used in the work with blind children.

Publicity, which has been one of our problems in the past, has been excellent this year. We have provided much material to the Woman's Page editors of the newspapers by sending our monthly newsletter to them. Beginning with a full page in the spring on the community service work done by the auxiliary, frequent articles have been in print about the families and activities of individual doctors as well as the organization as a whole.

The legislative committee has reported each month, either at the regular meeting or in the newsletter, on items of interest in government on the local and national level. As a result of interest so stimulated, the Tarrant County group had reported 976 communications with congressmen and senators and 52 personal calls on them. A resolution was passed in favor of the Bricker Amendment and our representatives so notified. Payment of poll taxes was stressed.

The mental health chairman reported on the result of the county survey on mental health conditions and means for taking care of problems resulting from these illnesses.

To further our aim of closer fellowship, the auxiliary has continued the custom of small coke parties in each district of the city before the first meeting in the fall. Special efforts were made to see that the previous year's new members attended in order that old and new members might become acquainted before the general meeting. We also have sent out a monthly newsletter containing announcements, committee reports, and personal items so that all our members will be informed on the activities of the group.

Doctor's Day was observed with a dinner given by the medical society and the presentation of the "Gold Headed Cane" Award to the outstanding local physician of the year.

Two parties were given by the auxiliary—a masquerade dance and breakfast at Halloween and an informal supper at the Boat Club in the spring. Each committee was entertained by its chairman during the year. The variety show was staged cabaret style and dancing was enjoyed after the show.

A full and interesting year has been enjoyed by all our members. We have had 34 new members. One hundred and eighty-five of our members have served on committees. One of the nurse administrators summed it up very well when she commented, "You really have an active medical auxiliary here, don't you?"

MRS. W. N. JENKINS, Fort Worth.

Taylor-Jones Counties

The Woman's Auxiliary to the Taylor-Jones Counties Medical Society began its work in September with a coke party for senior high school girls in the interest of nurse recruitment.

In November it was our pleasure to have our State President, Mrs. E. W. Coyle, with us. She gave us a stimulating talk on the plans for the year's work.

The Christmas party was a dinner-dance entertaining our doctor-husbands. The auxiliary voted to take out membership in the mental health society. Also it voted to contribute to the American Medical Education Foundation, members making individual contributions. Twenty-five dollars was given to the student nurses at Hendrick Hospital toward improvement of their recreation room.

Subscriptions were taken to *Today's Health* magazine and the *Bulletin*.

The AAPS essay contest was sponsored, the chairman having contacted each of the sixteen high schools in Taylor and Jones Counties.

Hostesses were supplied for the mobile x-ray program of the Texas Tuberculosis Association while it was in our city. Several members devote regular time to the rehabilitation and education program for cerebral palsy and crippled children at the Taylor County Crippled Children's Center.

Health talks on cancer were given by members. They also participated on mental health panels.

Our March meeting was devoted to public relations and legislation. Mr. Robert Kennedy, public relations representative for our local utilities company, gave the auxiliary an invigorating talk on how, in her manner and speech, the doctor's wife is a walking example of public relations in her community.

Doctor's Day is planned for May.

MRS. SOL B. ESTES, Abilene.

Tom Green-Eight County

The Tom Green-Eight County Medical Auxiliary, with 48 members, has tried to bring individual service into our everyday lives. In May, we will have had nine meetings: 4 business and social, 3 of varied social themes, 1 joint meeting with the county medical society, and 1 strictly social honoring husbands.

We have followed a policy of being informed on local activities, both civic and political affairs, and having a working knowledge of state and national problems.

Our members are active in various activities locally, having given approximately 3,000 hours to volunteer services including Community Chest drive, cancer drive, baby clinic, handicapped children clinic, transportation for Young Women Service League clinic, tuberculosis bungle sale, United Council of Church Women, and League of Women Voters.

Of special note is the work of the welfare committee in helping to plan for improved conditions for inmates of the city jail and providing Christmas for residents of a local rest home for the aged.

A course for instructors in home nursing is being planned with four of our members enrolled.

Members serving on various executive boards report important activities to our organization, and our time and efforts are employed in helping further their well being. We have representation on the following boards: Community Council, health and medical section of Community Council; Family Service, parent-teacher, heart, cancer, infantile paralysis, and tuberculosis associations; Tom Green County Baby Clinic; handicapped children's clinic; San Angelo Day Nurseries; council of churchwomen; Episcopal Guild; symphony association; county library; City Federation of Women's Clubs; and Y Service League.

We have attempted to continue to improve our public relations by working with others on the aforementioned activities as well as having two meetings for visitors, one specifically honoring members of the Federated Clubs.

We are sponsoring the AAPS essay contest for the first time.

A full scholarship has been given one student nurse as a gift; and a nurse recruitment campaign is to be carried out in the high schools this spring.

MRS. WILLIAM LACEY SMITH, San Angelo.

Travis County

The Woman's Auxiliary to the Travis County Medical Society shows an increase of 1 member over last year, making a membership of 159. Sixteen of this number, however, are new members.

With the growth of the auxiliary, the personnel file was renewed this year. Keeping in mind the objectives of the

auxiliary and drawing from the personnel file and material mailed us, the committees were set up and program planning started. Many program planning hours in early summer by the chairman brought great dividends and a fruitful year through much interest in programs and good attendance. Seven combination business and social meetings were held and one social.

Our guest speakers were ten in number and included Mr. C. G. Fairchild, assistant director, Vocational Rehabilitation Division, Texas Education Agency; Mrs. E. W. Coyle, State Auxiliary President; Miss Elizabeth King, nursing arts instructor at Brackenridge Hospital in Austin; and Miss Ruby Neubauer, authority on vocational nursing.

The most outstanding program was our public relations program. An interesting talk on vocational rehabilitation was given. Also, our members were interested to hear representatives from the hospital auxiliaries tell of their work and the membership. Mrs. Fred C. Norris of the YWCA was given speaking time on this program because last year a nursing scholarship was set up through this group, and, too, because it was celebrating its centennial year.

All members and guests enjoyed the program on "Talents and Hobbies." Painting and sculpturing were exhibited. One member told that she took up gardening on advice of her doctor.

Speakers on all programs were limited to twenty minutes including a question and answer period. Several were given only two to three minutes. We did this to maintain the interest of the membership and to keep the length of meetings within one and one and a half hours. Committee planning was done over cups of coffee, thereby allowing us to get better acquainted. Approximately ten coffees were held, including one for the district auxiliary women.

Outstanding is the work of our civil defense committee. All work offered has been completed. Ten members hold first aid cards and ten others took the course but chose not to complete notebook requirements. A second class is being held. A film "The Waking Point" was shown and cards showing the qualifications of members have been completed and placed on file at civil defense headquarters.

Our *Today's Health* chairman proudly reported an increase of 50 subscriptions. Twelve schools, libraries and organizations were given subscriptions. We will use these powerful words "the only authentic health magazine" and work toward placing this much improved *Today's Health* in the hands of the public, where it can play its part in health and public relations.

The committee on nurse recruitment reports six possible recruits through personal contacts. Some on this committee will continue to work through the summer since recruits enter training in July and September.

We again sponsored the AAPS essay contest with $80 in prizes. The auxiliary staffed the blood bank every Thursday throughout the year and cooperated with the diabetic detection tests. It was voted to sponsor the organization of the St. David's Hospital Auxiliary, and we participated in the mental health survey as requested by the State Mental Health Committee. Physical examinations totaled 248. Our members chose not to go into projects with prolonged work because a majority are active in civic affairs, often as leaders and many times over as committee members.

Publicity was excellent. News of meetings usually appeared twice before each meeting and once after. A full front page of photographs of busy doctors' wives was given the auxiliary in the Sunday Society Section.

The auxiliary has made substantial contributions to United Fund, Child and Family Service, Planned Parenthood, AMEF, Library Fund, and Student Loan Fund.

We continue giving $120 annually in monthly checks to a doctor's widow who is in a nursing home. One member stated she regularly visits the aged. This year baskets of fruit were presented to homes for the aged at Christmas. We are compiling information for a doctor's daughter, aged 80, who wishes later to enter a home for the aged. One member is attending meetings on establishing a loan closet. We have a member who is co-author of a textbook on safety entitled *Live and Help Live*. The book depicts healthy living and safety in homes.

The death of Mrs. Dalton (Margaret) Richardson on February 18, 1954, was a great loss to the auxiliary.

This auxiliary year has been fruitful in the objective of promoting friendship among doctors' families. We contribute its success to all presidents and committees who served before us and to the cooperation and enthusiasm as shown by all members. Also most appreciated are all the materials now available to us.

MRS. CHARLES B. DILDY, Austin.

Upshur County

The Woman's Auxiliary to the Upshur County Medical Society has 4 members, the same as last year. One meeting, social in nature, has been held. Two personal communications were sent to legislators. Members have participated in the civil defense program which is under way in the area.

All four members are active in church, school, and civic affairs. We promoted the County Health Unit. Contributions and services were given to Red Cross and polio, and three members assist in the crippled children's clinic. Members and their families have been urged to have yearly physical examinations. Members read the Auxiliary Section in the JOURNAL and the *News Letter*.

MRS. J. L. FENLAW, Gilmer.

Victoria-Calhoun-Goliad Counties

The year's work began with a luncheon for District 8 held in El Campo, with our State President, Mrs. E. W. Coyle, as guest speaker. This auxiliary was represented by two of its members from Port Lavaca, who brought a summary of Mrs. Coyle's message to our organization at its next meeting.

The suggestion brought from this meeting for methods of raising funds for the American Medical Education Foundation Fund was accepted by our members to be carried out on a volunteer basis.

The auxiliary has placed much emphasis on legislative matters this year and brought as our guest speaker our State Legislative Chairman, Mrs. John K. Glen of Houston. She imparted much worth-while information and left the members feeling much more capable of doing their part toward carrying information along to others.

One program was devoted entirely to mental health, at which time a most informative and interesting lecture was given by Dr. George A. Constant, local psychiatrist.

On March 30, Doctor's Day, a carnation will be sent to each doctor in our district. The day will be celebrated by a dinner at a local hotel with all doctors and their wives attending. Our entertainment committee will select a speaker for the evening.

MRS. HEATON SMITH, Victoria.

Walker-Madison-Trinity Counties

The Woman's Auxiliary to the Walker-Madison-Trinity Counties Medical Society has a membership of 8 and has no regular meeting time. However, we have met three times with an average of 3 attending. Most of the doctors'

wives in the communities work on the health committees in PTA, hospital auxiliaries, American Legion Auxiliaries, and study clubs. They have also assisted with drives for funds and with the blood drives. The hospital auxiliary makes bandages for the M. S. Anderson Foundation. The members work in the teen-age clubs and helped with signs for safety near the schools.

MRS. SAM R. BARNES, Trinity.

Washington-Burleson Counties

The members of the Washington-Burleson Counties Medical Auxiliary feel we have had a good year. We have had 13 members, and we are proud of the good attendance at our meetings.

Since we are a small group we have had combined social and business meetings. Three times we have met at luncheons with our business transacted afterward.

In October at one of our luncheon meetings we had as our guests Mrs. Joe B. Foster and Mrs. Mark Latimer, State Auxiliary President-Elect, of Houston. Their friendly advice and counsel encouraged us greatly in our plans for a complete reorganization of our auxiliary. Our membership now follows more closely the pattern of the state and national auxiliary constitutions.

In November six of our members worked at the chest x-ray unit in our county. Others of our members gave unselfishly of their time to the Red Cross drive.

Election of our 1954-1955 officers was held at our January meeting and the installation will be held in April.

One of the highlights of our auxiliary year was that of being privileged to be hostesses to the Ninth District Auxiliary at its meeting held in Brenham in March. At this meeting the ladies and their husbands were entertained at a chicken barbecue at the farm of Dr. and Mrs. W. A. Knolle. In the afternoon a tea was given for the ladies at the home of Dr. and Mrs. C. E. Southern.

Our auxiliary year closes in May when we plan to have a picnic for our husbands.

MRS. G. V. PAZDRAL, Sommerville.

Webb-Zapata-Jim Hogg Counties

In this first report of the Webb-Zapata-Jim Hogg Counties Medical Auxiliary, I will endeavor to set down briefly a few of our accomplishments for the past year, 1953-1954.

Many of our first meetings were devoted to organization; that is, discussions on the time and place of meetings, dues, local policies, setting up of committees, and projects for the year.

Our regular December meeting was enjoyable. Following a brief business session, Miss Diana Lafon, a home economics major, gave a demonstration of various table and holiday arrangements for the Christmas season.

We were most grateful when the doctors invited us to be their guests for dinner at the December meeting of the medical society when Mr. N. C. Forrester, Austin, Executive Secretary of the Texas Medical Association, addressed the group on "Your State Medical Association and Auxiliary." His topic was most interesting and informative to our newly organized auxiliary, particularly.

The January luncheon meeting honoring Mrs. E. W. Coyle, our State President, proved to be quite the highlight of the year inasmuch as auxiliary itself is concerned for, at this meeting, with her much-needed assistance, we were able to adopt our local constitution, to vote to sponsor the dressing program for the local chapter of the American Cancer Society, and to crystallize the final plans for the AAPS essay contest which we were sponsoring for the medical society. It was indeed an honor to have had the privilege of a visit from a gracious lady and a well-informed auxiliary member.

Another not-to-be overlooked highlight was the barbecue given by the auxiliary honoring the essay contestants and announcing the winners. This was a delightfully informal affair at which the doctors and their wives showed their appreciation to the students of the five schools who participated in the contest.

From the social angle, we have been quite successful. Several lovely buffet suppers by individual doctors and their wives, at which the local dentists and their wives, and the army medical personnel for the Laredo Air Force Base were included as guests, were given.

With all of the aforementioned activities, we feel that probably the most outstanding meeting of the year, from the actual service standpoint, was that of March 2, when our group (including the dentists' wives and widows, who are forthcoming associate members for 1954-1955) engaged in making our first dressings for the cancer society. Our dressing chairman, Mrs. M. L. Fuller, has done a splendid piece of work in organizing the program. She has contacted the hotel managers and tourist court owners who will cooperate by donating their old sheets. Our particular part in sponsoring the dressings program is to supply the old linens and to volunteer our time to make the dressings. We are proud of this project since it is the first opportunity we have had to function publicly as a medical auxiliary, and, it is also the first time this program has been done for the cancer society in Laredo.

All in all, our first year has been a little difficult with getting organized, but with such a good start and this much accomplished, there is no telling what our capacity is, nor what the future holds in store for our group.

MRS. M. E. MALAKOFF, Laredo.

Wharton-Jackson-Matagorda-Fort Bend Counties

The Wharton-Jackson-Matagorda-Fort Bend Counties Medical Auxiliary meets once a month at a combined dinner meeting with the medical society. After dinner, the auxiliary holds its business meeting and social hour while the medical society has its scientific meeting.

This auxiliary has a nursing scholarship of $50 a year to be paid back at the convenience of the nurse. At present, plans are being made to change this to a gift scholarship taking care of a nurse's tuition for three years.

The AAPS essay contest was represented by three schools with a total of fourteen entrants. The prize winning essays were entered in the state contest. A total of $95 was awarded in prizes.

The District 8 luncheon and business meeting was held in El Campo in October with this auxiliary acting as hostess. About 50 district members attended.

A yearbook was printed and distributed to the members. Individual subscriptions to *Today's Health* were sold and the auxiliary donated a subscription to all local high schools (twenty-five in number).

Many of the members of this auxiliary are active in church, civic, and political affairs.

MRS. R. E. LESLIE, El Campo.

Wichita County

The Wichita County Auxiliary has 79 active members and 17 honorary members, many of whom are still quite active in auxiliary work.

The District 13 meeting was held here in June, and it was our pleasure to have Mrs. E. W. Coyle, State President,

as our guest at the luncheon at the Wichita Falls Country Club.

During the North Texas-Southern Oklahoma Fall Clinical Conference in September, we joined our husbands and their guests for a banquet in the evening.

For our October business meeting, we toured the Wichita General Hospital (new City-County Hospital) under the direction of the administrator, Mr. P. W. Adhlstedt, who explained the great work of such an institution. Furnishing the doctors' lounge in this hospital has been our special project this year. Draperies, a sofa, chairs, and a table were bought to make it an attractive and comfortable room.

We entertained several hundred members and guests with a style show and tea in November. A February dinner-dance was enjoyed by about 200 doctors, wives, and guests, and in March we observed Doctor's Day with an informal barbecue.

Our auxiliary sponsored the Association of American Physicians and Surgeons essay contest. Prizes of $75, $35, and $15 were awarded for first, second, and third places. The winning essay will be read at the April meeting. May will find us in the country for a picnic to close our year's work.

A junior student in the Wichita Falls School of Nursing has been the recipient of much needed clothing and $70 in cash for her personal use.

Our members work with Gray Ladies and Women of Rotary at the Wichita Falls State Hospital (a mental institution), the Community Council at Sheppard Air Force Base, the Red Cross, blood bank, county-wide tuberculosis x-ray survey, polio and heart drives, the cancer clinic, and other civic organizations.

In fact, they are a group of friendly women who are ready to work at anything which benefits the community and humanity.

MRS. W. L. PARKER, Wichita Falls.

Wilbarger County

The Woman's Auxiliary to the Wilbarger County Medical Society has 17 members and has met three times this year. We have combined business and social meetings. All members contribute financially to civic drives and organizations and most work in the drives. Red Cross, polio, cancer and Community Chest have been supported in this way. The members have all read the State Auxiliary *News Letter*.

MRS. F. B. STEELE, Vernon.

Wood County

The Woman's Auxiliary to the Wood County Medical Society has had 3 members. Because of the small number of members it was voted to become members-at-large to the Smith County Auxiliary.

MRS. ROSCOE O. MOORE, Mineola.

STYLE SHOW LUNCHEON HONORING COUNTY PRESIDENTS

At 12:00 noon Monday, May 3, 1954, a style show and luncheon honoring county presidents was given in the Colonial Room of the Menger Hotel, San Antonio, with the President, Mrs. Edward W. Coyle, presiding. Mrs. S. Foster Moore, San Antonio, was chairman of the luncheon.

The invocation was given by Mrs. O. W. Robinson, Paris, a Past State President.

Following luncheon a lovely style show was presented by Joske's, San Antonio.

The President presented Mrs. A. O. Severance, San Antonio, Essay Contest Chairman, who presented Milton Copeland, Wichita Falls, AAPS essay contest state winner, who expressed his appreciation of the opportunity to enter the essay contest on the subject of "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care." He told of his belief in the private practice of medicine and urged the Auxiliary to continue its sponsorship of the contest. He mentioned that in his research he had realized anew that because of the high standards of medical education, the conscientious service by the individual doctor, and the freedom and right of the medical profession to organize this country is furnished with the finest medical care. He closed his remarks with the final paragraph of his theme: "Thus, since the private practice of medicine does furnish this country with the finest medical care, this system should be encouraged and maintained. Leadership and spokesmen should arise both from within and without the profession. All arguments for government control of medicine should be shattered by the living proof that our free way is the better way for the patients. By helping to keep the medical profession free, we will help to keep America free—and happy."

Mr. N. C. Forrester, Austin, Executive Secretary of the Texas Medical Association, brought greetings from the staff.

Dr. George Turner, El Paso, President of the Texas Medical Association, presented the first place award of $250 to Milton Copeland. In thanking Mr. Copeland, Dr. Turner said that the contest is just another expression of this generation's desire to fight for its freedom and that America won the prize—through the participants' expression of loyalty to the principles of freedom.

Following the luncheon the first business session was continued in the Minuet Room of the Menger Hotel. At 3:30 p. m. Mrs. Thomas H. Sharp, San Antonio, Chairman of Registration, announced that 478 women had registered.

Following the reports of the county presidents the meeting was recessed until 8:30 a. m. Tuesday, May 4.

SECOND BUSINESS SESSION

The second business session of the Woman's Auxiliary to the Texas Medical Association was held in the Minuet Room of the Menger Hotel, San Antonio, at 8:30 a. m. on Tuesday, May 4, 1954, with the President, Mrs. Edward W. Coyle, San Antonio, presiding.

The invocation was given by Mrs. W. R. Thompson, Fort Worth, a Past State President.

Mrs. Edward C. Ferguson, Beaumont, reporting for the Revisions Committee moved the adoption of the proposed revised Constitution and By-Laws. She stated that in accordance with the Constitution and By-Laws printed copies of the proposed revisions were sent at least sixty days prior to the Convention to members of the Executive Board and to all committee members. Amendments to the proposed revised Constitution and By-Laws which were sent in prior to the Convention were printed and handed out at the first session of the Convention, along with copies of the original proposed revisions. Action on each of these amendments was taken at this time. All amendments to the revisions were considered and voted upon individually and were adopted except the amendment under Article V of the Constitution, Section 1, which would have inserted the words "and county presidents." In accordance with this action, the words "and county presidents" were added to Article II, Section 6 (now Article IX, Section 6) of the By-Laws.

Mrs. John H. Wootters, Houston, moved the incidental motion that since copies of the proposed revised Constitu-

tion and By-Laws had been in the hands of the Executive Board and presented to county auxiliaries prior to the Convention and since copies had been handed out at the first business session of the Convention to be voted on at the second business session, and further since each amendment had been carefully considered and voted upon, that the proposed revised Constitution and By-Laws as amended be voted on without re-reading. The motion carried.

Upon motion of Mrs. Jacob F. Schultz, Houston, it was voted to follow the newer trend by combining our Constitution and By-Laws under one heading to be known as "By-Laws."

By general consent the Revisions Committee was given authority to delete the word "Constitution" throughout, to devise a method of amendment which would combine the stricter points of the two methods previously adopted for amending the Constitution and By-Laws, and to make such grammatical changes as deemed necessary so long as the original meaning remains the same.

The following revised Constitution and By-Laws was adopted:

By-Laws (Revised 1954)

Article I—Name

The name of this organization is the Woman's Auxiliary to the Texas Medical Association; it is a federacy of its component auxiliaries and a constituent member of the Woman's Auxiliary to the American Medical Association.

Article II—Objects

The objects of the Auxiliary are:

1. To assist the Texas Medical Association in its program for the advancement of medicine and public health.

2. To cultivate friendly relations and promote mutual understanding among physicians' families.

3. To coordinate and advise concerning the activities of component auxiliaries.

Article III—Membership

Section 1. Membership in the State Auxiliary shall be composed of (1) active members and (2) honorary members.

Section 2. Active members in this Auxiliary shall be:

(a) The wives of physicians who hold active membership in the Texas Medical Association and who are members in good standing in the component auxiliaries.

(b) Widows of physicians who were in good standing of the Texas Medical Association shall be active members and eligible for all offices except that of President.

(c) Members-at-large shall be active members from counties where there are no component auxiliaries, and who are wives of physicians who hold active membership in the Texas Medical Association.

Section 3. Honorary membership in this Auxiliary may be conferred by the Convention on the recommendation of the Executive Board on a member who has rendered long and signal service to this Auxiliary. Honorary members shall pay no state dues and shall have all the rights and privileges of active members.

Section 4. A member of the Texas Medical Association who is the wife of a physician shall be eligible for active membership in this Auxiliary.

Article IV—Officers

The officers of the Auxiliary shall be a President, President-Elect, five Vice-Presidents, a Recording Secretary, a Corresponding Secretary, a Publicity Secretary, a Treasurer, and a Parliamentarian.

Article V—Executive Board and Advisory and Executive Committees

Section 1. The officers, chairmen of standing and special committees, and district council women shall constitute an Executive Board.

Section 2. The Advisory Committee shall consist of the past Presidents.

Section 3. The Executive Committee shall consist of the officers and the five (5) living immediate past Presidents.

Section 4. The Executive Secretary of the Auxiliary to the Texas Medical Association may attend the meetings of the Executive Board and Executive Committee, without the privilege of membership. (The Executive Secretary shall be the member of the staff of the Texas Medical Association assigned to work with the Auxiliary.)

Article VI—The Convention

Section 1. The legislative powers of this Auxiliary shall reside in the Convention. The Convention shall transact all business of the Auxiliary not otherwise specifically provided for in the By-Laws.

Section 2. The Convention shall be constituted as follows: (1) all members of the Auxiliary and (2) voting delegates as provided for in Section 3 of this Article. All members of this Auxiliary shall be entitled to attend the sessions of the Convention and to report to or address the Convention or to discuss the business, or a portion thereof, pending before it; but only voting delegates may vote on the business of the Convention. The Executive Secretary may attend all sessions of the Convention without the privilege of membership.

Section 3. Each component auxiliary shall be represented in Convention by its president or her alternate, and one delegate or her alternate. These accredited delegates with the members of the Executive Board and the past Presidents shall constitute the personnel of voters at the Convention.

Section 4. The Convention shall meet annually at the same time and place as the annual sessions of the Texas Medical Association.

Article VII—Government

The Auxiliary shall be guided by the policies of the Texas Medical Association and shall seek the counsel of its Advisory Committee.

Article VIII—Nominations and Election of General Officers

Section 1. The Nominating Committee shall consist of seven members, one of whom shall be the immediate past President who shall serve as chairman. The other members of this committee, three of whom shall be members of the Executive Board, shall be elected by the Executive Board at its post-convention meeting. If there are more than six nominees, then the election shall proceed by ballot. A plurality vote shall elect. At the next annual Convention this committee shall present the nomination of a candidate for each elective office. Nominations from the floor shall be allowed.

Section 2. No person shall be elected to office who is not in attendance at the Convention at which the election is held, unless her presence is prevented by a legitimate excuse recognized by the Nominating Committee.

Section 3. The annual election of officers shall be held at the final business session of the Convention. A majority of votes shall constitute an election. The election shall be by ballot except where there is only one nominee for an

office, in which case the election shall be viva voce. The installation of officers shall take place at the close of the Convention.

Section 4. The term of office shall be for one year. The Recording Secretary, Treasurer, Publicity Secretary, and First Vice-President may serve two terms.

Section 5. The President-Elect shall automatically assume the office of the Presidency at the expiration of her term as President-Elect.

Section 6. Component county auxiliaries shall hold their elections by March 10.

Section 7. Council Women are to be elected by their own District members, the election to take place prior to the annual Convention, at which time each shall assume the office of Council Woman. The President-Elect of the State Auxiliary shall appoint Council Women in unorganized Districts.

Article IX—Duties of Officers

Section 1. Each officer shall present at the Convention a report concerning her activities during her term of office.

Section 2. The President shall preside at all meetings of the Convention and shall be chairman of the Executive Board and the Executive Committee. She shall be an ex-officio member of all committees except the Nominating Committee. She shall appoint, with the approval of the Executive Committee, the chairmen of standing and special committees except where these By-Laws provide to the contrary. She shall authenticate by her signature all orders on the treasury. She may call special meetings of the Auxiliary, the Executive Board and Executive Committee. On written request of seven members of the Executive Board a special meeting shall be called. She shall attend the annual Convention and the annual Conference of State Presidents and Presidents-Elect of the Woman's Auxiliary to the American Medical Association. As far as practicable, she shall make personal visits to the component county auxiliary groups. She shall appoint Convention committees to serve at the time of the Convention, whose term of office shall expire at the close of the Convention.

Section 3. The President-Elect shall be an active aid to the President. She may visit district auxiliary meetings as a duty of the office and other meetings upon request of the President. By membership on the Executive Board during her term of office she shall conduct herself so as to obtain the greatest possible acquaintanceship with the affairs of the Auxiliary, to enable her to fulfill efficiently the office of President when she succeeds thereto. She shall appoint, with the approval of the Executive Committee, the chairmen of the standing and special committees and the District Council Women in the unorganized Districts to serve during her term as President. Upon the organization of such District, the Council Woman shall then be elected by the district. She shall submit the names of a Corresponding Secretary and a Parliamentarian to the Nominating Committee. She shall attend the annual Convention and the annual Conference of State Presidents and Presidents-Elect of the Woman's Auxiliary to the American Medical Association.

Section 4. The First Vice-President shall be State Chairman of Organization and Membership. She shall, in the absence of the President, perform the duties of that office; and upon the death, resignation or removal of the President she shall fill that office for the unexpired term. The Organization and Membership Committee shall consist of the other Vice-Presidents and Council Women.

Section 5. The Second, Third, Fourth and Fifth Vice-Presidents shall be Regional Chairmen of Organization and Membership. Each shall develop and supervise the extension program of the Organization and Membership Committee of the Auxiliary in the region in which she resides, working in close cooperation with the First Vice-President, who is State Chairman of Organization and Membership. The Vice-Presidents in their order shall assume a vacancy that may occur in the office of President.

Section 6. The Recording Secretary shall keep in permanent form the minutes of all meetings of the Convention, the Executive Board, and the Executive Committee. She shall request and compile the annual reports of the members of Executive Board, including the Treasurer's report, and county presidents, for awards, filing, and for publication in the Texas State Journal of Medicine.

Section 7. (a) The Treasurer shall be the custodian of the General and Special Funds of the Auxiliary, except where these By-Laws provide to the contrary, and shall deposit them in a depository approved by the Executive Board. Disbursements may be made by the Treasurer only on written order of the President and the Chairman of the Finance Committee. She shall present a statement of account at all meetings of the Executive Board and shall make a full report to the Convention. The Treasurer's books shall be closed annually by two weeks following the Convention. The Treasurer shall be bonded in the amount of not less than ten thousand dollars ($10,000.00), the fee to be paid by the Auxiliary.

(b) The accounts of the Treasurer shall be audited by a certified public accountant approved by the Executive Board. The Accountant shall prepare from the records, without audit, a statement to be submitted by the Treasurer at the Convention, and, when the books are closed, shall make a complete, detailed audit, copies to be submitted to the President, Finance Chairman, and the Texas Medical Association for publication in the July issue of the Texas State Journal of Medicine.

Section 8. The Corresponding Secretary shall conduct the correspondence of the Auxiliary.

Section 9. The Parliamentarian shall advise on points of parliamentary law when requested and serve as ex-officio member of the Revisions Committee.

Section 10. The Publicity Secretary shall direct all monthly reports of meetings of component auxiliaries and press notices for the Texas State Journal of Medicine. She shall advise concerning publicity on the local level. She shall reside in the city where the Journal is published or in the same city as the President.

Article X—Duties of Council Women

Section 1. Each shall serve as Organization and Membership Chairman of the District she represents, working in cooperation with her regional chairman of Organization and Membership.

Section 2. Each shall coordinate the aims or objectives of the National, State, District, and County Auxiliaries as set forth in their respective Constitution and By-Laws.

Section 3. Each may create such committee or committees as may be necessary to carry out the duties of her office.

Section 4. Each shall preside at all regular and called meetings of the District Organization. If the District is not organized, the Council Woman shall be appointed by the President-Elect.

Section 5. Each Council Woman shall present at the Convention a report concerning her activities during her year in office.

Article XI—Duties of Executive Board and Executive Committee

Section 1. The Executive Board shall carry out the mandates and policies of the Auxiliary as determined by the Convention, subject to (1) the provisions of these By-Laws; (2) resolutions and enactments of the Convention; and (3) instructions from the Advisory Committee of the Texas Medical Association. The Executive Board shall have power and authority over the affairs of the Auxiliary during the interim between its Conventions, excepting that no debt or liability except for current and operating expenses approved by the Finance Committee shall be incurred.

Section 2. The Executive Committee shall transact such business as requires action before the next meeting of the Executive Board and shall fill any vacancies occurring in office not otherwise provided for in these By-Laws.

Section 3. The Executive Board and Executive Committee are authorized to transact business by mail when necessary.

Section 4. A regular meeting of the Executive Board shall be held immediately before and after each annual Convention and in the Fall, preferably in September, the date and place of the Fall meeting to be set by the Executive Committee. Special meetings may be called by the President or upon written request of seven members of the Executive Board.

Article XII—Standing Committees

Section 1. The standing committees of the Auxiliary shall be as follows: Advisory; American Medical Education Foundation; Bulletin; Civil Defense; Courtesy Resolutions; Editorial; Essay; Finance; Historical; Legislative; Library Fund; Memorial Fund; Memorial Services; Mental Health; Nominating; Nurse Recruitment; Organization and Membership; Program; Public Relations; Reference; Revisions; Student Loan Fund; Today's Health and Workshop.

Section 2. The chairman of each committee, or someone designated by her, shall present a report to the Convention on the activities of her committee during the year.

Section 3. The chairman of each standing and special committee, subject to the approval of the President, shall select the members of her committee except where the membership is otherwise designated in these By-Laws.

Section 4. The American Medical Education Foundation Fund Committee shall help in obtaining funds for the support of medical schools. Contributions to this committee shall be sent to the American Medical Association Committee for this Fund, a detailed report being made to the Treasurer of this Auxiliary.

Section 5. The Editorial Committee shall consist of the Editor of the *News Letter* as chairman, two other members, and the Executive Secretary of the Auxiliary as ex-officio members without the right to vote. It shall accumulate and edit material of interest to members of the Auxiliary.

Section 6. The Finance Committee shall consist of five members as follows: a chairman, the Treasurer, the immediate past Treasurer, the immediate past President, and a member from the general body. This committee shall, in cooperation with the incoming Finance Committee, prepare a budget based on dues received the current year, this budget to be read at the Convention for information and presented for action at the Post Convention Executive Board meeting. This committee shall work out a plan for all expenditures and shall receive all vouchers for payment of budget allocations. It shall be the duty of this committee to require detailed bills to accompany such vouchers before paying same. The chairman of this committee shall forward promptly all approved vouchers to the President for her approval and signature. Such vouchers shall then be forwarded to the Treasurer for payment. Bills shall be paid after expenditures are made. No bill may be paid unless itemized and approved by persons contracting them.

Section 7. The Historical Committee shall consist of a chairman and four members. This committee shall serve as the Awards Committee, working with the various committees in determining the annual awards in the Auxiliary fields of endeavor. This committee shall be responsible also for encouraging written histories of county groups, for keeping the historical chart up to date each year, and for the filing of all Auxiliary records in the Texas Medical Association Library Building.

Section 8. The Legislative Committee shall consist of a chairman and a member from each of the four regions of the State. This committee shall work closely with the Advisory and Judicial Committees of the Texas Medical Association and The American Medical Association and Auxiliary to keep the Auxiliary informed concerning existing laws and proposed legislation of interest to the medical profession.

Section 9. The Library Committee shall encourage gifts of funds, books and other materials, and cooperate with all requests to improve the Memorial Library of the Texas Medical Association.

Section 10. The Memorial Fund Committee shall encourage contributions to the Auxiliary Memorial Fund. The beneficiaries of the Memorial Fund shall be members of families of doctors in good standing of the Texas Medical Association at the time of their death or retirement.

Section 11. The Program Committee shall consist of a chairman, co-chairman, and the chairmen of the following standing committees: Civil Defense, Legislative, Mental Health, Public Relations, Nurse Recruitment, and Workshop. This committee shall encourage the preparation of yearbooks; physical examinations among members of physicians' households: and the sending copies of outstanding programs and other valuable program material to the Central Office. It shall be the duty of this committee to familiarize itself with the work of the State and National Auxiliaries, the American Medical Association, and the Texas Medical Association, and with authentic health literature, and to outline and suggest programs for component county auxiliaries.

Section 12. The Public Relations Committee shall consist of a chairman and one member from each of the four regions of the State. It shall be the duty of this committee to foster interest in matters of public importance relative to health education and, through the component auxiliaries and with the approval of the Advisory Committee of the Texas Medical Association, to correlate the work of the Auxiliary with that of other organizations.

Section 13. The Reference Committee shall consist of a chairman and two members appointed by the President. This committee shall receive and pass on Convention business before it is presented to the body.

Section 14. The Revisions Committee shall consist of three members, each with a term of office of three years, one term expiring each year and one appointment made by the President each year. The member serving her third year shall automatically become the chairman. The Parliamentarian shall be an ex-officio member of this committee.

Section 15. The Student Loan Fund Committee shall consist of five members appointed by the President. It shall have a chairman aad a co-chairman. The co-chairman shall act as the chairman of the George Plunkett Red Division of

the Student Loan Fund. Each city wherein an accredited Medical School is located shall have a representative on the committee. The beneficiaries of the Student Loan Funds shall be: (1) Students of junior and senior years of medical colleges in Texas recognized by the American Medical Association; (2) Students of junior and senior years who reside in Texas but attend medical colleges in another state may be eligible for loans at the discretion of the committee; and (3) residents of Texas serving internships and residencies in hospitals approved by the American Medical Association. The funds in these accounts shall be handled by the Texas National Bank of Houston, Trustee, loans being made at the discretion of the committee and the Trust Department of the bank.

Section 16. The duties of all other committees shall be as their names imply.

ARTICLE XIII—DUES

Each component auxiliary shall pay annual dues to the State Auxiliary at the rate of two dollars ($2.00) per capita; this to include the dues of one dollar ($1.00) per capita to the Woman's Auxiliary to the American Medical Association. The dues shall be sent to the State Treasurer by March First.

ARTICLE XIV—QUORUM

Twenty voting members, ten of whom shall be members of the Executive Board, shall constitute a quorum at any meeting of the Convention. Fifteen members shall constitute a quorum of the Executive Board.

ARTICLE XV—PARLIAMENTARY AUTHORITY

The rules contained in "Robert's Rules of Order Revised" shall govern the Auxiliary in all cases to which they are applicable and in which they are not inconsistent with these By-Laws.

ARTICLE XVI—AMENDMENTS

The By-Laws may be amended at any regular business session of the annual Convention of the Auxiliary by a two-thirds vote, provided notice of the proposed amendments has been submitted in writing to the component auxiliaries not less than sixty days prior to said meeting.

STANDING RULES

1. The Convention Committee shall consist of members of the hostess auxiliary and shall have charge of the registration and entertainment of members and visitors at the annual Convention, working in cooperation with the President and/or the Executive Committee.

2. A registration fee of one dollar ($1.00) shall be paid by those attending the Convention.

3. (a) Council Women shall maintain a membership roster of their district, said roster shall be checked for accuracy with the Treasurer of the Auxiliary.

(b) Wherever possible, Council Women shall effect merger or consecutive meetings of component auxiliaries for the purpose of a visit from the State Auxiliary President or her representative, thereby saving time and expense in carrying out this important objective of the offices.

4. The Auxiliary shall pay, from the Auxiliary Special Fund, the State and National dues of members whose husbands are serving temporarily in the armed forces.

5. There shall be a uniform method of preserving annual reports. The Recording Secretary of the Auxiliary shall give detailed instructions to those making reports. All records except current ones shall be kept in the Auxiliary files at the headquarters of the Texas Medical Association.

6. There shall be held annually, at the same time and place as the Fall Executive Board meeting, a Workshop specifically planned to aid county presidents and presidents-elect, the program to be arranged for by the President. It is suggested that this Board meeting and Workshop be held in Austin, the location of the headquarters of the Texas Medical Association.

7. In the interest of organization and membership, the State shall be divided into four geographical regions as follows:

1. Northern.—Districts 2, 3, and 13.
2. Eastern.—Districts 9, 10, 11, 12, 14, and 15.
3. Western.—Districts 1 and 4.
4. Southern.—Districts 5, 6, 7, and 8.

8. Districts shall be the same of the fifteen councilor districts as set up by the Texas Medical Association.

9. The State Auxiliary Handbook shall be kept up to date and passed on by members of the Executive Board and county presidents to those succeeding them.

10. No expenditure shall be voted upon at the Convention unless previously approved by the Finance Committee.

11. These Standing Rules may be amended or suspended at the annual Convention without previous notice, by a majority vote.

Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, extended greetings to the Auxiliary.

The highlights of the reports of the council women, committee chairmen and officers were given.

In lieu of the report of the American Medical Education Foundation Committee, which had been filed, Mrs. J. L. Jinkins, Galveston, Chairman, presented Mr. Hiram Jones, Chicago, Executive Secretary of the AMEF, and Dr. D. B. Calvin, Dean of the University of Texas Medical School, who spoke briefly on the need of the AMEF and urged our continued support.

These reports were interrupted to go into luncheon and were continued after luncheon.

The following are the reports filed:

REPORT OF FIRST DISTRICT COUNCIL WOMAN

The First District, composed of 12 counties, has 3 medical societies and 3 auxiliaries. There are 185 members, including 1 honorary member, in the district auxiliary.

In September I attended the Executive Board meeting in Austin. The first project of the year, following as our theme, "Knowledge, Judgment, and Action in Health Leadership," was for us to make a special effort to lead in health education.

From our largest auxiliary—El Paso—to our smallest—Big Bend Auxiliary, a new emphasis was placed on friendliness within. With good relations within we had that "extra something" we feel we need to go outside ourselves in community activities. In serving our various communities we have had a definite part in preserving our American way of life.

I made my official visit to El Paso County Auxiliary in February, 1954, at which meeting Mrs. E. W. Coyle, San Antonio, State President, was guest speaker. The chairmen's reports were outstanding in nurse recruitment, television programs, and mental health.

Pecos-Jeff Davis-Presidio-Brewster Counties Auxiliary has met each month, the members having supper with the doc-

tors and then going to their own meeting. There are 13 members. Distance is their big problem. Nurse recruitment was their important project. My official visit to this auxiliary was in November. The Reeves-Ward-Winkler-Loving-Culberson-Hudspeth Counties Auxiliary has a membership of 22 and 1 honorary member. The medical auxiliary women won in the Community Chest drive. Friendship within was stressed in this group. This auxiliary was hostess to the District 1 meeting. On February 12, 1954, I presided over the annual District 1 Auxiliary meeting at Pecos. The Auxiliary met with the doctors at the Pecos Valley Country Club for luncheon.

At the meeting Mrs. Coyle was guest speaker. She gave us an inspiring message.

Mrs. George Turner of El Paso, President-Elect of the National Auxiliary, was an honored guest. "Let's put more U in your commUnity" was her emphasis. Mrs. Robert Thompson, past State President from El Paso, commended the ladies for their good work.

Community public relations was shown when one of our druggists' wives, Mrs. D. W. Bozeman, had a pink tea for our guests that afternoon.

Dr. George Turner of El Paso, President of the Texas Medical Association, was guest speaker for the evening meeting. Dr. Leighton Green, councilor for District 1, showed slides.

The new president and council woman is Mrs. Andrew Eck of El Paso, Vice-President, Mrs. Hugh Martin of Pecos; and secretary, Mrs. Charles Oswalt of Fort Stockton.

More than a hundred doctors and wives attended the District meeting. I was presented an engraved sterling silver cup for my three years work as council woman. The doctors and wives voted this the best meeting we had ever had. They will meet in Pecos again next year.

MRS. HAROLD LINDLEY, Pecos.

REPORT OF SECOND DISTRICT COUNCIL WOMAN

The District 2 meeting was held in Sweetwater April 15. There were 22 women present. Mrs. E. W. Coyle, San Antonio, State President, spoke on the importance of community service by doctors' wives individually and collectively. Following the business session, the women of Sweetwater arranged a tea at the home of Mrs. T. D. Young. A cocktail party and banquet were held in the evening.

MRS. THOMAS MARINIS, Midland.

REPORT OF THIRD DISTRICT COUNCIL WOMAN

The Third District is composed of 36 counties, having 9 medical societies and 5 active auxiliaries. In all the 4 inactive auxiliaries, there are doctors' wives who have paid their state and national dues and are members of those organizations or are members-at-large of other auxiliaries.

I began my year as council woman by attending the state meeting in Houston and the post-convention Executive Board meeting and School of Instruction.

It was my privilege and pleasure to attend one of the first meetings of the Dallam-Hartley-Sherman-Moore Counties Auxiliary, a luncheon with Mrs. William V. Coventry of Dumas presiding. This is a new auxiliary in the district and they are doing a wonderful job.

I attended the fall Executive Board meeting in Austin and soon after this meeting wrote personal letters to each county president in District 3, outlining the state program for the year and offering to visit their auxiliary or help them in any way possible.

Because of the distance involved and frequent bad weather, it has been difficult to travel, so a great deal of my work has been done by correspondence and long distance telephone calls. I have had personal interviews with the presidents or vice-presidents of those auxiliaries which I have not visited as a group. In January, I visited the Hattie Hunt Auxiliary in Childress and spoke to them on the American Medical Education Foundation and Bricker Amendment.

On April 13, the annual meeting of the Panhandle District Medical Society (District 3) was held in Amarillo. A District Executive Board was formed, composed of the county presidents, the council woman, and the district secretary. This board met in the morning with Mrs. E. W. Coyle, San Antonio, State President, to discuss county reports and auxiliary problems.

A luncheon was held at the Amarillo Country Club honoring Mrs. Coyle. Potter County Auxiliary, with Mrs. W. E. Scott of Amarillo as president, was the hostess auxiliary.

The council woman presided at the business meeting at which time a constitution and by-laws were presented for the district. Mrs. Coyle was the guest speaker.

Communications directed to me have been answered and a record kept of all correspondence in hopes that it might be of some help to my successor.

MRS. E. K. JONES, Wellington.

REPORT OF FOURTH DISTRICT COUNCIL WOMAN

The emphasis for 1953-1954 in District 4 has been placed on encouraging and helping in every possible way with letters, phone calls, and visits the newly organized auxiliaries.

In District 4 there are 20 counties with 6 societies and 5 active auxiliaries. The auxiliary members total 90, with a possibility of having several members-at-large before the close of the year.

Geriatrics, nurse recruitment, nursing scholarships, the Association of American Physicians and Surgeons essay contest, health films, and cooperation with various health projects in each auxiliary's community have helped further public relations in our district.

Invitations were mailed to all district doctors' wives inviting them to attend the district convention in Brownwood on October 8, 1953. The auxiliary met with their husbands for lunch at Hotel Brownwood where they heard an inspiring talk given by Dr. F. J. L. Blasingame, President-Elect to the Texas Medical Association.

After lunch, auxiliary members met at the home of Mrs. Paul Wheelis for tea and a meeting and discussion period. Officers elected for 1954-1955 are Mrs. Oscar N. Mayo, council woman, Brownwood; Mrs. John L. Wright, vice-president, Big Lake; Mrs. W. Lacey Smith, secretary-treasurer, San Angelo.

Our next District 4 convention will be held in San Angelo in October, 1954.

MRS. PERRY J. C. BYARS, San Angelo.

REPORT OF FIFTH DISTRICT COUNCIL WOMAN

During this past year I have written thirty-five letters to the Auxiliaries in District 5, keeping these groups in touch with the various projects that were being done. I wrote letters to members in the district, inviting all to our Bexar County Auxiliary April meeting, our guest day.

In October, it was my pleasure to visit the Kerr-Kendall-Gillespie-Bandera Counties Auxiliary meeting, at which time our State President was present and gave an inspirational

and informative talk about the year's work. This meeting was held in Mrs. Sam Thompson's beautiful home.

Later in the year a visit was made in Atascosa County. I also attended a meeting in Karnes-Wilson Auxiliary.

In Guadalupe County an interesting meeting was held followed by luncheon. Comal County Auxiliary is cooperating in a splendid way.

As individuals these members are active in most civic and philanthropic projects in their communities.

MRS. JOHN L. PRIDGEN, San Antonio.

REPORT OF SIXTH DISTRICT COUNCIL WOMAN

District 6 is composed of 18 counties, 8 medical societies and 8 auxiliaries. The auxiliaries which have carried on an active program have stressed civil defense, nurse recruitment, subscription to *Today's Health,* the Association of American Physicians and Surgeons essay contest, public relations, and a legislative program.

The Fifth and Sixth District meeting was held in Corpus Christi, July 10, 1953. The auxiliary luncheon and style show at the Corpus Christi Country Club was well attended. Mrs. E. W. Coyle, San Antonio, State President, was the speaker and gave us an interesting report on her activities. A business meeting followed at which I presided. Mrs. Stanley Bohmfalk of Weslaco was nominated and elected our next council woman and will take office at the July meeting.

September 10 I attended the Board meeting in Austin. Mrs. Sam Powell, the Nueces County Auxiliary president, accompanied me, and we were especially impressed with the new Library Building and the luncheon provided by the Austin members. We were unable to attend the night meeting.

In Alice at the home of Dr. and Mrs. P. S. Joseph, the Auxiliary to the Brooks-Duval-Jim Wells Counties Medical Society was organized on October 29, 1953. It was my pleasure to install Mrs. G. G. Wyche, Sr. as the first president. This is the only invitation I have received from an auxiliary in this district and it was a pleasure, indeed.

State dues have been paid by all auxiliaries in this district.

The State Meeting in San Antonio will be attended by this council woman, and we will be looking forward to the District meeting in July, 1954, in Corpus Christi.

MRS. JUNE YATES, Corpus Christi.

REPORT OF SEVENTH DISTRICT COUNCIL WOMAN

Because of inactivity in District 7 last year, the year 1953-1954 was spent in stressing friendship and trying to set up a program of activity suited to the interests of all auxiliaries involved.

Nurse recruitment is the major project of the Woman's Auxiliary to the Bastrop-Lee Counties Medical Society where Mrs. Robert B. Burns of Giddings is president. Their program is excellent and should be fruitful. Mrs. Kermit Fox of Austin helped this group during the past summer. Hats off to the splendid progress this newly organized auxiliary is making!

Mrs. Albert LaLonde was personally responsible for the recruitment of three nurses from her home town of Buda.

In Caldwell County, Mrs. A. A. Ross, president, the Cancer Crusade has been the main project, with emphasis on educating the lay people. This is an excellent program for a small auxiliary—where every member counts.

We are proud to say that Caroline Covington, a junior in Burnet High School, is first prize winner for the AAPS essay contest in District 7. Mrs. Joe A. Shepperd of Burnet has been our District 7 contest chairman, and we are proud of her interest, effort, and achievement in this field.

Mrs. Eugene Schock, chairman for civil defense in the Woman's Auxiliary to the Travis County Medical Society as well as for District 7, has worked diligently all year and has presented a concise, workable program for emergency and disaster relief—educating the doctors' wives in first aid courses and registering them as civil defense volunteers.

When the Travis County Auxiliary held its luncheon style-show in February honoring Mrs. E. W. Coyle, President, Woman's Auxiliary to the Texas Medical Association, all presidents of auxiliaries comprising District 7 were invited to attend as my guests. The style-show was excellent, and Mrs. Coyle's address was a fine example for all doctors' wives to follow.

On February 18, 1954, the Seventh District Medical Society held its mid-winter session. A tea for the wives of members was held in the home of Mrs. Charles B. Dildy, Austin. It is hoped this can be made an annual affair in the future, for it certainly affords us a good opportunity to know each other better.

The Travis County Auxiliary, under the able leadership of its president, Mrs. Dildy, has presented an excellent and varied program this year. With the large membership divided into committees many activities such as civil defense, *Today's Health,* community service, health education, and nurse recruitment were carried forward and the community definitely has been made to feel that the doctors' wives in this community are active, interested citizens who are working to preserve our American Way of Life!

Each auxiliary in the district was requested to have a definite representative and alternate to serve for two years on a District Council in order to assure the district council woman a true picture of activity in her district.

During the year 200 postcards were sent out, 30 letters were written, and 5 long distance calls were made.

MRS. THOMAS J. ARCHER, Austin.

REPORT OF EIGHTH DISTRICT COUNCIL WOMAN

The potentialities of District 8 are great. At present 4 of the 6 county auxiliaries in the district have carried on fairly rounded programs. Outstanding work has been done by two of the groups. The average number of meetings for the groups is 8 a year, most of them being held at night with dinner with husbands before programs. All 6 groups took part in contributing to the AMEF. Four auxiliaries cooperated with the essay contest, with 131 essays being written. One county reports 100 per cent subscription to *Today's Health,* and all auxiliaries celebrated Doctor's Day.

Four nurses are in training on loans or scholarship funds totalling $950. One small group has two nurses in training, one of whom is a Negro, at an expense of $600.

The district meeting was held on October 23, 1953, at El Campo, and a detailed report has been filed with the State President, with copies of letters sent to groups attached.

MRS. WILLIAM D. NICHOLSON, Freeport.

REPORT OF NINTH DISTRICT COUNCIL WOMAN

District 9 has 7 organized auxiliaries and 1 chapter. One finds varying degrees of interest and activity in these auxiliaries.

We held our annual meeting this year on March 25 in Brenham with the Washington-Burleson Auxiliary serving as hostesses. The highlight of this meeting was an informative talk by the President-Elect of the State Auxiliary, Mrs. Mark H. Latimer of Houston.

There was an interest shown in increasing knowledge and methods of auxiliary work in several of the counties and an effort will be made to furnish these details at an early date.

MRS. H. O. SAPPINGTON, Baytown.

REPORT OF TENTH DISTRICT COUNCIL WOMAN

There were two meetings held during the year. In the fall a tea was given in the home of Mrs. L. C. Heare, Port Arthur. We were privileged to have our President-Elect, Mrs. Mark Latimer, Houston, with us. She gave an inspiring talk covering all aspects of auxiliary work. The spring meeting was in Nacogdoches, where we were entertained with a trip to all the historical places and later returned to Mrs. J. Frank Beall's home for refreshments.

MRS. R. C. BELLAMY, Liberty.

REPORT OF TWELFTH DISTRICT COUNCIL WOMAN

The Woman's Auxiliary to the Twelfth District Medical Society, comprising the 13 auxiliaries of Bell, Bosque, Brazos-Robertson, Coryell, Erath-Hood-Somervell, Falls, Hamilton, Hill, Johnson, Limestone, McLennan, Milam and Navarro Counties met for its first meeting July 14, 1953, at the Alcoa plant in Rockdale with Milam County as hostess auxiliary. Thirty members, representing 9 counties, were present. Each county presented and discussed plans for the coming year. Mrs. F. F. Kirby of Waco introduced Mrs. E. W. Coyle, San Antonio, President of the Auxiliary to the Texas Medical Association. Mrs. Coyle held a discussion period on the various functions of the departments of the state and national auxiliaries. Mrs. Charles L. McGehee of San Antonio, State Corresponding Secretary, was also a guest.

In the fall, as council woman, I visited the Navarro, Milam, Bell, and McLennan County Auxiliaries to gather and distribute helpful suggestions. Each auxiliary of the district was contacted by phone and by many letters throughout the year.

The McLennan County Auxiliary was hostess for the winter meeting which was held at the Roosevelt Hotel in Waco, January 12. Twenty-eight members of 7 auxiliaries registered. County reports were read and a nominating committee composed of Mrs. S. H. Burnett, Corsicana; Mrs. F. F. Kirby, Waco; Mrs. J. H. Johnson, Temple, was appointed. Officers elected for 1954-1955 were president, Mrs. G. V. Brindley, Jr., Temple; vice-president, Mrs. E. B. Fine, Waco; secretary, Mrs. S. J. Barron, Corsicana; and press-reporter, Mrs. S. R. Miller, Marlin.

Donations totaling approximately $25 were sent, in memory of deceased members, to the State Auxiliary's Memorial Fund.

Response from the older, larger auxiliaries was excellent throughout the year. However, this council woman was discouraged by the lack of response from many of the newer, smaller auxiliaries in the district.

A tentative total of 293 credits for *Today's Health* subscriptions have been obtained in District 12.

On the whole I feel the Twelfth District Auxiliary is an active unit which, by helping to distribute ideas and information, contributes much to the individual county auxiliaries.

MRS. MILTON SPARK, Waco.

REPORT OF THIRTEENTH DISTRICT COUNCIL WOMAN

The Thirteenth District Medical Auxiliary met as guests of the Tarrant County Woman's Auxiliary on March 24 in Fort Worth for a luncheon. Mrs. Jack A. Crow, district council woman, presided. The invocation was given by State Civil Defense Chairman, Mrs. Mal Rumph of Fort Worth.

County auxiliary presidents gave a brief summary of the past year's work. Talks were given by Mrs. John D. Gleckler, Denison, First Vice-President and Chairman of Organization for the State Auxiliary, a guest; Mrs. Rumph; Mrs. A. B. Pumphrey, Fort Worth, State Mental Health Chairman; and Mrs. J. A. Hallmark, Fort Worth.

The following slate of new officers was presented by Mrs. Pumphrey, chairman of the nominating committee, and duly elected: Mesdames Frank Armstrong, Fort Worth, council woman; Mrs. Blaine Divine, Graham, vice-president; and Mrs. D. O. D. Ware, Fort Worth, secretary-treasurer.

MRS. JACK A. CROW, Abilene.

REPORT OF FIFTEENTH DISTRICT COUNCIL WOMAN

District 15 consists of 10 counties, all of which have an organized auxiliary, although Upshur and Red River Counties Auxiliaries, with 4 members each, are inactive.

The annual Fifteenth District meeting was held in Longview. At a short business session held in the morning, Mrs. Charles J. Wise of Naples was elected to serve as council woman for the coming year. Luncheon and a tea and style show were held in the afternoon, with members of the Gregg County Auxiliary serving as models for the style show.

MRS. CHARLES J. WISE, Naples
(Incoming Council Woman).

REPORT OF ADVISORY COMMITTEE

The duties of this committee are defined to act in an advisory capacity to the President, other officers, and committee chairmen.

As chairman of the Advisory Committee it has been my privilege to work closely with our capable President, Mrs. E. W. Coyle. Upon request, I have expressed opinion and advised with other officers and committee chairmen.

The accomplishments of the year are gratifying. Of particular interest is the progress and usefulness of our outstanding *News Letter*. The new Handbook is a work of art, a source book of necessary auxiliary information, and something of which we should be proud to own. To meet the needs of the growth of the Auxiliary in recent years, necessary revisions of the Constitution and By-Laws have been worked out and proposed for your approval.

In the interest of the Auxiliary I have attended the post-convention Board meeting, the September Board meeting, the meeting of the Texas Medical Association Executive Council in January, and the American Medical Association Rural Health Conference in March.

To be included in making plans for the Woman's Auxiliary to the Texas Medical Association and watching these plans materialize has been a pleasure. In the name of the other six members of this committee I thank you for the opportunity for further service.

MRS. GEORGE TURNER, El Paso, Chairman.

REPORT OF AMERICAN MEDICAL EDUCATION FOUNDATION COMMITTEE

As chairman of such a new committee as the American Medical Education Foundation Committee, there has been much to do to plan and organize this work.

On July 5 cards were mailed to all auxiliary presidents, asking them to appoint a chairman for AMEF and by all means to include this project in the year's work.

In September, one week after the fall Board meeting, each auxiliary president and each council woman was sent a letter explaining, in detail, the functions, aims, and goal of AMEF. Many suggestions were made about methods of raising money or getting contributions. Pamphlets on the subject, prepared by national headquarters, were mailed to the president or chairman, where an appointment had been made.

Only 9 counties answered the first card and appointed local chairmen.

In February notices were sent to the presidents reminding them of report time and urging them to send their contributions, if they had not already done so.

During the year 37 auxiliaries sent contributions. One sent its gift directly to the national AMEF office; 8 others gave only as a part of their district; 4 auxiliaries wrote they were inactive; 7 others answered that they could not give this year; and 58 auxiliaries did not acknowledge any of the cards and letters in any way. Districts 2 and 11 sent gifts from their districts. District 8 was the only district in which each auxiliary in the district gave a contribution.

As your chairman, I have written and sent out approximately 600 cards and letters during the year.

As of May 28, 41 counties had reported contributions to the AMEF and the total of county, district, and individual contributions stood at $2,795.85. Also, it was voted at the Convention that $300 be given in memory of Drs. E. H. Cary, H. R. Dudgeon, and M. L. Graves, and that in addition the State Auxiliary supplement the gift to AMEF so that the amount contributed by county auxiliaries and the $300 memorial gift would total at least $3,500. Accordingly, an additional $500 from the Auxiliary's Special Fund was appropriated, bringing total contributions to $3,595.85.

The following is a report of contributions made as of May 28, 1954:

County Auxiliary Contributions—		
Andrews-Ector-Midland	$ 40.00	
Armstrong-Donley-Childress-Collingsworth-Hall	5.00	
Bell	50.00	
Bexar	400.00	
Bowie-Miller	20.00	
Brazoria	20.05	
Caldwell	2.00	
Cameron-Willacy	8.00	
Camp-Morris-Titus	15.00	
Cass-Marion	2.00	
Cherokee	12.00	
Coleman	5.00	
Colorado-Fayette	4.00	
Crane-Upton-Reagan	8.00	
Dallas	200.00	
DeWitt-Lavaca	5.00	
Ellis	1.00	
El Paso	20.00	
Falls	50.00	
Galveston	289.40	
Grayson	25.00	
Gregg	5.00	
Hardin-Tyler	5.00	
Harris	700.00	
East Harris	15.00	
Harrison	10.00	
Hopkins-Franklin	10.00	
Howard-Martin-Glasscock-Borden-Scurry-Kent-Dickens-Garza-Stonewall	10.00	
Jefferson (Beaumont Chapter, $161.00, and Port Arthur Chapter, $56.00)	217.00	
Lamar	16.00	
LaSalle-Frio-Dimmit	6.00	
Liberty-Chambers	51.00	
Lubbock-Crosby	100.00

Navarro	5.00	
Nueces	20.00	
Tarrant	213.00	
Taylor-Jones	11.00	
Tom Green-Eight	25.00	
Travis	74.00	
Victoria-Calhoun-Goliad	38.40	
Wharton-Jackson-Matagorda-Fort Bend	33.00	$2,750.85
District Auxiliary Contributions—		
District 2	$ 9.00	
District 11	30.00	$ 39.00
State Auxiliary Contributions—		
From Three Members in Lieu of Orchid	$ 6.00	
Memorial Contribution in Honor of Drs. E. H. Cary, H. R. Dudgeon, and M. L. Graves	300.00	
From Special Fund	500.00	$ 806.00
Total Contributions		$3,595.85

MRS. J. L. JINKINS, Galveston, Chairman.

REPORT OF ARCHIVES COMMITTEE

Your Archives Committee has worked many hours culling out materials and has used a chronological classification to give some idea of the material on hand. A more accurate classification has been made by labeling folders for each year's work.

Your committee recommends that:

1. Before sending data to the Archives, you consult with Mrs. Draker at the central office in Austin concerning the size of material used, since it must be standard size to fit in the new filing cabinets.

2. The quantity of work for the officers grows each year as the organization grows. Therefore, we recommend your sending just the most pertinent material concerning your county auxiliary's accomplishments for the year.

We thank the Texas Medical Association for sharing Mrs. Draker with us, also for housing our Archives files in the headquarters building at Austin.

MRS. F. F. KIRBY, Waco, Chairman,
MRS. GEORGE TIPTON, Austin,
MRS. H. O. WYNEKEN, San Antonio.

REPORT OF BULLETIN COMMITTEE

The *Bulletin,* with its new look, has been welcomed as a bargain by Texas Auxiliary members this year. Subscriptions have been sought particularly by auxiliary officials on all levels—county, district, and state.

Renewal notices went to subscribers, and local presidents responded to your chairman's request for assistance. In May and October, subscriptions were most prevalent. The best method used was inclusion of *Bulletin* in yearly dues. Many auxiliaries strive for 100 per cent Executive Board subscription. To save time and to acquire pertinent information, all members should make a "Bee" line for the *Bulletin* Chairman.

Final count for Texas' fiscal year will be available following the June issue of the *Bulletin.*

MRS. EMIL H. MAREK, Yoakum, Chairman.

REPORT OF CIVIL DEFENSE COMMITTEE

There is nothing mysterious about the atomic threat to the United States. We all are conscious of the peril that exists to our homes because of the high speed global bomb-

ers and the arsenal of atomic weapons which includes the hydrogen bomb and the guided missile. Yet, the few reports received (only 32 out of a possible 115) indicate we are doing little to protect ourselves and our property in case of an attack. Civil defense is a local problem—an individual responsibility that should be started in the home.

In the communities where civil defense programs are getting started or are well-established some of the auxiliary members are working closely with civil defense planning in the blood donor program, by taking as well as instructing courses in Red Cross first aid and home nursing, and by participating through hospital auxiliaries and Parent-Teacher Associations. A few auxiliaries reported that programs were given with talks and films on civil defense shown. Several have completed a file of the nurse members in the group.

Two outstanding reports of auxiliary membership participation came from the Travis County Auxiliary and the El Paso County Auxiliary. Each of these groups has registered its entire membership and placed a card file at the local civil defense headquarters. This file contains information needed in time of disaster—whether civil or natural.

Ten members of the Travis County Auxiliary who completed the Red Cross first aid course taught for auxiliary members served as first aid workers at the Livestock Show in Austin. Other members also are being trained in first aid and this group had a program on civil defense showing the film "The Waking Point."

The El Paso Auxiliary sponsored a series of thirteen weekly television programs, "Nurse Please," on civil defense and home nursing. These were adapted to the local needs. One teacher used the programs for homework in her health class. Many viewers requested the leaflet "Six Survival Secrets" which was offered.

As interest grows and we realize more and more the importance of civil defense in our lives, let us keep in mind this verse: "For God hath not given us the spirit of fear; but of power, and of love, and of a sound mind."—*II Timothy 1:7.*

Your greatest power is you. Prepare now for a safer tomorrow.

MRS. MAL RUMPH, Fort Worth, Chairman.

REPORT OF ESSAY CONTEST COMMITTEE

For the 1954 essay contest of the Association of American Physicians and Surgeons, forty county auxiliaries reported they planned to sponsor the contest locally in their high schools. The subject of the essay was "Why the Private Practice of Medicine Provides This Country With the Finest Medical Care." The following results have been reported:

1. Reports received—35.
2. Reports not received—5.
3. Auxiliaries reporting success—22.
4. Auxiliaries reporting poor results—15.
5. Auxiliaries reporting no response—3.
6. Money given in county prizes—$2,865.
7. Approximate number of essays written in Texas—866.
8. Approximate number of schools participating—100.

The Texas Medical Association donated $1,000 in prize money. The winners and prizes were as follows:

First prize, $250—Milton Copeland, Wichita Falls.
Second, $150—David Curry, El Paso.
Third, $100—Kate Wood, El Campo.
Fourth, $50—Gerald Richmond, Henderson.
Fifth, $25—Tobye Fram, Baytown.
Sixth, $10—Carolyn Monaghan, Waco.
Seventh, $10—Bernadette Borchers, Laredo.
Eighth, $10—Sheridan Mott, El Paso.
Ninth, $10—Helen Meurer, Fredericksburg.
Tenth, $10—Jackey Lumpkin, Houston.

In addition, there were fifteen prizes of $25 each for the best essay in each of the Councilor Districts.

District winners were:

District
1—David Curry, El Paso.
2—Nancy Conway, Big Spring.
3—Norma Friedman, Amarillo.
4—Gladys Coldewey, Winchell.
5—Helen Meurer, Fredericksburg.
6—Bernadette Borchers, Laredo.
7—Caroline Covington, Burnet.
8—Kate Wood, El Campo.
9—Tobye Fram, Baytown.
10—Billy M. Willis, Nacogdoches.
11—Gerald Richmond, Henderson.
12—Carolyn Monaghan, Waco.
13—Milton Copeland, Wichita Falls.
14—Ernest Couch, Dallas.
15—Clara Schell, Longview.

The San Antonio gentlemen who so kindly consented to serve as state judges were: Dr. Royall M. Calder; Owen J. Reamer, Ph. D., Professor of English, Trinity University; and Robert D. O'Callaghan, LL. B., lawyer.

After studying results and reports, I recommend personal contact with the teachers early in the school year; posters or other visual announcements in the school; and a definite outstanding method of presenting prizes. Teachers who do an outstanding job of cooperating should be given recognition.

MRS. A. O. SEVERANCE, San Antonio, Chairman.

REPORT OF FINANCE COMMITTEE

The Finance Committee met in Houston during the Convention and prepared a budget which was presented and accepted at the post-convention Executive Board meeting. As nearly as possible this budget has been adhered to throughout the year.

Letters were sent to all officers, committee chairmen, and council women with enclosed vouchers, information as to use, and the amount allocated in the budget to their office.

I attended the Executive Board meeting in Austin, at which time we made the following recommendations:

1. That the Archives Committee be instructed to purchase a filing cabinet similar to the one already in use, the approximate cost to be $140.

2. That ring binders be purchased for officers, committee chairmen, council women, and county presidents, these binders to be the property of the Auxiliary, to be used to contain all materials pertinent to the office, and to be passed on to the successors in office.

3. That the films which have been approved at this meeting be purchased, these films to be kept in the headquarters building of the Texas Medical Association.

4. That the editor of *News Letter* be allowed $2,000 maximum expenses for the year.

These recommendations were approved by the Executive Board.

On March 1 another letter was sent to all officers, committee chairmen, and council women asking them to return all vouchers to me not later than April 1 in order that the Treasurer might be able to pay all bills and close her books in time for a preliminary audit before the Convention May 2 in San Antonio.

Upon request of the President and President-Elect, a joint meeting of the Finance Committees for 1953-1954 and 1954-1955 was called in April in Dallas. All members except one were present. A budget for 1954-1955 was prepared, to be presented at the Convention.

All bills have been paid promptly. You know from the report of the Treasurer that our finances are in splendid order. It has been a real pleasure to have a part in this

year's work with our President, Anita Coyle, and our efficient Treasurer, Mary Marchman.

MRS. H. LESLIE MOORE, Dallas, Chairman.

REPORT OF HISTORIAN

Your Historian began her year's work by attending the Board meeting in Austin last September. At this meeting it was voted to award blue ribbons in twenty fields of endeavor. The auxiliaries were to be grouped into four groups according to membership to compete for the ribbons.

During the year there have been five official letters mailed out to county auxiliaries, council women, and state committee chairmen concerning the awards. A list of the twenty fields of endeavor was mailed to each county president in October so that she would know about the awards and could work for one. The Historian also mailed letters asking for yearbooks and histories. There has been good response to her requests.

Awards were made by the Historian's Committee with the help of the chairmen of standing state committees who submitted recommendations for awards. These recommendations were checked by the Historian's Committee in an effort to place the awards as fairly as possible. Final decisions were made at a joint meeting of the chairmen held during the Convention.

The Historian this year was able to function only through the splendid interest, cooperation, and help of her committee and the various chairmen.

The following is a history of the year's activities.

History of Year's Work

The year 1953-1954 has been a full and satisfying one for the Woman's Auxiliary to the Texas Medical Association because of the interest, cooperation, and efforts of auxiliaries and individuals.

With "Knowledge, Judgment and Action in Health Leadership" as our theme, special emphasis was placed on friendliness within, that there might be that "extra something" we must feel to accept fully the privileges and responsibilities as individual citizens as well as doctors' wives. Reports show that there was unity in our objectives of fellowship, knowledge and action, and a realization of the true meaning of the national auxiliary theme: "Together We Progress."

We have 105 organized auxiliaries, which include one organized chapter (a part of our largest auxiliary), and nine counties having members-at-large, giving us a total membership of 4,749, an increase of 286 members. One group reported being responsible for the organization of a medical society so that they might have an auxiliary! To strengthen our Organization and Membership program, our Constitution and By-Laws was revised and a fifth vice-president was added. She will serve with the second, third, and fourth vice-presidents as regional chairmen of Organization and Membership, and the first vice-president will serve as state chairman. May we remember that in some parts of the State distances are such that members have to travel 150 miles to attend meetings.

A special effort was made by the President, in cooperation with the Organization Chairman, the Council Women, and the President-Elect, to keep in touch with county groups and to offer encouragement and auxiliary information. Fifty official visits were made to auxiliaries, eleven to district meetings, and, personally and by telephone, approximately twenty-five other contacts with small groups were made while "Touring Texas."

Reports from all size auxiliaries are magnificent, enthusiastic, and stimulating. One auxiliary of three members wrote: "We are necessarily circumscribed in our activities. We feel, however, that we form a nucleus of informed members who can work on an individual basis for better community health and public relations. Through organization we can keep in touch with other communities over the state and be ready to grow when the opportunity presents itself. Although we do not meet regularly, we did present one film on cancer and more films are planned. We would be happy to hear what other small auxiliaries over the state are doing." When such heartening notes as this come in, then we may feel we truly are serving as an Auxiliary to the Medical Profession.

Complete program material, secured from state and national sources and including suggestions from the President of the Texas Medical Association, Dr. George Turner, was prepared and given to county presidents at the annual convention last year. A School of Instruction was conducted at the post-convention Executive Board meeting. Additional material was sent later in the summer by the various chairmen and through the *News Letter*. A one-day Board meeting and conference with a preview of available films was held in September at the headquarters building of the Texas Medical Association in Austin.

Social meetings varied from the strictly social to those combined with other phases of our program. Large and small groups alike adopted projects to increase interest and attendance at medical society meetings, among which was the serving of dinners in homes and medical society library buildings.

Programs for self-education were stressed by speakers, panel discussions, demonstrations by children from such schools as that for the deaf, visits to welfare agencies and special education classrooms, book reviews, and answers to roll call on assigned subjects. "Know Your AMA," "Know Your Auxiliary," "Know Your Community," "Our State Medical Association and Library," civil defense, mental health, safety, juvenile delinquency, geriatrics, legislation, vocational rehabilitation, public relations, health departments, American Medical Education Foundation, nurse recruitment, constitution and by-laws, hobbies, cancer, polio, and many other subjects were presented. Thirty-seven yearbooks of programs were received from county auxiliaries.

"Public Relations in '53 Means Community Service for You and Me," suggested by our chairman at the beginning of the year, truly has been our guide. Health education programs were presented in many different ways on practically every known health subject. Community leaders were taken on tours of hospitals and free clinics. There was an essay contest. Radio and television programs—live and recorded, single and in series—were given on such subjects as "Healthy Living," "Help Yourself to Health" and "Focus on Health." Surveys of health facilities, resources, needs, and the like were made. Exhibits and booths at fairs, stock shows, and rodeos were sponsored, and posters and much health literature was distributed.

In community service we held to the thought that as citizens we play a very definite part in preservation of our "American Way of Life." Auxiliary members, individually and collectively, have cooperated generously with practically all known community agencies, both in special drives and by year-round service on various advisory committees and boards. Other activities included work at "Well-Baby" and other clinics; service on the anti-rabies committee of a Chamber of Commerce; physical examinations among members, their families, servants, and friends; and participation in a "Go to Church" campaign. We sponsored a school immunization program; sent 4,000 medical journals and 500 textbooks to Korea; maintained a coke machine at a county

hospital which netted sufficient for two oxygen tents and other equipment; sponsored the collection of dolls from all clubs in a city for a Christmas Clearing Bureau; and assumed the responsibility for financial, personnel, and special care for children temporarily in a "children's shelter." Books were collected for libraries; parentcraft classes with special TV programs for expectant parents conducted; films donated for weekly showing at juvenile homes; the sale of blind-made products sponsored; and so on. Incomplete reports credit us with 25,390 hours and as having contributed more than $2,500 in cash.

Our Handbook was a special project of the Public Relations Committee. It includes objectives, projects, duties, and lists of auxiliary officers and legislators on state and national levels. The property of the Auxiliary, it was given to every officer, committee chairman, council woman, and county president, to be passed on by her, along with records and suggestions, to her successor.

Eight hundred and sixty essays were written on the subject of "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care." County awards, amounting to $2,800, were given by county medical societies. The Texas Medical Association gave a total of $1,000 to state winners. The first place winner was our luncheon guest at our convention, when the President of the Association presented to him the award. Texas had two national winners, again, this year—the third and sixth place winners!

Nurse recruitment was adopted as a project for all size groups. The films "Keepers of the Lamp" and "When You Choose Nursing" have been added by the Auxiliary to those available at the Texas Medical Association's Memorial Library. Fourteen loans totaling $2,475 and eighteen gift scholarships amounting to $3,653 were reported. Four vocational nurses were reported in training and one scholarship given. Approximately 2,233 nurse prospects were reached, with 210 actual recruits. We have forty Future Nurses Clubs, including one male club. The President and the Nurse Recruitment Chairman served on the Coordinating Council of the State Committee for the Improvement of Nursing Service. The President-Elect attended their fall meeting. At a recent meeting of the Coordinating Council, which is composed of the Board of Directors of the Texas Graduate Nurses Association and the Texas League for Nursing, our Auxiliary was commended for the brochure previously mentioned and for the work done throughout Texas in nurse recruitment.

As a mental health project we sponsored, in cooperation with the Texas Society for Mental Health, a "spot survey" of the facilities, resources, and needs of the handicapped child under eighteen years of age. This was done by auxiliaries in all population groups. "Angry Boy" was purchased for use throughout the state, along with other mental health films in our Texas medical library. There were many different kinds of programs, including those on recreation (particularly hobbies) and vocational rehabilitation. "Scattered Showers" was presented on numerous programs. Members worked on financial drives and served on various executive and advisory boards. One auxiliary originated a new slant—an annual visit to a state mental institution, to which community leaders were invited. The patients furnished the program, and reports have it that the patients eagerly look forward to these affairs and plan for them months in advance.

Working in cooperation with the coordinator of women's activities in the State's Defense and Disaster Relief program, a well-planned civil defense program was presented to each auxiliary. This was printed in the monthly bulletin prepared by the Division of Defense and Disaster Relief, with copies of the bulletin being made available to auxiliaries. Our state civil defense chairman served on the Advisory Board of this group. Information and reports show auxiliaries cooperated with local organizations as members on planning committees and working with blood mobiles and other blood donor programs. Surveys were made of qualifications of members and encouragement was given other groups to do the same. This information was placed on file in civil defense headquarters. Suggestions were made on "What To Do" in case of emergencies, and many took part in and taught first aid and home nursing. One thirteen-week TV series was entitled "Nurse, Please."

Our Legislative Committee worked under the direction of the Council on Medical Jurisprudence of the Texas Medical Association. Information received from the national auxiliary was passed on through our chairman and through our *News Letter* to individuals and county groups. There were study groups, speakers, open meetings, "pay your poll tax and vote" campaigns, and communications sent to local, state, and national legislators. Most groups received the AMA's *Washington News Letter,* and attention was called to the *Bulletin* and to the legislative article in the state and AMA journals. The President attended AMA's Regional Legislative Conference in Dallas, Texas, in January.

Auxiliaries and individual members have contributed, often as memorials in lieu of flowers, to our three benevolent funds and the American Medical Education Foundation fund. The amounts contributed this year were:

1. Memorial Fund.—Gifts and interest to this fund amounted to $1,852.26, with $455.10 being given as "love gifts."

2. Student Loan Fund.—Gifts, interest, and loans repaid added $1,700 to this fund, and loans totaling $1,400 were made.

3. Library Fund.—From gifts, $1,000 was given to the Library Building Fund and $340 for rare books, old transactions, and other needed materials.

4. American Medical Education Foundation Fund.—Forty-one counties and two districts reported gifts amounting to $2,795. From our Treasury additional amounts given increased the total to $3,595.

Receipt of an award of merit was announced at the Convention by Mr. Hiram Jones, the national executive secretary of AMEF.

Today's Health was stressed through doctors and members of the Auxiliary. Copies have been placed in libraries and waiting rooms, and have been given out at fairs and health booths. The magazine is used as an official textbook in the schools in one of our larger towns. One group reported giving it to local newspaper editors. Our chairman reported 2,559 credits, with fifteen counties having reached 100 per cent or more of their quotas. *Bulletin* subscriptions have been urged. Five counties report 100 per cent subscription. Ten counties report 100 per cent Executive Board subscription—with our two largest auxiliaries included in this number. County reports showed 536 subscriptions. Our chairman designed a clever little tag to be worn at meetings—which was used by the *Bulletin* committee at the November Conference in Chicago.

Our *News Letter,* a bi-monthly publication sent to every member and to national officers and other state editors, has improved dissemination of information and facilitated better public relations.

Other publicity channels are the "Auxiliary Section" of the TEXAS STATE JOURNAL OF MEDICINE, which has special articles written by Association and Auxiliary officers and chairmen and information concerning county auxiliaries

and individuals. Local newspapers and radio and television stations have been most generous.

We are delighted and honored with the guidance and assistance given by the Texas Medical Association. We have worked closely with the President, Dr. George Turner, and the public relations and legislative councils and more recently met with the Rural Health Committee. In September, 1953, the State Association assigned one of its staff journalists to serve as our executive secretary, whose services have resulted in better planning and greater achievements for the auxiliaries. Office space and a place for our permanent files also were given. Our Archives Committee this year sorted and filed chronologically all records since our organization in 1918. Communications from state officers and committee chairmen were sent out from the central office. Our fall Executive Board meeting was held in the headquarters building for the first time. There was a marked increase in efficiency and interest in the proceedings because of the assistance of the entire staff.

Among projects on the state level, we add that of the revision of our constitution and by-laws. This had not been done, except for minor revisions, since 1942. One important change, in addition to those in organization, is the arrangement of a Program Committee with an appointed chairman instead of an elected vice-president and members to include the chairmen of public relations, civil defense, legislation, mental health, and nurse recruitment. Another is the plan whereby the current and incoming Finance Committee cooperate in preparing the budget.

At our annual state convention in San Antonio, May 1-5, Mrs. George Feldner, President of the Auxiliary to Southern Medical Association, was our guest and speaker for our preconvention luncheon and Executive Board meeting. We had long looked forward to the special pleasure and privilege of having our National President, Mrs. Leo J. Schaefer of Salina, Kan., with us and sincerely regret that because of illness in her family she could not be present. We were honored and pleased, however, to have as our guest speaker the National President-Elect, Mrs. George Turner, El Paso. The Texas Auxiliary is honored to give, for the fourth time, a President to the Auxiliary to the American Medical Association. It is with genuine pride and joy that we give "our Nina," Mrs. George Turner, to serve as President for 1954-1955.

MRS. TRAVIS SMITH, Abilene.

REPORT OF LEGISLATION COMMITTEE

Freedom remains the most valuable possession of Americans. Our prosperity is naught beside it. Of recent years our freedom has been assailed in the interest of distributing our prosperity, and unquestionably the tides of battle have gone more in favor of distribution than of freedom. Apathy remains freedom's greatest enemy.

Your chairman last year in her report stated a credo of the highest type. She placed some confidence in the new national administration but was cognizant that the New Fair Deal stood a good chance of turning the administration away from the ideals expressed in the credo unless apathy were dispelled and individuals—all individuals—got busy and worked to support the beliefs they held.

It has been the endeavor of your committee this year to stimulate auxiliary members throughout the state to assume more interest and effort in legislative affairs at all levels. This being an off-year for the state legislature, we were under no necessity to do anything pertaining to specific legislation at the state level. Local auxiliary presidents and legislative chairmen were urged to assist actively the legislative committees of their respective medical societies in local legislative affairs. The legislative committee of the state auxiliary has exerted its principal effort in informing local presidents and chairmen of the national legislative situations as they arose.

Let us advise all auxiliary members again through this report to remain keenly aware of the continuing rapid advance toward socialism to which much of the health legislation now pending exposes us. If we remain apathetic, uninformed, and silent we progressively will surely lose more of our freedom by default.

As of March, 1954, the bills or issues to watch are:

1. The Bricker Amendment, which lost by one vote and will probably come up in one form or another again soon.
2. Federal reinsurance corporation for voluntary health plans.
3. Medical benefits for veterans with non-service connected disabilities.
4. Federal aid to medical education.
5. Reed-Keogh type bills, allowing tax deferment funds for the self-employed.
6. Free hospitalization benefits for beneficiaries under old age and survivors insurance act.
7. Extension of the Social Security Act to include physicians and other self-employed persons.

I wish to express my thanks for the splendid efforts of my committee members.

It is my pleasure to introduce your legislation chairman for 1954-1955, Mrs. F. Paul Burow of Killeen.

MRS. JOHN KING GLEN, Houston, Chairman.

REPORT OF LIBRARY FUND COMMITTEE

When we think of the reasons we have for feeling proud of being doctors' wives in Texas, one of the first things that comes to mind, I believe, is our contribution to the Association's Memorial Library. The Woman's Auxiliary has been happy to have a part in the realization of the dream of Dr. and Mrs. Sam E. Thompson of Kerrville.

The Auxiliary has given six $1,000 donations, and Mrs. Thompson includes two more—the Thompson Memorial Fund and the Hattie Preston Hunt Memorial Fund, making a total of $8,000. This year we are adding another $1,000 endowment through our county auxiliary donations and Library Memorial Cards.

We are grateful to the Past Presidents for their project this year of supplying rare books and journals for the Library shelves.

A valuable set of volumes 1 to 100 of "The Practitioners" was selected as the gift from eight of our Past Presidents of the Auxiliary.

Our sincere thanks go to Dr. and Mrs. P. I. Nixon of San Antonio and the Bexar County Medical Society and Auxiliary for a wonderful contribution to the Library, several volumes of the "Transactions" of the Texas Medical Association.

Also, from the library shelves of Dr. and Mrs. Sam Thompson a complete library on tuberculosis has been given by them. We will ever be grateful for the vision, work, and love of our Dr. and Mrs. Sam Thompson.

In 1953-1954, 36 auxiliaries donated to the Library Fund. A total of $408.50 was contributed through 70 Library Memorial Cards, which, with the Auxiliary donations of $302.50 and the 1953 balance makes our total $1,126.50. The Past Presidents have contributed $340 to their project of books for the Library.

May we quote again from Dr. Thompson: "Our Library will in time come into its fullest service. It is doing a wonderful work now, but I want to see its purposes and

services broadened and expanded until every doctor in Texas is making use of it."

MRS. S. F. HARRINGTON, Dallas, Chairman,
MRS. SAM E. THOMPSON, Kerrville, Co-Chairman.

REPORT OF MEMORIAL FUND COMMITTEE

It has been said that "an effort made for the happiness of others lifts us above ourselves."

The Memorial Fund Committee has made every effort through the years to scatter a little happiness and comfort to our friends, our doctors' wives or members of a doctor's family who have been left in unfortunate circumstances.

We are grateful to the auxiliaries which made contributions large or small to the Memorial Fund this year. I am sure you have been rewarded with real pleasure and satisfaction. We sincerely hope your interest will continue. To those of you who did not contribute to the Fund, we trust you will become interested in this worthy cause and stress the importance of the work to your auxiliary.

We might say that the Memorial Fund Committee has a three-fold purpose. It is a convenient privilege to contribute to the Fund in lieu of flowers in memory of deceased friends. The relatives who receive the lovely engraved memorial cards deeply appreciate the living memorial honoring their loved ones. Literally the most gratifying aspect of this Fund is our knowledge that it enables us to take an active interest in the often secret but trying hours of a doctor's wife or a member of a doctor's family, hours we could never share individually.

The total amount of contributions to the Memorial Fund this year is $1,170.17, with 34 counties contributing. Our beneficiaries were given $455.

There are two auxiliaries which the committee feels deserve special recognition through their interest and generous contributions to the Fund. Navarro County with a membership of 25 gave $289.40 and according to membership exceeded all other auxiliaries in the state.

Then, Reeves-Ward-Winkler-Loving-Culbertson-Hudspeth Auxiliary with a membership of 21 gave $50. In order to make this gift the auxiliary made a thoughtful gesture in foregoing their annual exchange of Christmas gifts.

"They that do much themselves deny
Receive more blessings from the sky."—*Creech.*

As active, busy women, privileged in life's circumstance because of our husband's high profession, we should recognize the transcience of providence which sometimes apportions us lean years after plenty. Those of us still blessed with health and security must never close our hearts to the needs of others.

MRS. J. GUY JONES, Dallas, Chairman,
MRS. O. M. MARCHMAN, Dallas, Co-Chairman.

REPORT OF MEMORIAL SERVICE COMMITTEE

Letters have been written to each county president asking for names of deceased members, and letters of condolence have been written to the nearest of kin.

Invitations to attend the Memorial Service were sent to the families of deceased members. A memorial tribute was given at the state meeting.

MRS. G. V. BRINDLEY, Temple, Chairman.

REPORT OF MENTAL HEALTH COMMITTEE

The new Committee on Mental Health has undertaken the awakening of state auxiliary members as to the needs each community has in regard to this type of illness. To carry out this plan, an educational campaign was begun early in September. A complete set of suggestions with valuable information was sent each local president. This material was designed not only to inform our own members, but to encourage them to inform the public on this major health problem—a problem growing in intensity each day.

The memorandum presented a variety of activities that could be carried on by any voluntary organization in the health welfare or educational fields. We suggested that our organization do as much as possible in each particular community.

In addition to this, the committee instigated a spot check survey in cooperation with the Texas Mental Health Society. This survey was made by 30 auxiliaries on the problem of handicapped children in each of these localities. The survey listed size of population, number of handicapped, ages, medical treatment, private or public schools, facilities available, number not in school, and what counseling was available to parents. The auxiliaries cooperated well. A statistical report will be published at a later date.

It is felt that the results were well worth the effort, as the survey was done in a scientific manner and was accurate. It informed local auxiliary members as to the conditions of mental problems in their own communities. We hope after being informed that each auxiliary will feel the desire to help alleviate conditions for the mental cases in all fields.

Many counties did valiant work in programs and in individual endeavors in addition to the survey. Perhaps it would be well to commend the following auxiliaries: Armstrong-Donley-Childress-Collingsworth-Hall; Cherokee; Dallas; El Paso; Harris; Harrison; Jefferson; Potter; and Tarrant. Many others carried out suggestions made, as the county reports show.

A bell is the symbol of the mental health movement. The Mental Health Bell was cast in April, 1953, from bits of metal taken from restraints formerly used to bind the mentally ill. It will be rung each year at the launching of Mental Health Week.

Hardly a family in the United States has not in some way been brought close to the problem of mental illness. At any one time probably more than one of every 200 of the population need hospitalization for mental illness, and over a lifetime 1 out of 12 may be expected to need such hospitalization at some time.

The job of helping people become or remain mentally healthy is ours with which to help.

MRS. A. B. PUMPHREY, Fort Worth, Chairman,
MRS. CLEMENT C. BOEHLER, El Paso,
MRS. JOE THORNE GILBERT, Austin,
MRS. RIDINGS LEE, Dallas,
MRS. D. O. D. WARE, Fort Worth.

REPORT OF NEWS LETTER EDITOR

Volume II of the *News Letter* consisted of six issues, published bi-monthly by the printing department of the central office in Austin. Production and mailing are done by the staff there. The editor has planned the material and edited it in accordance with the state auxiliary program for the year.

The total costs have been approximately $1,750. Of this amount, $540 has been for postage; $300, paper; $600 (approximately), mechanics of production; and $300, miscellaneous (including photographs, art, editor's supplies, telephone calls to Austin, and postage).

Besides going to state members, the *News Letter* is sent to editors of other states and national auxiliary and AMA

officers. Often special requests for extra copies are filled as in the case of the picture and story of Mrs. Edward McCormick, wife of the president of the American Medical Association; Mr. Eugene Smith; the National Safety Council; and so forth.

Files are kept by the central office and the editor.

Following the Executive Board meeting in September, 1953, the editor conducted a conference on auxiliary publications assisted by Miss Harriet Cunningham, Mr. Dan Lehman, and Mrs. A. H. Neighbors, Jr.

The editor acknowledges her indebtedness to the many who have assisted in the work of the *News Letter:* the staff in Austin, Mrs. Edward Coyle, Dr. and Mrs. George Turner, Dr. Troy Shafer, state chairmen, and numerous county presidents and secretaries.

MRS. HASKELL D. HATFIELD, El Paso, Editor.

REPORT OF NURSE RECRUITMENT COMMITTEE

In studying reports submitted by county auxiliaries, one fact stands out: Future Nurses Clubs are definitely the means of interesting more girls and boys in the field of nursing and other careers pertaining to the medical world. More enthusiasm was shown in those counties where the auxiliary members themselves were responsible for the sponsoring of these clubs. We should be pleased with the cooperation received from everyone concerned because the response to the clubs has been gratifying.

It has long been recognized that selling girls on the idea of choosing nursing as their careers takes much publicity. Two auxiliaries, Dallas and El Paso, stand out in this endeavor.

Dallas County, under the guidance of Mrs. Joseph L. Knapp as chairman, did an excellent job of publicizing nurse recruitment. It cooperated with representatives of other groups similarly interested, namely, the Committee on Careers in Nursing, the Red Cross director, the Home Nursing instructor, and the deans of nursing from the four schools of nursing in the city. This group sponsored a contest to select "Miss Dallas Student Nurse" at the request of Twentieth-Century Fox Studio and the Interstate Theaters, this being part of the publicity in the first showing of the picture, "The White Witch Doctor." The group then layed the groundwork for Nurse Recruitment Week. Mayors of Dallas and near-by towns proclaimed a week in September as Nurse Recruitment Week. Fifty-two store windows displayed student nurses' uniforms and literature of nursing. In all 3,600 posters and brochures were used for display and distribution. Fifty-eight drug stores joined in with displays of first aid kits and posters in their windows. The radio and television stations gave free time for talks and spot announcements and the newspapers gave free space for special features and pictures. It was the opinion of all individuals who helped in this project that it stimulated the interest of many potential students in making nursing their career, as well as educating the general public concerning the opportunities in nursing as a profession.

El Paso, with Mrs. Louis Breck as chairman, set up a decorated trailer at a local fair for the purpose of acquainting the public with the benefits of nursing as a profession. Both student nurses and members of the auxiliary were present to answer questions and to give literature. El Paso had an excellent idea in the development of a paper cap with the name "Future Nurse" printed across the front; this cap is worn by club members during meetings. This auxiliary compiled brochures on all schools of nursing in the state and gave two copies to each high school in El Paso. It submitted two resolutions for consideration by the Convention. These are that: (1) a brochure of all schools of nursing in Texas be prepared by the State Auxiliary and copies placed in each high school in Texas, and (2) that literature aimed at convincing parents that nursing is a desirable career, showing the salaries, the possibilities for advancement, the hours of work, and the respect in which a career of nursing is held by the community be distributed through the county medical auxiliaries.

The Houston Auxiliary was responsible for having the picture of a student nurse on the front page of the rotogravure section of the *Houston Chronicle,* thus commemorating anniversaries of both the Texas Medical Association and Harris County Medical Society.

Cameron-Willacy Auxiliary reports an excellent job of organizing Future Nurses Clubs. Galveston Auxiliary also has maintained much interest in this portion of its year's work.

Many auxiliaries participated in "Career Days" in local high schools, some actively taking part and others furnishing transportation to various colleges for the same programs.

MRS. J. C. TERRELL, Stephenville, Chairman.

REPORT OF PUBLIC RELATIONS COMMITTEE

"Public Relations in '53 Is Community Service for You and Me." This motto has been carried out well from the state and county levels. The state set the pace by the completion and distribution of the Auxiliary Handbook, the purpose of which is to provide information useful to county and state auxiliary leaders.

The county reports show excellent results in all phases of volunteer work, and a good proportion of the county budgets was spent on public relations projects. These auxiliaries provided speakers, skits, films, and educational material for lay groups and state fairs. Rural group education was stressed, and more people from rural areas took part in medical education projects.

There was evidence also of closer cooperation between the county medical society and the county auxiliary, particularly in the fields of radio and television education, essay contests, and raising funds for the American Medical Education Foundation.

Nurse recruitment and *Today's Health* projects received major attention, with an increasing number of smaller auxiliaries showing impressive results there and in community health workshops.

There was not a community project for better mental and physical health; better social relations; better schools, roads, fire protection; better citizenship; or better community cooperation in which numbers of the auxiliary did not serve as workers or leaders.

Surely this fine display of citizenship demonstrates the execution of the Auxiliary public relations motto and that of our President: "Knowledge, Judgment, and Action in Health Leadership." With large and small auxiliaries showing such outstanding health and sociological leadership, Texans will find a healthy climate for the continuance of the American way of good medicine.

MRS. V. J. SIMMON, Temple, Chairman,
MRS. A. A. ROSS, Lockhart,
MRS. E. A. ROWLEY, Amarillo,
MRS. TRUMAN C. TERRELL, Fort Worth,
MRS. ANDREW S. TOMB, Victoria,
MRS. L. L. D. TUTTLE, Houston,
MRS. H. B. WILLIFORD, Beaumont.

REPORT OF RESEARCH COMMITTEE

A letter was sent in November to all state officers, council women, committee chairmen, and county presidents requesting material for our state files on the following subjects: outstanding and different programs; unique skits; informative and interesting talks by guest speakers; biographies of outstanding physicians; historical reprints; and information on what part medical personnel has played in obtaining and improving health laws and conditions in the various counties. Approximately thirty articles have been received to date.

MRS. J. PEYTON BARNES. Houston, Chairman.

REPORT OF REVISIONS COMMITTEE

The Revisions Committee has undertaken the rewriting of the Constitution and By-Laws. Copies of the proposed revisions were mailed to officers, committee chairmen and members, council women, and county presidents with an enclosed postcard to be returned with comments on the same.

The work has been done under the able direction of the President, Mrs. E. W. Coyle; the President-Elect, Mrs. Mark H. Latimer; the Parliamentarian, Mrs. H. S. Renshaw; and the Executive Secretary, Mrs. Arleen Draker.

MRS. EDWARD C. FERGUSON, Beaumont, Chairman,
MRS. SCOTT C. APPLEWHITE, San Antonio,
MRS. T. H. THOMASON, Fort Worth.

REPORT OF SCHOOL OF INSTRUCTION COMMITTEE

A School of Instruction was held at the post-convention Board meeting in Houston on April 29.

Two hundred and twenty-five invitations were mailed to Board members including the officers, past presidents, council women, county presidents, and committee chairmen. The theme for the School of Instruction was "The Auxiliary Tree of Facts," which brought out facts concerning auxiliary work. The School was planned in order to present information needed for the year's work.

MRS. RAMSAY H. MOORE, Dallas, Chairman.

REPORT OF STUDENT LOAN FUND COMMITTEE

This has been an active year for the Student Loan Fund. Every area of the state has shown interest in this important work. Thirteen of the fifteen districts participated. Many checks from auxiliaries were more generous than before.

A greater number of requests for loans have come to the committee than at any time since your chairman has been associated with the Fund. Six loans have been made for a total of $1,400. There is at this time on my desk a request for a greatly needed loan from a senior medical student. Apparently, the need is growing. A recent letter from Dr. Carl A. Nau, chairman of the committee for loans to students at the Medical Branch of the University of Texas at Galveston, says, "The demands here are heavy and we have reached the point where we are at the 'bottom of the barrel.' We are badly in need of funds and anything that you and your group might do will be greatly appreciated."

Mrs. E. H. Cary, Dallas, made a generous gift in memory of Dr. Cary. Through this gift additional loans can be made. Dr. Cary meant much to the young men in medicine of Texas over the years. His influence will continue for many years because they respected and loved him, and now this memorial will continue to benefit worthy students in a practical way.

The following is a report on growth of the Fund from May 1, 1953, to May 1, 1954:

Gifts from Auxiliaries as Additions to Fund	$ 499.50
Interest on Loans	44.61
Income Earned on Invested Principal	334.18
Gifts Made as Memorials	550.00
Total Increase	$1,428.29

A payment of $50 was made on a long overdue loan. Also, one loan of $250 was repaid and another loan was extended for one year.

It has been a privilege to serve as your Student Loan Chairman for three years. The splendid increase this year is a tribute to your interest and generosity. Since no effort is made by the committee to solicit funds, your support merits even greater commendation.

Mrs. J. Charles Dickson, Houston, who has served so ably during these three years as co-chairman will be chairman next year. She has long been actively interested in this work. She understands the working of the Fund and is most sympathetic with the needs of the students. She will make an excellent chairman.

I shall always retain my interest in the Student Loan Fund and remember with much joy the many contacts it gave me.

MRS. JOHN H. WOOTTERS, Houston, Chairman.

REPORT OF YEARBOOK COMMITTEE

In August letters were written to every county auxiliary president urging them to make their yearbooks and distribute them, sending copies to the President, Historian, Recording Secretary, and Yearbook Chairman.

The Recording Secretary advised this year that her copy of the yearbooks be sent to the central office for filing.

Thirty-seven yearbooks have been received and are on display at this meeting. These yearbooks will be judged according to the four membership groups and blue ribbons will be awarded the winner in each group.

MRS. R. T. TRAVIS, Jacksonville, Chairman,
MRS. DUDLEY JACKSON, JR., San Antonio.

REPORT OF PRESIDENT-ELECT

One of the chief duties of a president-elect is to prepare herself fully that she may meet the challenging responsibilities ahead with intelligence and confidence. This President-Elect has had ample opportunity to learn, to broaden her scope, and to make invaluable contacts through the thoughtfulness of the President, who invited this officer to represent her at several meetings, who made trips with her, and who helped her all along the way.

The President-Elect represented the President at two allied meetings during the year—the first annual convention of the Texas League of Nursing in Austin and the National Rural Health Conference in Dallas.

On a national level the President-Elect attended the annual convention of the Woman's Auxiliary to the American Medical Association in New York, June 1-5, 1953. The highlight of the meeting was the election of Texas' own Nina (Mrs. George) Turner of El Paso as President-Elect of the National Auxiliary. Later, the Annual Conference of State Presidents and Presidents-Elect in Chicago, November 18-20, proved to be a real school.

On a state level this officer attended the post-convention Executive Board meeting in Houston, was presented, and offered herself as an interested apprentice to the President. During the year she attended the fall Executive Board meeting; the Conference on Auxiliary Publications; the Conference of County Presidents and Secretaries of the Texas

Medical Association; and the Association's January Executive Council meeting. These meetings all convened in Austin.

On a district level she represented the President and spoke at the District 14 meeting in Gainesville; the District 10 meeting in Port Arthur; and the District 9 meeting in Brenham.

On a county level she assisted the council woman of District 9 in the reorganization of Washington-Burleson Counties Auxiliary and spoke to Bowie-Miller Counties Auxiliary. Other county auxiliary presidents contacted along the route include those from Polk-San Jacinto, Nacogdoches, Cass-Marion, Anderson-Houston-Leon, Montgomery, and Walker-Madison-Trinity. This officer also accompanied the President when she spoke to the Harris and Liberty-Chambers Counties Auxiliaries.

She was invited to work with the President and the Revisions Chairman in rewriting the state Constitution and By-Laws. This was, indeed, a thoughtful courtesy.

This officer has contacted every county president, council woman, and past State President by personal letter seeking advice and suggestions for appointments and talents. Only with an up-to-date file of such information can all of Texas be represented adequately. This file has been started.

The President-Elect wishes to thank the Texas Medical Association, especially Dr. George Turner, President, and Dr. F. J. L. Blasingame, President-Elect; the central office staff, particularly Mrs. Arleen Draker, Executive Secretary of the Woman's Auxiliary to Texas Medical Association, and Mr. Dan Lehman; and auxiliary members for their patience, understanding, and cooperation during this year of preparation.

MRS. MARK H. LATIMER, Houston.

REPORT OF FIRST VICE-PRESIDENT—CHAIRMAN OF ORGANIZATION

As Chairman of Organization, your First Vice-President wishes to thank the splendid group of council women who have worked so faithfully and conscientiously throughout the year 1953-1954 to promote the aims of the Woman's Auxiliary to the Texas Medical Association. Every effort has been made to sustain and maintain each medical auxiliary in Texas.

At the fall Board meeting last September, the council women who were present met with your chairman to discuss the most practical and far-reaching plan to hold the newly organized auxiliaries and at the same time maintain interest in the established auxiliaries. At that time each council woman received a map of her district, which she accepted with enthusiasm, welcoming the challenge it suggested. Pamphlets and kits of organization material from national headquarters were distributed at this meeting.

As the year progressed, your chairman met with, telephoned, and wrote many letters to each of the council women regarding her individual district and problems. We sincerely feel, on reviewing the past months' accomplishments, that the work done by all the committee with the untiring help of Mrs. Coyle and Mrs. Latimer was tremendous and outstanding.

During the months following the September Board meeting, the picture of state organization became clearer. Where auxiliary strength was found, it was encouraged, and where there was weakness, every effort through personal contact, letters, and telephone calls was made to renew interest and friendship. Not one organization was "left to die" if it felt it could not maintain itself.

At the beginning of the year your chairman asked the older well-established auxiliaries to adopt a smaller newer auxiliary for the purpose of instructing and befriending that auxiliary. Many auxiliaries invited their young neighbor groups to share their programs with them now and then, and we sincerely hope that this will become a custom, as it will give mutual pleasure and support.

As of May 2 we have 105 organized auxiliaries, with members at large from nine counties where there are medical societies. Our total membership has increased to 4,749, of which we are very proud.

MRS. JOHN D. GLECKLER, Denison.

REPORT OF SECOND VICE-PRESIDENT—CHAIRMAN OF PHYSICAL EXAMINATIONS

As Chairman of Physical Examinations, I wrote a personal letter to each county auxiliary president asking her to urge that all members and servants in every doctor's family have physical examinations.

The report as of April 1 is as follows:

District	No. Examinations	District	No. Examinations
1	349	9	1,986
2	1	10	729
3	341	11	76
4	131	12	436
5	488	13	1,044
6	831	14	2,240
7	277	15	139
8	359		
		Total	9,427

MRS. CECIL O. PATTERSON, Dallas.

REPORT OF THIRD VICE-PRESIDENT—CHAIRMAN OF TODAY'S HEALTH

As Third Vice-President and Chairman of *Today's Health*, I have sent out letters and material from the *Today's Health* circulation department to all auxiliaries. Also, sample letters from our National *Today's Health* Chairman, Mrs. Richard F. Stover of Florida, were sent out to provide suggestions for promoting the sale of *Today's Health*. In December a mimeographed "Texas Tips 'N Topics" on *Today's Health* was sent to each auxiliary.

Our contest closes April 14, 1954, so my report is incomplete; however, I am hopeful our final report will show Texas in the forefront.

A report from *Today's Health* circulation department lists the following auxiliaries having 100 per cent or more subscription: Angelina (176%), Armstrong-Donley-Childress-Collingsworth-Hall (353%), Bell (100%), Brazos-Robertson (114%), Cameron-Willacy (171%), Camp-Morris-Titus (240%), Cherokee (178%), Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson (100%), Hardin-Tyler (117%), Kerr-Kendall-Gillespie-Bandera (203%), McLennan (297%), Navarro (275%), Orange (106%), Potter (101%), and Wharton-Jackson-Matagorda-Fort Bend (162%).

A special mention should go to Harris, Dallas, and Bexar Counties for their splendid *Today's Health* and public relations joint effort.

Many thanks for a wonderful year for Texas.

MRS. RALPH B. PAYNE, Amarillo.

REPORT OF FOURTH VICE-PRESIDENT—CHAIRMAN OF PROGRAM

The program for the Woman's Auxiliary to the Texas Medical Association has been built around the President's

slogan for the year: "Knowledge, Judgment, and Action in Health Leadership." Materials have been sent to county presidents concerning the various projects the Auxiliary is promoting, as well as material on health topics which could be used as a basis for programs during the year.

The program material from the Woman's Auxiliary to the American Medical Association was received in August, and this material was distributed to the county presidents in the fall of 1953. The theme of this material "Know Your Community" met with response in many groups this year and, perhaps, will be enlarged upon in future programs. Safety, juvenile delinquency, and mental health were three subjects used most often in programming.

It is becoming evident in program materials that the emphasis of auxiliary members is turning more from just "Good fellowship among doctors' wives" to "Good relationships in our communities as doctors' wives."

MRS. GUY E. KNOLLE, Houston.

REPORT OF RECORDING SECRETARY

It was a pleasure to serve as Recording Secretary for the post-convention and fall Executive Board meetings. However, due to illness in my family I was unable to carry on my duties after Christmas. Full credit should go to Mrs. Charles McGehee, San Antonio, Corresponding Secretary, and Mrs. Newton F. Walker, El Paso, Recording Secretary pro tem, who have substituted for me most capably and graciously. My lasting appreciation goes to Mrs. E. W. Coyle for her understanding and assistance.

MRS. PAUL BRINDLEY, Galveston.

REPORT OF TREASURER

State and national dues have been credited to 4,726 members as of April 20, 1954. Included in this number are seventy-three wives of doctors in service whose dues were paid from the Special Fund, two state honorary members who are exempt from state dues and one national honorary member who pays no dues.

Your Treasurer has four funds in her custody: the General Fund, which is the administrative account; the Special Fund, in which the receipts from Texas Medical Association are kept and disbursed for specified purposes; the Memorial Fund Account, which is the depository for memorial donations and the interest received from the trust and disbursed to indigent widows; and the Library Fund, which holds the donations to this fund until they are given to the Texas Medical Association Memorial Library.

A thorough check of these accounts was made April 20, 1954, by the auditor and his letter of verification has been submitted. The complete audit extends to the final closing of the books and the detailed account of transactions will be found in the report of the auditor. The balance on hand in these accounts April 20, 1954, follows:

General Fund	$12,806.45
Special Fund	6,673.06
Memorial Fund:	
Checking account	$359.83
Emergency account	452.77
	812.60
Library Fund	126.50
Total Funds under custody of Treasurer	$20,418.61

The Memorial Trust Fund is held by the Republic National Bank of Dallas. On March 31, 1954, the following report of assets was issued:

Cash	$ 1,031.52
Bonds	8,953.00
Common Trust A	5,480.00
Accrued Interest on Bonds	292.00
Total Memorial Trust Fund	$15,756.58

The Student Loan Fund Trusts are held by the South Texas National Bank of Houston. On March 1, 1954, the following report of assets was issued:

George Plunket Red—Trust 33	
Bond	$ 3,000.00
Savings	2,537.15
Cash	85.07
Notes Receivable	660.00
Total	$ 6,282.22
Student Loan Fund Trust—Trust 147	
Bonds	$ 3,000.00
Stock	3,748.50
Cash	5,370.58
Notes Receivable	3,969.83
Total	$16,088.91
Total Student Loan Fund Trust Funds	$22,371.13

(Since there is a difference in the date of report on the various funds and trusts, the total assets figure is necessarily an approximate one.)

Approximate total assets of the Woman's Auxiliary to the Texas Medical Association, May 1, 1954, $58,496.32.

I wish to add that since this report was filed, the membership has increased to 4,749.

MRS. OSCAR MARCHMAN, JR., Dallas.

REPORT OF AUDITOR—SUBMITTED BY TREASURER

Woman's Auxiliary to the Texas Medical Association
Dallas, Texas
Ladies:

In accordance with your request, we have examined the records of receipts and disbursements of the following fund accounts of the Woman's Auxiliary to the Texas Medical Association for the period April 22, 1953, to May 18, 1954: General Fund, Special Fund, Regular Memorial Fund, Emergency Memorial Fund, and Library Fund.

Our examination was made in accordance with generally accepted auditing standards and included such tests of the records of receipts and disbursements as we considered necessary.

In our opinion, the accompanying Summary of Fund Transactions and the Statement of Receipts and Disbursements for each fund present fairly the results of operations of such funds for the period April 22, 1953, to May 18, 1954.

May 25, 1954.

E. R. BOYD & COMPANY.

E. R. BOYD & COMPANY, CPA, Dallas.
MRS. O. M. MARCHMAN, JR., Dallas.

REPORT OF CORRESPONDING SECRETARY

As Corresponding Secretary it was my pleasure to attend the state meeting in Houston and San Antonio, and the fall Board meeting in Austin.

Cards were mailed to the delegates representing Texas at the national convention. Letters and cards were written to obtain the names of incoming county presidents.

Cards were sent to all officers and chairmen asking for names of committee members and for amounts of stationery needed. Lists were compiled of the names and addresses of officers, committee chairmen, committee members, council women and county presidents.

Letters were written when possible for the President, and several county and district meetings were attended with her. Notices were sent of the fall Board meeting.

Because of unforeseen circumstances, this office handled the annual reports which are usually processed by the Recording Secretary.

It has been a distinct privilege to work in such close contact with our State President who has done so much to alert us to our responsibilities as auxiliary members and as active citizens.

MRS. CHARLES L. MCGEHEE, San Antonio.

REPORT OF PUBLICITY SECRETARY

The Publicity Secretary attended the Board meeting in Houston and the Board meeting held in Austin in the fall.

Since this year brought a new policy for our TEXAS STATE JOURNAL OF MEDICINE publicity, I tried to help the program by attending the Conference on Auxiliary Publications which was held in September. This conference was called to discuss the various medias of communication used by the Auxiliary. The media available are primarily the county bulletins, local newspapers, state auxiliary *News Letter*, TEXAS STATE JOURNAL OF MEDICINE, and the national *Bulletin*. The program for each of these channels was planned.

With the assistance of two staff members, an outline in detail for the material used in the JOURNAL was approved. The articles used in the JOURNAL were of interest in recording items which were reflective of the objectives and major attainments of the Auxiliary. Our goal also was to interest physicians in the work of the Auxiliary and encourage their cooperation with the Auxiliary. Over the period of this past year we have tried to use articles which would touch on all major phases of our Auxiliary work. This procedure gave the various state chairmen an opportunity to reach their audience, not only auxiliary members (their co-workers), but also their doctor-husbands.

The general articles described have not taken all the allotted space in the JOURNAL each month. We have used the remaining space to give reports of activities done in counties over the state. These reports have in no way covered all we would have wished to report but were the items reported to me.

For the first time a scrapbook of auxiliary publicity has been compiled in order to give an account of the year's publicity and to act as a guide for incoming county presidents and publicity secretaries in showing how, where, and what makes for good auxiliary publicity.

In September each county president and publicity secretary was given a directive, "Publicity for Woman's Auxiliary," this to be used as an aide for writing and obtaining material for JOURNAL news, ideas for newspaper publicity, and for radio and television spots. Postcards were sent later in the year requesting news for the national *Bulletin*.

Detailed information giving suggestions for publicity was sent out to several counties upon request. For example, Grayson County Auxiliary asked for ideas on how to publicize its first Doctor's Day observance.

MRS. A. H. NEIGHBORS, JR., Austin.

REPORT OF PARLIAMENTARIAN

As Parliamentarian it has been my privilege to consult with our President, Mrs. E. W. Coyle, whenever called upon concerning parliamentary procedure. I have worked with the Revisions Committee and Mrs. Coyle upon the revisions

of the state Constitution and By-Laws. I have attended the post-convention Executive Board meeting in Houston in May, 1953, the Executive Board meeting in Austin in September, 1953, and the Executive Board meeting in San Antonio in May, 1954.

MRS. H. S. RENSHAW, Fort Worth.

REPORT OF PRESIDENT

The year 1953-1954 has been a most enjoyable, stimulating and an enriching one for your President, and *you* have made it so. Your friendliness, your interest, and your enthusiastic cooperation in the aims and ideals of our Auxiliary have produced the excellent results shown in your reports.

This officer is proud of your wonderful achievements and realizes the only claim she can make to any part of your success is in the hope that as she visited you, or in correspondence with you, she conveyed information and inspiration, plus the feeling she has concerning the privileges and responsibilities that we have as doctors' wives and citizens. She did try to pass on to you information and suggestions from the Texas Medical Association, and the American Medical Association and its Auxiliary, as well as thoughts from messages of outstanding lay speakers heard at state and national meetings and the Conference of State Presidents and Presidents-Elect and information on legislation and other subjects in our state and national medical journals.

Since her activities have been covered in detail elsewhere, your President mentions only that she presided at three Executive Board meetings—the post-convention breakfast-meeting in Houston, the fall meeting in Austin, and the pre-convention luncheon-meeting in San Antonio—and the Annual State Convention in San Antonio, May 1-5, 1954.

She has served on the Advisory Boards of the State March of Dimes, the Texas Division of the American Cancer Society, and the Coordinating Council of the Texas Graduate Nurses and the Texas League for Nursing. Though she was invited to attend meetings of the state mental health and civil defense organizations, the Auxiliary was represented officially by our chairmen of these two committees. She attended the American Medical Association's Regional Legislative Conference in Dallas, and regretted that she was unable to attend its Rural Health Conference.

Though greatly disappointed that she could not personally visit all auxiliaries, she did meet with approximately fifty county and eleven district groups. At these meetings she contacted representatives of approximately twenty-five smaller groups not otherwise visited. While "touring Texas" she visited with presidents and other members of the newer small auxiliaries and reached numerous others by telephone. She stressed the importance of their united efforts and working as individuals in their communities and was delighted to find that many groups feel as does a group of three who wrote: "We are necessarily circumscribed in our efforts. However, we feel that we form a nucleus of informed members who can work on an individual basis for better community health and public relations. In organization we can keep in touch with other communities throughout the state and be ready to grow when the opportunity presents itself. We did show one film on cancer and other films are planned. We shall be interested in hearing what other small communities are doing." You may be interested to know that approximately 23,000 miles were traveled by plane, train, and car in the year's "touring."

Though there is no record of outgoing mail, approximately $75 in stamps was used. An effort was made to answer all mail promptly. When your President was out of the city, mail was taken care of by her husband and the Corresponding Secretary. When she was home, answers were made by personal postals, letters, telegrams, and telephone. She must confess that there are many "thank you" notes still unwritten. She is constantly remembering and is grateful for your many thoughtful courtesies extended when visiting you, and for all that you, through individual and collective effort, did during the year in your community.

The record of your achievements has been sent to the National Auxiliary and is included in the History compiled by your Historian and President and appearing as a part of these Transactions. May I urge you to read it so that you may realize anew the value of your service even though we know that no one can realize how far reaching a continuing influence such as yours can be.

Your President wishes to express to the following her sincere gratitude and appreciation for all that has been done to make this year such a happy and fruitful one:

I. The Texas Medical Association, through:

A. The Board of Trustees for:

1. Their interest in and appreciation of the efforts of the Auxiliary in its purpose to serve as an Auxiliary to the Medical Profession;
2. The financial assistance which has enabled the Auxiliary to serve more intelligently and efficiently and with greater and more far reaching results, through publication and mailing of the *News Letter,* expanded this year to a bi-monthly publication; attendance by the President and President-Elect at the meeting of the Auxiliary to the American Medical Association and the annual Conference of State Presidents and Presidents-Elect; publication and distribution of a Handbook for officers, committee chairmen, council women and county presidents; purchase of a mental health and two nurse recruitment films; payment of State and National dues of members whose husbands are temporarily serving in the armed forces; giving of a substantial gift to the American Medical Educational Foundation Fund; and payment of the major portion of Convention expenses, certain essay committee expense, and the like;
3. Furnishing an Executive Secretary whose guidance and assistance during the year and with the Convention is incalculable and whose services will continue to grow in value. The work and effectiveness of the Auxiliary program have greatly increased.

B. Mr. N. C. Forrester, Executive Secretary of the Texas Medical Association, Miss Harriet Cunningham, Managing Editor of the TEXAS STATE JOURNAL OF MEDICINE, Mr. Dan Lehman, Association staff member in charge of services, and other members of the staff for their complete cooperation and help in many ways.

C. Mrs. Arleen Draker, Auxiliary Executive Secretary, who has been most gracious and efficient in the planning and the execution of plans for the year and for the Convention, and whose services definitely enhanced the effectiveness of the work of the President.

D. Dr. George Turner, President of the Texas Medical Association, for his valuable suggestions, guidance, understanding, and even his spontaneous "chuckle" which furnished encouragement all along the year's

way. The President is grateful for the information and inspiration received by her and other members of the Auxiliary through attendance at the Association's Executive Council Meetings;

E. The Public Relations and Judicial Committees for information and guidance in the fields of public relations and legislation, and for the privilege of meetings with these committees; also, the Committee on Rural Health for its information and encouragement for Auxiliary programs in this field.

F. The firm of Syers, Pickle and Winn, public relations counsel of the Texas Medical Association, for their direction and particular help with the Handbook, as well as all other phases of our work plus the special mailings sent to each member of the Auxiliary prior to the Convention.

II. Mrs. John Parsons, the General Chairman for the Convention, and her committees for the planning and smooth operation of all arrangements which made the Convention our most successful and enjoyable one.

III. You, "My Official Family," who so willingly cooperated in carrying out the duties and privileges of your various offices; you, each member, whose interest, work, and importance is deeply appreciated.

IV. Mr. H. B. Zachry, who furnished plane transportation to various county and district meetings, making it possible to visit more groups, and, because of the ease with which the President "toured" on these trips, to serve more efficiently and with greater enthusiasm.

V. My spouse, Edward, whose unselfishness, thoughtfulness, and helpfulness during the year exemplified the fact that without the complete cooperation and understanding of our husbands, auxiliary members, particularly the President, cannot execute well their various official duties.

And so, for the honor, privilege, and responsibilities which I have enjoyed to the fullest, may I, again, say "Thank you."

MRS. E. W. COYLE, San Antonio.

LUNCHEON HONORING MRS. E. H. CARY AND CHARTER MEMBERS

At 12:00 noon Tuesday, May 4, 1954, a luncheon honoring Mrs. E. H. Cary, Dallas, first President of the Woman's Auxiliary to the Texas Medical Association, and charter members was given in the Colonial Room of the Menger Hotel, San Antonio, with the President, Mrs. Edward W. Coyle, San Antonio, presiding. Mrs. S. Foster Moore, San Antonio, was chairman.

The invocation was given by Mrs. P. R. Denman, Houston, a Past State President.

The President read the names of the 1918 officers and council women, then known as district organizers. Two of these, Mrs. M. L. Graves, Houston, Fourth Vice-President and Chairman of Organization in her district, and Mrs. E. V. DePew, San Antonio, Publicity Secretary, were introduced. Messages from the following 1918 officers and district organizers were acknowledged: Mrs. A. P. Howard, Houston; Mrs. H. G. Walcott, Dallas; Mrs. O. M. Marchman, Dallas; Mrs. Frank Boyd, Fort Worth; Mrs. William Simminger (formerly Mrs. J. M. Daly), Abilene; Mrs. Charles R. Hartsook, Wichita Falls; Mrs. J. E. Dildy, Brownwood; Mrs. T. J. Bennett, Arlington, formerly of Austin; and Mrs. J. W. Burns, Cuero.

Eight charter members present then were introduced by the President: Mrs. H. Leslie Moore, Dallas; Mrs. Scott C. Applewhite, San Antonio; Mrs. P. I. Nixon, San Antonio; Mrs. J. P. Oldham, San Antonio; Mrs. John L. Pridgen, San Antonio; Mrs. Frank W. Sorrell, San Antonio; Mrs. Jack Watts, San Antonio; and Mrs. Frank N. Haggard, San Antonio.

In the absence of Mrs. E. H. Cary, the President gave the following early information of the Auxiliary and read portions of a letter from Mrs. Cary:

Our meeting today is incomplete because our first State President, Mrs. Edward H. Cary, could not be with us. We had hoped until the last moment that she might feel that she could attend. Before I read portions of a letter from her, may I bring a bit of information of our organization.

Before 1918, the wives were just "visiting ladies." There were all-day shopping tours, teas, little dinner parties, and grand receptions—all for their pleasure. In 1918, there were drives, breakfasts, musical teas, swimming parties, Mexican eats and knitting parties for the boys "over there." The *San Antonio Express,* May 16, 1918, said that: "The entertainment committee of the Auxiliary to the Bexar County Medical Association gave a luncheon at the Country Club . . . honoring the wives and daughters of members of the State Medical Association, the affair being marked by the organization of a state auxiliary. . . . Covers were laid for 350. The auxiliary will lend its aid in all patriotic, philanthropic and social activities. . . .

". . . more than 200 women enjoyed an early morning swim and . . . breakfast . . . cooked in the open. . . ."

Dr. E. H. Cary of Dallas had enthusiastically championed the cause of the new organization and was greatly responsible for its being born. I want to read to you portions of a letter received from Mrs. Cary: "Easter has come again, leaving me with a renewed sense of gratitude to our Creator that among other gifts to mankind, He provided for those who are in sorrow His compassion and the sympathy of friends. . . . The extra copies of the *News Letter* with its tribute to him (Dr. Cary) are treasured by us all. . . . May I repeat the lines which are so beautiful?

DR. CARY

'Silently . . .
in greeting,
in kindness shown,
in humble and in noble tasks well done,
in faithfulness to that for which he lived
this man had grown
his own magnificat,
quick'ning in the lives of all whom he had known
more lastingly than words of pen
or lines in stone may tell,
an epitaph eternal.'

In an unequalled way this expresses the fineness of him and other doctors who have gone. I want to thank its author.

"When you suggested having the luncheon in honor of your first President and her co-workers and charter members of the first State Auxiliary, I was deeply touched and pleased . . . into my inexperienced hands, so long ago, was placed the first two years of the Presidency. Our work, of course, was principally that of organization. I wrote to every president of every county medical society in Texas. Some opposition was shown, but our objective of social, philanthropic and patriotic work won enough support to carry on and we did quite a lot of war work. . . . There was no pattern to guide us during those first years . . . but the newly formed county auxiliaries found and did much good work. . . . For the second meeting I wrote a paper entitled, I think, 'Since

we have the vote, what shall we do with it?' It was most comprehensive, starting with woman's influence since the dawn of civilization to the then present day. . . . I suggested that we doctors' wives use our votes to further health legislation and for the protection of the Medical Profession. . . . I do want you and the Auxiliary, through you, to know of the deep appreciation I have of the honor, the sympathy, and help given me through the years—individually and as an organization. In my last greatest sorrow, their help has been incalculable.

"I am sorry not to be at the Luncheon and the meeting. To the workers in the formative stage of the State Auxiliary, I send anew my thanks for their support and interest; to the impressive line of brilliant and efficient Presidents who followed me, my greetings; and to the members of the State Auxiliary as a whole, my affectionate appreciation.

"I am enclosing a check for the Student Loan Fund in memory of my husband, Edward Henry Cary. He appreciated the work of the Auxiliary and would be pleased that through it a young man could be helped to enter the Medical Profession which he loved and considered the greatest career of all—that of being a *good* doctor.

"With gratitude and affectionate good wishes, I am,

Most sincerely,

GEORGIA F. S. CARY."

The President presented the Convention Chairmen and thanked them, again, for all the planning and efforts that had made the Convention so successful. Messages were read from Mrs. Paul Brindley, Galveston; Mrs. S. A. Collom, Texarkana; and Mrs. O. M. Marchman, Dallas.

Report of Resolutions Committee

Mrs. Joseph H. McCracken, Jr., Dallas, Chairman of the Resolutions Committee, presented the following report:

As we come to the close of our thirty-sixth annual meeting of the Woman's Auxiliary to the Texas Medical Association, held in the beautiful and historical city of San Antonio, May 1 through 5, 1954, the Resolutions Committee wishes to express for the entire Auxiliary our deepest appreciation for the wonderful meeting we have had and the achievements which have been accomplished in each county and district through the work of each county president, council woman, and committee chairman.

We wish to express to our charming State President our love and appreciation for the work she has so competently accomplished for our State.

To Dr. George Turner of El Paso and the doctors of Texas, we wish to express our appreciation for our having the privilege of being a part of the great organization, and for the wonderful work they do for the health and happiness of the people of Texas.

At this time we should also like to express our appreciation to the committee of three men which judged the AAPS essays.

To the Menger Hotel, which is ninety-six years of age and has played such an important part in the life of San Antonio and Texas, we wish to say "Thank you" for all the courtesies extended the Auxiliary during our meeting.

To Mrs. John Parsons and the Bexar County Auxiliary, we wish to express our thanks for the delightful meeting and entertainments we have enjoyed and the spirit with which they have carried out the plans and wishes of this meeting.

We wish to thank also the press for the wonderful publicity they have given to this most successful Convention.

BE IT RESOLVED, that in appreciation for the above stated courtesies, a copy of these Resolutions be entered into the minutes of this meeting.

MRS. JOSEPH H. MCCRACKEN, Dallas,
Chairman;
MRS. CARLOS HAMILTON, Houston;
MRS. SAMUEL M. HILL, Dallas;
MRS. NEWTON F. WALKER, El Paso.

Mrs. S. F. Harrington, Dallas, suggested that thanks be sent to Dr. and Mrs. P. I. Nixon, San Antonio, and Bexar County Medical Society for early transactions of the Texas Medical Association given to the Memorial Library.

The President expressed her appreciation and gratitude for the generous contributions made by Mr. H. B. Zachry during the year to the Auxiliary and, thus, to the Medical Profession. Through his kindness and generosity, she had been able to visit by plane, more auxiliaries than originally planned, thereby allowing her to give more time and efficient service to the Auxiliary.

The President expressed regret that Mrs. Leo J. Shaefer, Salina, Kan., President of the Woman's Auxiliary to the American Medical Association, was unable to attend the Convention due to the serious illness of Dr. Shaefer. Mrs. Frank N. Haggard, San Antonio, moved that a telegram be sent to Mrs. Shaefer expressing our regret. Motion carried.

The President then introduced Mrs. George Turner, El Paso, one of our Past Presidents and now President-Elect of the Woman's Auxiliary to the American Medical Association and the official representative of the national organization at the Convention. Mrs. Turner gave the following address:

Address of Mrs. George Turner

We never fully merit the honors bestowed upon us, for there are so many others with whom any accomplishment must be shared. To each of you of my own El Paso County Auxiliary and State Auxiliary who have given me the opportunity to serve, I share the honors you have made possible for me. As I speak to you, I am filled with mixed emotions. The responsibility of the office I am about to assume and the confidence you have manifested in me on many occasions make me feel very humble. The opportunity of another year to serve the Auxiliary in the promotion of health education and community health service makes me most happy.

In any endeavor, we are guided by the light of the lamp of past experience. There is no safer way of projecting plans for the future than by the past. I accept with pride the years of experience which is our heritage. I pledge to you that I will use it as a pattern and guide to advance progressively the program and sphere of the Auxiliary, as outlined for us by the American Medical Association and the varying needs of the communities in which we live. I pray for guidance and that I may be deserving of the confidence placed in me and ask your cooperation and help. I wish to speak to you on *Leadership in Community Health.*

Aim.—In any undertaking a definite aim must be established and a program planned to support it. Leadership in Community Health will be our aim. Our program will be blueprinted for self education within the Auxiliary and health education and health service in the respective communities. The mantle of health leadership falls upon the shoulders of the doctor's wife the day she marries her doctor; the people in her community naturally look to her for guidance and help in health problems. Outside the realm of home, family, and church, the obligation of the doctor's wife is an active interest in her husband's profession which can be met if she fulfills her duties as an auxiliary member.

The diverse program of the Auxiliary makes it possible for the member to choose the field for her contribution to her community. It may be something in which she is already trained or that in which she has a vital interest.

The problem today seems to be how to live "in the thick of thin things," to borrow a phrase from Edith Wharton. It can be done by bolstering our convictions, seeing things as they are, and where possible changing them for the better. This is not always the easy or popular thing but it does put us in a position to do a better job.

It can be done by recognizing that vast areas of life are wholesome. This realization is a source of confidence to us and adds strength to our efforts to make life, as we see it, more effective.

It can be done by casting our lot with ideas and institutions in which we believe. The Auxiliary has done this—we do believe in the ideas and ideals of American medicine and our lot is cast with the American Medical Association, State Medical Association, and the various county medical societies.

It can be done by work, words, and deeds worthy of record. The 64,000 women who make up the membership of the Auxiliary are working for health, speaking out for health, and striving to establish acceptable health standards through Leadership in Community Health.

Organization.—The structural frame of our organization is complete. However, the recent announcement of 146,723 members of the American Medical Association sets a new and all time high goal for our membership. A matching auxiliary membership would establish the idea of complete unity and be an effective means of placing the Auxiliary in the role of Leadership in Community Health.

Community Facilities.—It is recommended that county and state auxiliaries make a survey of the existing health facilities and make their findings available to the community, as a public service and directive to better community health. A prepared leaflet with this information should receive wide distribution, especially among newcomers in the community and the lower income bracket groups. The medical society, the health department, the hospitals and health clinics, the American Cancer Society, the National Foundation for Infantile Paralysis, the Cerebral Palsy clinics, the Light House for the Blind, the Commission on Chronic Illnesses, the Red Cross, school health services, the nursing associations, and the like are maintained in the communities for the betterment of community health. Individual participation in the work of these organizations by the auxiliary member places her in a natural role for Leadership in Community Health.

Program.—Nothing new is added to the program this year. Re-evaluation, special emphasis where needed, and an all-out effort will be placed behind the projects already under development to increase their effectiveness. Health legislation, civil defense, the American Medical Education Foundation, nurse recruitment, and rural health are vital factors for consideration in the health pattern of the community.

The fact that more proposed bills with medico-economic implications are introduced to Congress than any other type of legislation is positive proof of public interest in health. The county auxiliary must be informed currently on this type of proposed legislation by a monthly report from its legislative chairman. Individually, members are asked to participate in the "get out the vote campaign" for the November, 1954, elections.

Voluntary health insurance plans are in a state of reorganization since the introduction of the proposed federal "reinsurance" of voluntary health insurance. Industry and the insurance companies are discussing a new type plan, which would cover catastrophic illnesses and contain a deductible clause whereby the beneficiary would underwrite the first one to two hundred dollars medical expense, as he would pay for minor auto damage under a deductible policy.

Recruiting, training, and registration of volunteers for civil defense must continue at a stepped-up speed. The recent hydrogen bomb tests reveal the increased power of explosion such as to render bomb shelters totally inadequate. Obviously, the problem becomes one of mass evacuation, transportation, housing, and nutrition in temporary surroundings, in addition to all the other aspects of such disaster. Likewise, recruiting and training of nurses remains a specific and acute problem.

A steady supply of well trained physicians is essential to meet the demands of the armed forces and the civilian population. This year the deficit in maintenance of our seventy-nine medical schools totaled ten million dollars. The American Medical Association and the Auxiliary believe that private contributions, rather than government aid, should solve this problem. Individual, county, and state auxiliary donations added together will help materially to reach the goal of the American Medical Education Foundation.

Rural people have become very health conscious and adept in solving their own health problems and improving their general living conditions. Auxiliaries can render a real community service by assisting this group with their health problems by sponsoring health forums featuring speakers on timely subjects of local interest and general health education.

Special Emphasis.—In cooperation with your county medical society, encourage the revival or the establishment and the availability of a *speakers bureau* composed of medical society and auxiliary members for community health programs.

The *medical forum* idea is snowballing throughout the country as medical societies, auxiliaries, and the newspapers join forces to bring their communities up to date health information. Medical societies will capitalize on the public relations potential of the Woman's Auxiliary in carrying through on this project. You are urged to climb aboard the medical forum bandwagon for 1954-1955 by being instrumental in putting on, at least, one health forum in your community.

Mental health is a burning question on all sides. You are asked to study and actively work with your county and state mental health societies, as individuals. As a stimulus, advise your county medical society, your state mental health commissioner, and the local and state psychiatric societies that you are interested in working with them. The mental health committee of the American Medical Association requests the names of state and county medical societies and auxiliaries having mental health chairmen with a resumé of aims and accomplishments in mental health.

Put *safety* high on your activity list. Medical science will never produce a vaccine to prevent accidents. The recent White House Conference on Highway Safety emphasized the importance of participation of women's groups in initiating safety programs; developing a conscious responsibility for traffic safety; and a positive, active support of the efforts of the professional highway safety people. Everyone knows the three "E's" of traffic safety: Engineering, Enforcement, and Education. If we, through conscious responsibility, are willing to set an example of carefulness and consideration and influence others to do the same, we can add other "E's" to safety: Example and Experience. Mobilization of public opinion is the solution and here lies another opportunity

for Leadership in Community Health. Saving healthy lives is more important than saving diseased lives.

Juvenile delinqency problems blazon the headlines of all newspapers and magazines. Again, the problem is only indirectly related to health. Drug addiction, alcoholism, sex perversion, and petty thievery seem to be the main offenses of these youths who sooner or later become both physical and mental cases. Leadership in Community Health through the juvenile courts, youth agencies, and Parent-Teacher Associations is the auxiliary member's entree into the solution of this community problem.

Auxiliary members, as individuals, were asked this year to support and cooperate in the local areas in the vaccine validity study of the National Foundation for Infantile Paralysis and the Crusade for Freedom which is the project of the American Heritage Foundation. No doubt, this or a similar opportunity for community service will again be ours in 1955.

Self Education.—To be a qualified health leader, auxiliary members must keep informed by reading the *Bulletin; Today's Health;* the editorials and organization sections and the President's monthly message in the *Journal of the American Medical Association* and the state journals of medicine; and the letters and literature sent to you by the Auxiliary committee chairmen and officers. Our central offices in Chicago and Austin are maintained to serve you and through our efficient staffs and the resources available to them, you may obtain any help you need.

Universal interest in the American Medical Association is significant because it is the voice of American medicine. The world is small. This realization led to the organization of the World Medical Association which is the voice of 700,000 practicing physicians, representing forty-three national medical associations. The World Health Organization is in no way connected with these two organizations. It is a branch of the United Nations and represents governments of the world in the health field. As individuals, I implore you to study the history, aims, and the resources of these three organizations as a part of your education for Leadership in Community Health.

The achievements of American medicine are unparalleled and our pride in them justifiable. However, we must realize that the appreciation of the public is not based on excellent medical care alone but in ratio to our devotion to the welfare of the community through health education and community health service. It is in this unobtrusive daily relationship between the doctors and his patients and the doctor's wife and her contacts that confidence in our sincerity and ability as leaders in community health is established.

"A leader is best
When people barely know he exists,
Not so good when people obey and acclaim him,
Worse when they despise him.
Fail to honor people, they fail to honor you
But a good leader, who talks little,
When his work is done, his aim fulfilled,
They will all say, 'We did this ourselves.' "

—Laotze, 500 B. C.

The annual Auxiliary awards were presented by the Historian, Mrs. Travis Smith, Abilene, as follows:

AWARDS

Bosque County Auxiliary, District 12, and Webb-Zapata-Jim Hogg Counties Auxiliary, District 6, both with a 233.3 per cent increase in membership, were awarded a tie for the silver membership loving cup.

Other awards include the following:

(Group 1 includes auxiliaries having a membership from 1 through 25; Group 2 from 26 through 50; Group 3 from 51 through 100; and Group 4 all over 100.)

MEMBERSHIP

Group 1—Bosque.
Webb-Zapata-Jim Hogg.
Group 2—Wharton-Jackson-Matagorda-Fort Bend.
Group 3—Cameron-Willacy.
Group 4—Harris and East Harris Chapter.
Galveston.

Election and Installation of Officers

In the absence of the Parliamentarian, the Recording Secretary read from the By-Laws concerning the officers and their election.

In the absence of Mrs. Robert F. Thompson, El Paso, Chairman, the report of the Nominating Committee was read by Mrs. F. F. Kirby, Waco. There being no nominations from the floor, upon the motion of Mrs. E. H. Marek, Yoakum, the following officers were elected by voice vote:

President—Mrs. Mark H. Latimer, Houston.
President-Elect—Mrs. Joseph H. McCracken, Jr., Dallas.
First Vice-President—Mrs. Mal Rumph, Fort Worth.
Second Vice-President—Mrs. Harold Lindley, Pecos.
Third Vice-President—Mrs. Howard Dudgeon, Jr., Waco.
Fourth Vice-President—Mrs. Troy Shafer, Harlingen.
Fifth Vice-President—Mrs. August J. Streit, Amarillo.
Treasurer—Mrs. J. C. Terrell, Stephenville.
Recording Secretary—Mrs. P. M. Kuykendall, Ranger.
Corresponding Secretary—Mrs. William Palm, Houston.
Publicity Secretary—Mrs. A. H. Neighbors, Jr., Austin.
Parliamentarian—Mrs. John E. Hill, Marshall.

(Mrs. Hill could not be present for reasons explained and accepted by the Nominating Committee.)

These officers were installed by Mrs. George Turner, El Paso, as follows:

The installation of new officers is a momentous occasion. It is the end of a year and the beginning of a year. The accomplishments of the officers who are retiring from office are projected into the year which you are entering. To be elected to these offices is an honor, but, the final and lasting honor depends upon how well you carry your responsibilities and discharge your duties.

Leadership is the guiding of the activities of an organization; and the accomplishments of the year depend upon the quality of the leadership.

Leaders must assume responsibility.
Leaders must be hard workers.
Leaders must make decisions.
Leaders must have confidence in themselves.
Leaders must have knowledge.
Leaders must be open-minded.
Leaders must be unselfish, unbiased, and understanding.
Leaders must delegate details.
Leaders must spend their time organizing, deputizing, and supervising.

Mrs. Latimer, as President you are the chief executive officer. Your duties are to promote the objectives and advance the work of the Auxiliary; plan the work with the Executive Board and officers; consult with the Advisory Committee; select the chairmen of standing committees with the approval of the Executive Committee; assist the committees with their work; assist the county auxiliaries by visits, communications and literature; plan and preside at all meetings; and finally, at the end of the year, submit your reports.

The honor of being elected President has come to you in recognition of your years of loyal service to the Auxiliary. Your sincerity, enthusiasm, ability, and belief in the Auxiliary will bring credit and honor to us. Yours is a great responsibility.

Mrs. McCracken, as President-Elect the office of President automatically falls upon you after the next annual Convention. You were chosen for your ability and your devotion to the work of the Auxiliary in the other offices which you have held. The coming year will give you the opportunity to study and familiarize yourself with the routine of the

President's office. You may do this by working with the President, carrying out your assigned tasks, and attending district, state and national meetings. May you have a profitable year.

Mrs. Rumph, as First Vice-President you are the Chairman of Organization and Membership. You shall perform the duties of the President, in her absence, and if for any reason the office of President becomes vacant, you shall succeed to that office with all the prerogatives and duties pertaining thereto.

The Second, Third, Fourth and Fifth Vice-Presidents, Mrs. Lindley, Mrs. Dudgeon, Mrs. Shafer, and Mrs. Streit, you shall be Regional Chairmen of Organization and Membership in the region where you reside, working under the First Vice-President. In order, you shall assume vacancies in offices as they occur.

The Recording, Corresponding, and Publicity Secretaries, Mrs. Kuykendall, Mrs. Palm, and Mrs. Neighbors, you are charged with keeping an accurate record of the Auxiliary transactions and reports; answering and keeping a file of the Auxiliary correspondence; and giving publicity, as deemed advisable, to Auxiliary affairs. The history of the Auxiliary is based upon your records.

Mrs. Terrell, as Treasurer you are the custodian of the funds. Your specific duties are to instruct the county treasurers in their work; collect the dues; keep the membership records up to date; keep accurate record of all receipts and disbursements and present a financial report upon the request of the President; and give an annual audited report at Convention.

These officers, by their presence here, have signified their willingness to serve. May we, as members, pledge them our loyalty and support? Our responsibility to them is as great as theirs is to us. Will you please rise and thereby give assurance of your wholehearted cooperation?

As installing officer, I now declare these officers duly elected and installed. Under their leadership, the Auxiliary should enjoy another successful year. The Nominating Committee is to be congratulated for selecting such a fine group of officers.

The gavel and the President's Pin were presented to Mrs. Latimer by Mrs. Coyle:

Presentation and Acceptance of Gavel and President's Pin

We are glad, Charlotte, that Auxiliary matters are to be in the hands of one so capable and so fine and who realizes the ever increasing responsibilities we have to the medical profession and to the world we live in. We look forward to a year of interest and progress under your leadership. At the end of the year, I know you will find as I have that you have reaped far more than you could sow. The combined love, goodwill, and enthusiastic cooperation given you everywhere will give you a feeling that your own efforts were feeble by contrast. It has been a genuine joy to work with you this year. I look forward to our continued service together, however, I trust that I shall not forget that I am a *Past President* even though my love for the Auxiliary and my belief in our purpose and objectives shall never wane. It is with mixed emotions that I present to you our gavel and our President's pin. A bit of sadness creeps in when I realize that I shall be missing the touring and the visits this year, but I am happy because it is to you that I am passing those privileges and joys. May the coming year be our most successful one!

As Mrs. Latimer accepted the gavel and President's Pin she was presented a bouquet of red roses from the Woman's Auxiliary to the Harris County Medical Society. Her message was as follows:

This pin I shall wear over my heart as evidence that my heart is in the work of this organization. I shall wear it with pride and joy. How fortunate I am to be privileged to represent such a great body of women.

It is appropriate yet trite to say I accept this gavel, the symbol of great responsibility, with qualms—wondering how I can measure up to my predecessors, especially Mrs. Coyle, whose outstanding work and accomplishments are so fresh in our minds.

Yet I chose to say it is because of these fine women and the specific contributions each has made that I accept the responsibility as a challenge. They shall be my pattern. But in the end we must be ourselves, not in a personal, petty way but by working diligently and constructively in the way we know to work.

There is no set formula for success, yet that is what we ever strive for in all walks of life. I like the definition of the late Henry Ford who said:

> "Getting together is a Beginning.
> Staying together is Progress.
> Working together is Success."

With the Grace of God and the help and trust of each of you we can have a healthy, happy year of work together. Yes, we can have success.

Mrs. Frank N. Haggard, San Antonio, then presented the Past President's Pin and a lovely silver tray from the Bexar County Auxiliary to Mrs. Edward W. Coyle:

Presentation and Acceptance of Past President's Pin

Anita, I am indeed happy to present to you for your very own a facsimile of this beautiful gold pin you have cherished for the past year. May it be a reminder of the love and esteem this Auxiliary has held for your constructive work during your administration, and now that you will no longer be touring Texas officially I would like to welcome you home to the ranks of the retired presidents.

Our gracious Bexar County president, Mrs. John C. Parsons, was to have had the honor of presenting this gift to you from the Bexar County Medical Auxiliary, but she was called away to preside at our tea which follows.

We feel that few members have given so much to her auxiliary, community, church and home, as has Anita. This token symbolizes the love and appreciation of our entire membership.

Mrs. Coyle graciously accepted the Past President's Pin and the silver tray:

Thank you, Josephine. I shall cherish this pin, always. It shall remind me constantly of the vision and the accomplishments of you who have contributed so much. I shall ever be conscious of the love, interest, and the work of you who led us in building the foundation and adding each year to the growth of the organization which we are so proud of today. I am conscious of the high honor and the rare privilege of serving this year and of joining, now, that wonderful group of auxiliary members—the Past Presidents!

And, thank you again, Josephine. The tray is beautiful and I shall enjoy using it. It shall remind me of the joys and privileges I have enjoyed through the years as a member of the Bexar County Auxiliary; of the training received while serving here that has enabled me to continue doing my bit for the medical profession through our State Auxiliary; of the Auxiliary's fine work in fellowship and community service this year; and of the wonderfully successful Convention, with you, the Auxiliary to the Bexar County

Medical Society, as hostess. With all my heart, I thank you.

The final registration number of 537 was announced by the Registration Chairman, Mrs. Thomas H. Sharp, San Antonio.

There being no further business, the President, Mrs. Latimer, declared the thirty-sixth annual convention of the Woman's Auxiliary to the Texas Medical Association adjourned, sine die.

MRS. NEWTON F. WALKER, El Paso,
Recording Secretary Pro Tem.

TEA AND TOUR

Following the adjournment of the 1953-1954 convention, a tea and tour of the King William Street Homes in San Antonio was given honoring the State President, Mrs. Edward W. Coyle, San Antonio, and the President-Elect, Mrs. Mark H. Latimer, Houston, and the National President-Elect, Mrs. George Turner, El Paso. Other honored guests were Mrs. F. J. L. Blasingame, Wharton, wife of the President-Elect of the Texas Medical Association; Mrs. Merton M. Minter, San Antonio, wife of the President of the Bexar County Medical Society; and Mrs. John C. Parsons, San Antonio, President of the Woman's Auxiliary to the Bexar County Medical Society.

POST-CONVENTION EXECUTIVE BOARD MEETING

The Executive Board of the Woman's Auxiliary to the Texas Medical Association met in post-convention session at 9:30 a. m., Wednesday, May 5, 1954, in the Minuet Room of the Menger Hotel, San Antonio, with the President, Mrs. Mark H. Latimer, Houston, presiding. Approximately 100 Board members and guests, including eighteen county presidents, were present.

The invocation was given by Mrs. P. R. Denman, Houston.

The President introduced Mrs. S. M. Hill of Dallas, who presented the President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas. Mrs. McCracken brought greetings and expressed appreciation for the confidence placed in her.

With the consent of the Board, Mrs. Latimer appointed the following committee to approve the minutes of the post-convention Executive Board meeting: Mrs. O. W. Robinson, Chairman, Paris; Mrs. Joseph H. McCracken, Jr., Dallas; and Mrs. Thomas J. Vanzant, Houston.

Mrs. E. W. Coyle, San Antonio, immediate Past President, was introduced. Mrs. Latimer also presented her mother, Mrs. Walter Knowd of Houston.

The President then introduced Mrs. George Turner, El Paso, President-Elect of the Woman's Auxiliary to the American Medical Association, who spoke briefly.

Following the introduction of the twelve Past Presidents attending the meeting, Mrs. Latimer greeted members and guests and thanked Bexar County Auxiliary members; the General Convention Chairman, Mrs. John C. Parsons, San Antonio; and all Convention chairmen, particularly Mrs. John L. Pridgen, San Antonio, chairman for the post-convention meeting of the Board. The President expressed appreciation for the arrangements and many courtesies.

Mrs. Latimer announced the theme for 1954-1955, "Better Health in a Free America." She emphasized the idea that we must develop a positive attitude of leadership in community health. We must keep ourselves informed and alert concerning matters of medicine, with special stress placed upon safety, juvenile delinquency, and mental health. No organization is better than its members, she said. We are proud of our position as doctors' wives and we must accept the responsibility such a position entails. Mrs. Latimer expressed her desire to know each county auxiliary, its strength and its weakness, and she asked that county presidents keep her informed of their local problems. Her informal talk closed with the hope for much accomplishment in 1954-1955.

The President appointed Mrs. O. W. Robinson of Paris to serve as Parliamentarian pro tem for the meeting in the absence of the Parliamentarian, Mrs. John E. Hill of Marshall, and announced the following special appointments for the year: Chaplain, Mrs. P. R. Denman, Houston, and President's Book, Mrs. W. Frank Renfrow, Houston.

Officers and Committees

Mrs. P. M. Kuykendall, Ranger, Recording Secretary, then read the names of the officers and standing committee chairmen. The complete listing of officers, committees, and council women for 1954-1955 is as follows:

OFFICERS

President—Mrs. Mark H. Latimer, Houston.
President-Elect—Mrs. Joseph H. McCracken, Jr., Dallas.
First Vice-President—Mrs. Mal Rumph, Fort Worth.
Second Vice-President—Mrs. Harold Lindley, Pecos.
Third Vice-President—Mrs. Howard R. Dudgeon, Jr., Waco.
Fourth Vice-President—Mrs. Troy A. Shafer, Harlingen.
Fifth Vice-President—Mrs. August J. Streit, Amarillo.
Treasurer—Mrs. J. C. Terrell, Stephenville.
Recording Secretary—Mrs. P. M. Kuykendall, Ranger.
Corresponding Secretary—Mrs. William M. Palm, Houston.
Publicity Secretary—Mrs. A. H. Neighbors, Jr., Austin.
Parliamentarian—Mrs. John E. Hill, Marshall.
Executive Secretary—Mrs. Arleen Draker, Austin.

STANDING COMMITTEES

Advisory—Mrs. Joseph B. Foster, Chairman, Houston; All Past Presidents members.

Civil Defense—Mrs. J. V. Blair, Chairman, Corpus Christi; Mrs. James W. Atchison, Co-Chairman, Gainesville; Mrs. George D. Bruce, Baytown; Mrs. Charles L. McGehee, San Antonio; Mrs. Milton W. Talbot, Jr., Big Spring.

Convention (all of Fort Worth)—Mrs. Ivan H. Readinger, Chairman; Mrs. John B. Patterson, Co-Chairman; Mrs. H. S. Renshaw, Co-Chairman; Mrs. C. Keith Barnes, Finance; Mrs. Robert D. Bickel, Hospitality Rooms; Mrs. R. V. Brasher, Decorations; Mrs. Walter West, Post Executive Board Meeting; Mrs. J. R. Cochran, Registration; Mrs. E. M. Cyrus, Jr., Arrangements; Mrs. J. A. Hallmark, Luncheons; Mrs. W. N. Jenkins, Information; Mrs. Cuvier P. Lipscomb, Favors; Mrs. A. B. Pumphrey, Courtesy; Mrs. Mal Rumph, Transportation; Mrs. D. O. D. Ware, Publicity.

Courtesy Resolutions—Mrs. Cecil O. Patterson, Chairman, Dallas; Mrs. Robert F. Thompson, Co-Chairman, El Paso; Mrs. Marvin Duckworth, Cuero; Mrs. E. H. Marek, Yoakum; Mrs. Howard E. Puckett, Amarillo.

Essay—Mrs. Perry J. C. Byars, Chairman, San Angelo; Mrs. John T. Porter, Co-Chairman, Baytown; Mrs. Elmo L. Clark, Cleburne; Mrs. C. L. Gary, Jr., Corsicana; Mrs. W. Lacey Smith, San Angelo.

Finance—Mrs. V. M. Longmire, Chairman, Temple; Mrs. O. W. Robinson, Co-Chairman, Paris; Mrs. E. W. Coyle, San Antonio; Mrs. O. M. Marchman, Jr., Dallas; Mrs. J. C. Terrell, Stephenville.

Historical—Mrs. John H. Wootters, Chairman, Houston; Mrs. Rabun T. Wilson, Co-Chairman in charge of Archives,

Austin; Mrs. Paul Brindley, Galveston; Mrs. Truman C. Terrell, Fort Worth; Mrs. George S. Woodfin, Paris.

Legislation—Mrs. F. Paul Burow, Chairman, Killeen; Mrs. William C. Barksdale, Co-Chairman, Borger; Mrs. Ernest E. Anthony, Jr., Fort Worth; Mrs. F. J. L. Blasingame, Wharton; Mrs. Everett T. Duncan, San Antonio.

Memorial Service—Mrs. Marion R. Lawler, Chairman, Mercedes; Mrs. Tom B. Bond, Local Chairman, Fort Worth.

Mental Health—Mrs. Jacob F. Schultz, Chairman, Houston; Mrs. A. B. Pumphrey, Co-Chairman, Fort Worth; Mrs. Clement C. Boehler, El Paso; Mrs. W. E. Cline, Corpus Christi; Mrs. Joe Thorne Gilbert, Austin; Mrs. Scott H. Martin, San Angelo.

Nominating—Mrs. E. W. Coyle, Chairman, San Antonio; Mrs. J. V. Blair, Corpus Christi; Mrs. Jacob F. Schultz, Houston; Mrs. August J. Streit, Amarillo; Mrs. L. S. Thompson, Dallas; Mrs. Andrew S. Tomb, Victoria; Mrs. Newton F. Walker, El Paso.

Nurse Recruitment—Mrs. William D. Nicholson, Chairman, Freeport; Mrs. Claunch G. Brindley, Co-Chairman, Borger; Mrs. Joseph L. Knapp, Dallas; Mrs. S. Braswell Locker, Brownwood; Mrs. Andrew J. Magliolo, Dickinson.

Organization and Membership—Mrs. Mal Rumph, First Vice-President, Chairman, Fort Worth; Mrs. Harold Lindley, Second Vice-President, Pecos; Mrs. Howard R. Dudgeon, Jr., Third Vice-President, Waco; Mrs. Troy A. Shafer, Fourth Vice-President, Harlingen; Mrs. August J. Streit, Fifth Vice-President, Amarillo; All Council Women.

Philanthropic Funds:

American Medical Education Foundation—Mrs. J. L. Jinkins, Chairman, Galveston; Mrs. Newton F. Walker, Co-Chairman, El Paso; Mrs. W. Frank Armstrong, Fort Worth; Mrs. H. J. Ehlers, Houston; Mrs. L. S. Thompson, Dallas.

Library—Mrs. Allan Shields, Chairman, Victoria; Mrs. Sam E. Thompson, Co-Chairman, Kerrville; Mrs. S. F. Harrington, Dallas; Mrs. V. R. Hurst, Longview; Mrs. P. I. Nixon, San Antonio; Mrs. August J. Streit, Amarillo.

Memorial—Mrs. J. Guy Jones, Chairman, Dallas; Mrs. O. M. Marchman, Co-Chairman, Dallas; Mrs. Paul H. Mitchell, Corsicana; Mrs. Frank Steed, San Antonio; Mrs. Seward H. Wills, Houston.

Student Loan Fund—Mrs. J. Charles Dickson, Chairman, Houston; Mrs. M. L. Graves, Chairman Emeritus, Houston; Mrs. John B. Bourland, Dallas; Mrs. John W. Middleton, Galveston; Mrs. Edward T. Smith, Houston.

Program—Mrs. Guy E. Knolle, Chairman, Houston; Mrs. Charles B. Dildy, Co-Chairman, Austin; Mrs. R. C. Bellamy, Workshop Chairman, Liberty; Mrs. J. V. Blair, Civil Defense Chairman, Corpus Christi; Mrs. F. Paul Burow, Legislation Chairman, Killeen; Mrs. Ridings E. Lee, Public Relations Chairman, Dallas; Mrs. William D. Nicholson, Nurse Recruitment Chairman, Freeport; Mrs. Jacob F. Schultz, Mental Health Chairman, Houston.

Publications:

Bulletin—Mrs. Charles V. Bintliff, Chairman, Texarkana; Mrs. Sol B. Estes, Co-Chairman, Abilene; Mrs. Carlos R. Hamilton, Houston; Mrs. Jack M. Partain, San Antonio; Mrs. R. T. Travis, Jacksonville.

News Letter—Mrs. Haskell D. Hatfield, Editor, El Paso; Mrs. Jacob Rodge, El Paso; Mrs. George Turner, El Paso.

Texas State Journal of Medicine—Mrs. A. H. Neighbors, Jr., Publicity Secretary, Austin.

Today's Health—Mrs. Milton Spark, Chairman, Waco; Mrs. S. V. Granata, Co-Chairman, Beaumont; Mrs. C. E. Oswalt, Jr., Fort Stockton; Mrs. G. V. Pazdral, Somerville; Mrs. R. L. Rode, Abilene.

Public Relations—Mrs. Ridings E. Lee, Chairman, Dallas; Mrs. Speight Jenkins, Co-Chairman, Dallas; Mrs. W. N. Jenkins, Fort Worth; Mrs. Delphin Von Briesen, El Paso; Mrs. H. B. Willeford, Beaumont.

Reference—Mrs. Lynn Hilbun, Chairman, Henderson; Mrs. F. F. Kirby, Co-Chairman, Waco; Mrs. Joe Nichols, Atlanta.

Revisions—Mrs. T. H. Thomason, Chairman, Fort Worth; Mrs. Scott C. Applewhite, San Antonio; Mrs. Ramsay H. Moore, Dallas.

Workshop—Mrs. R. C. Bellamy, Chairman, Liberty.

SPECIAL APPOINTMENTS

Chaplain—Mrs. P. R. Denman, Houston.

President's Book—Mrs. W. Frank Renfrow, Houston.

COUNCIL WOMEN

District 1—Mrs. A. J. Eck, El Paso.
District 2—Mrs. Thomas P. Marinis, Midland.
District 3—Mrs. William C. Barksdale, Borger.
District 4—Mrs. Oscar N. Mayo, Brownwood.
District 5—Mrs. John C. Parsons, San Antonio.
District 6—Mrs. S. W. Bohmfalk, Weslaco.
District 7—Mrs. Abner A. Ross, Lockhart.
District 8—Mrs. Andrew J. Magliolo, Dickinson.
District 9—Mrs. Carl M. Hansen, Navasota.
District 10—Mrs. L. C. Heare, Port Arthur.
District 11—Mrs. C. H. Stripling, Jacksonville.
District 12—Mrs. G. V. Brindley, Jr., Temple.
District 13—Mrs. W. Frank Armstrong, Fort Worth.
District 14—Mrs. Emmett Essin, Sherman.
District 15—Mrs. Charles J. Wise, Naples.

Mrs. Latimer pointed out that Mrs. Charles B. Dildy, Austin, as Co-Chairman of the Program Committee will have charge of supplying county presidents with program materials from the central office, while Mrs. Rabun T. Wilson, Austin, will serve on the Historical Committee as Co-Chairman in charge of the Archives.

The President asked that all proposed letters to county presidents and other auxiliary officials be directed for preparation and mailing to Mrs. Arleen Draker, the Auxiliary's Executive Secretary at the central office in Austin. Mrs. Draker was introduced and spoke briefly.

Mrs. Latimer stressed the importance of county auxiliary presidents consulting with their local county medical society concerning planned activities and urged presidents to read carefully all communications received.

Reports of Officers and Committee Chairmen

The President next called for reports from officers and committee chairmen. Mrs. Mal Rumph, Fort Worth, First Vice-President and Chairman of the Organization and Membership Committee, presented the four other vice-presidents and the fifteen district council women, all of whom are members of this committee. Mrs. Rumph explained that the State is divided into four regional districts, with the vice-presidents serving as regional chairmen of organization and membership as follows:

Western Region.—Districts 1 and 4. Mrs. Harold Lindley, Pecos, Second Vice-President, Chairman.

Eastern Region.—Districts 9, 10, 11, 12, 14, and 15. Mrs. Howard R. Dudgeon, Jr., Waco, Third Vice-President, Chairman.

Southern Region.—Districts 5, 6, 7, and 8. Mrs. Troy A. Shafer, Harlingen, Fourth Vice-President, Chairman.

Northern Region.—Districts 2, 3, and 13. Mrs. August J. Streit, Amarillo, Fifth Vice-President, Chairman.

The Treasurer, Mrs. J. C. Terrell, Stephenville, submitted

for approval by the Board the names of the Fidelity and Casualty Company of New York through Ellis Insurance Agency of Stephenville, Texas, to care for the bonding; the Stephenville State Bank of Stephenville, Texas, to handle the Auxiliary accounts kept by the Treasurer; and Mr. Carl E. Crimmins, Stephenville, Texas, certified public accountant whose license number is 4272, to audit the accounts.

Upon a motion made by Mrs. S. H. Watson, Waxahachie, and seconded by Mrs. F. F. Kirby, Waco, it was voted to accept the Treasurer's report.

Printed outlines on suggested programs were given to county presidents by Mrs. Guy E. Knolle, Houston, Program Chairman, who said that the outlines were aimed to meet the needs of the smaller auxiliaries particularly. Mrs. Knolle stated the material would be mailed to those presidents who were not present and asked that each president insert the information in her copy of the State Auxiliary Handbook.

The regular order of business was interrupted in order to discuss possible ways in which to honor Mrs. George Turner upon her installation as President of the Woman's Auxiliary to American Medical Association at the national convention in San Francisco in June. Upon a motion made by Mrs. Jacob F. Schultz, Houston, which was seconded by Mrs. J. L. Jinkins, Galveston, it was voted to take up a voluntary contribution from the Board for the American Medical Education Foundation in honor of Mrs. Turner. The collection was taken at this time and it was agreed to present the contribution in the form of a money corsage at the national installation ceremonies.

Mrs. Ramsay H. Moore, Dallas, moved that $25 be taken from the Auxiliary's Special Fund and added to the contribution from the Board so that the gift might come from the entire auxiliary membership. The motion was seconded and carried.

Mrs. Perry J. C. Byars, San Angelo, Essay Contest Chairman, announced the subject for the 1954-1955 Association of American Physicians and Surgeons essay contest would be "The Advantages of Private Medical Care." She emphasized the importance of contacting the schools well in advance of the fall term. Literature on the contest may be obtained by writing Mrs. Byars.

The Legislation Chairman, Mrs. F. Paul Burow, Killeen, reiterated the need for keeping informed on legislative matters throughout the summer.

Mrs. Haskell D. Hatfield, El Paso, Editor of the *News Letter,* requested that items for publication be sent to her ten days before the announced deadlines.

Mrs. A. H. Neighbors, Jr., Austin, Publicity Secretary, asked that all county auxiliaries send copies of publicity received in local newspapers to the Auxiliary office in Austin.

Mrs. Milton Spark, Waco, *Today's Health* Chairman, urged county auxiliaries to push the sale of *Today's Health* and suggested that copies be placed in all schools.

Mrs. R. C. Bellamy, Liberty, Workshop Chairman, reminded council women to inform county presidents of the Workshop for County Presidents and other interested auxiliary members to be held during the Executive Board meeting in September at Austin. She urged members to attend this meeting.

Adoption of Budget

The budget for 1954-1955 was presented as the next order of business by Mrs. V. M. Longmire, Temple, Finance Chairman, who moved its adoption. The motion was seconded by Mrs. J. L. Jinkins, Galveston, and approved as follows:

BUDGET FOR 1954-1955

General Fund

Balance on Hand April 20, 1954		$12,806.45
Less Accounts Payable		300.00
		$12,506.45

Special Fund

These funds are not specifically budgeted but are used to cover the expenses of the following:

Public Relations
Convention
Essay Contest
President's Pin
News Letter

President's and President-Elect's expense to AMA convention and fall conference. (The expense to be equivalent to round trip fare by railroad, first class, plus roomette or lower berth, and single room for the duration of the convention and conference.)

Salary of either part or full time secretary for the Auxiliary at the central office in Austin if one is obtained.

The President then asked the Board to consider the matter of selecting delegates to represent the State Auxiliary at the 1954 Convention of the Woman's Auxiliary to the American Medical Association. She stated Texas may send forty-four delegates, one for each one hundred members. The motion was made by Mrs. Scott C. Applewhite, San

Antonio, and seconded by Mrs. J. L. Jinkins, Galveston, that the selection of delegates be left to the discretion of the President, Mrs. Latimer. The motion carried. Mrs. Latimer asked Mrs. Joseph H. McCracken, Jr., Dallas, President-Elect, to assist her with her job as President of the Texas delegation by serving as the dean of delegates.

An informal discussion on proposed revisions to the national auxiliary's constitution ensued. It was agreed that the Texas delegates, upon arrival at the national convention, should receive information concerning the proposed changes.

Mrs. Scott C. Applewhite, San Antonio, moved that the Texas Auxiliary endorse the name of Mrs. Mason Lawson, Little Rock, Ark., for President-Elect of the Woman's Auxiliary to American Medical Association. The motion was seconded by Mrs. E. W. Coyle, San Antonio, and carried. The Corresponding Secretary was instructed to send a letter of endorsement to the proper national committee.

Election of Nominating Committee

The acting Parliamentarian, Mrs. O. W. Robinson, Paris, read from the by-laws concerning the election of a Nominating Committee. The following members were elected to serve on this committee: Mrs. E. W. Coyle, Chairman, San Antonio; Mrs. J. V. Blair, Corpus Christi; Mrs. Jacob F. Schultz, Houston; Mrs. August J. Streit, Amarillo; Mrs. L. S. Thompson, Dallas; Mrs. Andrew S. Tomb, Victoria; and Mrs. Newton F. Walker, El Paso.

Reporting for the Courtesy Resolutions Committee, Mrs. E. H. Marek, Yoakum, read the following introduction before presenting the Resolutions: "Our handshakes, smiles, and words are unable to convey the full measure of gratitude in our hearts."

Whereas, We miss the presence of our friends, particularly those who have contributed effectively to our program over a long period of time,

THEREFORE BE IT RESOLVED: That we forward expressions of love and of our feelings of loss by their absence to our beloved past presidents of Texas and to Mrs. Leo J. Schaefer, Salina, Kan., President of the Woman's Auxiliary to the American Medical Association, and

BE IT ALSO RESOLVED: That we express our appreciation to that silent partner Dr. E. W. Coyle, San Antonio, for the major share of his wife's time; to her for her unselfish gifts of time and work during the past year; and to Mrs. John L. Pridgen, San Antonio, chairman for this delightful breakfast which concludes for us another outstanding convention in historic San Antonio. We shall always cherish the thoughts of exquisite flowers, the unusual homes on King William Street, unique La Villita, and every other detail which was executed for our pleasure and comfort by the Bexar County Auxiliary. We depart with happy memories of friendly relations and of the lasting accomplishments of our organization and with fervent wishes that we may return in the not too distant future.

MRS. CECIL O. PATTERSON, Dallas, Chairman,
MRS. ROBERT F. THOMPSON, El Paso,
MRS. MARVIN DUCKWORTH, Cuero,
MRS. E. H. MAREK, Yoakum.

The President urged all members to attend the fall Executive Board and County Presidents Workshop meeting to be held September 22 and 23, 1954, at the headquarters building of the Texas Medical Association in Austin.

There being no further business, Mrs. Latimer declared the meeting adjourned.

MRS. P. M. KUYKENDALL, Ranger,
Recording Secretary.

MRS. MARK H. LATIMER

Mrs. Mark H. Latimer, the thirty-seventh President of the Woman's Auxiliary to the Texas Medical Association, comes to her high office well prepared in every way. She has marked qualities of leadership and a personality that will enable her to win the attention, the confidence, and the allegiance of all Auxiliary members.

Charlotte was born in Topeka, Kan., the daughter of Mr. and Mrs. Walter M. Knowd; they moved to Texas when she was 2 years old. She received both her bachelor of arts and master of arts degrees from the University of Texas. She taught in Temple High School, was a chemistry laboratory instructor at the University of Texas, and taught organic chemistry at Texas Dental College. Mrs. Latimer is a Phi Beta Kappa, a member of Alpha Phi Epsilon honorary literary fraternity, and a member of Delta Zeta sorority.

Charlotte Knowd was married in 1929 to Dr. Mark H. Latimer, Houston surgeon. Dr. Latimer received his bachelor of business administration degree from the University of Texas, his doctor of medicine degree from the University of Texas School of Medicine. He did postgraduate work at the University of Pennsylvania School of Medicine. He is a fellow of the American College of Surgeons. He now

MRS. MARK H. LATIMER

teaches anatomy at Baylor University College of Medicine. They are both active members of the River Oaks Baptist Church, where Mrs. Latimer has taught in the Senior High Department of the Sunday School.

The couple have no children, but five godchildren and a 6 year old niece, Penny, who spends much time with them. Mrs. Latimer's mother, Mrs. Walter Knowd, is living near them in Houston.

Although a busy wife, Mrs. Latimer finds time to do many worth-while things. She works in Occupational Therapy, Women in Yellow at Jefferson Davis Hospital, Gray Ladies at the Veterans Administration Hospital, Blue Bird, and Shrine Crippled Children's Hospital.

For their hobby Dr. Latimer finds land, improves it, and builds without an architect or contractor; then Mrs. Latimer decorates and landscapes the result. She studied interior

decorating at Moor Institute in Philadelphia while Dr. Latimer was studying there.

Mrs. Latimer has held many offices in her county and district medical auxiliaries and held the following state offices successively from 1941 to 1951: General Chairman of the State Convention, Council Woman of the Ninth District, Recording Secretary (two years), Fourth Vice-President and Program Chairman, member of Nominating Committee, Historian, chairman of the Bulletin Committee, Corresponding Secretary, and Council Woman of the Ninth District. During 1953-1954 she was President-Elect. With this wealth of experience and her natural ability, she will undoubtedly lead the Auxiliary wisely and well.

With all of her accomplishments and honors, Mrs. Latimer is modest, understanding, and sympathetic and is ever interested in better health for all mankind. The Woman's Auxiliary to the Texas Medical Association is fortunate indeed to have such a President. It may well be said of her: "She stretcheth out her hand to the poor; yea, she reacheth forth her hand to the needy. . . . Strength and honor are her clothing; and she shall rejoice in time to come. She openeth her mouth with wisdom; and in her tongue is the law of kindness. She looketh well to the ways of her household, and eateth not the bread of idleness. . . . Many daughters have done virtuously, but thou excellest them all." (Proverbs 31:20-29.)

DISTRICT AUXILIARIES

The Seventh District Auxiliary met April 20 at the home of Mrs. C. H. McCuistion in Austin and elected Mrs. A. A. Ross, Lockhart, president of the district. After the business meeting, Mrs. Homer Garrison, Austin, gave a book review of "Dear Kate."

The Eleventh District Auxiliary met on April 15 in Crockett, with the Anderson-Houston-Leon Counties Auxiliary as hostess. Officers installed were Mrs. C. H. Stripling, Jacksonville, council woman; Mrs. J. E. Ross, Henderson, vice-president; Mrs. H. F. Rives, Jacksonville, corresponding secretary and treasurer; Mrs. C. E. Willingham, Tyler, recording secretary; and Mrs. R. T. Travis, Jacksonville, reporter. The Eleventh District Society and Auxiliary were entertained at the home of Dr. and Mrs. John Dean, Jr., Crockett.

DEATHS

J. L. SPIVEY

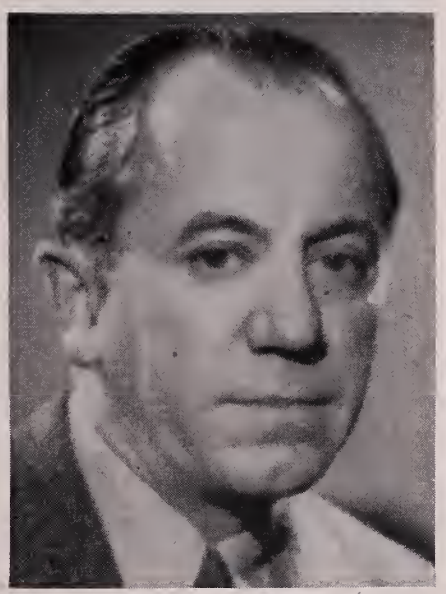
Dr. James Langdon Spivey, Wichita Falls, Texas, died in a hepatic coma on April 19, 1954, in Wichita Falls.

Born in Bellevue on December 16, 1894, Dr. Spivey was the son of Langdon Swilley and Leah (Melton) Spivey. He was valedictorian of the Bellevue High School class of 1911 and entered the old Polytechnic College in Fort Worth. He was graduated with honors from Southwestern University, Georgetown. Dr. Spivey attended the University of Texas School of Medicine, Galveston, and was graduated from the Columbia University College of Physicians and Surgeons, New York, in 1920. Having interned at Bellevue Hospital, New York, Dr. Spivey also took two years of residency there. He practiced in Fort Worth for twenty-five years and was staff physician at the Wichita Falls State Hospital for five years.

Dr. Spivey had been a member of the Texas and American Medical Associations almost continuously since 1924 through Tarrant County Medical Society. He was elected an honorary member of the Texas Medical Association in 1948. He was a former fellow of the American Academy of Pediatrics, a member of the American Psychiatric Association, a member of the Fort Worth Academy of Medicine, and a member of the Texas and Fort Worth Pediatric Societies while practicing in Fort Worth.

A member of Phi Alpha Sigma medical fraternity, Dr. Spivey was a member of Alpha Chi honorary fraternity and Kappa Sigma social fraternity. He was a member of the Episcopal Church. Dr. Spivey was a former member of the Fort Worth Boat Club, being a sailing enthusiast. He also liked to play golf and to fish. Dr. Spivey, active in work with the Cub Scouts and the YMCA, enjoyed working with children and for their betterment. He was in the Army as a medical student during World War I.

Dr. Spivey is survived by his wife, the former Miss Edwina Baskin, whom he married on January 1, 1926, in Fort Worth. Also surviving are a daughter, Mrs. Mary Madeline Lyon, Oklahoma City; a son, Lieut. James Langdon Spivey, Jr., serving with the United States Navy, San Diego, Calif.; four sisters, Mrs. Mattie Richter, Taylor; Mrs. Nora Ford, Dallas; Mrs. May Hurdleston, Marietta, Okla.; and Mrs. Ruth Alcorn, Ardmore, Okla.; two brothers, S. P. Spivey, Ardmore, and F. H. Spivey, Courtney, Okla.; and two grandchildren, Mark Lyon and Madeline Lyon, Oklahoma City.



DR. J. L. SPIVEY

J. P. GILL

Dr. James P. Gill, San Antonio, Texas, died on April 4, 1954, in a San Antonio hospital after a short illness.

Born in Dallas on March 4, 1900, he attended Southern Methodist University, Dallas, and was graduated from Vanderbilt University School of Medicine, Nashville, in 1926. He interned at Station Hospital, Fort Sam Houston; and he was a graduate of the Army Medical and Field Service Schools. He was a captain in the regular Army until 1931,

when he resigned. He practiced in San Antonio until 1940, when he moved to Beeville. He entered the Army again in 1941 as a colonel and was in charge of the Fifth Medical Supply Depot, Honolulu, during World War II. He began practicing in San Antonio again in 1946, where he was associated with the late Dr. W. D. Gill, specializing in eye, ear, nose, and throat.

A member of the Texas Medical Association through Bexar County Medical Society, Dr. Gill was a member of the Southern and American Medical Associations. He was a member of the Bexar County Health Board and the San Antonio Eye, Ear, Nose, and Throat Society. He was a

DR. JAMES P. GILL

thirty-second degree Mason, a Shriner, a member of the American Legion, and a member of the Presbyterian Church.

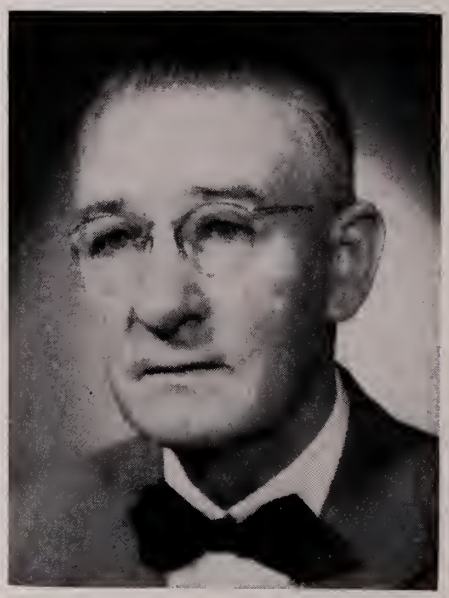
Survivors include his wife, Mrs. Torrie Gill, San Antonio; a brother, Dr. E. King Gill, Corpus Christi; and a niece, Mrs. C. D. Nicholas, Houston.

C. N. MEADOR

Dr. Clarence Nelson Meador, Corpus Christi, Texas, died April 17, 1954, at his home of coronary occlusion.

Born on May 23, 1889, in Kingman, Kan., Dr. Meador was the son of Mr. and Mrs. David Hester Meador. He attended high school at Epworth Methodist University-Academy, Oklahoma City; received a bachelor of arts degree from Methodist University, Guthrie, Okla., in 1913; and was graduated from Northwestern University Medical School, Chicago, in 1917. He was a lieutenant in the Navy from 1917 to 1922. He did postgraduate work at the United States Naval Hospital and Walter Reed General Hospital, Washington, D. C., and served at the United States Naval Hospital at Mare Island, Calif., and Norfolk, Va., and in hospitals in Lock Foyle, Ireland, and London during this time. Dr. Meador practiced in Anadarko, Okla., from 1922 until 1931, when he moved to Corpus Christi.

A member of the Texas and American Medical Associations through Nueces County Medical Society from 1936 until this year. Dr. Meador had been president of the Fred Roberts Memorial Hospital staff in 1938, and he had been Caddo County health officer in Oklahoma in 1927. He was a member of the Corpus Christi and San Antonio Eye, Ear, Nose, and Throat Societies and was affiliated with an eye, ear, nose, and throat society in London when he was there. He was a member of the Corpus Christi Kiwanis Club and a deacon in the First Baptist Church.

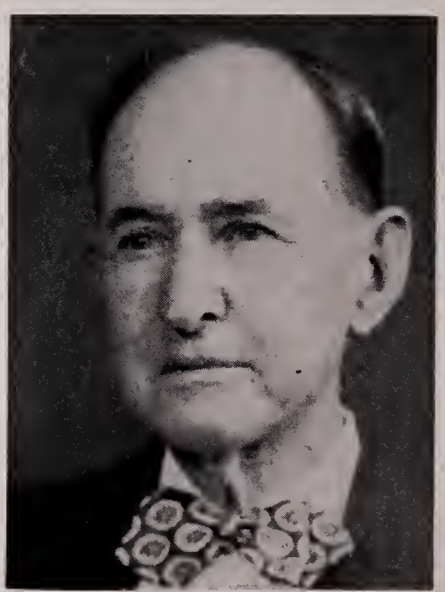


DR. C. N. MEADOR

Dr. Meador was married to the former Miss Edna Clay in Bowie on October 8, 1931. She survives, as do a daughter, Mrs. Bill Petty, and a son, David Charles Meador, all of Corpus Christi.

T. R. BASSETT

Dr. Thomas Richard Bassett, Mount Pleasant, Texas, died in a Dallas hospital on April 19, 1954, of arteriosclerosis.



DR. T. R. BASSETT

The son of Mr. and Mrs. John Bassett, Dr. Bassett was born September 29, 1873, in Gilmer. He attended public school in Gilmer and medical school in Memphis and Nash-

ville; he was graduated from the old Southwestern Medical School in Dallas, now Baylor University College of Medicine, Houston, in 1901.

Beginning his practice in Harleton in 1902, Dr. Bassett moved to Mount Pleasant in 1919 and practiced there until a year ago when illness forced him into semiretirement. He had served Titus County as health officer for several terms.

A member of the Texas Medical Association and the American Medical Association continuously throughout his career, Dr. Bassett was president of Titus County Medical Society in 1942 and 1943. He was a member of the Church of Christ.

Dr. Bassett and the former Miss Georgia Alice Wilkes were married on July 2, 1899, in Mount Pleasant. She survives, as do a daughter, Mrs. Charles I. Lide, Mount Pleasant; a sister, Mrs. W. L. Vivian, Gilmer; two grandchildren; and four great-grandchildren.

J. M. CAMERON

Dr. James Malcolm Cameron, Corpus Christi, Texas, died April 25, 1954, at a local hospital of a heart disease.

Born August 31, 1901, in Tavistock, Ontario, Canada, Dr. Cameron was the son of Charles and Ellen J. Cameron. He attended public schools in Toronto, Canada, and was graduated from the University of Toronto Faculty of Medicine in 1925 and served an internship at St. Joseph's Hos-

DR. J. M. CAMERON

pital in Reading, Pa. He received a masters degree in public health at Harvard School of Public Health, Boston, in 1932. He had practiced in Canada and in Robesonia, and Altoona, Pa.; Ponca City, Okla.; and St. Joseph, Mo., with emphasis on public health and industrial medicine. He came to Corpus Christi in 1950 as director of the City-County Health Unit.

Dr. Cameron was a member of the Missouri Medical Association while practicing there and had been a member of the Texas and American Medical Associations through Nueces County Medical Society since 1950. He was also a member of the American Public Health Association and Delta Omega, honorary public health society. He was president of the state health officers' section of the Texas Public Health Association in 1952. He was a Mason and a member of the Presbyterian Church.

Dr. Cameron was married on August 30, 1930, to the former Miss Dorothy Darrough, in Lebanon, Ind. She survives, as do his mother, Toronto; and a brother, A. J. Cameron, San Carlos, Calif.

L. T. PRUIT

Dr. Lee Tinkle Pruit, Beaumont, Texas, died on April 4, 1954, in Beaumont of a cerebral hemorrhage.

The son of Dr. and Mrs. J. N. Pruit, Dr. Pruit was born October 4, 1898, in Jacksonville. He attended old Alexander College, Jacksonville, and Baylor University, Waco. He was graduated from the University of Louisiana School of Medicine, New Orleans, in 1923. He interned and took his residency at Scott and White Hospital and Clinic, Temple, and was a member of the staff there from 1927 until 1933. He practiced in Beaumont from 1933 until the time of his

DR. LEE T. PRUIT

death, excepting the years of 1942 to 1946 when he was in the Army Medical Corps. He attained the rank of colonel while serving in Europe.

A member of the Texas Medical Association and the American Medical Association since 1926, Dr. Pruit was a fellow of the American College of Physicians, a diplomate of the American Board of Internal Medicine, a member of the Texas Academy of Internal Medicine, a fellow of the Royal Society of Medicine (England), a fellow of the American College of Cardiology, and a member of the Texas Heart Association and the American Heart Association, the Texas Rheumatism Association, and the Texas Club of Internists. He was a member of the Rotary Club, Masonic Lodge, and Methodist Church.

Dr. Pruit and the former Miss Victoria Welge were married on November 17, 1933, in Temple. He is survived by his wife; one brother, William Wall Pruit, Shreveport, La.; and three sisters, Mrs. Roy Hunsinger, Alice; Mrs. Tom Callier, Crockett; and Mrs. Russell Davis, San Antonio.

A. B. WORSHAM

Dr. Archer Ben Worsham, Sulphur Springs, Texas, died on March 16, 1954, in a Greenville hospital of carcinoma of the liver.

The son of William A. and Clara (Moore) Worsham, Dr. Worsham was born at Gaffords Chapel on June 20, 1886.

He attended Gaffords Chapel schools and the Texas State Normal School, Commerce. Dr. Worsham was graduated in 1914 from Southern Methodist University Medical Department, Dallas. He then began practicing in Brashear and in 1917 joined the Army, serving as a captain in Europe during World War I. He moved to Dawson in 1918 and practiced there until 1943, when he opened the Worsham Clinic at Sulphur Springs.

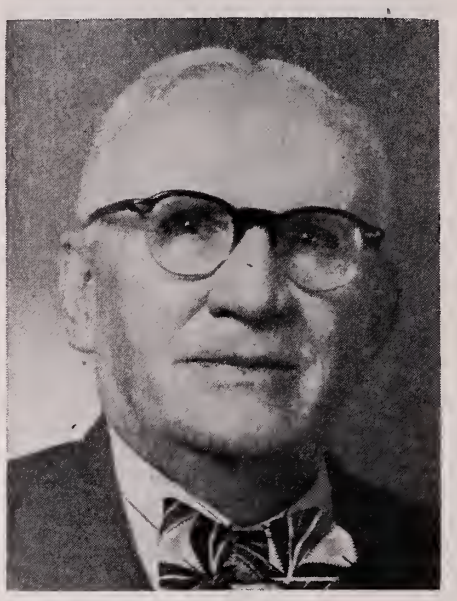
Dr. Worsham had been a member of the Texas and American Medical Association almost continuously since 1915, being president of Hopkins-Franklin Counties Medical Society in 1948. He had served Hopkins County as health officer. Dr. Worsham was a member of the Masonic Lodge, the Shrine, the Lions Club, and the Methodist Church.

He is survived by his wife, the former Miss Betty Anderson, whom he married February 22, 1917, in Purdon. Also surviving are two daughters, Mrs. Aline Lewis, Murchison, and Mrs. Jim Boswell, Austin; three sons, Laird E. Worsham, serving with the Navy in Quantico, Va.; A. B. Worsham, Jr., Martin Springs; and Joe Allen Worsham, Sulphur Springs; and two sisters, Mrs. Marvin Williams, Gaffords Chapel, and Mrs. Will McKay, Martin Springs.

J. A. ALLISON

Dr. Joseph Alec Allison, Grapevine, Texas, died on April 20, 1954, of coronary thrombosis.

The son of Thomas Jefferson and Susan (Stephens) Allison, Dr. Allison was born September 21, 1872, in Alto. Dr. Allison attended the old Add Ran Christian College, Thorp Springs, and attended the Kentucky School of Medicine, Louisville. He was graduated in 1898 from the old Fort Worth School of Medicine, which later merged with



DR. JOSEPH A. ALLISON

Baylor University College of Medicine. He took postgraduate work in surgery at Chicago, St. Louis, and New Orleans.

A member of the Texas and American Medical Associations continuously since 1904, Dr. Allison was elected to honorary membership in the state Association in 1951.

Dr. Allison was physician and surgeon to Singletary's Saw Mill, Alto, from 1899 to 1903. He practiced in Alto until 1910, when he moved to Henrietta. He moved in 1928 to Mercedes, practicing there for a year before settling in 1929 in Grapevine, where he practiced until the time of his death.

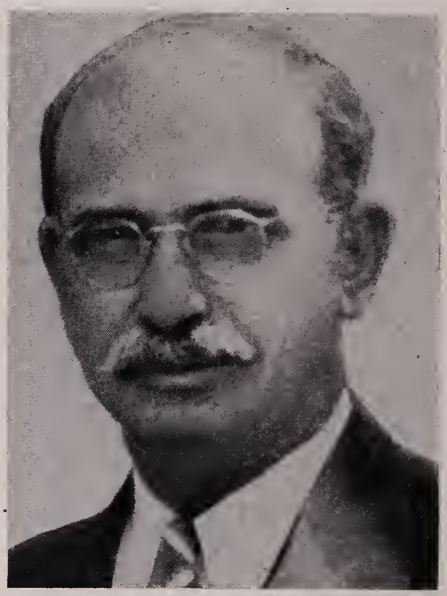
Dr. Allison had been a member of the Masonic Lodge since 1894, and he was a member of the Church of Christ.

The former Miss Laura Cunningham and Dr. Allison were married on April 3, 1901, in San Pedro. He is survived by his wife; a son, Dr. Joe M. Allison, Grapevine; and four grandchildren, Miss Mary Jane Barr and Misses Rose Ann, Elaine, and Joyce Allison, all of Grapevine.

A. N. PIKE

Dr. Arthur Nolan Pike, Iredell, Texas, died on March 4, 1954, of coronary thrombosis at his home.

The son of J. C. and Nancy Pike, Dr. Pike was born on December 31, 1884, in Alabama, but he moved to Bosque County and then Hamilton County with his family when a child. He attended the Hico Public Schools and was graduated in 1906 from the Fort Worth School of Medicine, which later merged with Baylor University College of



DR. ARTHUR N. PIKE

Medicine. He practiced in Iredell from the time of his graduation from medical school until his death.

A member of the Texas and American Medical Associations through Bosque County Medical Society almost continuously throughout his career, he was elected an honorary member of the state and county organizations in 1950. Dr. Pike was president of the Bosque County Medical Society in 1940 and secretary in 1943. He had been Bosque County health officer and local surgeon for the Missouri-Kansas-Texas Railroad. For years he was a trustee for the Iredell public schools and at the time of his death he was chairman of the county school board. During World War II he was a member of the Bosque County Ration Board and the War Manpower Board. Dr. Pike was a member of the Masonic Lodge and the Methodist Church.

Dr. Pike and the former Miss Katie E. Dozier were married on December 8, 1909, in Iredell. She survives, as do one daughter, Mrs. J. L. Goodman, Pecos; one son, Albert N. Pike, Iredell; his father, J. C. Pike, Dallas; two brothers, Roland L. Pike, Borger, and Dan Pike, Shamrock; four sisters, Mrs. Nannie Bowen, Dallas; Mrs. Ollie Schenck, San Diego, Calif.; Mrs. Jessie Smith, Shamrock; Mrs. J. G. Carr, Austin; and two grandchildren, Gay Goodman, Pecos, and A. Nolan Pike, Iredell.

MEMBERSHIP

Woman's Auxiliary to the Texas Medical Association

MAY, 1954

The membership list which follows is compiled from names sent by county auxiliaries to the State Treasurer. The names are listed by county auxiliary within the fifteen districts. The number after each county listed below indicates the district in which the county is located.

Ragland, Mrs. Madison S., 216 S. Montgomery, Gilmer
Reed, Mrs. Richard J., Buffalo St., Gilmer

*Address is Marshall unless otherwise stated.

President's Page

COUNTY SOCIETY ATTENDANCE

Stimulation of attendance at county medical society meetings is one of the major objectives to which I have pledged my efforts this year.

Widespread lack of interest in the county medical society is perhaps the greatest defect in organized medicine. A recent statewide survey showed attendance has been far short of the desired level at the meetings of our 116 county societies in Texas.

This survey revealed a correlation between the numerical membership of a county medical society and the percentage of attendance at meetings. In general, the larger the membership of a society, the smaller is its percentage of attendance. The smaller county societies with membership of five to ten averaged a healthy 71 per cent attendance at meetings last year. A 68 per cent average attendance was reported by those societies with eleven to twenty-five members. In contrast, the average attendance at meetings of those organizations with 100 to 215 members was 38 per cent. The large metropolitan societies showed a combined average attendance of only 15 per cent.

Increasing attendance and stimulating the interest of membership are primarily responsibilities of the county medical society, but the State Association can and should contribute in several ways.

At the 1954 annual session in San Antonio, the House of Delegates adopted an amendment to the By-Laws which gives component county societies the right to provide a probationary period for applicants seeking membership. County societies might consider employing this probationary period, which cannot exceed twenty-four months, to encourage attendance by new members. In further pursuit of this same principle, several individuals have suggested that county societies should be permitted to install compulsory or semicompulsory attendance measures which would apply to all members. For example, a county medical society might set up requirements of attendance at one-third of the meetings for a given year for a physician to continue his membership in good standing.

Your state officers are fully aware that, particularly in the large cities, compulsory hospital staff meetings command a large share of

the physician's time. Compulsory hospital staff meetings work to the disadvantage of county medical societies which rely upon the voluntary initiative of the physician. The implications of compulsory attendance at hospital staff meetings should be reviewed critically on national and state levels. Many substitute provisions might be considered; perhaps the busy physician can receive some hospital credit for attendance at his county medical society meetings.

The central office of the Texas Medical Association is completing an analysis of outstanding attendance records by a select group of county medical societies. Forty-six county societies with above average records were asked to cite factors which contributed to good attendance. This study was undertaken with the belief that many of the societies are employing techniques which might benefit other groups.

Replies have indicated that there is no magic formula for guaranteed attendance. However, secretaries responding to the inquiry have pointed out that there are at least six factors which contribute to good attendance. They follow:

1. Outstanding scientific or socio-economic programs.
2. Food, fellowship, and social hour.
3. Adequate notification of the time, date, and place of the meeting.
4. A central location which permits the majority of physicians to attend without hardship.
5. Concurrent meetings of the medical society and the woman's auxiliary.
6. Individual initiative and good human relationships displayed by officers of society and members.

Physicians need to give much thought to the causes and remedies for the lack of interest in the county medical societies and correct this defect in organized medicine. While these efforts by state and county society officers are noteworthy, the individual physician is the only one who can accomplish the desired result—improved attendance at meetings. Attendance in any organization that is not compulsory must come from a personal desire to contribute to that organization. All physicians should be interested in contributing to the organization which is most important to their professional welfare.

J. J. L. Blasingame, M.D.

PR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: In a determined effort to aid county societies to strengthen their membership, attendance, and programs and to learn their needs, a visitation team was formed, and late in June the first visitation was made to the Brown-Comanche-Mills-San Saba Counties Medical Society in Brownwood. Since that time, more than thirty-one dates have been set with county societies--more than twice the number of visits made last year. The team will endeavor to gain firsthand information on the problems confronting the society and report on current activities, programs, and problems which are vital to organized medicine --a concrete step to strengthen intercommunication among the county societies.

An attendance improvement brochure is now in production at the central office. Research of forty-six societies with better than average attendance shows at least six basic factors contribute to increase. TMA received AMA recognition on its Medical Students' Day program of last year, with write-up in July PR Doctor. Thorough coverage included reprints of detail sheets, invitation, program, survey card, and final analysis.

FROM OVER THE STATE: Taylor-Jones Counties Medical Society recently sponsored newspaper ad series. Readers were reminded of local 'round-the-clock medical service, invited to discuss fees, and urged to secure a personal physician before illness strikes. The Abilene Reporter-News went along with a series of articles mirroring the doctor as a human being instead of a machine and reminding lay public of his intensive training, untiring availability, and dedication to his high code of ethics.

Individual efforts across the state fully rewarded in primary defeat of reinsurance bill. Proves effectiveness of active interest in legislative matters. No group did a better job than the doctors of Texas. Issue is not final, however--supporting forces are pulling no stops for reconsideration.

ON THE NATIONAL FRONT: Associations and societies are countering summer laxity with to-the-point mailing pieces. In Spokane, Washington, the county medical society has prepared an attractive booklet, "Your Doctor Speaks," urging readers to contact the society for qualified physician-speakers on health subjects (public service feature also provides panel of physicians when requested for large meetings). Designed to spotlight society's Speakers' Bureau, the folder lists available topics, explains bureau service.

AMA snowballed on requests for four new leaflets "Why Wait," "Health Today," "Quack," and "On Guard." So popular in Texas that central office has already reordered, these readable leaflets provide excellent material for distribution at fairs, in doctors' reception rooms, and as stuffers in statements and other mailings.

A two-day series of informal discussions on medical public relations is on the agenda for AMA's third PR Institute at the Drake Hotel, Chicago, September 1 and 2. Emphasis this year is placed on the exchange of ideas in all areas of medical PR, including major sessions to discuss how to solve conflicts between the medical profession and health and welfare workers, how to stimulate interest in reading material mailed to medical men, how to evaluate the medical assistant and his training requirements, and how to promote and present medical society-sponsored TV programs. Program, entitled "The Idea Exchange--A Public Relations Seminar," will brief audiences on a unique method worked out by a county society to sell its public relations program to local physicians and to the community. Will also premiere new AMA television film, "A Life to Save."

TIP OF THE MONTH

Since PR Institute subject matter is carefully keyed to developing and carrying out public relations programs at all levels, the seminar is invaluable to executive secretaries, public relations directors, and other representatives of state and county medical groups. Medical societies are strongly urged to have their representatives attend.

GUEST SPEAKERS BEING INVITED

Invitations are being extended to distinguished physicians throughout the nation to be guest speakers at the forthcoming annual session of the Texas Medical Association, and at press time a dozen acceptances already had been received.

Nominated by specialty societies and section officers and approved by the Council on Scientific Work, the guests and other possible guests compose an impressive list. From Minnesota to Tennessee and from California to Massachusetts noted men of medicine are making plans to address various groups during the 1955 convention.

The Section on Clinical Pathology in collaboration with the Texas Society of Pathologists has received an affirmative reply from an invitation to Dr. Russell Fisher of Baltimore, and Dr. Hugh R. Leavell of Boston is to be the guest of the Section on Public Health and the Conference of City and County Health Officers.

Those speakers already committed to section programs along with the names of the section which nominated each follow: Dr. William J. Kerr, San Francisco, Section on General Practice; Dr. Robert L. Sanders, Memphis, Section on Surgery; Dr. Frank Lock, Winston-Salem, N. C., Section on Obstetrics and Gynecology; Dr. Clair M. Kos, Iowa City, Iowa, Section on Eye, Ear, Nose, and Throat; and Dr. John A. Anderson, San Francisco, Section on Pediatrics.

The following physicians have accepted the invitation to participate in specialty society programs: Dr. Walter A. Fansler, Minneapolis, nominated by the Texas Society of Gastroenterologists and Proctologists; Dr. John S. Lundy, Rochester, Minn., nominated by the Texas Society of Anesthesiologists; Dr. James C. Sargent, Milwaukee, nominated by the Texas Urological Society; and Dr. William Bickel, Rochester, Minn., nominated by the Texas Orthopedic Association.

Remember the Second Primary on August 28

Dr. John Caffey of New York will participate in the annual session program as a nominee of the Council on Scientific Work.

These twelve guests, with a number of other out-of-state and Texas physicians, will contribute to an outstanding scientific program in 1955.

The annual session, planned for April 25-27 in Fort Worth, will bring to Texas twenty to thirty out-of-state physicians to participate in the specialty society and section programs and in the refresher courses, a new addition on the agenda.

A Texas doctor, no matter what his field or special interest, will be provided an opportunity by this program to learn from some of the country's foremost physicians.

TUBERCULOSIS CONTROL IN COLLEGES

Great strides have been made in controlling tuberculosis in Texas college students in the past decade, and even greater goals are in view. Those physicians who are most interested in tuberculosis and its control can see in the not too distant future the day when a thorough program is carried out by the family doctor. He will be responsible for giving the tuberculin skin test and if necessary following up with a chest roentgenogram as a part of the regular physical examination for college admission.

Until that day, the problem of control is the responsibility of the colleges with the wholehearted support of local physicians. In 1953, only nine of forty-six colleges in the state which replied to a questionnaire reported that a tuberculin test or a roentgenogram was required for admission.

The Texas Tuberculosis Association, under its Committee on Student Health, Dr. J. Edward Johnson, Austin, chairman, has suggested the minimum standards for tuberculosis control in Texas colleges. The report, prepared by a subcommittee composed of Dr. Daniel E. Jenkins, Baylor University College of Medicine, Houston, chairman; Dr. John W. Middleton, University of Texas Medical Branch, Galveston; and Dr. John S. Chapman, Southwestern Medical School of the University of Texas, Dallas, combines the most favorable points of the control programs followed by each of the three medical schools in the state.

The members of the subcommittee agree that the tuberculin test, being highly sensitive and relatively inexpensive, is the method of choice for surveying students in colleges and universities throughout the state. They recommend the use of a single medium strength dose of tuberculin as the only test in college students. If the purified protein derivative of tuberculin is used, the initial testing dose would be 0.0001 mg. given intradermally; if old tuberculin is used, the dosage of 0.1 cc. of a 1:1,000 dilution of a commercial preparation is suggested. In either case the minimum number of readings should be one at forty-eight hours. However, twenty-four, forty-eight, and seventy-two hour readings are preferable with recording of both the erythema and the induration in millimeters.

A tuberculin test once a year is sufficient for students whose test is negative, the subcommittee believes. All students whose tuberculin test is positive should receive a chest roentgenogram at least once a year throughout their college program, and those students whose tuberculin test converts from negative to positive should have a roentgenogram made every six months. A 70 mm. microfilm is acceptable for the former provided that any suspicious shadow is followed up on a standard 14 by 17 inch film, whereas for the latter a 14 by 17 inch film is preferable.

Minimum effective standards should in all probability require a preemployment chest roentgenogram of faculty members and other adult employees on the campus. This is now required by approximately 80 per cent of the

Texas colleges. The subcommittee further recommends that annual follow-up chest roentgenograms be obtained on all faculty members and campus employees and that it be done on a mass microfilm basis as an economy measure for the institution.

With the encouragement and assistance of physicians, this program may lead to the complete control of tuberculosis among college students in Texas.

CONSTITUTION OUT

An up-to-date issue of the Constitution and By-Laws of the Texas Medical Association has been printed and will be mailed to officers of the Association and every county medical society secretary by September 1. Although the supply is limited, a copy for other interested doctors may be obtained from the Executive Secretary, Austin.

Amendments passed by the House of Delegates at the 1954 annual session have been incorporated in this edition.

SALK VACCINE FOLLOW-UP

The emphasis of the Salk poliomyelitis vaccine has shifted from the inoculation to the evaluation study. The validity of the evaluation depends upon data gathered on poliomyelitis cases in the test groups, including those children in the first three grades who did not get the vaccine.

Early diagnosis, prompt reporting and follow-up, and the securing of necessary epidemiologic information and laboratory specimens are important factors in the study which is under the direction of Dr. Thomas Francis, Jr., University of Michigan School of Public Health, Ann Arbor.

Physicians in areas in which vaccinations were not given also are asked to assist in the study by notifying local or state health officers of cases occurring among children who participated in the trials and then moved to another area and children who go to summer camps. Health officials also need information on participating children who receive injections of gamma globulin and on cases developing among family members of participating children.

The cooperation of every practicing physician is necessary to make this study a success.

CURRENT EDITORIAL COMMENT

EMPLOYMENT OF DIABETIC PATIENTS

Employment of the diabetic patient by industry is a challenge to industry and the physician alike. Such authorities as Joslin, Sprague, Tolstoi, Metropolitan Life Insurance Company, and United States Department of Labor agree that the diabetic can be employed in industry, with industrial hazards, except as an engineer or pilot or in a similar job.

Diabetes in industry is not a major problem, but the number of persons with diabetes who are employed, particularly at the younger ages, has been growing. The adult diabetic patient lives longer today and is in better condition to take a job than he was two decades ago. The prognosis, death rate, and accident rate for the person with diabetes is strikingly improved, and the working record of the diabetic, despite an absence of statistical information, appears to be good.

With good medical care, diabetic patients can carry on their jobs as well as they did before the onset of the disease. They do well enough to warrant continued employment without restriction except in a few jobs. The guiding principle is that a diabetic should not be in any position where, experiencing a reaction

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and scientists closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions should not be more than 500 words in length.*

or other diabetic emergency, he might endanger the lives of others as well as his own.

The Committee on Employment of the American Diabetes Association has suggested the following standards and procedures for persons with diabetes seeking employment and for employers planning to hire diabetics:

"1. A diabetic seeking employment should be required to present a note from his physician or clinic to the plant physician or the personnel manager, stating that he is a controlled diabetic and is examined at regular intervals.

"2. Diabetics are capable of performing any type of work for which they are physically, mentally and educationally equipped. Those diabetics who are taking large doses of insulin should not, however, be assigned work in which hypoglycemic attacks might result in injury to themselves and others.

"3. An effort should be made to see that diabetics work the same hours on a steady shift; or, if they must work on a rotating schedule that they avoid the 'grave-yard' shift from midnight to 8 a. m. This is the only concession in terms of hours that a well-controlled diabetic should ask.

"4. Wherever diabetics are employed, it is often wise to inform certain key people in labor and management organizations, as well as the plant physician and personnel managers, as to the nature of diabetes and the possibility of coma or insulin reactions. (This is not always a necessary procedure, since in some instances it may create prejudice against the diabetics. The decision as to the advisability of indoctrinating key plant personnel on the problem should usually be left to the plant physician, or in the absence of such a physician, the personnel manager.)

"5. Diabetics should carry cards or tags identifying their condition at all times, particularly when on the job.

"6. The plant physician can save time for the company and also help the employee by performing blood sugar and urine examinations, whenever the patient's usual laboratory facilities are available only during working hours. Ordinarily, of course, this should be done only after consultation with the family physician.

"7. A complete physical examination of each diabetic should be made regularly, at least once a year.

"8. A plant physician is within his rights if he re-assigns a diabetic employee to other work whenever the arising of new complications creates new risks for himself or for other employees.

"9. The diabetic requiring insulin should be considered controlled if the fasting blood sugar is not below normal limits and not above 150 mg. per 100 cc. by the Folin Wu method and the blood sugar three hours after a meal is not higher than 250 mg. per 100 cc. by the Folin Wu method and if the patient is under regular medical supervision. Although these or more nearly normal blood sugar levels are desirable, greater hyperglycemia alone, if not extreme or habitual, need not be considered a disqualification for employment in those cases where the patient's personal physician and the industrial physician both feel that other limits should be observed."[1]

There is no denying that occasionally real problems are associated with employment of diabetic patients, but they no longer have the importance they once had, and in these days they should not stand in the way of a more liberal attitude on the part of management toward such employment.

SOME PHYSIOLOGIC MECHANISMS OF AGING

ROBERT A. HETTIG,* M. D., Houston, Texas

THROUGHOUT the past hundred years medicine has been making great strides in the therapy of diseases which have stricken principally the young and the productive portions of our population. As the result of these tremendous scientific and humanitarian contributions the expected span of life has been greatly lengthened. Between the years of 1870 and 1950 the number of older persons living in the United States increased from about 1,000,000 to more than 12,000,000. Not all of this increment can be accounted for simply by the over-all increase in population in this country since during this same period the ratio of persons past 60 years of age to the entire productive group has increased by more than 140 per cent.[8] By helping to provide many of the therapeutic advancements which have prolonged life, medicine has aided in the creation of a new problem—that of geriatrics.

Unfortunately, despite our current emphasis on medical research, relatively little money and interest have been devoted to the specialized problems of the aged and, in fact, to the more basic problem of how and why people grow old and nonproductive in the first place. It is of interest to note that the first edition of a well known text on geriatrics appeared only sixteen years ago. The Gerontological Society was founded as recently as 1945 and its *Journal* in 1946. Our understanding of many of these problems has been delayed by the meager interest of medical research in the study of senescence. Now that the aged seem here to stay it is high time that we learn something of the physiology of the senile state in order to cope adequately with its many problems.

In the recent literature many data concerning physiologic aspects of aging have been accumulated, but unfortunately much of this information has been obtained in the study of laboratory animals and can be applied to the human being only by analogy. There still remains a paucity of large scale studies on the problems of human aging. It becomes necessary then to offer an apology for what is to follow, for the answers to many of even the commonest problems of senescence are simply not forthcoming at this time.

Read as part of a symposium on geriatrics for Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

**Associate Professor of Internal Medicine, Baylor University College of Medicine.*

FACTORS IN AGING

One of the basic problems in studying the effects of age has been to separate the factors which are due to prolonged life alone from those which may be the result of stresses, illnesses, and traumas. On the other hand practical studies of human aging must take into account that both hereditary and environmental factors are to be included in the composite state which is clinically recognized as senility. Anton Carlson[2] has said: "The debate on heredity vs. the strain and the accidents of living as the cause or causes of aging is from now on a waste of time and paper. It is not an either/or. Evidence now at hand shows conclusively that both play a role in the aging process of man and animals."

At the outset let it be said that to define aging with any exactness is difficult. Because of its simplicity the definition of Lansing[9] is as satisfactory as any: A process of unfavorable progressive change, usually correlated with the passage of time, becoming apparent after maturity and terminating in death. Dock[4] has defined aging as "the sum of the losses of function and structure and of the callosities, scars, and nodular hyperplasias due to 'wear and tear' and involution. 'Wear and tear' includes trauma, infection, overstimulation by emotional, dietary, or other abuses, dietary inadequacies, exposure to inclement weather, exhausting activity, and so on." These definitions may seem rather vague, but in the present state of our ignorance one cannot hope to be more explicit.

Despite these difficulties in separating aging from disease processes there remains a group of progressive changes which have not as yet been shown to be due to specific diseases. The most important of these follows:[1, 2]

1. Gradual retardation of cell division, cell growth, and tissue repair.
2. Gradual retardation in the rate of oxidation of tissues (lowering of the basal metabolic rate).
3. Cellular atrophy, degeneration, and fatty infiltration.
4. Increased cell pigmentation.
5. Gradual decrease in tissue elasticity and degenerative changes in elastic tissue.
6. Progressive degeneration and atrophy of the nervous system, including impaired vision, hearing, attention, memory, and mental endurance.
7. Gradual impairment of the factors which in the normal person in his earlier years maintain a fairly constant internal environment for the cells and tissues (homeostasis).

DEGENERATIVE CHANGES

It may be said that the process of aging begins in utero, for during this stage of development the embryonic ovary commences a lifelong involutional pattern in the gradual reduction of the number of ova. This involution continues throughout childhood and is accelerated just before the onset of puberty. Another example of intrauterine aging is the placenta, which at birth demonstrates evidence of a process of deterioration which may be termed senescent. Its vessel walls have lost much of their elasticity, and there are patches of necrosis and fibrosis scattered throughout.

Immediately after birth involution of the ductus arteriosus and of the umbilical vessels is observed—a process not dissimilar to that of aging.

Between birth and puberty relatively little regressive activity is encountered in the healthy child, but with the advent of adolescence the thymus gland commences its involution so that by the age of 30 years, extensive atrophic and degenerative changes are observed.[12] These include disappearance of the lymphoid tissue, calcification of Hassell's bodies, striking thickening of the arteries, and interstitial fibrosis.

These youthful involutions, although evidence of aging, are not deleterious to the functioning of the organism as a whole but act rather as landmarks in growth and development. Contrariwise, the alterations which occur after maturity are of importance in gauging the physiologic age of the human machine, the presence of these aging phenomena indicating decreased efficiency or decreased functional reserve.

One of the commonest involutionary patterns recognized in the fifth decade of life is the menopause. This termination of the reproductive life of the human female may be altered in its timing by disease, but it cannot be prevented merely by the presence of good health. Its regular occurrence at a fairly consistent age in most women bespeaks of some type of unknown physiologic "time clock" of inherited nature. At this time of life the ovary loses its ability to respond to the follicle stimulating hormone of the anterior pituitary gland, and no further ovarian follicles are formed. Consequently no ovarian estrogenic and corpus luteum hormones are secreted. Senile atrophy of the uterus and thinning of the vaginal mucosa soon follow the withdrawal of the ovarian hormones. Why the ovary loses its ability to respond to pituitary stimulation is the great mystery, the answer to which would help solve many of the problems of sexual aging in the human female.

Of paramount importance to the welfare of the human animal is the aging of the cardiovascular system. Deterioration of the vital structures of this system not only threatens man's life and limits his joie de vivre but also endangers his economic value. It is of interest to reflect that cardiovascular-renal disease is responsible for 25 per cent of all deaths in the fifth decade, 40 per cent in the sixth decade, and 52 per cent in the seventh decade.[5] Yet in all probability the incidence of cardiac disease within any age group is not on the rise; the apparent increase is a matter of greater longevity. Man now has a far greater chance to live long enough for this type of vascular degenerative disease to catch up with him.

The aged heart demonstrates an atrophy of the muscle fibers, accumulation of brown pigment at the nuclear poles of the muscle cells, disappearance of perinuclear striations within the cells, and minimal interstitial fibrosis unless coronary disease is present. Functionally, senile heart muscle shows a diminished ability to consume oxygen and to recover during diastole. The muscle may become irritable and arrhythmias develop. The senile heart despite the abiotrophic atrophy of the muscle is not a small heart. Because of the loss of myocardial efficiency the fibers may become elongated so that clinically and roentgenographically it may appear definitely enlarged, and anatomically it is found to be dilated. There is as yet a paucity of data on the physiology of the normal aging heart, one reason being that the high incidence of heart disease in the older population makes it difficult to ascertain beyond doubt that the cardiac status of an elderly experimental subject is suitable for research purposes. Obviously the final determinant of life is the myocardium, but it is not altogether certain that the myocardium ceases to function on the basis of old age alone. Some toxic or pathologic process seems to end the cardiac stroke in practically every person.

Turning to the vascular side of the picture, the tremendous emotional impact which sudden death due to coronary occlusion and to cerebrovascular accidents has had on our civilization has created an intense interest in the study of arteriosclerosis. It is utterly impossible to review this extensive literature in the limited time at hand. It should be pointed out that it is not definitely established that arteriosclerosis is an essential part of the aging process, but it is so commonly encountered in geriatric practice that its presence or absence must be assessed in each aged patient.

Heredity may play a role in the development of arteriosclerosis. It has been cited that among Chinese people in their native environment coronary occlusion is relatively infrequent and that this finding is due to a racial inheritance. However, in American-born Chinese coronary heart disease occurs with a much greater frequency, suggesting that factors other than heredity determine its incidence.

Anatomic variations of arteries, such as the redun-

dancy of the intima of the coronary vessels of males, described by Dock,[3] may be important in the production of a higher incidence of coronary disease in the male sex.

Biochemical changes of vessel walls are being investigated in relation to the development of arteriosclerosis. Lansing and his group[11] have found that with aging there is an increased content of aspartic and glutamic acids in arterial elastic tissue and that, because of the free carboxy groups of these acids, an affinity of the elastic tissue for calcium may develop. This diffuse calcium deposition in the wall together with alterations of the elastic fibers may pave the way for the deposition of lipid materials.[10] The many studies of lipids with reference to arteriosclerosis are far too numerous to outline in this paper, but mention should be made of the investigations of Steiner, Kendall, and Bevans[13] in producing vascular lesions in dogs by means of high lipid diets and antithyroid drugs as well as the research of Gofman,[6, 7] who has made extensive studies of lipoproteins in serums by means of ultracentrifugation. From the immense amount of research currently being conducted in this field it is hoped that the first truly significant steps will be taken in the conquest of arteriosclerosis.

Arteriosclerosis and its consequent circulatory disturbances play an important, if not dominant, role in the senescent changes of several viscera. The diminution of glomerular filtration, of effective renal plasma flow, and of excretory and resorptive tubular capacities as measured in the senile kidney are due principally to changes in the renal parenchyma secondary to sclerotic vascular lesions. Arteriosclerotic changes are observed also in the arteries of the aging thyroid gland, thymus gland, and spleen.

The senile brain likewise often demonstrates degenerative lesions resulting from arteriosclerosis of the cerebral vessels. However, alteration of nerve elements may occur independently of vascular degeneration. There are well authenticated cases of senile dementia in the absence of any striking abnormalities of intracranial circulation. Atrophy of the ganglion cells of the cerebrum, reduction of the number of cortical cells, changes in the glia and intercellular matrix, hypertrophied astrocytes, and increased pigment content of nerve cells are characteristic of the structural alterations of the aged brain. Functionally, loss of adeptness at skilled movements, poor coordination, and resistance to passive movements are noted at the motor level while progressive retardation of the ability to learn, inability to form new interests, and nominal aphasia gradually develop at the cortical level —all of these changes terminating in the full blown senile psychosis. In most of these far advanced cases both atrophy and vascular changes are responsible for the diminished function of the brain.

In the geriatric changes of the lung on the other hand we must consider muscle and elastic tissue degeneration once more. In this organ a myelo-elastic-fibrous stroma forms the interstitial architecture. During inspiration this stromal tissue elongates and develops kinetic energy which permits the lung to collapse during expiration. The action is similar to that of a rubber band which alternately stretches and shrinks back to its original dimension. In senility disruption of the elastic fibers, increasing fibrosis of the interstitial tissue, and rupture of alveolar walls result in a poor bellows action with the result that the chest tends to remain in an inflated position.

In the skin disruption of the elastic fibers of the dermis together with a loss of subcutaneous fat produces the many wrinkles associated with aging. There is also an associated atrophy of the epidermis with focal areas of increased pigmentation, graying or loss of hair, and possibly atrophy of the sweat and sebaceous glands.

Another example of the mechanism of atrophy is senile osteoporosis. This clinical entity, which usually makes itself evident by severe and at times incapacitating low back pain, is really a soft tissue defect brought about by a failure of bone matrix formation due to a lack of osteoblastic activity. Bone resorption proceeds at a normal rate, but the matrix into which calcium is to be deposited fails to form. Hence the bones become thin, radiolucent, and susceptible to pressure deformities and fractures.

As we have seen, the foregoing physiologic mechanisms of atrophy, vascular change, elastic tissue degeneration, and increased cell pigmentation may interact in many organ systems to produce the changes which are termed "old age." It should be pointed out that not all of the organs age and wear out at the same rate. In one person striking arteriosclerosis of the kidneys is discovered, whereas in another person excellent renal function is preserved but a deplorable loss of pulmonary function is the limiting factor of aging. The basic reasons for this "hit and miss" process of aging can only be surmised, and definite answers are not available from compiled data at this time. One is led to query again how much of senility is due to aging per se and how much is the result of stresses, illnesses, and traumas.

Equally mysterious is the ability of certain organ systems to function as efficiently in old age as in youth. Except for minor alterations the gastrointestinal tract of the aged never seems to cause death simply by wearing out, and despite its ability to produce several millions of cells daily throughout life, the hematopoietic system rarely fails to function simply because it is old.

THEORIES OF AGING

So far we have been dealing with certain basic physiologic and histologic alterations which occur in aging, but we have not dealt with the question of prime importance: What sets off the process of aging in the first place? This question has been asked ever since the world was young. Expeditions have crossed oceans in quest of magic potions which would provide eternal youth. Alchemists concocted noxious mixtures guaranteed to ward off senility. Yet even today with all of our scientific acumen we are no closer to the solution of the problem than were our more primitive forebears.

In recent years several attractive theories of aging have been promoted, but none of them have been proved correct. One hears the oft repeated phrase that man "is as old as his arteries." Certainly arteriosclerosis with its attendant vascular insufficiencies is a common factor of aging, but what of the senile person who demonstrates but little sclerosis? He is no blooming rose. The correlation between age and vascular status is highly imperfect. Hence we must look elsewhere.

Another attractive hypothesis is that old age is a gradual failure of the endocrine glands. This theory gained impetus from the fact that the ovarian failure of the human female at the menopause precedes senescence by but a few years. However, if ovaries are surgically removed in youth, there is little evidence of premature aging and no shortening of the life span. Myxedema and senility are often compared because of a superficial resemblance of the skin, hair, and musculature, but the administration of thyroid hormone to the aged person produces no rejuvenation. Likewise the administration of pituitary extracts and adrenal hormones has failed to turn back the inroad of time. Even the popular craze of sex hormone injections of recent years has not prevented anyone from becoming old. It is obvious that no single endocrine gland is responsible for the multitudinous changes of senility, and unless these glands interact in some unknown manner it seems unlikely that senescence ever will be considered an endocrinopathy.

CONCLUSION

This sketchy presentation has not been intended to try to explain the aging process of man. It is hoped that it has called attention to some of the mechanisms involved and to some of the fragmentary data in the medical literature. Our state of knowledge is much as if we had a few pieces fitted together in an immense jigsaw puzzle. These bits fall in place, but we cannot visualize the entire picture as yet. This is not surprising when it is considered that despite the tremendous energy which has been poured into the research of growth and development of the young, we still have no clear concept of that process in toto. Aging should be considered as the logical sequence of growth and development, and through correlating research studies of both ends of this problem a far greater understanding of the essential nature of life and of living is bound to result.

PROCTOLOGY AWARD

The International Academy of Proctology has announced its annual cash prize and certificate of merit award contest for 1954-1955. An award of $100 and a certificate of merit will be given the author of the best unpublished contribution on proctology or allied subjects. The contest is open to all physicians whether or not they are affiliated with the International Academy of Proctology.

Entries should not be more than 5,000 words, and five copies should be submitted no later than February 1 to the academy, 43-55 Kissena Boulevard, Flushing, N. Y.

World Health Assembly

At the close of its three-week session in May in Geneva, delegates to the seventh World Health Assembly returned to the more than seventy countries represented. Included on the program were the presentation of international health prizes to three scientists, one of whom was G. R. Coatney, Ph. D., Bethesda, Md.; technical discussions on public health problems in rural areas; and the decision to meet in Mexico in the spring of 1955. Dr. Joseph Togba, Liberia, served as president.

PSYCHIATRIC ASPECTS OF CARE OF THE AGED

MELBOURNE J. COOPER, M. D., San Antonio, Texas

THE care of elderly people calls for a particularly fine degree of skill and understanding on the part of the physician in general practice. Alfred Noyes[6] has pointed out that in the year 1900 one person in 25 was more than 65 years of age, and in 1950 one person in 13 was more than 65 years of age. This increase in the percentage of elderly people living among all the complexities of modern civilization results in changing medical, economic, and public health problems. The patient himself finds increasing stress in adapting himself to the civilization in which he lives.

Helping the elderly person to adjust his way of life to his changing capacities and to external demands depends upon two principal factors: (1) the possibility of reduction of stress in the demands of his everyday life and (2) the ability of the patient, figuratively speaking, to walk the tight rope of adaptation to those demands. The psychiatric status and the emotional stability of the patient are integral parts of the total picture of his health, his happiness, and his adjustment. Just as his digestion, his circulatory efficiency, and his resistance to infection will change with advancing age and will be affected by daily habits, so will his intellectual and emotional capacities and adaptability be dependent upon his age, his habit pattern of reaction, his general health, and the environmental stresses. The psychiatric problems of the aging person frequently equal or exceed his physical and economic difficulties.

In the familiar picture of the normal process of aging we see a decline in energy, drive, enthusiasm, and physical and mental endurance. The novelty of life, of new enterprises and new things to learn, and of people as such has worn thin. It becomes more difficult for the old man to learn new techniques or to change the habits of a lifetime. He recognizes his reduced efficiency and his inability to compete with new blood. He becomes irritable, partly because of organic cerebral changes and partly because of his recognition of his increasing limitations. Add to this the physical discomfort of his rheumatism, the pain that he gets every time he eats a pork chop, the inconvenience of that unsteadiness on his feet, and the increasing difficulty in hearing over the telephone and reading the fine print even with his best glasses —all these make things worse. Then, in addition, he forgets what it was he wanted at the store, and can't remember where he parked his car, and things have come to a sorry state.

Usually aging is a gradual process, and the intellectual and emotional effects of aging in the majority of instances develop gradually, as just outlined. The line of distinction between the normal usual changes of advancing age and the pathologic manifestations may be vague. In some patients rapidly developing organic psychoses, sudden vascular accidents, and abrupt depressive reactions occur. Most personality disorders or disruption may be visualized as falling into one of four general categories, namely, (1) senile or arteriosclerotic mental deterioration, (2) depressive reactions, (3) paranoid reactions, and (4) a simple, gradual aging process with irritability, impatience, forgetfulness, defects of judgment and concentration, and declining drive and vigor.

MENTAL DETERIORATION

In the first category, that of organic deterioration (table 1), there are the classical signs of severe memory and concentration failure, disorientation, confusion, restlessness, carelessness in dress and in cleanliness and toilet habits, and pronounced defects in judgment. Such persons are likely to wander away from home and become lost. The defects of concentration and attention and defects of sight and hearing increase the hazards in traffic. Patients may think they are in another town or may relive childhood days, thinking they are in the old home. They collect innumerable little odds and ends of worthless things, conceal such things as food or clothing or money in unsuspected places, and forget about hiding them, or if they do remember having had the articles, accuse others of stealing them when they are unable to remember the hiding places. Oftentimes they sleep poorly and may be up and puttering around the house at all hours of the night. They have trouble keeping warm and occasionally just sit down and build a fire on the floor in the middle of the living room. Some may have the additional misfortune of having gross vascular accidents, with resulting paresis, paralysis, or aphasia.

TABLE 1.—*Management of Patients with Organic Deterioration.*

Home care for mild cases
Protection and custody.
Simple tasks.
Food, vitamins, and hygiene.
Exercise, rest, and recreation.
Treatment of organic disease.
Mild sedation.
Hospitalization if disturbed, noisy, combative.

Read as part of a symposium on geriatrics for Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

The patient who shows mild organic deterioration may be handled in the home in most cases, provided the relatives are intelligent, willing, and able. It means a considerable responsibility, since these old people must be protected against injury or against becoming lost in their wanderings. Simple tasks under supervision may be possible, and home care of the quiet and pleasant-mannered little old lady or man with moderate deterioration may be entirely feasible. It may mean simply keeping Grandma or Grandpa in sight most of the time; giving her a dishtowel to hem or giving him a hoe or a trowel to putter around with outside; preparing adequate meals with supplementary vitamins; encouraging normal elimination, reasonable exercise, and rest; and seeing that the bedroom door is locked from the outside at night. If organic disease of any type is present, adequate treatment is essential, since older people are particularly susceptible to toxemias and infections. Many senile and arteriosclerotic patients improve on a high nicotinic acid intake, up to 900 mg. per day orally and 100 mg. parenterally as suggested by Gregory.[3] Other workers[7] have reported excellent results from the use of chlorpromazine for control of the restlessness and irritability in these patients. My experience with this drug is encouraging, but it is too early to draw definite conclusions at present.

The disturbed, noisy, soiling, and combative deteriorated patient usually must be hospitalized in a psychiatric hospital or adequately equipped and well operated convalescent home. Some of these patients make surprising improvement under competent supervision and treatment. They respond better to association with groups of patients under as little individual restraint and restriction as possible. Clow[1] reported that in his series no patients with senile psychoses recovered, but 20 per cent of those with arteriosclerotic psychosis showed substantial improvement. Ginzberg's[2] experience demonstrated that even intellectually deteriorated elderly psychotic patients responded well to respect, consideration, and group therapy under hospital conditions. An attitude of kindliness, patience, and an absolute minimum of restraint frequently gives surprisingly good results.

DEPRESSIVE REACTIONS

Depressive reactions (table 2) occur rather frequently in advanced age. They may represent recurrent depressions of the manic-depressive type, late involutional depressions, psychotic depressions, or psychoneurotic reactive depressions. The symptoms are easily recognized. Depression may be manifested by simple restlessness and agitation, or by a more obvious and agonizing sense of despondency, blueness, hopelessness, and self-blame. There may be preoccupation with organ functions or with real or fancied organic disease. Insomnia usually is troublesome, the appetite usually is impaired, and the patient usually loses weight and may become incapable of decision or action. Where depression is present, suicide is a real danger. Many times the relatives, and occasionally the physician, will be misled by the patient's apparent "cheering up" as a result of reassurance and pep talks by family, friends, and doctor. The suicidal risk should be remembered constantly and precautions taken wherever this risk is apparent. In addition to reducing opportunities for self-injury by removing all weapons, poisons, and even potent drugs, the best single factor in minimizing suicidal risk is the constant presence of a member of the family or an attendant. Rarely will a person attempt to take his own life in the presence of another person. These precautions, however, must be only supplementary to adequate treatment.

TABLE 2.—*Management of Depressed Patients.*

Conservative program.
Precautions against suicide.
Dextro-amphetamine and mild sedatives.
Adequate diet and vitamins.
Neutral tub baths.
Intensified program.
Home management as in conservative program.
Standard electric convulsive therapy as out-patient procedure.
Hospitalization as alternative.

In the very mild depressions of short duration dextro-amphetamine may be given in several divided doses, from breakfast time until about midafternoon. The addition of a small dose of an intermediate acting sedative (I prefer Amytal, Butisol, Mebaral, chloral hydrate, or Dormison) may be used both day and night. Large doses of sedatives or the use of those having strong cumulative tendencies such as bromides are contraindicated. Adequate diet, with additional snacks one and one-half hours after each meal are helpful. In the absence of physical contraindications, neutral tub baths taken by the patient in his own bathtub at home are useful. The technique of taking such baths is for the patient to stay in the tub twenty to forty minutes at a time with the water at a constant temperature of 98 F. running continuously into the tub and out the overflow drain. Careful precautions against exposure to drafts or chilling are necessary. The neutral tub baths may be repeated as often as necessary, day or night. Tonic insulin in doses of 10 units (regular) half an hour before the morning and noon meals may be helpful. High vitamin intake, using multiple vitamin preparations by mouth, with additional vitamin B complex factors, amounting to about four times the minimal daily requirements of the B complex factors, are helpful.

Any depressed patient who does not respond promptly to such conservative management should be given the advantage of electric convulsive therapy, unless definite contraindications exist. Patients who can be cared for at home, with adequate precautions against the suicidal risk, are treated by preference as out-patients for the course of electrical treatments. I prefer to have the patient continue living at home, but come into the treatment room usually three times a week. At the time of treatment intravenous sedatives are given, followed immediately by succinyl choline chloride (Anectine) intravenously to prevent vigorous muscular contraction; then the electrical treatment is administered. The patient remains in the treatment room for the recovery period of approximately one hour, then returns to his home and to relatively unrestricted activities until time for the next treatment. Satisfactory recovery from the depressive symptoms after a series of such treatments occurs in the majority of patients, with a minimal disturbance of the home living situation and the family routine.

Recognition by the physician of a depressive reaction, his taking stock of its intensity and estimating the hazards promptly, treating conservatively as outlined if suitable, and instituting electrical convulsive therapy promptly if and when indicated are the important considerations.

PARANOID REACTIONS

In the severe paranoid reactions (table 3) delusions of persecution are prominent. These delusions often are bizarre and fantastic and are associated with irritability. Hallucinations of hearing are frequent in these reactions. In people showing this type of reaction unjustified hostility, bitterness, and suspiciousness may be intense. Denunciation of the fancied enemies, legal action, or even physical attack may occur. Patients with mild paranoid trends may be managed in the home, just as the patient with mild deterioration is managed, except for more careful avoidance of restraint and irritation if possible. If strong emotional reactions and intense bitterness and hostility occur, hospitalization is necessary.

TABLE 3.—*Management of Patients with Paranoid Reactions.*

Conservative management for milder cases at home as in mild deterioration. Electric convulsive treatment indicated in selected patients. Hospitalization for custody, protection, and treatment in more severe cases.

Electric convulsive therapy may be given in selected cases on an out-patient or in-patient treatment basis. Such therapy tends to reduce the tension and make adjustment to living conditions in the home or hospital somewhat easier. The paranoid trends usually are persistent, however, and usually they do not subside under electric convulsive therapy as rapidly or as satisfactorily as do depressive trends. The prognosis in patients with pronounced paranoid trends is distinctly guarded.

SIMPLE CHANGES OF AGING

In the simple changes of advancing age (table 4), even with mild degrees of organic deterioration, the situation is ideal for management by the family doctor. These patients may show a simple, mild to moderate memory failure and recognize their difficulty in concentrating on tasks requiring mental effort particularly. Usually there is a restlessness, a tendency to be up and about and rambling through the house at night, searching through drawers and cabinets, often without being able to say what is sought. There is impatience, querulousness, and sometimes defect of orientation.

TABLE 4.—*Management of Patients with Simple Usual Changes of Aging.*

Adequate diet; added snacks if desired.
Long rest at night and nap at midday.
Daily light exercise.
Hygiene and elimination.
Treatment of any organic disease.
Program of mental hygiene.
Regular duties and work. Productive work where possible in a field in which patient has had experience and skill.
Affection, friendliness, and appreciation at home.
Identification with a group.
Sense of independence and self-sufficiency.
Recreation.

Effective techniques of management of such patients in the home usually are possible under the direction of the family physician. General hygienic principles apply as in the case of any other person of advancing years. It is important to recognize that an older person is more susceptible than a younger one to dietary deficiency, fatigue, and either endogenous or exogenous toxemias. It is especially important to recognize that mental aberrations and emotional reactions, as well as exaggerations of the less desirable personality traits of the aged patient, are precipitated more readily by such factors as malnutrition, exhaustion, toxemia, or physical disease.

From the practical standpoint this means that the diet should be adequate in caloric intake, easily digestible, and well balanced. The total caloric intake should be between 2,200 and 4,000 calories dependent upon the degree of physical activity. Kountz[4] recommended a daily protein intake of 1.2 Gm. per kilogram of body weight, with fat intake up to 80 Gm. and relatively little sugar. High calcium and phosphorous intake with multiple vitamins and added trace minerals are important. It is well to plan a light to moderate meal at each regular mealtime, and to allow a light snack between meals and at bedtime if this is tolerated by the patient. Adequate time for sleep at night is important, and certainly an early

afternoon rest period of one to two hours, during which the patient rests lying down, sleeping if possible, should be a regular routine. In the absence of physical contraindications, daily light exercise, outdoors when possible, should be prescribed. Bowel elimination, preferably with the aid of methyl cellulose or other bulk-forming preparations, and adequate fresh or dried fruit intake is important.

From the standpoint of mental hygiene, it is essential to recognize that the aging person is subject to increasing emotional stress and trauma with the change in his daily habits. He finds it necessary to slow down and reduce the total of his activities because of decrease in energy, endurance, and drive. Further conflict emanates from his feeling of being "on the shelf" in comparison with his previous activities. Instead of his former position of being dominant to some degree in his household, his work, and his neighborhood, he finds now that failing strength and judgment prevent his taking a dominant position, or competing with other younger and more vigorous associates for positions of attention and respect and authority. It is a discouraging realization when it dawns on him that he is less essential to his own family and is approaching the stage of being excess baggage so far as their lives are concerned. To top it off, if his intellect is well preserved and his insight is sound, he realizes fully the futility of attempting to reverse the process, to regain youth and vigor, and to recapture the enthusiasm and motivation for long-term future plans.

To counterbalance these stresses, the elderly patient should be so situated that his emotional needs will be supplied adequately with the following basic requirements:

1. He should have a regular working schedule. Preferably the work should be productive and within the limits of his capacity, and similar to his former occupation if he is retired. If he can keep a regular job, even working only an hour or two a day, with only light pressure of responsibility, he will be happier. If he is unable to work for pay, or incapable of doing work related to his regular job, the nearest possible approach to this should be arranged. Regular duty, keeping him in contact with some productive activity program, is important, even if it is only answering the telephone and taking messages, or soliciting orders by telephone, or greeting customers. He should receive some pay for his efforts. If it is impossible for him to do any work for pay, either because of complete inability to get such work or because of his own incompetence to perform even simple jobs, improvised work around the home within the limits of his capacity is important. Any one of dozens of little chores about the household (sweeping the kitchen, making the beds, putting out the garbage, dusting the window sills) or the business or the farm are helpful. If possible, such work should be planned a day or two ahead, giving it an aura of importance, and giving the individual patient the savor of planning ahead and impressing him with the fact that other people count on his help.

2. Another basic requirement is an openly and frequently expressed friendliness and affection on the part of others in the home environment. The elderly person feels deeply any lack of attention, love, and appreciation, and he is more keenly aware of such lacks because of his inability to keep pace with activities of others. The divergence of interests between himself and other younger people, his increasingly limited activities and contacts with other people, and deaths of increasing numbers of friends of his own age intensify his loneliness. Warmth, respect, and affection and attention are important in offsetting these stresses.

3. Acceptance by and companionship with others in the neighborhood and in the community is of almost equal importance. If possible, association with other people of his own general age range and interest level should be arranged and encouraged. He needs to have that highly important feeling of "belonging" and of identifying himself with others in the form of formal organizations of some type, either in the working situation, community activities, or recreation. Church group work, veterans' organizations, hobby clubs, political activity, and charity solicitation all help. If no formal organization is available, the less formal basis of friendship and companionship outside the immediate home environment is helpful.

4. He needs as much of a feeling of independence and self-sufficiency as possible. It is important not only to contribute to his own support, but to be in the position of helping other people in some way. If he is unable to help financially, his morale is lifted enormously by having the family ask advice, even on small things. Members of the family can make a point of listening attentively to his words of wisdom, whether or not they follow his advice. If they ask small favors of him, and ask him to do things which he feels he can do better than others, either because of longer experience, skill, or special knowledge, he will feel much better. If he writes letters or attempts to conduct any business correspondence on his own responsibility, he should have his own letterheads and envelopes printed. The tonic effect of his independence, expressed in small ways of this sort, is enormous.

5. He should have recreation regularly. The type should be of his own choosing, within the limits

of safety and reason, but friendly competition at an easy pace should be encouraged. Dominoes, horseshoe pitching, shuffleboard, croquet, miniature golf, and cribbage are popular and cheap, and music, either instrumental or vocal, often stimulates interest. Square dancing, post-office, and dating may appeal to the more enduringly optimistic. Suffice it to say that some recreation, with some variation in its form, should be encouraged as a daily pleasure and relaxation.

SUMMARY AND CONCLUSIONS

Helping the elderly person to a wholesome adaptation to his everyday life requires skill, tact, and understanding on the part of the family and the physician. The areas of help and guidance include the physical and the mental and emotional fields. Abnormal psychologic reactions in many forms occur in the older age groups, the most frequently encountered being the senile or arteriosclerotic deteriorations, the depressions, and the paranoid reactions. Techniques of management at home and techniques of out-patient treatment are available for the milder forms of these reactions. Hospitalization of the more severely ill patient is advisable.

Management of the problems of the majority of elderly patients involves adjustment to the home situation and flexibility and adaptability of family attitudes in the home. The basic requirements for such patients showing the usual changes of aging include the physical factors of proper diet, hygiene, rest, and treatment of any organic disease. The satisfaction of the emotional needs of such patients demands a program of regular work, an atmosphere of affection and acceptance in the home, an opportunity for identification with a group and a community, the privilege of being both independent and helpful to others, and the opportunity to have regular and wholesome recreation.

ABSTRACT OF DISCUSSION

AUDIENCE MEMBER: Would Dr. Cooper comment further about the choice of sedatives for the usual elderly patient and give his opinion about the use of alcoholic drinks?

DR. COOPER, closing: Sedatives which may be used instead of barbiturates must be selected according to the needs of the individual patient. If the blood pressure is not too low, chloral hydrate is useful and rarely produces toxic symptoms. Dormison and Isoval are useful and relatively safe. Chlorpromazine may prove to be very satisfactory in that it tends to reduce tension and keep the patient on a more uniformly stable emotional level throughout the day and night without producing the confusion and disturbing drowsiness noted with many sedatives. My experience with chlorpromazine has been too short for me to feel justified in drawing definite conclusions just now. It must be used cautiously and the dosage individualized since it does produce a drop in blood pressure which might be dangerous in the elderly arteriosclerotic patient with low blood pressure, and it might be equally hazardous if given to the patient with severe hypertension since too great a drop in blood pressure in such patients might make vascular thrombosis more likely. Chlorpromazine appears to have a synergistic effect when used with sedatives.

I believe that the use of a limited amount of alcohol in the form of wine or distilled liquor is beneficial, provided the patient's history indicates that he has never had any tendency to addiction or to the use of alcohol or any other drugs in excess periodically. I think that the use of one to three highballs in a day, or an equivalent amount of wine, helps in the relaxation and gives the patient a sense of well being which adds to the total picture of his comfort and health. The use of alcohol, of course, should never be allowed to interfere with food intake and should not be permitted if unfavorable gastrointestinal or other reactions occur.

OBSTETRICS AND GYNECOLOGY EXAMINATIONS

Applications for certification by the American Board of Obstetrics and Gynecology for the 1955 Part I examinations are now being accepted by the secretary, Dr. Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.

Candidates for admission to the examinations are required to submit with their application a typewritten list of all patients admitted to the hospitals in which they practice for the year preceding their application or the year prior to their request for reopening of their application, with the diagnosis, pathologic diagnosis, nature of treatment, and end result. These applications must be received prior to October 1, 1954. Under a change of requirements for the Part I examination, candidates must submit twenty case abstracts, five of which can be from their residency service.

"Our danger at home is fixed and constant. Right at this moment, every major city in the United States is within reach of Russian bombers. We know that Russia has atomic bombs. We know that Rusisa has the facilities to wage biological warfare. We know that Russia is supplied with all of the modern war gasses. So long as those things are true—and every one of them is true—America's Main Street must be on the alert day and night."—FCD Administrator Millard Caldwell.

MEDICAL CARE AND SOCIAL AND ECONOMIC PROBLEMS OF THE AGED

O. M. PHILLIPS, M. D., Fort Worth, Texas

THE meaning of the word "aged" suggests various connotations, possibly depending upon a person's own age or perhaps on the association he has had with older persons. Since the usual age of retirement in many industries and professions has been fixed at about 65 years, many persons think of the aged as being 65 years or older. This is not necessarily true, as some people age or deteriorate earlier than others. There is often a difference in the chronologic age and the age as determined by mental and physical capabilities. It is said, aging is a process that sets in during the late forties or early fifties.

Because of the advance of medical science, there has been a rapid increase in the population of the aged. In 1953, the number of persons 65 years or older exceeded 13,400,000 or 8.4 per cent of the total population. This group is increasing at the rate of about 325,000 annually.[5] In 1949, the life expectancy at 65 years of age was 14.6 years for women and 12.4 years for men. At the age of 75 years, the life expectancy was 8.5 years for women and 7.5 years for men, and there was a fifty-fifty chance of outliving the expectancy. Of the 50 per cent that survive past the expectancy, some may live for an indefinite period. It has been estimated that there are more than 4,000 persons in this country who are more than 100 years of age at this time.

INCOME OF AGED

The income of the aged may be from private resources, relatives, old age assistance, social security or old age and survivors insurance, or pensions from one source or another. Last year, of the 13,400,000 persons 65 years or older, 4,100,000 were employed or were the wives of employed persons. About two-thirds were receiving payments under some public plan or earnings from employment.[5]

A person is not eligible for old age assistance until he has reached 65 years of age, and the amount varies in different states. In Texas, one must be a citizen of the United States, and he must have lived in the state for five years or more including at least one year just prior to his making application for assistance. He cannot possess more than $300 besides his homestead. A resident of any state institution is not eligible. The Constitution of Texas does not permit more than $20 to be paid to each recipient per month. The federal government pays $20 of the first $25, and anything over this amount up to the federal matching maximum of $55 is paid equally by both the state and federal governments. Thus the maximum old age assistance a person may receive in Texas is $55, of which $20 is paid by the state and $35 by the federal government.

In July, 1953, the highest average old age assistance in any state was $79.19, which was in Connecticut, and the lowest was $27.01 in Virginia.[4] Texas was fortieth on the list, with an average payment of only $38.47. The Texas Constitution also does not permit more than $35,000,000 for the three programs of old age assistance, aid to dependent children, and aid to dependent blind. There is a statutory limitation of $31,000,000 for old age assistance. Monthly payments often vary, as the number of recipients may increase or decrease from time to time.

When one makes application to the State Welfare Department for old age assistance, a budget is worked out for him, allowing a certain amount for living quarters, food, medical expenses if ill, and so forth. If he has an income from social security or other sources, the department will supplement this to the extent of his budget, but not in excess of $55. For instance, if his budget is for $75 and his income is $35, his old age assistance payment will be $40 per month. There were 220,980 persons on the old age assistance roll in Texas as of September 1, 1953.[4] The amount one may receive from social security varies, but the maximum payment for a family is about $127 per month. There is a bill before Congress that, if passed, will increase this amount considerably. One can readily see the predicament of the multitude of old people whose resources are meager or nothing when they are forced to retire.

OTHER PROBLEMS

Retirement, no matter at what age, brings to most people a new way of living. To a few, who have equipped themselves for this milestone, it means an opening of new vistas, time to travel and to do the things they have long wanted to do. However, only a small percentage can provide for themselves adequately as long as they live. To the majority, retirement brings untold problems and adjustments. Often

Read as part of a symposium on geriatrics for Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

their income is so reduced that their scale of living drops. Some find full or part time jobs. Many find that time hangs heavily on their hands; they have been too busy concentrating on their work to develop outside interests.

Often, old people are unable to make the necessary adjustments that retirement brings without some assistance. In some localities, classes are sponsored by boards of health, boards of education, industry, and social agencies for those who have reached or are nearing the retirement age. They are taught what kind of job they should apply for and how to go about getting it, how to invest what money they may have, how to utilize the existing facilities in the community, where to get help when sick, and numerous other things that may be of aid to them. Older people need counseling, and more facilities should be developed to provide this service. One out of three who seek jobs needs advice. Each should be placed in a job in which his past experience and training can be used. He can be trained for new work, but he is not as flexible as when he was younger.

Many have gone through the years making efforts at what they thought would afford adequate income on which to retire, but the higher costs of living can play havoc with a fixed income. Fifty years ago, more than half of the country's population lived on farms, whereas today no more than 20 per cent compose the rural population. Living was cheaper on the farm, and accommodations could be stretched more easily than in the present day small house or apartment. Several generations living together in crowded quarters is not conducive to happiness, as the younger may feel imposed upon and the older may feel unwanted. It is not surprising that the older people often develop a feeling of insecurity as they, no doubt, wonder what will happen to them since they are no longer able to provide for themselves.

Unfortunately, there is a general trend in industry to employ the younger people. Consequently, there is a tremendous waste of the older person's resources and experience which could be utilized and could be an aid to the economy of the nation. There has been an increase in the number of aged persons but not a corresponding increase in employment opportunities. In April, 1945, which was during wartime, 51 per cent of the men 65 years and older in this country were in the labor force, but by April, 1952, the number had dropped to about 42 per cent.[1]

All too often a passive attitude is taken toward the problems of the aged. Perhaps it is because most of us are too busy with our own problems, or maybe it is due mainly to the fact that we are not made aware of these problems. The aged need (1) an adequate income to meet the requirements for healthful living, (2) adequate medical care and facilities when they become ill, (3) suitable living quarters, (4) opportunity to obtain counseling, (5) opportunity for new social contacts, (6) recreation of various types, (7) some occupation, whether gainful or a hobby, and (8) rehabilitation which should include not only the physical but the mental and social aspects as well.

There is a gradual development of public awakening and consciousness to these needs. Facilities are being provided to correct these problems. Most communities provide for the young, but few give much attention to the aged. Perhaps they expect their respective families to shoulder this responsibility, and, usually, when possible, they do. But think of the many old persons who are alone in the world or whose families are unable financially to contribute to their support. In many cities where funds are raised each year for charitable organizations, frequently only a small amount of money is allocated to the needs of the aged. Many of the social agencies so financed are not equipped to assist them with their problems. Surely, there is the usual "poor farm" or "home for the poor," and I suppose they do the best they can with the money allotted to them. If we could but project ourselves into the future, how many would like to spend the twilight of our lives in such a place?

If a community would help its older people in making their adjustments, there would be less tendency for them to migrate. Unfortunately, for many their hoped for Utopia is disappointing as they find themselves in unfamiliar surroundings, and the problems they thought they had left behind are still with them. Many, however, migrate because they are seeking a better climate; too, because they know there will be others with common interests. St. Petersburg, Fla., is such a place. In 1950, there was 22.2 per cent of the population 65 years of age or older.[2]

SOLUTIONS

There is a brighter side of the picture since there are many private and community agencies working to make living for the aged happier. Clubs and community centers are being formed. Recreational programs and classes in subjects of interest to them as well as instruction in the various crafts are being developed. There has been a rapid growth over the country of Golden Age Clubs through which old people are brought together for planned recreation. This is good, for many lack initiative and depend more and more on others, even to planning their everyday activities. When interest is stimulated in such projects, mental outlook improves, and a decrease in physical complaints frequently follows. It

is believed that such activities reduce the number applying for admission to homes or institutions.

More so, in the last decade has there been a trend to provide for the aged in building projects. Villages are being built to provide community centers, dispensaries, workshops, recreational programs, and so forth. Certain areas are reserving units in large public projects. The New York Housing Authority has placed aside approximately 5 per cent of the available space for the aged. Many of the better homes for the aged have been developed by various church groups, fraternal orders, philanthropic and nonprofit associations, and private foundations. As increasing illness comes with increasing age, facilities for such are being incorporated in most building projects. Before the advent of public assistance, many such places were essentially for the indigent 65 years and older, and often only the well ambulatory ones were admitted. There is still a number of homes to which one must sign over most of his personal resources before he is admitted.

An example of existing projects for the aged is one the Upholsterers' Union in Philadelphia has developed. It is a retirement village in Florida located on about 600 acres, and it has a model community center, shopping center, and convalescent home.

"Moosehaven" is another project, located near Jacksonville, Fla., and operated by a fraternal organization. The guests, about 350, must be members of the fraternal order or widows of members. The average age is 76 years. Medical service is provided, but the facilities are usually strained because of the average age of the inhabitants.[1]

More private nursing homes are being opened. Some are good, but others are not properly or sufficiently staffed to give the attention needed. I recently had a patient in one that appeared above the average. One day she climbed over the sideboards and fell to the floor, and I was called only after she had complained bitterly of pain for three days. She had a fracture of the right femur.

We are still far from providing adequately for the aged, but we are going in the right direction. However, our pace must be speeded if we expect to attain that goal. Surely this will be accomplished eventually, once there is a realization and understanding of the problem by the general populace.

GROVE HOME

I have been associated closely in an advisory capacity with the W. H. Grove Home for the Aged in Fort Worth. Mr. Grove had the happy idea that he would like to provide a home for both men and women who had reached that period of life when they were faced with the problem of how and where to live. He realized that many were alone and that many were without resources to enable them to live in healthful and happy surroundings. Before his death he bought the land and left provisions in his will to build such a home. It was opened in the fall of 1951 with a capacity of 26 guests. Because of so many more applicants than the home could possibly care for, accommodations for 16 more guests were added, bringing the total to 42. There is still a long waiting list.

The E. D. Farmer Foundation took over the responsibility of running the home and makes up any deficit, but for the past year and a half or more, it has paid its own way. The Etta Newbury estate has been responsible for most of the furnishings. Occasionally, the home is the recipient of small gifts. A guest in a double room pays $55 each month, and those in single rooms pay $58.

The only requirements for admission are that the applicants must be mentally and physically fit to the extent that they can care for themselves and their own rooms and that someone must be responsible for them should they become ill. The home is not equipped to care for those who are acutely ill or have a disabling chronic illness. There is not even a nurse in attendance. The city nurse comes by to give the guests any parenteral medications prescribed by their physician. Those unable to pay for medical care are taken to the City-County Hospital and Clinic. It was thought by some that such a plan would not work, but it has so far.

A happy, cheerful, homelike atmosphere prevails. The guests take great pride in how the home looks. No one is asked to take over any duties, and all work is done on a volunteer basis. Interests are encouraged. One may ask to look after certain flowers, another something else. There is a spirit of comradeship and a helpful attitude toward each other. There is a feeling of independence as each has the privilege of coming and going as he pleases. Many have told me that they are happy and enjoying living for the first time and that for the first time they have a feeling of security. They have regained their self respect, and frustration is a thing of the past.

Parties and planned entertainment are arranged by the hostess. Only a few need any urging to participate. A camping trip for two nights near some lake is planned twice each year, and members of the Golden Age Club are invited. Also held twice each year is a bazaar at which items made by the guests are sold. This creates an incentive and desire to keep busy and gives to some a little extra spending money.

They all feel that they are paying guests, although all the income some have is from public assistance

except for that added by the Farmer Foundation. There are 38 living in the home at present, as some have moved, mostly because of illness. Vacancies are readily filled from the long waiting list. Guests are between 64 and 83 years. The following shows their source of income: 12 have independent incomes; 3 receive money from their families; 17 receive old age assistance; 3 are retired on pensions; and 3 receive old age assistance and a small amount from social security.

I fully realize that this type of home for the aged is not the solution to the over-all picture but only a small part. It does show, however, that once the physical setup is made available, it is possible to operate with little or no outside assistance.

SUMMARY

There has been a marked increase of the aged in the total population. With age comes increasing illness and many problems and adjustments. The trend is toward their solution. One new project for the aged is discussed.

PUBLIC HEALTH ASPECTS OF THE AGING POPULATION

MAURICE A. ROE, M. D., Dallas, Texas*

IN referring to the aspects of public health as applied to the aged, attention is given to those conditions or diseases considered preventable or controllable. The indicated control measures are commonly implemented through programs operated by public agencies, complemented by the usual role of the practicing physician.

A concept of the physical picture encountered in old age might be considered a result of the total changes of maturity in an aging person in whom may be manifested varying degrees of physiologic changes and the earmarks of superimposed physical conditions or diseases of a chronic nature.

The health status of the elderly person thus in some respects represents the accumulated effects of survival. The application of the principles of preventive medicine and environmental sanitation, therefore, has an important bearing on the final product in old age. The traumatic effects on the surviving organism from contagious diseases that could have been prevented by immunization and the isolation of infected cases, infectious diseases that could have been prevented by proper handling of water and milk supplies, nutritional diseases preventable by suitable measures taken as regards food intake, the ravages of contact diseases such as venereal disease that are controllable, and the crippling effects of preventable accidents name but a few of the factors affecting indirectly the problem of old age.

As to the future of those aged persons who are surviving, many of the established public health programs are applicable for preventing certain disease conditions that otherwise might result in earlier death, disability, or dependency. As a result of the institution of such measures, the remaining years of life instead of being a liability may well become ones of usefulness and enjoyment. The general public or certain classes or age groups to a considerable degree might be motivated to adopt more favorable modes of living, particularly in relation to their environment, through public health education. An example of this technique might be creating awareness for correction of existing household structural defects that would result in lessening the possibility of home accidents.

Attention has been drawn to general public health programs already in effect that help prevent disease. Such programs that can be carried out on a public scale in several instances consist in the early detection of disease by means of screening procedures, followed by exact diagnosis and treatment through proper referral to private practitioners or, in the case of those unable to pay, to designated public clinics for final diagnosis and treatment. The role of mental health should be considered a vital part in this picture. A public attitude of appreciating the positive aspects as well as the limitations of old age, and where applicable instituting physical rehabilitation,

Read as part of a symposium on geriatrics for Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

**Medical Director, United States Public Health Service.*

would make for alleviation of many of the problems of older persons.

Vital statistic reports, as well as information obtained from health surveys, indicate some of the major health problems of the aged that may be altered appreciably for the better through the initiation of appropriate public health programs. At the same time the indications found in these data should point out to the practicing physician those disease conditions, particularly those of a preventable nature, that might not necessarily be anticipated in caring for older patients. Furthermore, the physician in his handling of the elderly patient also might bear in mind certain remedial or control measures that he himself can bring about in the patient's household.

MAJOR PROBLEMS

Home Accidents.—In recent years attention has been drawn to the heretofore overlooked role that accidents play as a cause of disability and death. It has been found that one-third of the nation's accident fatalities are home accidents. This fact has stressed the wide field that preventive measures can play in this category. Home accidents and old people are intimately related in view of the fact that in 1949 more than half of those killed in 30,500 deaths were caused in the home, and that in that year more than one-half of those killed in home accidents were 65 years and older. "Approximately 50% of all fatalities are caused by falls, and six out of seven such persons killed are 65 years of age and over."[11] The remedy to be sought undoubtedly is principally through correcting household hazards that create unsafe conditions.

Diabetes.—It has been established that the prevalence of diabetes increases with age. Diabetes, therefore, needs emphasis in health programs concerned with older persons. In the screening survey conducted in Dallas from 1950 to 1952, it was demonstrated that 5.2 per cent of those between the ages of 65 and 74 years either had or were clinically suspected of having diabetes.

Tuberculosis.—In communitywide chest roentgenray surveys recently made in four cities, it was found that the prevalence of diagnosed active tuberculosis (per 1,000 of population surveyed) in those persons 65 years and older ranges from .9 to 3.5. This range among the older population indicates a higher prevalence of tuberculosis than would be suspected from the results of other case finding procedures and also indicates that the problem of hidden tuberculosis in all probability is more serious in older persons than in the younger population groups.

Cancer.—The incidence of cancer increases rapidly during old age. From about the age of 60 and on, the male rates are higher than the female rates. In the survey of cancer illness among residents of Dallas made in 1948 by the United States Public Health Service the percentage distribution of all cases of cancer diagnosed at that time by primary site in the age group from 65 to 75 years and older was buccal cavity and pharynx 42.4 per cent, respiratory system 26.3 per cent, breast, 23.3 per cent, male genital organs 64.6 per cent, skin 34.5 per cent, and lymphomas 25.9 per cent. Attention particularly is drawn to the high incidence of skin and buccal cavity cancer in old age, both of which conditions are considered amenable to a more favorable prognosis when detected and treated early.

Heart Disease.—Arteriosclerotic heart disease, the leading cause of death, begins to be prominent in persons 35 years of age and continues to rise through the age group of 85 years and older. Next in order is hypertensive heart disease deaths, which are usually preceded by long periods of high blood pressure and often are accompanied with disablement. At the present time a great deal can be done in alleviating the distress of hypertension and hypertensive heart disease even more than in other cardiovascular conditions. It also might be pointed out that there is a high death rate from the effects of rheumatic fever and rheumatic heart disease in those persons 65 years and older. A significant point is that preventive measures on rheumatic fever in the early years of life can have a considerable bearing on lowering the death rates resulting from rheumatic fever in the later years.

Syphilis.—Syphilitic infection plays an important role in the older age group as compared with other age groups in the population. As late as 1949, of all patients first being admitted to state mental institutions with psychoses due to syphilis 16 per cent were 60 years of age and older. In 1950, more than 35 per cent of deaths from syphilis recorded in the expanding death registration area were in the age group of 65 years and older. In 1953, it has been estimated that in five American cities among the white population of 65 years and older from 0.45 to 2.45 per cent had syphilis needing treatment.

Nutrition.—Problems of nutrition deserve recognition in the care of the aged. It has been stated that in the case of obesity and its bearing on disease conditions (including vascular changes, diabetes, gallbladder disease, cancer of the endometrium, degenerative arthritis, hernia, and impaired kidney function), as many as 60 per cent of obese adults are women 50 to 70 years of age. Malnutrition with concomitant vitamin deficiency occasionally may be associated with institutional care where an undue attempt is made to keep down food costs. There seems to be a tendency on the part of old persons to eat improperly, because they either are sick, do not have or use

properly fitted dentures, cannot afford the proper food, do not prepare their food properly, are subject to dietary fads, or otherwise are subjected to unbalanced diets. A grossly inadequate diet followed for a prolonged period of time can lead to anemia in elderly persons and may be manifested in multifarious aspects of ill health, including mental confusion. Secondary anemia resulting from blood loss due to hemorrhoids also may be associated with mental confusion and can be alleviated by simple measures such as corrective surgery and the addition of iron to the diet.

Environmental Conditions.—Some types of air contamination can be particularly deleterious in respect to older persons. In the smog episode of Donora, Pa., in 1948, it was clearly indicated that more than half of the severely affected persons were 65 years of age and older. Whereas serious technical and economic considerations often are involved in the control of air pollution, nonetheless reduction of gaseous contaminants in many instances can be accomplished. Also may be mentioned the adverse effect of prolonged heat waves in the older age groups. Examples have been cited, particularly in the East, where the death rate experience in institutions housing the aged is pronouncedly increased during prolonged excessively high temperatures. The elderly are highly susceptible to heat cramps, heat exhaustion, and heat stroke, particularly those already in a debilitated condition. However when old persons are under medical observation, a considerable amount can be done toward early detection and consequent preventive measures taken to forestall heat syndromes.

SUMMARY

In recapitulation it is evident that public health programs carried out during the lifetime of a person have an accumulative beneficial effect on the health condition of the aged population as a whole. There is also a special appropriateness to the direct application of public health programs to the benefit of older age groups. Such activities may be in terms of creating a more suitable environment from the standpoint of correcting conditions hazardous to the aging population as well as offering activities directly affecting the health status of the individual. Attention is drawn to the fact that in the old age group are found many debilitating diseases and conditions that are preventable or susceptible to amelioration through control measures. Taking these into consideration, special attention is drawn to the importance of home accidents, diabetes, tuberculosis, heart disease, cancer, syphilis, poor nutrition, and the effects of contaminated environment by air pollution and excessive exposure to heat.

HOUSTON SCHOOL FOR DEAF CHILDREN

The Houston School for Deaf Children celebrated its seventh anniversary on May 16. The program included an explanation of the type of training that is given to the children and how it is accomplished, including examples of training in memory and observation, auditory skill, speech, lip reading, and language. Robert Goldstein, Ph. D., Central Institute for the Deaf, St. Louis, spoke on "Problems of the Education of the Deaf." Children from the school presented nursery rhymes as a part of the program.

The school was organized seven years ago with one teacher and five students and now has a staff of six teachers and thirty-five pupils. It is a nonprofit, charitable institution charging a nominal monthly rate which covers only a small part of the actual cost per child. A few scholarships are given by local civic clubs.

A Houston Council for the Deaf was organized in October, 1953, with one point of its program to make scholarships available for people wishing to teach the deaf.

ACCIDENTS CAUSE HIGH DEATH TOLL

In every state accidents take a higher toll of life than any other cause of death except the cardiovascular diseases and cancer, statisticians of Metropolitan Life Insurance Company report.

Death rate based on accidents is highest in the mountain region, Nevada and Wyoming having the highest accidental death rates in the country for 1949-1950, and is lowest in the middle Atlantic and New England areas, with New Jersey having the lowest rate.

Contributions to Medical Schools

More than 48,000 physicians contributed $2,459,102 in unrestricted funds to medical education through the American Medical Education Foundation and directly to the medical schools last year. This is an increase of more than 10,000 contributors over the previous year.

SURGERY OF THE AGED

JOHN V. GOODE, M. D., Dallas, Texas

A BABY born in 1953 can be expected to live to the age of 69 years. This is about twice the age that was expected for babies born in 1800. As a result of increased individual longevity the population as a whole is aging. According to the most recent estimate by the Bureau of the Census,[3] there were about 12,759,000 persons at ages 65 and older in July, 1951. These old people have problems of survival that are quite different from the problems faced by young or middle aged adults. These two facts, the increasing number of old people and the fact that their problems differ from problems of other adults, justify the medical specialty designated as geriatrics.

As babies are not just small adults, so the aged person is not just an old adult. Old people have decreased reserves of protein and electrolytes; also they are much more sensitive to fluid and electrolyte imbalance. Because the extremes of normal electrolyte balance are more rigid in the aged, these patients may become either dehydrated or overloaded with fluid much more quickly than would a younger person. It is wise to estimate that both liver and kidney function are below par in older patients. These organs may function adequately in health but may be inadequate when faced with the added load of operative trauma and/or infection. As a result of decreased liver and kidney function and the commonly found low basal metabolic rate in the aged, drugs are excreted more slowly and must be used in decreased amounts in elderly patients. Because their aging circulation operates on such a narrow margin of safety, old people are unusually sensitive to oxygen lack. They must not be allowed to have long periods of hypotension or long periods of hypoxia. Because of all these physiologic changes and because the heart has been working so long, it is probably wise to consider all surgical patients in the old age group as cardiac patients and take all the precautions with them that would be taken if a cardiac lesion were known to be present.

SURGICAL CONDITIONS

Although most of the diseases of old age fall into the medical category (heart disease, mental disease, arthritis, and renal disorders), there remain a sizable number of serious disorders that must be treated by the surgeon. It is useful to group these surgical diseases under three headings.

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

In the first group are diseases immediately dangerous to life. These include intra-abdominal suppuration, obstructive lesions, gangrene of an extremity, massive hemorrhage or infection, and certain fractures. Since these disorders must be corrected even at great risk or the patient is lost, it is rarely difficult to decide what course to follow in the management of such lesions.

The second group is comprised of disorders not immediately dangerous to life but remotely dangerous to life. In this group are found the large benign intra-abdominal cysts and tumors, certain goiters, cholecystic disease, peptic ulcers, diverticulitis, and certain slow growing malignant lesions. It is difficult to be sure just what treatment is best for diseases in this group. Careful balancing of reserves, risks, expected years of life at a given age, all must be taken into consideration. It is here the surgeon must ask himself whether the good he will do justifies the pain, expense, and possible harm he might do.

The last of the three groups mentioned contains diseases that are not dangerous to life but are uncomfortable or painful. In this group may be found most hernias, hemorrhoids, bunions, cataracts, rectoceles, prolapse of the uterus, extraction of teeth, and so forth. Fortunately the relief obtained by correction of diseases in this group is great and the operative risk relatively small. It should be remembered that elderly people often are ready to die but are exceedingly intolerant of pain. It seems that constant slight nagging pain in an elderly patient breaks his morale and makes his life seem not worth living. For these reasons I usually advise operation for this group of painful or uncomfortable disorders.

PREOPERATIVE STAGE

Diagnosis of a surgical disease in the aged is difficult for several reasons. In the first place the patient's attitude toward his disease and his younger physician presents a problem. We have all heard such patients say, "Why did this have to happen to me?" "No one cares if I die, just leave me alone." "I'm too old anyhow." These old patients are suspicious of young doctors. They feel they know more than any young upstart, so they are prone to treat themselves through the early stages of a disorder. The physician's attitude may be at fault as when he looks at his very old patient and, accepting senility as an excuse for withholding treatment, says "Let him die in peace." There are other real difficulties present in making diagnosis in these older patients, for example, their variable

reaction to pain. They may seem less sensitive and minimize severe pain which they localize poorly, or be intolerant of slight irritating pain which they exaggerate. Also examination may be difficult because of obesity, arthritis, or poor muscle tone. Finally, there often is more than one lesion present in these old patients, and it may be difficult to tell which is causing the symptoms of which the patient complains.

Medical consultation should be obtained for all patients more than 60 years old who are to have a serious operation. It should be added that most operations on these old patients are serious. During the preoperative treatment an attempt should be made to determine by appropriate tests the functional reserves of the heart, liver, kidneys, and bone marrow. Also during the preoperative stage a careful attempt should be made to reveal and correct all deficiency states. Hypoproteinemia and avitaminosis are best recognized by a careful history of the patient's dietary habits. Electrolyte imbalance should always be suspected because, as stated previously, these old patients usually have inefficient kidneys resulting in a state of chronic dehydration. Serious illness quickly throws them into a sodium deficit, and after a few days there may develop a potassium deficit which further complicates the picture. The routine blood count may be misleading because there may be, as Champ Lyons has described, a contracted vascular bed and contracted blood volume.[2] If a patient has recently lost weight, such a condition should be strongly suspected and transfusions given before as well as during the operation.

Careful watch must be made not to overlook diabetes, which is often latent in the aged. Also important is the problem of pulmonary disease either chronic or acute. No elective operation should be carried out in the presence of even a slight infection of the upper respiratory tract. If possible, old patients should be encouraged to get up early the morning of operation and walk about so they will cough thoroughly and clean out the bronchial tree. Toward this end heavy premedication is contraindicated the night before operation and the preoperative hypodermic injection is postponed until after this coughing has been carried out. The last and one of the most important functions of the physician in the preoperative preparation of his patient is the building up in the patient's mind an optimistic attitude toward his disease and its treatment by operation. A well prepared patient feels that his surgeon really cares for him, that his family wants him to get well, and, most important, he is sure he wants to get well. If a patient wants to get well, he probably will get well; if he does not want to get well, he may not get well. It is my opinion that the surgeon, the family, and the patient's pastor must work together to produce if possible this will to live before any operation is carried out.

OPERATIVE STAGE

In planning the operation itself the surgeon must always remember that the aged stand blood loss and oxygen lack poorly and that they may enter shock rapidly and recover from it slowly. Also it should be recognized that low levels of blood pressure are much more dangerous in the elderly patient than in the young or middle aged patient. Hypotension is dangerous to the older patients because it may bring about coronary or cerebral thrombosis. With these facts in mind the operation should be carried out with the minimum blood loss and the least possible trauma to the tissues. Since extreme operative speed is rarely possible without sacrifice of gentleness and since blood loss and shock are so dangerous to elderly patients, it stands to reason that operations on them should be done slowly and very carefully rather than very rapidly.

The choice of operation in any given case should come after a balancing of several factors: the number of years of comfortable life that could reasonably be expected for the patient if all goes well, his reserves to withstand trauma or infection, the statistical hazards of the various operations, and, most important, what is the risk of the operation in question when the physician in the case carries out that operation. A good rule to follow is to carry out the less dangerous of two procedures whenever there is a choice of more than one procedure that will greatly improve the patient's condition. This does not mean the exclusion of all hazardous curative procedutes in favor of some palliative procedure. At times the definitive operation is the only one that will palliate, and the easier so-called palliative operation brings only suffering and grief to the patient.

The point I wish to make is that because of senility occasionally a gastroenterostomy is wiser than gastric resection, a cholecystostomy with removal of stones is more desirable than cholecystectomy, and even at times it is wiser to remove a slow growing ulcerating cancer of the breast by simple mastectomy than to remove it by radical mastectomy. While we dread the idea of throwing away a patient's last chance for cure of his disorder, we must keep in mind the first law of medicine, "at least do no harm."

There can be no question that emergency operations in the elderly group of patients are more hazardous than elective operations. Anglem[1] has reported that where the mortality rate was 6.9 per cent for elective operations it was 19.5 per cent for emergency operations. This was in a group of 621 patients more than 70 years of age in whom the over-

all mortality rate was 9.98 per cent. Such figures give support to the idea that operation should be carried out in the aged before the emergency arises.

Since most of the postoperative deaths in this group are caused by cardiac or pulmonary complications, special attention must be given to the problem of anesthesia for these older patients. It is probably wiser for the surgeon to spend his energies in selecting an anesthetist than to worry about the anesthetic agent to be used. The anesthetist should be urged to use the drug he considers safest in his hands, not the agent that is popular for this operation at some large medical center. For certain lesions spinal anesthesia is best, but it is dangerous for patients with very high diastolic pressures or for patients with central nervous system disease. I prefer 1 per cent Novocain used as a nerve block or for local infiltration whenever the resulting anesthesia will suffice for the operation at hand. By either or both of these procedures the abdomen can be entered and many operations completed without the addition of general anesthesia. However, when exploration is indicated or pulling on the viscera required, light general anesthesia should be added before the patient feels pain and starts to push down with his diaphragm and unanesthetized abdominal muscles.

POSTOPERATIVE STAGE

Proper care of the elderly patient during the postoperative period is quite important and often more difficult than the operation itself. Every effort should be directed toward preventing atelectasis. To this end the patient must be told of the danger of shallow breathing, must be urged to cough up thick secretions, and must be forced to move about both in bed and out of bed. Occasionally it is necessary to help the patient cough or even to aspirate the tracheal secretions to secure satisfactory aeration of lungs. Deep sedation is to be avoided. Early ambulation (walking, not just sitting up) is highly desirable. It not only encourages deep breathing, but by increasing the circulatory rate in the extremities probably helps prevent vascular thrombosis and embolism. When there is a history of previous phlebitis or when varicosities exist, bandaging the legs with Ace bandages and rarely the administration of anticoagulants are indicated.

The maintenance of a proper fluid and electrolyte balance in the postoperative period is a delicate problem in the aged patient. It is much easier to make sure the fluids and electrolytes are in good balance before the operation and to replace fluids as lost than to have to make up large deficits in the postoperative period. For this reason unless there is some cardiac or other contraindication I prefer to give all elderly patients 1 or more liters of 5 per cent dextrose in saline solution the day before operation. This helps to control the subclinical dehydration before the inefficient kidney it temporarily injured by the trauma of the operation. Also it removes the necessity of administering salt solution immediately after operation when kidney function is still depressed. A fluid intake and output chart must be kept for all these patients in order to calculate their daily fluid requirement. In planning the fluid requirement the physician must plan to replace the 1,000 cc. of fluid lost through sweating and breathing plus the amount of fluid lost as urine. This urine volume should be at least 1,000 cc. daily. It should be remembered these requirements will be elevated in the presence of fever, during the high temperatures of summer, or if there are other losses of fluid such as by vomiting, fistulas, and weeping open wounds. Fluid replacement should be made at a slow rate because it is so easy to overload the circulation and bring about pulmonary edema. In fact it is probably wise to keep the elderly postoperative patient a little on the dry side but not too dry, because there is evidence available that intravascular clotting is more likely in the dehydrated than in the normally hydrated patient.

Although the postoperative nutritional requirements of an acute illness in the aged may pose no problem, at times when the illness drags on for weeks, failure to manage this phase of the postoperative course properly may result in failure of the entire procedure. The surgeon must watch out for loss of appetite in his elderly patient. It does not take many days for a vitamin and potassium deficit to develop. With a potassium deficit the voice becomes high pitched, muscles become flabby, the patient states he cannot raise his arms, and the surgeon may notice a paralytic type of ileus. At this time the serum potassium level is likely to be low, and the electrocardiogram is likely to show low T waves. Treatment should consist of high level vitamin supplement and 3 to 10 Gm. of potassium chloride daily until satisfactory levels of potassium are obtained. To prevent this condition it is wise to add 40 milliequivalents of potassium chloride to one of the liters of fluid given daily if a patient is being carried entirely on intravenous fluids.

Amino acids and protein hydrolysates are useful in maintaining nitrogen balance in patients who cannot eat, but it must be remembered that patients receiving protein hydrolysates should also receive about 30 calories per kilogram of body weight as glucose daily. This prevents the proteins being burned by the body as fuel rather than used as sources of nitrogen for protein synthesis. Alcohol, testosterone, and small doses of cortisone may be used to increase the sense of well being and thus the appetite. In this

problem of getting sick people to eat we should pay particular attention to the way the meals are served. A small attractive serving may be enjoyed, whereas a huge serving of the same food looks impossible and is sent back untouched. All disagreeable dressings, conversation, and relatives should be avoided at meal time. Every effort should be made to make eating a pleasure and not an ordeal. In spite of the fact we can keep a patient alive with intravenous fluids and supplements, he is never cured until he can eat and gain weight.

Old patients require special attention to the genitourinary system and the bowels. If possible, the evidences of prostatism should be sought and corrected before operation, especially if the operation is herniorrhaphy. After operation early ambulation helps empty both bladder and bowels. Nevertheless, if there is any question of bladder overflow, early catheterization and occasionally the use of an indwelling catheter is preferable to overdistention and atony of the bladder. When it is necessary to leave a catheter in the bladder, the administration of small doses of Gantrisin daily is desirable. All old people seem to feel that a daily bowel movement is highly desirable. In fact it seems that the day is made or ruined by the presence or absence of a bowel movement. For this reason the surgeon should see to it they have this pleasure. Petrogalar at night and occasionally a saline cathartic such as Fleet's Phospho-Soda in the morning usually suffices. If an enema is needed, a saline enema is probably the best one to use since it causes no irritation if partially retained. Since old people are so prone to develop fecal impaction, careful attention should be given to any complaints of fullness in the perineum, unsatisfying frequent small bowel movements, and the fact that an enema does not enter the colon easily.

The last but one of the most important rules for the management of elderly postoperative patients is the rule that they must be protected from emotional upsets. Old people are suspicious that they are not being told all the truth, they frighten easily, and they become despondent easily. For these reasons the surgeon must always present an optimistic outlook. He must point out some favorable development of the case each day. He should scrupulously avoid gruesome details. He should never brag how difficult the operation was or how near the patient came to dying. Keep the patient interested in visitors, books, family, other patients, and above all make him feel that everyone is interested in him and wants him to hurry and get well. It is not advisable to break his habits of years' duration during the postoperative period. Unless contraindicated by the particular operation it is wise to let him chew, dip, smoke, or have an occasional toddy. Get him out of bed and brag on how strong he is rather than keep him in bed and feel sorry for him.

CONCLUSION

It should be remembered always that at age 70 a patient can expect ten more years, at 80 five more years, and at 85 three more years. Also when there is no pain and when the mind is alert, these old people seem to love life even more than young people. Therefore we should not withhold surgical relief when it is indicated. These older people stand operations remarkably well if the operation is done gently, the anesthetic is not too deep, sedatives are used to the barest minimum, and early ambulation is practiced really early. It is my opinion that these older patients as a group present our most challenging problems, call for our nicest surgical judgment, and finally become our most grateful patients.

High Blood Pressure Remedy

Three Houston physicians reported in the July 17 *Journal of the American Medical Association* that an old Indian snakeroot remedy offers "good reason" to expect that high blood pressure and its complications can be relieved in both the early and late stages.

Dr. William R. Livesay, Dr. John H. Moyer, and Dr. Sam I. Miller state that with the drug alseroxylon high blood pressure may be controlled after it starts, and the serious later complications may be prevented. The doctors used alseroxylon, an extract from the snakeroot drug Rauwolfia serpentina, in treating 43 hypertensive patients at the Cardiac Clinic of Jefferson Davis Hospital.

The authors report that this drug has the distinct advantage among hypotensive agents in being associated with no serious untoward side effects. They reported that it often produces certain desirable effects such as mild sedation without somnolence. They stated that the drug reduced blood pressure and pulse rate, increased appetite, and produced "a sense of well-being or tranquillity."

Barbiturate Poisoning

Deaths from barbiturate poisoning in the United States are about one and one-half times the number immediately prior to World War II, according to Metropolitan Life Insurance Company statisticians. The victims of barbiturate poisoning, more than 400 per year, are mostly adults, and women outnumber men two to one.

BONE GRAFT IN RECONSTRUCTIVE SURGERY

T. WILEY HODGES, M. D., Dallas, Texas

BONE tissue has been employed with increasing frequency as grafting material by surgeons engaged in carrying out reparative procedures. The use of bone grafts reached a peak during World War II with the high incidence of wounds involving extremities, and lessons learned during this period regarding the management of bone grafts have continued to be utilized by surgeons during the postwar years.

It should be emphasized initially that the reconstructive surgeon must have familiarity with skin plastic procedures and with the handling of peripheral nerve lesions in order to repair and carry to a successful conclusion many of the cases of severe multiple tissue damage. Bone grafts will fail in a high percentage of cases unless careful planning and preparation for proper skin management have been carried out prior to the grafting procedure. The importance of covering the bone graft with full thickness skin carrying its own blood supply and applied without undue tension can be exemplified by the nonunited fracture which often heals after excision of all overlying scar tissue and coverage with healthy skin.

PREOPERATIVE CONSIDERATIONS

The patient's general condition should be at its optimum operative state prior to surgery.[4] Antibiotics, blood transfusions, and other therapeutic agents are employed as needed to effect this optimum operative level. In the presence of a recognized nonunion or of a defect of bone, a carefully planned and supervised program of physiotherapy is used for the extremity to mobilize the joints, improve muscle tone, and increase circulatory efficiency. The preoperative use of an ischial bearing caliper to allow ambulation in the presence of a bone defect in an inferior extremity is an example of a valuable adjunct used to improve the status of the extremity.

Many cases having failure of union or actual loss of bone substance have had the serious complication of infection, or the infection may still be present at the time it becomes evident that a bone graft must be used to effect osteogenesis.

The necessity of control and elimination of the infection is self evident. Bacterial cultures afford early recognition of the offending organism and sensitivity tests demonstrate the antibiotic or chemotherapeutic agents which will render effective control of the infection. Many injuries have resulted in severe scarring about the bone fragments. Scar tissue with its impaired blood supply is indeed poor wound soil to receive a bone graft and often bacterial foci are retained enmeshed in this tissue. A preliminary wound toilet to eradicate completely all scar tissue and necrotic bone debris so as to allow early wound closure is an essential prerequisite to the proper preparation of the graft bed. This is an important step as the graft bed must furnish nourishment to the bone graft.

At times a bone defect of the nature of an exteriorized cavity is encountered. These difficult problem cases can be successfully handled by first controlling the infection, invariably present, and then covering the walls of the cavity with thin split thickness skin grafts maintained in position by splints. After a dry cavity is thus attained, the split thickness skin grafts are removed, a graft bed is prepared in the bone, the cavity is obliterated with iliac bone chips, and then the area is covered with full thickness skin.

The decision as to when to carry out the bone grafting procedure following an infection is based upon several important considerations. The nature of the infecting organism, the severity and duration of the infection, and the reaction of the patient's tissues are important factors, as are the length of time the wound has remained closed, and whether or not any evidence of activity is still present. It is my opinion that the bone graft operation may be successfully carried out four to six weeks following closure of the wound provided a careful preliminary wound toilet was performed where necessary and provided that the patient's tissues show no reaction indicative of a low-grade or smoldering infection. The latter must be carefully searched for, and if unfavorable soft tissue reaction is present, operation had best be deferred.

PURPOSE OF GRAFTING

The purpose of bone grafting is to bridge a gap between bones or to reestablish the continuity of a long bone, as in (1) nonunion of bones with or without loss of bone substance; (2) filling of defects or cavities in bone caused by trauma, tumor, or infection; (3) joint arthrodesis, as following tuberculosis or poliomyelitis, or for fusion of the spine; (4) stabilization procedures such as bone block for drop foot; (5) correction of deformities; and (6) establishment of union in a pseudarthrosis.

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

GRAFTING MATERIAL

Each case requiring the use of bone grafting material demands mature consideration of the individual problem presented. The type of bone material to be used, that is, whether cancellous or cortical bone; the location at which the bone graft is to be employed; the character of the host bone to which the graft is to be attached; and the nature of the bone lesion all require careful appraisal. In all instances the plan should be for the graft to become incorporated as a part of the living bone structure on which or into which it is placed and for it thereafter to subsist as living bone across the gap which it bridges.

Bone grafts generally consist of cortical bone or of cancellous bone, although it is recognized that no graft specimen is composed entirely either of cortical or of cancellous tissue. Cortical bone is a solid mass of mature elements, the surfaces of which are covered with periosteum and endosteum. Grafts of this type possess considerable strength but little osteogenic power. Cancellous bone is of a loose construction with branching and interlacing trabeculae, each covered by endosteal or bone forming cells, and thus having a high osteogenic power. Abbott[1] has shown that the loose structure of cancellous bone allows adequate accommodation space for the invasion of capillaries and their accompanying cellular elements, thus permitting early and thorough revascularization. Rapid revascularization insures survival of the endosteal cells covering the trabeculae, and early osteogenesis occurs. Cortical grafts structurally contain inadequate accommodation space for the ingrowth of capillaries and, being composed almost entirely of mature osseous elements, will not survive. This type of graft serves as an internal splint which must eventually be replaced by new bone by the process of "creeping substitution" described by Phemister. A considerable portion of the cancellous bone graft lives and forms new bone.

Bone tissue, whether cancellous or cortical, may be obtained as an autogenous graft from the patient on whom the graft is to be performed or as a homograft, usually secured from a relative, or as preserved bone from a bone bank. The use of preserved homograft[7] has the particular advantage of lessening the operative trauma and operation time to the patient, as additional exposure of sites for removal of grafts is eliminated. At times it is difficult if not impossible to secure sufficient autogenous bone for grafting large defects or filling large cavities, and the hazard of fracture at the site of removal of a bone graft from an extremity must always cause concern and be guarded against, usually with a cast or a well fitted molded leather cuff.

TECHNIQUES

Several types of bone graft have been described of which (1) the inlay graft of Albee, (2) the self sustaining wedge only of Kirk, (3) the massive onlay graft of Campbell, (4) the barrel-stave grafts of Steele, and (5) the key graft of Bunnell have been used most frequently.

The location at which the bone graft is to be employed is deserving of especial consideration. The upper shaft of the femur and humerus are subjected to powerful leverage forces exerted by muscles motivating the hip and shoulder. Rigid fixation is essential as a spica cannot effectively control the leverage action of the muscles. A cortical onlay graft, particularly if reinforced with a metal plate, affords the rigid fixation needed. The dual onlay graft of Boyd[3] also will provide adequate fixation with the additional advantage of offering greater osteogenic properties. In the forearm or leg an intact long bone component affords considerable splintage to the injured bone, and grafting may be successfully carried out with the use of the cortical onlay graft or by means of iliac bone having cortical surfaces for stability, but without the necessity of a metal plate. Horwitz[8] has demonstrated that a graft 5 inches in length and more than 1 inch in width may be obtained from an ilium. These grafts contain two thin but relatively strong cortical surfaces, and if the crest of the ilium is utilized, a third cortical surface is added affording considerable strength.

It is felt that any lack of rigidity of iliac bone is more than compensated for by its superior osteogenic qualities and that the addition of a metal plate imparts the required stability. The process of creeping substitution whereby the mature elements of the graft are replaced by new bone occurs in both cortical and massive iliac grafts and is last manifest in the center portion of the graft. The critical period is usually after three months at which time the center of the graft may begin to resorb and fracture may occur. In this area of structural weakness rigid support and prolonged protection are necessary and may be secured by the use of a metal plate applied at the time of grafting. Metal plates may thus be used in conjunction with bone grafts to impart additional strength and stability but are never to be considered as being a substitute for bone. Bone defects are best bridged by the use of dual, only cortical grafts plus the use of iliac bone placed in a lamellated fashion in the defect. The dual, only cortical grafts insure firm stability, and the iliac bone affords increased osteogenic properties. Bone cavities are best obliterated with iliac bone, and it should be noted that cancellous bone[6] often will survive in whole or in part in the presence of low-grade infection if the area has been well covered with full thickness skin without exces-

LIBRARY OF THE
COLLEGE OF PHYSICIANS
OF PHILADEL

sive tension. Spine fusions also are best accomplished with the use of cancellous iliac bone applied in the lamellated manner. Cancellous bone may be successfully used alone to promote healing of a nonunited fracture or to bridge a bone defect, but immobilization must necessarily be for a longer period than where a cortical graft has been employed or where a metal plate has been used with the cancellous bone.

Bishop[2] reported an end-result study of the healing time of bone grafts used in 358 cases in an Army general hospital during World War II. There were 40 failures or 11.2 per cent. "Iliac grafts used under the most favorable circumstances to secure union were the slowest to heal, averaging 27 weeks; onlay grafts used in the most favorable type of case averaged 20 weeks; and the dual type graft which was used only in those instances in which slow union was anticipated by other methods, averaged 19 weeks." Of 112 dual grafts used to bridge bone defect there were only 20 cases of delayed union (beyond sixteen weeks) and no failures without complicating factors. He concluded that the use of the inlay grafts should be reserved for those cases of delayed union showing evidence of some healing. The massive cortical onlay graft was the graft of choice for cases with uncomplicated nonunion of long bones. Cases having a bone defect, nonunion near a joint, or marked demineralization or sclerosis of the bone fragments were treated best by means of the dual onlay graft. The latter type of graft affords rigid fixation which is absolutely essential if early functional use of the extremity is to be allowed.

Eggers[5] has demonstrated the importance of the contact-compression factor in stimulating osteogenesis and producing union of fracture surfaces. This factor is described as being the "combination of contact and the force to promote contact, exerted on bone structures." It is therefore highly desirable to promote early activity of the extremity in order to gain a more ideal pressure and contact of bone structures with the resultant enhanced osteogenetic activity. The proper choice and placement of bone grafting material, whether used singularly or in combination, will allow early supported function of the extremity, thus hastening the formation of bone architecturally capable of sustaining the stress of muscle pull and weight bearing.

CONCLUSION

Bone grafts are utilized to bridge a gap between bones or to reestablish the continuity of a long bone as in (1) nonunion of bones with or without loss of bone substances; (2) filling of defects or cavities in bone caused by trauma, tumor, or infection; (3) joint arthrodesis as following tuberculosis or poliomyelitis, or for fusion of the spine; (4) stabilizing procedures such as bone block for drop foot; (5) correction of deformities; and (6) establishment of union in a pseudarthosis.

Each case requiring the use of bone grafting material demands mature consideration of the individual problem presented. This includes the determination of the type of grafting material most suitable, the location at which the bone graft is to be employed, the character of the host bone to which the graft is to be attached, and the nature of the bone lesion.

Bone grafts are highly successful when adequately planned, correctly applied, and properly placed.

HEART DISEASE VICTIMS

Heart disease victims who recover from an initial attack have a good chance of living for many years after the attack, according to Metropolitan Life Insurance Company statisticians. More than 70 per cent of a group of white men, disabled by heart disease but later recovered sufficiently to return to work, were still alive after five years. Those disabled solely by arteriosclerotic heart disease showed a five year survival of 85 per cent and a ten year survival of 70 per cent. Of those with arteriosclerosis and coronary occlusion, more than 50 per cent survived for ten years.

TUBERCULOSIS SYMPOSIUM

Thirty-five doctors from twelve states, Canada, and Bermuda attended the third annual Symposium for General Practitioners on Tuberculosis and Other Chronic Diseases, which was held at Saranac Lake, N. Y., July 12-16. Sponsored by the American Trudeau Society and local medical societies, this symposium had the largest number of doctors ever present for the program.

In addition to lectures and panel discussions, there were demonstrations in fluoroscopy, roentgen-ray techniques, bacteriology, pathology, and physiology.

DIAGNOSIS AND CLINICAL MANAGEMENT OF METABOLIC BONE DISEASE

MAVIS P. KELSEY,* M.D., Houston, Texas

THE final diagnosis of any widespread bone disease is proved only by the x-ray and the laboratory (table 1). Routine roentgenograms of selected bones; determination of serum calcium, phosphorus, and alkaline phosphatase; and measurement of urinary excretion of calcium following the Aub diet[2] are usually required for diagnosis. Often required are studies of serum proteins, urine for Bence Jones protein, stool for fat excretion, bone marrow aspiration, and renal function.

Bone is formed by osteoblasts which lay down an extracellular substance called osteoid or matrix; then alkaline phosphatase acts to precipitate inorganic calcium, phosphorus, and carbonate into this organic matrix to produce hard bone. Bone is resorbed by large multicelled osteoclasts. In both growing and adult bone, there is a dynamic balance of these processes. Generalized bone diseases are associated with an imbalance of these processes. Albright and Reifenstein,[1] from whose book I have drawn heavily for this presentation, have formulated a classification of metabolic bone disease based on these imbalances. The following classification is modified to include certain other bone diseases considered in differential diagnosis:

I. Generalized bone disease (so-called metabolic bone disease).
  A. Too little calcified bone.
    1. Too little bone formation.
      a. Deficient matrix formation (osteoporosis).
      b. Deficient calcification of matrix (osteomalacia).
    2. Too much bone resorption: osteitis fibrosa cystica (generalisata).
  B. Too much calcified bone (omitted in this paper).

II. Localized bone disease (usually not called metabolic).
  A. Fibrous dysplasia of bone (Albright's disease).
  B. Osteitis deformans (Paget's disease).
  C. Destruction by malignant disease.
  D. Destruction by granuloma.

TABLE 1.—*Usual Biochemistry of Bone Disease.*

Disease	Alkaline Phosphatase	Serum Phosphorus	Serum Calcium	Urinary Calcium
Osteoporosis	N	N	N	⇧⇩ or N
Osteomalacia	⇧	N to ⇩	N to ⇩	⇩ or ⇧
Primary hyperparathyroidism	N to ⇧	⇩	⇧	⇧
Renal osteodystrophy	N to ⇧	⇧	N to ⇩	⇧
Fibrous dysplasia	N	N	N	N
Osteitis deformans	⇧	N	N	⇧
Malignancy and granulomas	N to ⇧	N or ⇧	N or ⇧	N or ⇧

OSTEOPOROSIS

In osteoporosis the osteoblasts fail to lay down sufficient matrix, but that matrix which does appear is normally calcified since there is no disturbance of calcium and phosphorus metabolism. Osteoporosis may result from a lack of protein or vitamin C in cases of malnutrition, disuse atrophy, senility, hyperadrenocorticism resulting from Cushing's syndrome or excessive administration of cortisone, hyperthyroidism, and hypogonadism. The most common cause of all osteoporosis is postmenopausal hypogonadism. Occasionally the cause cannot be determined.

The level of serum calcium and phosphorus is normal; the serum alkaline phosphatase level remains normal or low. Urinary excretion of calcium will be altered according to the status of the process. If osteoporosis is progressing, as may be seen in disuse atrophy immediately following immobilization of a limb in a cast, calcium excretion will be increased. If osteoporosis is regressing, as may be seen immediately following removal of the cast and resumption of motion of the limb, the calcium excretion will be diminished; if the osteoporosis is stationary, as may be seen in long standing postmenopausal osteoporosis, the calcium excretion is normal. Hypercalciuria, and occasionally renal calculus formation in acute bone atrophy, may closely simulate hyperparathyroidism. These chemical studies are seldom required since usually the diagnosis is easily made from the history and radiologic findings.

Radiologic findings of osteoporosis are characteristic.[7] With the exception of localized disuse atrophy, there is a predilection for thinning of bone in the pelvis and spine, and to a lesser extent in the skull, and rarely in the extremities. The trabecular mark-

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.
**Clinical Professor of Medicine, University of Texas Postgraduate School of Medicine.*

ings are intact unless osteoporosis is severe. Pathologic fractures occur but not pseudofractures as seen in osteomalacia. The vertebral plates remain distinct even though compression of vertebral bodies occurs. There is no periosteal resorption in the phalanges, and the lamina dura of the teeth remains intact.

Treatment of osteoporosis requires correction of the causative factors and includes proper diet for nutritional inadequacy, adrenalectomy for Cushing's syndrome, release from immobilization for disuse atrophy, and use of androgens and estrogens for postmenopausal and senile atrophy. Often more than one factor needs correction; for example, in senile patients a high protein diet, increased physical activity, and administration of estrogens and androgens are all indicated.

Frequently the pain from compression fractures of the vertebrae is partially relieved by administration of steroids. Estrogen may be given daily by oral administration of any of several preparations, including diethylstilbestrol, 0.5 mg.; estrone sulfate, 2 to 3.75 mg.; or ethinyl estradiol, 0.5 to 1 mg. Intramuscular injections are not necessary and do not enhance results. To prevent irregular estrogenic bleeding, the treatment may be interrupted each month for a week to produce regular estrogen withdrawal bleeding. Testosterone when swallowed loses most of its therapeutic effect. Sublingual testosterone proprionate, 10 mg. each day, or intramuscular testosterone proprionate or slow acting testosterone, 25 mg. each week, may be given to enhance the calcium retention produced by estrogens. Only rarely will these doses cause masculinizing effects. Salt-retaining tendencies produced by these steroids usually may be overcome by a low salt diet or the administration of ammonium chloride. The patient must be examined carefully for a cancer which may be aggravated by these steroids. I have never seen or heard of a cancer produced in a patient by this treatment, but this possibility must be kept in mind.

OSTEOMALACIA

Osteomalacia results from generalized decalcification of bone. The osteoid or matrix is laid down normally, but there is a deficiency in its calcification. Osteomalacia is caused by deficient absorption of calcium from the intestinal tract or by excessive excretion of calcium by the kidneys.

The level of either the serum calcium or serum phosphorus, or both, is low so that the product of the two in milligrams is lower than normal, usually less than 35. The serum alkaline phosphatase is elevated as a result of the excessive activity of the osteoblasts, which attempt to form strong bone in the presence of abnormal decalcification.

Radiologic study reveals generalized decalcification. A characteristic finding is pseudofractures, which are ribbonlike zones of decalcification extending through the cortex of bones at right angles to the margins. Apparently these are partial fractures into which osteoid has formed but calcification has failed to occur. They are often bilaterally symmetrical and involve especially the scapulas, pubes, ribs, and femurs. Pseudofractures may appear even before general decalcification is obvious (Milkman's syndrome). Subperiosteal resorption in the phalanges and granular decalcification of the skull are not seen. Rarely loss of the lamina dura occurs. In cases resulting from renal acidosis there often may be bilateral, severe, and extensive nephrocalcinosis or nephrolithiasis.

Osteomalacia as a result of deficient absorption of calcium from the intestinal tract may occur as rickets or vitamin D deficiency in childhood and is corrected by small doses of vitamin D. In this country rarely, if ever, does simple rickets or vitamin D deficiency occur in adults, but this condition is said to occur in China. Resistance to vitamin D is said to produce osteomalacia and is curable with huge doses of vitamin D. Steatorrhea is the most common cause of osteomalacia and results from diminished intestinal absorption of fat-soluble vitamin D and calcium. Steatorrhea may result from sprue, chronic pancreatitis, or extensive destruction of the small bowel by disease or surgery. Treatment is attempted with a low fat, high protein diet and by large doses of vitamins, all of which are known to be poorly absorbed in this disease, and by the administration of cortisone.[9]

Osteomalacia as a result of excessive urinary excretion of calcium may occur in three unusual conditions. One of these is renal acidosis resulting from a form of nephritis in which there is extreme tubular damage without glomerular damage. The damaged tubules are unable to form sufficient ammonia to neutralize the acid ions which the kidneys are obliged to excrete. This results in the excessive excretion of base, including calcium, from the blood with the final result of decalcification of bone. The hypercalciuria often leads to extensive nephrolithiasis. Treatment is directed toward replacing the serum base as rapidly as it is excreted in the urine, thus sparing the bones as a source of base. This is accomplished by giving large doses of sodium citrate by mouth (50 to 100 mm. daily of Shohl's solution, 140 Gm. of citric acid and 98 Gm. of sodium citrate dissolved in 1 L. of water, as needed to produce an alkaline urine). Meanwhile calcium absorption may be enhanced by the administration of vitamin D.

The second form of renal acidosis with osteomalacia is Fanconi's syndrome.[6] This is one of several rare and incompletely understood syndromes characterized by urinary excretion of large amounts of

amino acids. Other features of Fanconi's syndrome include retarded growth, albuminuria, renal glycosuria with increased organic acids, ammonia, phosphorus and calcium in the urine, hypophosphatemia without hypercalcemia, and no azotemia. Degenerative changes in the renal tubules are found. Apparently these damaged tubules are unable to resorb certain solutes from the glomerular filtrate and the resulting excessive excretion of phosphate and calcium leads to decalcification of the bone. Treatment should be the same as for renal acidosis with tubular nephritis mentioned previously, including Shohl's solution, high calcium and phosphorus intake, and massive doses of vitamin D.[8]

The third form of osteomalacia results from idiopathic hypercalciuria. This is not associated with renal acidosis and is not benefited by administration of alkali. The hypercalciuria tends to produce a low level of serum calcium and decalcification of bone with negative calcium balance. Renal stones are common. If the kidneys have not been damaged by stones, treatment by a high calcium, high vitamin D intake effectively controls the bone changes.

HYPERPARATHYROIDISM

Adenoma, adenocarcinoma, and diffuse hyperplasia of the parathyroids may produce the identical picture of primary hyperparathyroidism.[5] Secondary hyperparathyroidism is a response to some condition outside the parathyroid glands. Excessive parathyroid hormone is thought to produce excessive excretion of phosphate by the kidneys, thus lowering the level of serum phosphate and disturbing the normal calcium-phosphorus equilibrium. This results in an increased level of serum calcium and an increased resorption of bone in an effort to maintain the high serum calcium. The high serum calcium level is responsible for an excessive excretion of calcium in the urine. In turn, there is an increased formation of bone to compensate for the increased resorption. This often leads to an increased serum alkaline phosphatase. Briefly this series of events is reflected in decreased serum phosphorus and increased serum calcium, increased urinary excretion of calcium and phosphorus, and often an increased serum alkaline phosphatase.

Symptoms result from one or more of the following three changes: hypercalcemia, depletion of calcium from bone, and hypercalciuria. Hypercalcemia produces polyuria; polydipsia; gastrointestinal symptoms of anorexia, nausea, vomiting, and abdominal pain; and neuromuscular symptoms of fatigue, weakness, stupor, loss of muscle tone, and constipation. Only a few cases of hyperparathyroidism have been diagnosed by these symptoms.

Symptoms resulting from depletion of calcium from the bones are responsible for about 25 per cent of the cases diagnosed. Minimal bone disease causes vague pains and backache, and more marked changes result in osteitis fibrosa cystica generalisata (von Recklinghausen's disease) with bone tenderness, pathologic fractures, decreased stature, deformities, bone cysts, and tumors. The disease produces characteristic roentgenologic changes. Early findings are moderate rarefaction of the bones of the hands, skull, or jaw, with ground-glass or miliary type thinning. Of great diagnostic significance is the lacelike subperiosteal resorption of cortical bone of the phalanges which Pugh considers to occur only in primary and secondary hyperparathyroidism.[7] Loss of the lamina dura around the teeth may be an early finding of special diagnostic value. Advanced bone changes are generalized decalcification, disordered trabecular arrangement, and variable sized cystic lesions.

Hypercalciuria is responsible for the most common clinical picture of hyperparathyroidism, that of renal calculi with colic or obstruction. In prolonged cases there is infection, pyelonephritis, and uremia. Rarely fulminating "parathyroid poisoning" may exhibit nephrocalcinosis or calcification of renal substance with renal failure.

Proof of the diagnosis of hyperparathyroidism depends on the demonstration of a combination of increased serum calcium of more than 10.5 mg. per 100 cc. or preferably 11 mg. and reduced inorganic phosphorus of less than 3 mg. per 100 cc. or preferably 2.5 mg. Repeated tests should be made. The patient should be given a standard low calcium diet for several days, after which the urinary excretion of calcium should be measured. Normally it should be less than 100 mg. daily, whereas patients who have hyperparathyroidism usually excrete more than 200 mg. daily. Increased serum alkaline phosphatase indicates only the presence of bone disease, not parathyroid disease. For ordinary exclusion of the disease a negative Sulkowitch test for excessive calcium in the urine is sufficient.

The two other diseases which produce hypercalcemia are hypervitaminosis and acute osteoporosis of disuse. These are the most difficult to differentiate, but all other cystic and demineralizing diseases of bone and secondary hyperparathyroidism must be considered in the differential diagnosis.

The only treatment is surgical removal of the adenoma or occasional multiple adenomas if present, or if diffuse hyperplasia is the cause, removal of all except about 100 mg. of tissue. One must be certain before operation that the diagnosis is correct since the tumor may not be found in the neck and it may be necessary to split the sternum and explore the mediastinum. Occasionally, however, the tumor may be palpated preoperatively in the neck.

If the serum alkaline phosphatase level is elevated, severe transient or permanent tetany may appear postoperatively requiring massive doses of dihydrotachysterol and calcium. Occasionally these tumors are malignant and metastasize beyond surgical reach. Radiation therapy may be of some benefit in such instances.

Secondary hyperparathyroidism due to long standing renal insufficiency may be indistinguishable roentgenographically from primary hyperparathyroidism except in children in whom chronic renal disease leads to the additional finding of altered epiphyses and calcium deposits around joints. These epiphyseal changes led to the term "renal rickets." Any condition which leads to glomerular insufficiency including chronic glomerulonephritis, pyelonephritis, polycystic kidneys, and congenital obstructions of the urinary tract may produce renal osteodystrophy. The mechanism of the bone changes is not understood, but Albright[1] has expressed the belief that elevation of serum phosphorus as a result of renal failure leads to a compensatory low serum calcium level and secondary hyperfunction of the parathyroids. The severe acidosis present leads to increased urinary excretion of calcium. Also found is a high nonprotein nitrogen and acidosis with low carbon dioxide level in the serum. Extensive vascular calcifications and calcium deposits around joints may be seen. Albright has claimed excellent improvement of the bone lesions following the administration of large doses of sodium citrate in Shohl's solution (mentioned previously) to conserve bone and administration of vitamin D (50,000 units daily) to increase intestinal absorption of calcium.

Vitamin D intoxication results from prolonged administration of vitamin D for arthritis. Since the advent of cortisone this treatment seems to be used less frequently and its complications are now seldom seen, but it should be mentioned since it may produce a chemical, roentgenologic, and clinical picture identical to hyperparathyroidism, the differentiation depending entirely on the history.

FIBROUS DYSPLASIA OF BONE

Fibrous dysplasia of bone is a localized disturbance of bone development and not a so-called metabolic disease. It produces cystic lesions similar to those of hyperparathyroidism. For years the two conditions were not segregated and the title osteitis fibrosa cystica or von Recklinghausen's disease was applied to both. The lesions usually appear in childhood and progress slowly into adult life.

Calcium and phosphorus metabolism are not disturbed. The alkaline phosphatase remains normal unless there is extensive bone involvement in which case it may be slightly elevated. Large solitary or multiple cystic areas appear in the marrow and the cortex in which bone and marrow are replaced by fibrous tissue. Intervening bone is normal. The overlying or nearby skin may be covered by cafe au lait nonelevated patches of pigmentation. The bone and skin lesions usually show a distribution in keeping with one or more of the nerve root segments. When the bone and skin lesions are accompanied by endocrine changes and precocious puberty in girls, it is called Albright's syndrome.

Roentgenographic changes include large cystlike areas with thinning and sometimes expansion of the overlying cortex. The lesions are usually multiple and unilateral, but when a single lesion is present, it may be confused with a giant-cell tumor or solitary bone cyst. When extensive, the lesions may be bilateral with a preponderance on one side of the body. Sometimes the long bones are shortened and exhibit bowing or pathologic fractures. When involved, the skull has characteristic expanding radiolucent areas resembling cysts. The base of the skull and maxillas may be thick and dense, obliterating the sinuses and deforming the orbits. The remaining bone including the lamina dura is normal.

Treatment is directed toward orthopedic correction of deformities resulting from pathologic fractures and crooking of the long bones. No treatment is yet available to correct the underlying developmental disturbance.

OSTEITIS DEFORMANS

The lesions of osteitis deformans or Paget's disease although usually widespread are well demarcated lesions with normal bone intervening. A vascular disturbance strongly suggestive of an arteriovenous shunt with active bone destruction followed by bone regeneration is thought to be the underlying cause. The skin overlying the active lesions is warmer and may be slightly reddened and swollen. The disease occurs in older patients and involves predominantly points of bone stress and muscle attachments of the pelvis, the femurs, the spine, and the skull. There is a high incidence of osteogenic sarcoma.

The serum calcium and phosphorus are usually normal or slightly increased. The alkaline phosphatase is elevated and may be extremely high. During active stages or following immobilization of pathologic fractures, there is hypercalcemia and hypercalciuria, and renal stones may form.

Roentgenologic findings are characteristic, the lesions exhibiting three zones, one of normal bone, one of bone destruction, and one of overgrowth of bone. Since there is no normal trabecular pattern in the regrown bone, it is weak and tends to develop fractures or bow. Patches of the process are scattered

through the bone in irregular sizes and shapes, producing a coarse moth-eaten appearance.

There is no effective treatment. A high calcium diet and vitamin D administration have not been appreciably beneficial and should be avoided following fracture and immobilization in order to prevent renal calculi. The patient should be kept as active as possible to prevent osteoporosis of remaining normal bone. Estrogen therapy has been suggested for its calcium-retaining property. Widespread pain may require narcotics, and localized painful areas must be observed with suspicion of complicating osteogenic sarcoma. Benefit following therapy with cortisone has been reported recently.[3]

DESTRUCTION BY MALIGNANT DISEASE

Primary and metastatic lesions of bone may produce pictures almost indistinguishable from hyperparathyroidism or other metabolic bone disease. The roentgenologic and chemical findings may be identical. Usually the metastatic lesions are well demarcated from areas of normal bone. Only rarely is diffuse involvement of bone seen, and in such instances bone marrow aspiration biopsy should be diagnostic. The primary malignant lesion also may be obvious. Although the serum calcium level is often high, the serum phosphorus is usually normal or slightly elevated. Hypercalciuria and renal stones may be seen. Carcinoma of the breast, prostate, thyroid, kidneys, or lungs; lymphomas; and many sarcomas are most prone to metastasize to bone. Multiple myeloma may produce a confusing picture, but Bence Jones proteinuria and altered serum proteins, when present, along with the findings in the bone marrow aspiration are diagnostic. Benign cysts and tumors of bone may be multiple and confused with hyperparathyroidism.

DESTRUCTION BY GRANULOMAS

Destruction by granulomas includes several rare diseases which usually are easy to differentiate from metabolic bone disease. The infectious granulomas of bone, such as syphilis and tuberculosis, are usually distinctive. Boeck's sarcoid may present hypercalciuria, renal stones, and high alkaline phosphatase. The high serum globulin level, the pulmonary changes, and the punched-out areas in the phalanges are diagnostic criteria. Xanthomas, hemangiomas, Gaucher's disease, and eosinophilic granulomas may produce widespread cystic changes which require biopsy for diagnosis.

SUMMARY

So-called metabolic bone disease may be the result of inadequate formation of bone matrix in osteoporosis, insufficient availability of calcium for bone formation in osteomalacia, and excessive bone resorption in hyperparathyroidism. Localized bone disease, usually not called metabolic, may be seen in fibrous dysplasia of bone (Albright's disease), osteitis deformans (Paget's disease), destruction by malignant disease, and destruction by granulomatous lesions.

The final diagnosis of metabolic or generalized diseases of bones is proved only by the x-ray and the laboratory. Selected roentgenograms and serum calcium, phosphorus, and alkaline phosphatase studies are required for diagnosis, and occasionally other tests are needed. Clinical management of each of the types of metabolic bone disease is different and dependent on the underlying cause.

BORIC ACID IN BABY POWDER

Boric acid in dusting powders can be used safely for babies, two New York physicians, Dr. Alfred J. Vignec and Dr. Rose Ellis, said in the July *American Journal of Diseases of Children.* The doctors report that infant deaths from boric acid solutions have been caused only by "ignorant" or accidental misuse of strong preparations and that standard baby powders "carefully tested and manufactured by ethical firms" usually contain no more than 5 per cent boric acid and are not harmful.

The doctors consider it unfortunate that it has not been made clear that all deaths have been due to "accidental, ignorant, and at times negligent handling" of solutions, ointments, and powders containing high concentrations of boric acid. They state that the greatest number of fatal cases have been from the accidental swallowing of boric acid by newborn infants.

The Library of the Texas Medical Association began its reference and lending service in 1931. The present expanded service is available to members without charge upon request.

PELLEGRINI-STIEDA'S DISEASE
Report of 6 Cases

A. ROSS DAVIS, M.D.; GEORGE V. MILLER, M.D.; and EDWARD T. SMITH, M.D., Houston, Texas

PELLEGRINI-Stieda's disease in the literature is also known as periarticular ossification of the tibial collateral ligament. This is a relatively rare condition as manifested by the fact that Russell and Smith,[16] in an examination of 9,218 roentgenograms of different knees in an Army general hospital, found only 8 cases of the disease. It is for this reason that we at Hermann Hospital are reporting on our 6 cases.

This disease was first described by Pellegrini[12, 13] in 1905 and by Stieda in 1908. Since that time numerous cases have appeared in the literature. The largest series reported in this country to date is of 42 cases presented by Dr. Jerome G. Finder[5] of the Cook County Hospital in Chicago. In March, 1942, Kulowski[7] found only 60 cases in the English literature, and in April, 1949, there were 8 cases recorded from the Mayo Clinic.[11] A much larger series has been reported in the European literature according to Kulowski[7, 14] and Pellegrini.

PATHOLOGY

The disease is characterized by a deposit of calcium or bone just over the medial femoral condyle. The disease is usually preceded by trauma, either of the repeated chronic type or by a single acute episode. The disease is more common in men, and particularly men in the younger age groups. However, cases of patients as young as 12 years of age and up to 71 years have been described. There appears to be no particular racial distribution.

The trauma that precipitates this calcification is either direct or indirect and occurs in most instances when the leg is flexed and externally rotated. The onset of the disease with calcification is usually less than three weeks following the initial trauma.

Anatomically the tibial collateral ligament, or the internal lateral ligament, is a fibrous or membranous band lying adjacent to the knee joint and extending from the medial condyle of the femur to the medial condyle of the tibia. The ligament bears a relationship to the tendons of the sartorius, gracilis, and semitendinosus muscles and associated bursas.[18] Brantigan and Voshell[1] believed this to be calcification of the bursa beneath the ligament and not actually of the tibial collateral ligament itself. This opinion, however, does not seem to be shared by the majority of writers on this subject. Since there is disagreement among the authors as to the exact location of the calcified or ossified mass, there is also much disagreement as to the possible etiology.

Some think the pathologic process is essentially the same as that seen in myositis ossificans.[6] Pelligrini believed that the calcification was due to subperiosteal hemorrhage and subsequent metaplasia of the medial collateral ligament. Callen[3] related the condition simply to well known factors that concern calcification in the tissues which are dead and in a state of reduced vitality. Since fatty degeneration precedes calcification, this may explain the interval of lag following injury until the shadow becomes manifest. Growth of the process then may be dependent upon the state of vitality of the tissues sensitized or affected. Since bone is a secondary tissue, it must be preceded by cartilage or fibrous tissue.

The etiology also has been variously ascribed to separation of a bone fragment from the femoral condyle, to development of a small hematoma within the connective tissues with subsequent calcification, and to fractureless callus as a result of periosteal tear and proliferation. Nachlas and Olpp[10] stressed the coexistence of chronic arthritis of the knee in their series of cases. In addition, they also thought that there was a membrane present which lay beneath the fascia and enveloped the entire medial femoral condyle. This membrane overlying the adductor tubercle became atretic, and hemorrhage and calcification followed.

We may conclude from this that trauma followed by degeneration and necrosis is certainly the pathogenic process, regardless of its location.[8] Histopathologically there have been three types of bone growth described. Finder[5] listed these three types as predominant primitive infiltrative type on the basis of connective tissue, callus-like bone formation, and enchondral bone formation. Early in its evolution the lesion may contain little calcium and have a poorly defined margin. As calcification progresses, the lesion becomes more mature and may remain in this state permanently. Usually, however, this calcium deposit is invaded by blood vessels, and the lesion becomes ossified. This ossification usually occurs in the center of the lesion and spreads peripherally, gradually enveloping the hyaline cartilage and fibrocartilage which precedes this ossification.

DIAGNOSIS

The diagnosis is established on the basis of roentgen-ray findings. A narrow space usually separates the lesion from the adductor tubercle. Some authors use this as a criterion for diagnosis; however, others feel that large masses may fuse to the medial condyle of the femur. Characteristically, on roentgen-ray examination a crescent shaped area of calcification is directed vertically or obliquely in the soft tissues just medial to the inner condyle of the femur and appearing to cap the epicondyle. Calcification can be distingushed from ossification on roentgen-ray only by the presence of trabeculations.[3] This calcification or ossification may be triangular or fusiform as well as crescentic. Various authors have described two different radiologic types of disease occurring in this region. The first is described as an evolutive type in which there is hazy or fuzzy opacification, which is not clearly demarked from the epicondyle. The second type has been described as the stabilized type with a dense sharply outlined ossified shadow clearly separated from the epicondyle.[9] Only a small number of cases that showed a tendency to deposition of calcium in other parts of the body have been reported.

The symptoms and physical findings include tenderness over the involved area with aching on weather changes, and tension on the ligament accentuates the pain. The patient will likely hold the involved joint in slight flexion, and extremes of flexion and extension will cause discomfort. Prolonged walking also seems to result in vague aching about the knee joint. Palpation over the adductor tubercle area reveals the local sensitiveness, and also the calcified area is sometimes palpable. In addition, some of the cases observed have shown atrophy of the thigh and calf muscles. On the basis of these symptoms and the history of trauma compatible with the establishment of this process, serial roentgen-ray study may be helpful in early recognition of the disease.

The differential diagnosis should include enchondroma, myositis ossificans, and paraosteal arthropathies in paraplegia. Characteristically on the roentgenogram there is a clear radiolucent space of varying degree between the shadow and the femoral condyle.

This is important in ruling out osteoma, periostitis, fracture of the femoral condyle,[15] and to a lesser degree the conditions mentioned previously. Other conditions which should be ruled out include semilunar cartilage tears, rupture of the cruciate ligament, avulsion of the tibial spine, detachment of the tibial tubercle, and joint mouse.

The disease may be prevented in some cases in which the trauma typical of that producing the lesion is suspected and the knee is put at rest. In other cases if pain has developed, roentgen-ray therapy may relieve the pain and prevent the characteristic calcification of Pellegrini-Stieda's disease from occurring.[2] If the disease already has begun, some of the cases will benefit from physical therapy, which should consist of diathermy, and some of these lesions will heal spontaneously.[17] Injection with local anesthetic is often helpful also. Finally, some cases will require surgical excision with plastic repair of the ligament thus releasing the tension.[4]

CASE REPORTS

CASE 1.—M. S., a 21 year old white football player, was injured on October 7, 1953, at which time he received a twisting injury to the knee which was in flexion at the time. This occurred while he was being tackled on the football field. The knee became painful immediately, but he continued to run and noticed that the knee was particularly painful when he attempted to cut to the left. That night swelling became marked in the knee, and he had difficulty bending the knee the next morning. The swelling persisted for about two weeks, during which time he noticed that the knee hurt him on the inner aspect while he was lying in bed, and he was unable to flex the knee past an angle of 30 degrees. Most of the pain was noted to he present following motion, however. Internal and external rotation were particularly painful. He ran for about two weeks working out on the track, and then he noticed that the knee got stiffer after running a play and became worse.

The first roentgenogram was made about three weeks after the initial injury and revealed beginning calcification. There was a sensitive area on the medial aspect of the knee for about six weeks. He was treated at Hermann Hospital with about twelve hours of ice packs, elevation, and pressure to the knee followed by whirlpool, diathermy, and seven courses of roentgen-ray therapy, which were completed about November 6. The symptoms gradually subsided, and the patient was able to return to football and entered the Cotton Bowl game on January 1, 1954. However, the knee was still sore and painful, particularly on flexion, at that time. At present he lacks about a 5 degree angle of having complete extension and has a palpable mass 1.50 cm. in diameter over the medial aspect of the knee. However, he is able to continue all of his normal activities and feels that he is able to go at full speed in football.

CASE 2.—R. E., a 24 year old white baseball player, received his injury the second week of March, 1952, at which time his left leg was externally rotated and flexed. This man, a left-handed pitcher, caught his heel as he was winding up to pitch. At that time he was aware of crepitation in his knee and had immediate pain in it, followed by swelling shortly thereafter. For six to seven weeks he had a sensitive area on the medial aspect of the knee and had pain at the extremes of motion. Flexion and extension were both limited. His treatment included ice packs, diathermy, whirlpool, and exercise, which consisted of running up and down the stands and around the track. Now he has some crepitus present in his knee. He has a full range of motion, and his only symptom is that the injury sometimes causes an ache in the knee.

CASE 3.—E. D., a 22 year old white man, was injured in the second week of July, 1953, when he was playing softball and slid into second base. At that time he had pain which eased up some, and later that night swelling developed. This was a flexion and external rotation type of injury which caused in addition to the pain and swelling some limitation

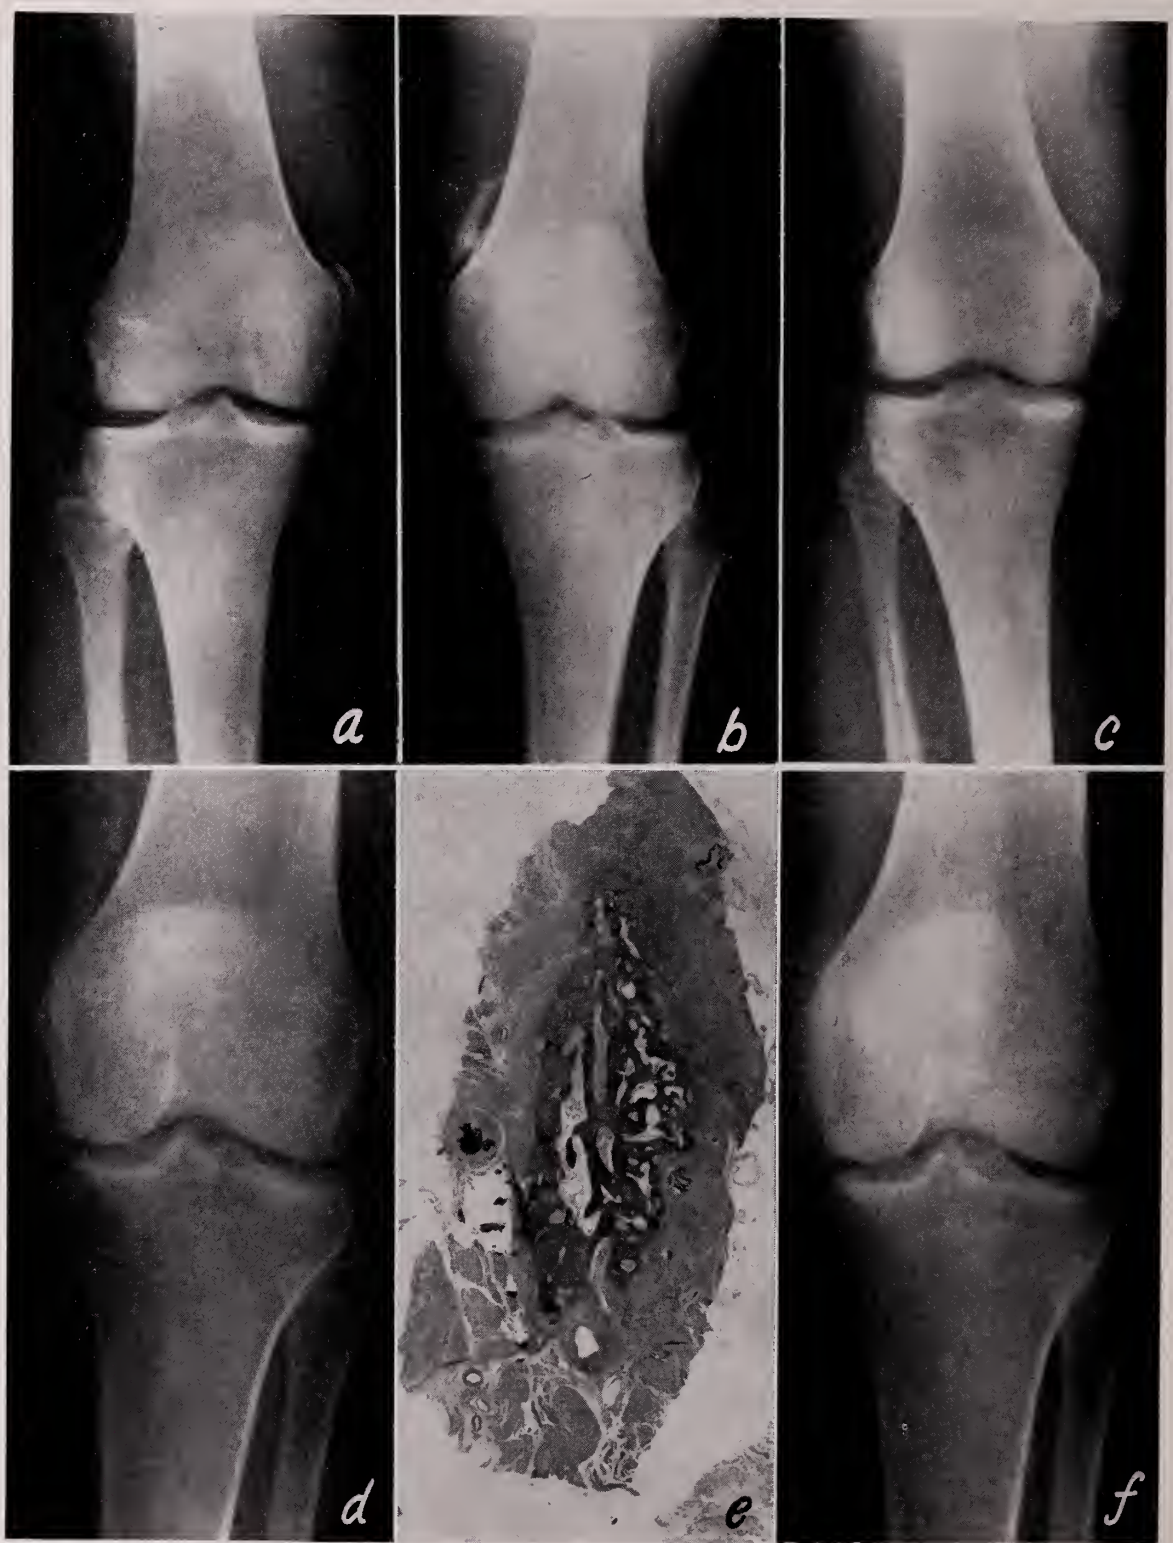

FIG. 1a. Case 1. Roentgenogram showing crescent shaped calcification capping the epicondyle.

b. Case 2. Extensive calcification of the tibial collateral ligament is revealed in the roentgenogram.

c. Case 3. Roentgenogram of compact, circumscribed area of calcification.

d. Case 4. An area of calcification closely adjacent to the condyle is seen in the roentgenogram.

e. Case 4. Photomicrograph of pathologic specimen reveals actual ossification in the center of the tibial collateral ligament. x 54.

f. Case 6. Faint, indistinct area of calcification adjacent to the medial condyle is shown in the roentgenogram.

of flexion. He was on crutches for two days at that time, and then he started motion. Swelling persisted for one week, and the pain persisted for two months. There was no special area of increased sensitivity, and he was unable to palpate a mass. He noticed that the knee loosened up some after walking but was stiff after periods of immobility. His first roentgenogram was made two weeks after the initial injury and showed calcification. Another roentgen ray film made about six weeks after the initial injury showed approximately the same amount of calcification. He was treated with a hot pad early, and two weeks after the initial injury when the first roentgenograms were made diathermy was instituted and continued for three to four weeks after the injury. At present the patient has a full range of motion and notices only that the knee is somewhat sore and stiff after playing ball and when he is walking upstairs.

CASE 4.—J. C. W., a 45 year old white man from Brenham, who was unemployed at the time he was seen, gave a history of having injured his right knee in approximately April, 1951, at which time he slipped in a hole and twisted his leg. Since that time he had gradually increasing severe pain in the knee and a feeling of tightness of the skin over the knee. The knee had never locked, but there was limitation of motion which was recorded as slight, and the knee gradually loosened up with rest and again became stiff with immobility. He had slight limitation of motion at the extremes of flexion and extension at the time he was seen and no other positive findings according to the examiner. Roentgen ray revealed calcification over the medial tibial collateral ligament, and the patient was taken to surgery on February 27, 1952, at which time a plaque of bone over the medial femoral condyle of the right knee was excised by sharp dissection. And, after this plaque was removed, it was necessary to remove the base of the ossified lesion with an osteotome. The patient had an uneventful postoperative course; he was up on the first postoperative day and discharged from the hospital on the fifth day with no complaints at that time.

The pathologic specimen revealed actual ossification of the ligament with cancellous bone present in the center of the ligament (fig 1e).

CASE 5:—G. B., a 46 year old Negro longshoreman, was injured February 15, 1946, by a 140 pound sack of flour which was thrown and hit the patient on the lateral side of his left knee. At that time he was seen by a physician and a roentgenogram was made, but he was not admitted to the hospital. Heat treatments were applied to his knee every day or so until May 17, when he was dismissed and told he could return to work. However, he continued to have pain in his knee, and although he walked on the leg, he did not return to work because of the pain. There was no history of other injury to the knee. At the time he was seen, he had pain in the knee and stiffness in it after walking. He was unable to flex the knee, and the knee was painful. He stated that a knot which appeared after the sack hit him gradually decreased in size, but it was still noticeable at the time he was seen. He had a full range of extension, but flexion was limited. He was brought into the hospital and operated on June 25, at which time an incision was made over the medial collateral ligament, and a small disklike mass was removed by sharp dissection. On August 28, he had a complete range of motion of the knee although there was still some tenderness in the skin. We believed that he had reached his maximum recovery, and he was considered as having a 5 per cent permanent disability as applied to the knee.

CASE 6.—B. L., a 37 year old Negro laborer, was injured about June 1, 1951, at which time the man struck the inner aspect of his left knee on a four wheel truck. This area became painful, but he was able to continue his work. He was seen by a physician on June 22, at which time examination revealed enlargement of the left medial femoral condyle. There was a complete range of motion, but tenderness was present over the condyle. No swelling was present. He continued his normal activities and was seen again on August 31, still complaining of some discomfort on the medial side of the left knee. No specific treatment was recommended. He was estimated to have 10 per cent permanent disability as applied to his left knee.

SUMMARY

Pellegrini-Stieda's disease is rarely reported but apparently occurs more frequently than the literature indicates. In these 6 cases trauma preceded the onset of the disease and is considered to be the cause. All 6 cases occurred in males, which would emphasize trauma as a precipitating factor. The treatment of these cases varied from no treatment to surgical excision. We believe that all patients should receive physical therapy, particularly diathermy. The residual disability of all cases was minimal.

We would like to acknowledge the assistance of Mr. Eddie Wojecki, athletic trainer of Rice Institute, Houston, in securing some of the clinical material for this article.

Some of the roentgenograms were taken through the courtesy of Dr. Luther M. Vaughn of Hermann Hospital, Houston.

The photography was supported by the Norsworthy Fund for Research in Pathology.

Hermann Hospital.

Clinical Evaluation and Management of the Painful Joint

HOWARD C. COGGESHALL, M. D., Dallas, Texas

THE general practitioner of medicine is frequently confronted by patients whose chief complaint is joint pain. This may be a manifestation of arthritis, trauma, systemic disease, or neoplasm. In many instances, there may be symptoms arising from the nonarticular structures, namely, the muscles, ligaments, tendons, fascia, and periosteum. The evaluation and significance of joint pain can be understood better if attention is given to the anatomic and physiologic factors involved.

The joint is composed of articular cartilage, a synovial cavity, a synovial membrane, and a surrounding fibrous capsule. The synovium is a specialized connective tissue membrane lining the joint cavity. A similar structure lines the tendon sheaths and bursae. In that articular cartilage and bone are devoid of nerve tissue, all pain must arise from the synovial membrane, periosteum, or fibrous capsule. The nerve fibers reach their end-organs by following along the course of the vascular system. These nerves may end as free nerve-endings or with special end-organs called the pacinian corpuscles. These bodies can be found in synovial tissue removed from the joints of patients suffering from rheumatoid arthritis. The most sensitive portion of a joint is along the junction of the periosteum with the articular cartilage, fibrous capsule, and synovial membrane.

Joint pain is poorly localized, and frequently is referred to areas away from the joint. Many times pain from the knee is referred to the medial upper third of the tibia. Patients with painful shoulders frequently complain of discomfort in the midbiceps area. Hip conditions are associated with pain above the knee. Trauma and inflammation may cause tenderness and spasm of the adjacent muscles. Joint pain may be induced by stretching, pinching, or tearing of the supportive articular tissues or by the development of abnormal conditions, such as neoplastic or inflammatory disease. A diagnosis may be suggested by giving special attention to the character of the joint pain.

The following discussion will be devoted to a few types of joint disease most commonly seen in a physician's office.

From the Department of Medicine, Southwestern Medical School of the University of Texas.

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

FREQUENCY OF TYPES OF ARTHRITIS

The relative frequency of various types of arthritis and rheumatic disease can be seen in table 1. It is evident that the frequency of arthritis is essentially the same, regardless of whether the patients are seen as consecutive admissions to special hospitals, at clinics, or in an office practice. A further examination of this table reveals that osteoarthritis, rheumatoid arthritis, fibrositis, and gouty arthritis make up from 61 to 68 per cent of the patients admitted to special rheumatic disease hospitals. This group constitutes approximately 75 per cent of those seen in private practice. This difference is due to the large number of soldiers under treatment for psychiatric disturbances labeled "psychogenic rheumatism." The group made up from 16 to 20 per cent of the total admissions in Army rheumatism centers. In private practice one rarely sees this group of patients, with the exception of the compensation cases.

Specific infectious arthritis, "septic," is rare. This difficult problem has been solved by the introduction of antibiotics. For the same reason, gonorrheal arthritis, formerly responsible for 2 to 3 per cent of this group, is almost nonexistent.

It is apparent from table 1 that the majority of patients complaining of joint symptoms will suffer from one of four conditions: osteoarthritis, rheumatoid arthritis, fibrositis, or gouty arthritis.

OSTEOARTHRITIS

Osteoarthritis, a degenerative process, results from the gradual "wearing out" of the articular cartilage during a lifetime. Articular cartilage has a limited ability to regenerate or repair; thus defects caused by trauma remain a lifetime. Examination of the articular cartilage of persons 40 years of age and above will

show roughened and fissured areas. This loss of articular cartilage continues until large areas of the joint surface become denuded. This process may be entirely painless until the poor alignment of the joint bearing surfaces causes additional stress upon the ligamentous marginal structures. This unaccustomed strain is responsible for pain and tenderness. Eventually, there is bone proliferation along the junction of the fibrous capsule and the articular cartilage. These structures are frequently called osteophytes or spurs because of their roentgenologic appearance. Many times this new bone forms a ridge along the joint margin. Histologic examination of the synovial membrane and synovial fluid shows little evidence of inflammation. There is no evidence that infection plays any role in the etiology of degenerative joint disease (osteoarthritis).

The disease is most frequently seen in middle-aged obese women. It occurs in the large weight-bearing joints, especially the knees, hips, lumbar spine, and terminal phalangeal joints of the hands. Laboratory examinations are normal. Roentgenologic examination may show narrowing of the joint space indicating a thinning or loss of cartilage, proliferation of the bone along the joint margins, and an increased density of the bone in the subchondral area.

A word should be said about the occurrence of Heberden's nodes on the terminal phalangeal joints of the fingers. In many instances, patients fear that this is the first manifestation of a generalized crippling arthritis. At first, these small nodules may be acute and painful. Later, the pain subsides, leaving a firm hard nodule or ridge. The joints become asymptomatic, except for varying degrees of deformity of the terminal phalangeal joints. Stecher has found a definite increase in the familial incidence in a study of 7,000 persons.[9] He did not find a greater incidence of arthritis in the other joints of these people.

Treatment of osteoarthritis is directed towards the correction of mechanical factors to prevent further joint trauma.[1] Obese patients should be put on reducing diets with a limitation of weight-bearing activities. Frequently, patients may remain asymptomatic if they are not permitted to climb stairs. Many other measures are helpful, especially physiotherapy with the applications of heat twice a day at home using simple methods of heat application. The regular use of salicylates, in daily doses of 3 to 4 Gm., is recommended. Phenylbutazone may be used for short periods of time. This drug has definite limitations because of its toxicity. Skin rash, hematemesis, purpura, hematuria, agranulocytosis, and anemia are the most significant complications. These hazards may be minimized by keeping the daily dosage at 400 mg.

The articular injection of 30 to 50 mg. of hydrocortisone gives prompt and lasting benefit. The usual period of benefit is from ten days to two weeks. A few patients may be relieved for several months.

Reconstructive surgery of the hip is helpful unless contraindicated by a poor physical condition. This may be accomplished by inserting a Vitallium cup or by a replacement prosthesis of the femoral head and neck.

TABLE 1.—*Relative Frequency of Various Rheumatic Diseases in Consecutive Admissions.*

Diagnosis	Hospital			Clinic		Office
	A 1,000 Patients %	B 800 Patients %	C 200 Patients %	D %	E %	F 200 Patients %

RHEUMATOID ARTHRITIS

Rheumatoid arthritis presents the most difficult problems in diagnosis and treatment. In many instances, the disease has an atypical onset which delays the making of a definite diagnosis. A careful history is important to bring out the constitutional symptoms that precede the arthritic involvement. The usual complaints are fatigue, loss of weight, anorexia, insomnia, depression, and irritability. Joint pain is worse in the morning, after periods of rest, and with weather change. Relief is obtained by exercise, heat application, and salicylates. The joint involvement is symmetrical with a predilection to the interphalangeal joints. This tendency for the interphalangeal involvement gives the fingers a spindle-shaped appearance. The swelling results from the inflammation in the synovium and joint effusion.

In addition to the joint deformities, there may be generalized lymphadenopathy, enlarged spleen, cold clammy hands and feet, pigmentation of the skin, hyperkeratosis of the skin and nails, and atrophy of the skin and muscles. Psoriasis and subcutaneous nodules are seen in about 5 per cent of this group. Pericarditis is rare; I have seen 3 cases.

The success of treatment depends upon a satisfactory physician-patient relationship. It is important for the physician to assume an optimistic attitude concerning the prognosis. Such an opinion is justified by the reports of results of untreated patients followed for a five-year period: approximately 25 per cent became asymptomatic, 50 per cent had good functional joints, and only 25 per cent showed progressive crippling. Every attempt should be made to get the patient's attention away from the day-to-day progress to the months ahead. Treatment of arthritis should be directed to obtain an active participation by the patient. It is important to explain the nature of the disease and instruct him in the use of simple physiotherapy procedures and analgesics.

Rest is important, but complete bed rest is to be avoided. This, of course, does not apply for short periods of time under hospital supervision. All bed patients should be taught a routine of nonweight-bearing exercises. Bed rest may encourage invalidism and promote loss of joint motion. Improper attitudes with pillows cause permanent flexion contractures. Bed splints are helpful in correcting and maintaining the arms and legs in good position.

A definite program of graduated nonweight-bearing exercises should be carried out for the affected joints. Excessive exercises causing an increase of the joint pain on the following day should be avoided.

There is no evidence that diet has any etiologic significance in arthritis. In general, the diet should include the daily vitamins, calcium, iron, and caloric requirements. Special high caloric diets should be given to combat anorexia, weight loss, and anemia. Vitamins should include the daily requirements only.

Salicylates, acetysalicylic acid, or sodium salicylate in doses of 3 to 5 Gm. daily are the analgesic drugs of choice. Other drugs less desirable because of toxicity, together with the conditions they may aggravate, are (1) phenylbutazone (Butazolidin), which in doses of 400 to 600 mg. daily gives marked analgesia but is of limited use because of its toxic qualities (agranulocytosis, hematemesis, anemia, salt retention); (2) aminopyrine (agranulocytosis); and (3) cinchophen (acute hepatitis).

The use of gold salts (sodium thiosulfate, sodium thiomalate, or thioglucose) is advisable in a limited number of patients with progressive resistant arthritis. The chief objection to its use is the toxic reactions. These reactions are of two types: (1) the acute allergic reaction to the initial small doses of 5 to 10 mg., including fever, rash, leukopenia, enteritis, and nephritis, and (2) the late reactions including usually a skin rash, leukopenia, or purpura. The acute reactions can be minimized by giving doses of 5 to 10 mg. weekly for a month and then gradually increasing the dose to not more than 25 mg. per week. The intervals of administration should be lengthened to three or four weeks as soon as there is improvement in the arthritis or a decrease in the sedimentation rate. Toxic reactions can be controlled by giving BAL (British anti-Lewisite), ACTH, or cortisone.

Roentgen therapy is recommended for rheumatoid spondylitis, but not for peripheral joints.

Cortisone should not be used routinely. It should be limited to those patients who get satisfactory relief from taking 75 mg. or less per day. This small dose rarely causes hypercortisonism. If ACTH is used for long periods, the dose should not exceed 20 mg. daily. In some instances patients may respond to 5 mg. per day. The continued use of ACTH over a long period, twelve months or more, may be accompanied by an increase in drug tolerance. In one instance, this tolerance was seen to develop over a period of twelve months to the point that as much as 180 units daily offered no relief of symptoms or joint swelling. Many patients with mild or moderate joint symptoms will receive marked benefit from 20 mg. of ACTH once weekly. This weekly schedule of treatment is helpful in combating fatigue and depression.

The results of treatment of rheumatoid arthritis with hydrocortisone duplicate those obtained by the use of cortisone and ACTH. When administered by mouth, the daily dose required is slightly less, 40 to 60 mg., and it is beneficial when injected into the joints, tendon sheaths, or bursae. The usual dose required is from 25 to 50 mg.

Testosterone, 25 to 50 mg. per week, improves nutrition and combats fatigability. The antirheumatic effect does not result if methyl testosterone is used. The reason for this difference may be due to the failure of the body to metabolize methyl testosterone as evidenced by its excretion unaltered in the urine. Testosterone is metabolized, which may account for its effectiveness.

The use of large doses of pregnenolone fails to give any benefit in the treatment of rheumatoid arthritis, except for occasional improvement in the sense of well-being.

Pregnenolone methyl ether, made by Max Huffman in 1949, differs from pregnenolone because of its marked sedative-like action. Three of my patients having rheumatoid arthritis in 1949 received pregnenolone methyl ether. There was no objective change

in the degree of joint involvement or the sedimentation rate, but there was a marked subjective improvement in their well-being, ability to relax, and ability to sleep without sedation. Since that time, 12 patients have been given pregnenolone methyl ether with the same results. There is no evidence of any abnormality in the salt, water, or carbohydrate metabolism. One patient took 300 mg. daily for two years without disturbance of the menstrual cycle. The use of pregnenolone methyl ether is useful in combating the tension and depression associated with rheumatoid arthritis and frequently acts as a mild sedative. Patients with fibrositis and premenstrual tension benefit from its use.

FIBROSITIS SYNDROME

There are a large number of patients who complain of generalized skeletal "aches and pains" of the muscles and joints. The lack of objective signs of arthritis in the physical and laboratory examinations has necessitated a separate classification of this group. The term fibrositis has been used for many years as a diagnosis of convenience and permits the physician to tell his patients, "You don't have arthritis." There is considerable controversy concerning the justification of this diagnosis, because it suggests an inflammatory process as yet unproved. Fibrositis may be either primary, without any apparent cause or signs of systemic disease, or secondary, a manifestation of another disease such as unrecognized rheumatoid arthritis, rheumatic fever, trauma, or infections.

Primary fibrositis is almost always associated with nervous tension and fatigue. The victim is not considered "nervous," but "high strung" and unable to relax. The person might be described as being "a perfectionist," "a finicky housekeeper," or an "emotional" misfit in office or home. Women with fibrositis give histories of prolonged periods of tension resulting from problems at home—difficult children or husbands, nursing care of an elderly parent. Except for fatigue, there may be no complaints. The lack of multiple complaints of other systems sets fibrositis apart from psychoneurosis.

The treatment of fibrositis is directed toward correcting the causes of the tension state. The symptoms can be relieved by salicylates, sedatives, rest, and psychiatric advice. It should be emphasized to the patient that the symptoms are "not imagined." The physiologic muscular stiffness that follows unaccustomed exercise may be used as an example in the explanation of what happens following the constant fatigue of emotional tension. The increased muscular tension causes chronic fatigue, constant pain, and stiffness. The patient should be told that the treatment is symptomatic until the tension state can be corrected.

GOUTY ARTHRITIS

During the past few years considerable progress has been made in the treatment and understanding of gouty arthritis.[2, 3, 5, 6, 8, 10] There are two types, primary gout, an inherited metabolic defect, and secondary gout, associated with other diseases such as polycythemia, myeloid metaplasia, chronic leukemia, Cooley's anemia, and lymphoma. Measurements of the miscible uric acid pool of the body have been estimated by using isotropes. It is possible to determine the uric acid content of the body by measuring the percentage of isotropic uric acid in the urine following the injection of N^{15} uric acid. A normal subject will have a total body uric acid content of approximately 1.2 Gm. while a gouty subject may have 3 to 30 Gm.

The important feature of gout is the hyperuricemia with a blood serum level of uric acid in excess of 6.0 Gm. per 100 cc. The stable solubility of uric acid in serum is about 6.5 mg. per 100 cc. A concentration above this level is supersaturated and subject to sudden precipitation. For this reason large amounts of sodium urate accumulate in tophi. The problem in gout is (1) an overproduction of uric acid and (2) an inefficient renal mechanism for uric acid disposal. In man, the collecting tubules of the kidney reabsorb about 90 per cent of the uric acid from the glomerular filtrate.

Treatment should be directed toward restriction of food rich in purines, the alleviation of the acute attack, and the use of uricosuric agents between episodes of joint pain. The acute attack can be brought under control by giving colchicine 1/100 grain (0.6 mg.) every hour until diarrhea or remission of joint pain. The response to colchicine therapy requires about twenty-four to forty-eight hours. When the attack is severe, 20 units of ACTH gel may be given once daily for three successive days. Colchicine should be used in conjunction with the ACTH to prevent a rebound attack. Phenylbutazone alone or in combination with colchicine and ACTH is effective in arresting the attack.

After the acute attack subsides, the patient should be started on probenecid (p-[dinpropylsulfamyl]-benzoic acid) in doses of 1 to 2 Gm. daily. This acts as a uricosuric agent by blocking tubular resorption of uric acid. When probenecid (Benemid) is first administered, it may induce an acute attack. For this reason, small doses, 0.5 Gm. daily, are recommended for several weeks. Colchicine given three or four times daily is also recommended during the initial probenecid therapy. The long time use of probenecid is not toxic and will reduce the frequency of attacks and the size of sodium urate tophi. The uricosuric action of probenecid is completely blocked by salicylates. Patients receiving probenecid should not be

given aspirin or other forms of salicylates. The maintenance dose of probenecid is from 0.5 to 2.0 Gm. daily and may be established by following the blood serum uric acid levels.

SUMMARY

A diagnosis of osteoarthritis, rheumatoid arthritis, fibrositis, or gouty arthritis can be made in at least 75 per cent of the patients suffering from joint pain seeking medical care. In the light of recent advances, the majority of these patients should expect to have a proper diagnosis and a satisfactory regimen of therapy.

Basic Orthopedic Principles in Rheumatoid Arthritis

BEDFORD F. BOYLSTON,* M. D., Houston, Texas

RHEUMATOID arthritis is a systemic disease that belongs in the realm of internal medicine or rheumatology. The orthopedic surgeon is strictly a consultant. He would indeed be an unusual surgeon who by training or temperament could take on the total care of one of these patients, either early or late. In order that the patient may receive the best medical care possible, more teamwork is required in this disease than in any other.

BIOPSY

The orthopedic surgeon can be helpful in establishing an early diagnosis in rheumatoid arthritis. It has been my observation that patients who have had a considerable delay in diagnosis have been critical of their medical treatment. They often go from doctor to doctor, and it is often difficult to establish confidence in these patients. On the other hand, of course, it is a serious mistake to brand a person a rheumatoid arthritic if he is not one.

The classical joint for biopsy is the knee. Biopsy is a benign procedure, and having done many biopsies, I can truthfully say that I have seen no untoward results. To help the pathologist most in the interpretation of the synovial tissue, the synovial membrane must be obtained consistently at the same site, preferably just medial to the midthird of the patella. The synovial membrane and subsynovial tissue will differ in thickness about the knee. A generous section of synovial membrane should be taken in such a way that the synovial membrane can be closed but at the same time in such a way that the forceps will not crush the biopsy substance. The synovial membrane is then placed on a piece of filter paper which is moistened with saline solution and immediately placed in the fixative. Wide exploration of the joint and extensive trauma to the joint are unnecessary and add little to the final diagnosis.

NONSURGICAL TREATMENT

I shall not enter into a dissertation as to whether it is necessary for an individual patient to have a psychiatrist and a social worker to help the rheumatologist. It is well known, however, that these patients universally have psychiatric difficulty. It has been my observation that most rheumatologists are also excellent psychiatrists.

The role played by social service is important, whether the part is taken by a physician or by a trained lay-worker. One person must help these patients plan their home life, their financial obligations, and their subsequent rehabilitation.

Physical medicine is an ancillary service in the treatment of rheumatoid arthritis. There is nothing more annoying than to have a patient tell me in the hospital that he has been down to "Physio" or "PT" for thirty minutes today. The remaining twenty-three

Presented at the annual meeting of the Texas Rheumatism Association, Houston, December 4, 1953.

**Assistant Professor of Orthopedics, Baylor University College of Medicine.*

and one-half hours he remained in bed idle. Where a patient gets the idea that he can spend a half hour doing some particular exercises and do nothing for the rest of the day, with great benefit, is beyond me. Exercise and stretching should be carried out frequently by the patient himself. It should be started early in the disease. The persons who outline this program must have a basic understanding of the disease and the types of deformities most likely to develop. Early, it should be a program of preventing deformity. The rheumatologist is most likely in the acute stage to insist on the patient's going slowly while the orthopedist is more likely to deviate too far toward the other extreme of too rapid activity. There is certainly a middle ground here, and this should be reached early in the disease and in the outline of the treatment.

Pain and Muscle Spasm

The etiology of muscle spasm is of course unknown as is the specific treatment of muscle spasm. It is assumed, however, that muscle spasm is on a basis of inflammatory reaction in the subsynovial tissue, in the muscle septums, and muscle bundles themselves. Muscle spasm is usually thought of in medicine as a protective mechanism. It has been interesting to me to see that under general anesthesia in a patient with acute rheumatoid arthritis, with particular reference to the hip, it is necessary to anesthetize the patient very deeply with ether, even past the plane of surgical anesthesia, before the muscle spasm will relax. As soon as the patient awakens from the general anesthetic, even before he is completely awake, this muscle spasm will recur and be just as severe as it was prior to anesthesia. So there is little wonder that we have no specific drug for severe muscle spasm. Early treatment or treatment during an exacerbation is directed primarily to the relief of pain and indirectly to the treatment of muscle spasm.

It goes without saying that during the acute phase of an exacerbation, when the sedimentation rate is high and the joints are hot and swollen, the patient should be in bed at complete rest as in any other acute systemic disease. It is important, however, that the positioning of the extremities in bed be watched carefully. For instance, it is desirable not to have the knees brought up to 90 degrees all the time. A program could be scheduled in such a way that the knees could be flexed up for comfort for a definite period and then extended as far as possible for a definite period. Moist heat is by far the most relaxing type of local application still in use; it is used by orthopedists in all types of muscle spasm whether it be traumatic in origin, as following a back injury, or following acute poliomyelitis. Traction is particularly applicable to the lower extremities where it is used intermittently in the form of Russell traction; it is the same form of preliminary traction used for broken hips and fractured femoral shafts. Traction apparatus does not work as well in the upper extremities.

I believe it is safe to say that circular plaster or a solid cast has little place in the treatment of rheumatoid arthritis. Circular plasters are placed on the upper or lower extremities and then bivalved into the two halves. These plasters are then relined with sheet wadding and stockinet and are then put together with webbing strap and buckles. If made right, they are comfortable and are best used at night. The orthopedist tends to take as much correction as he can obtain and remake the cast in three to six weeks. As a gain is made from the standpoint of a contracture or as muscle spasm tends to subside, one must try not to lose correction while the patient is asleep. Splints and braces are much more expensive and are not nearly so effective as a well molded plaster cast that has been bivalved. These bivalved casts can also be hinged to give a wedging effect.

Drugs certainly have a part to play in pain and muscle spasm. I shall not go into a discussion of the value of cortisone. It may be well to mention hydrocortisone, which I had an opportunity to use through the courtesy of Merck and Company. This drug was used intra-articularly under my direction for a variety of joint disabilities, one of which was rheumatoid arthritis. In the small series in which I used it, the results were inconsistent and unpredictable. It has a place in treatment and may be useful in the early mono-articular arthritic. The long-acting curare drugs have been of no help in muscle spasm generally in orthopedics and have had no effect on muscle spasm once the effect has worn off. Tolserol has been disappointing as a muscle relaxing agent; it has been of no help to me either orally or intravenously. Intravenous procaine has had its advocates and may be worth while in an occasional case. Aspirin is still an excellent drug.

When the patient first becomes ambulatory, it is often wise to begin using a walker. Crutches are used from an orthopedic standpoint primarily to protect the joints of the lower extremities. Patients allowed to bear unsupported weight on flexed joints distended with fluid will have rapid deterioration of the joints whether the underlying cause is rheumatoid arthritis or some other condition. A wheel chair is a dangerous instrument in a rheumatoid arthritic, particularly a young person, as these patients for some reason become very attached to wheel chairs. If possible, I should avoid the use of wheel chairs entirely

in rheumatoid arthritis. Either the patient should be in bed or on crutches.

The use of braces in rheumatoid arthritis is limited almost entirely to the hands and to the back. Functional hand splints are helpful in maintaining position, particularly at night, and for exercising the small joints of the fingers, which tend to subluxate. Back braces are used primarily for comfort and should be light. They play little part in the prevention of the kyphous deformity in rheumatoid spondylitis. There is no mechanical arrangement that will prevent the forward flexing of the spine in rheumatoid spondylitis. Braces for the lower extremities made out of the new lighter metals are still heavy and have little corrective influence. They are rarely used in rheumatoid arthritis. Good orthopedic oxfords with anterior metatarsal bar or longitudinal arch supports will make the patient much more comfortable when he is on his feet. Ace bandages for the knees are helpful and should be used when the patient is ambulatory if he has a hydroarthrosis of the knees.

Contractures

With long continued muscle spasm and because of the inherent strength of the flexor muscle groups, which is much greater than that of the extensor muscle groups, the patient tends to develop flexion contractures at the major joints. The attitude of flexion at the major joints is more comfortable for the patient because most joints tend to hold more fluid in a flexed position than in a completely extended position. Other contributing factors to fixed joints in flexion are muscle atrophy and fibrosis of the muscles themselves and of the capsule about the joint. Position is an extremely important factor in the development of flexion contractures. For instance, a patient lies recumbent in bed with about two pillows beneath his head, the Gatch bed in flexion, hips and knees both flexed. If he is allowed in a wheel chair again, he assumes the position of flexion throughout.

Methods of treatment in soft tissue contracture include (1) positioning to get help from gravity; (2) specific muscle exercise of extensor groups; (3) more vigorous stretching; (4) traction, intermittent and continued; (5) wedging of bivalved casts; (6) functional elastic hand splints; and (7) surgery.

Bony Deformity

Bony deformities which may develop include subluxation or dislocation, fibrous ankylosis, and bony ankylosis.

Destruction of cartilage by pannous formation, fixed soft tissue contracture, unsupported weight bearing on joints with fixed contracture, lack of muscle power, and prolonged hydro-arthrosis are factors which may produce bony deformity.

As we see, the early findings in a rheumatoid joint are acute inflammation, fluid, and pannous formation. The clinical signs are muscle spasm, soft tissue contracture, and finally bony deformity. This chain of events may be rapidly progressive or may be characterized by remissions and exacerbations over a period of many years.

SURGERY

Indications for surgery may include pain, ankylosis in nonfunctioning positions, a need to make or keep the patient ambulatory, or an effort to enable the patient to take care of personal needs.

By pain is meant the pain that usually occurs with fibrous ankylosis. Ankylosis in the nonfunctioning position, such as the elbow, interferes with the use of crutches; ankylosis of the spine in acute flexion makes it impossible to see straight ahead; and ankylosis of the knees and the hips in flexion prevents assumption of the upright position. Soft tissue surgery in the early rheumatoid arthritic may be useful where the knees are acutely flexed. This type of surgery is a capsulotomy performed before there is any bony deformity. It may be necessary to make the patient ambulatory. Every effort should be made to try to keep the patient as independent as possible. For instance, it is essential in taking care of patients with rheumatoid arthritis that they be able to take care of their own toilet, brush their teeth, comb their hair, and feed themselves. Surgery is often the only way to maintain these basic requirements.

The best surgical result will be obtained in patients with so-called "burned out" rheumatoid arthritis, if there is such a thing. Certainly an active rheumatoid arthritic is not a good candidate for best surgical results. On the other hand, why wait until the patient has been a chronic invalid for years in a wheel chair with marked muscle atrophy, bone atrophy, and complete lack of interest in rehabilitation? With active rheumatoid arthritis there is, of course, the inflammatory reaction of the fibrous tissue with gluing down of the muscle bundles themselves and subsequent atrophy. Timing in rheumatoid surgery is extremely important, but I do not believe that it is desirable to wait until the sedimentation rate is normal before undertaking a reconstructive surgical procedure.

In any type of reconstructive surgery the mental attitude of the patient is so important that a physician may do equally as good technical surgery on 2 patients and get opposite results. This is particularly true in arthroplasty type of surgery. A surgeon can make the joint movable, but the patient must have the will, endurance, and fortitude to keep it moving.

Again, the rheumatologist is the most important factor in this mental attitude. If the rheumatologist is convinced in his own mind that a surgical procedure is indicated, he immediately lays the groundwork for a successful operative procedure. Evaluating the end results of rheumatoid surgery is extremely difficult. For instance, the surgeon may do an arthroplasty of the hip on a patient enabling him to continue at his job, or a housewife to resume doing her work, but in the analysis of the range of hip motion, it has improved little. Here the simple factor of relief of pain may outweigh an increase in range of motion.

Cortisone should be continued right through the preoperative and postoperative phase. It has not been my experience that cortisone has anything to do with the blood clotting mechanism, and I have noted no difference in the amount of bleeding either operatively or postoperatively. The difficulty that I have encountered with cortisone is that there is considerable delay in discovering wound infections because of lack of pain and of systemic reaction.

A variety of surgical procedures have proved their value in arthritis.

A painful subluxed wrist will interfere with the entire use of the hand. There will be a tendency to exaggerate the deformities of the small joints of the fingers. By fusing the wrist in a functional position, the patient will be enabled to use his hand.

Arthroplasty of the elbow is necessary often to enable the patient to use crutches and, most important, to allow the patient to comb his hair, feed himself, and so forth. Acromioplasty is simple excision of the outer end of the acromium to allow more abduction at the shoulder.

The excision of painful rheumatoid nodules from the dorsal aspect of the elbow and upper forearm is a beneficial and simple procedure. It can be performed under local anesthesia. The patients are greatly relieved as this area is so repeatedly touched during a normal day's activity. Occasional excision of a single nodule from a finger is helpful.

Arthroplasty of the temperomandibular joint is often a necessary procedure to maintain bodily nutrition and to maintain normal oral hygiene. It is an effective procedure.

There are cases of rheumatoid involvement of the spine in which it would seem impossible to prevent the severe flexion of the spine. The result is a pitiful person who can neither sit, lie, nor stand with any semblance of normality. It is possible by osteotomy in the lower lumbar area to gain sufficient correction to enable the patient to lie comfortably and to look straight ahead when either sitting or standing. Postoperatively, these patients are perhaps the most grateful that one encounters.

Reconstructive surgery of the hip is a procedure that one undertakes for intractable pain or bilateral involvement with severe deformity. Many procedures have been attempted. At the present time both mold arthroplasty and femoral head replacements are in common use. The basis for this type of surgery is elimination of pain, a stable hip, and motion, as many cases are bilateral. Surgery of the hips is often the only way possible to keep the patient ambulatory.

Arthroplasty of the knee is seldom necessary in unilateral involvement. It has not generally gained favor as the results have not proved eminently satisfactory. In selected cases, carefully individualized, it is a worth-while procedure.

Triple arthrodesis of the midtarsal joints of the feet is a useful procedure when pain in this area is prolonged and spontaneous fusion is delayed.

Deformity of the forefoot is common in rheumatoid arthritis. Prevention in the progressive case is not possible. There is bunion formation with clawing of the toes and prominent callosities on the plantar aspect of the feet. Correction of the bunion with excision of metatarsal heads and proximal phalanges gives relief of pain and enables the patient to wear shoes.

RELIEF FROM SEVERE PAIN

Five Illinois doctors reported a new drug, already shown to be effective in controlling nausea, now promising to relieve pain in patients who no longer get adequate help from large doses of narcotics in the June 12 *Journal of the American Medical Association*. The physicians said that 22 of 28 patients treated with chlorpromazine in addition to narcotics or sedatives which had not helped alone were given "satisfactory relief" from severe abdominal, bone, and nerve pain. The study made by these doctors confirms earlier reports that the drug relieves nausea and vomiting.

It was reported by two Canadian doctors earlier this year that the drug had been used successfully in quieting severely excited patients without making them confused or otherwise inaccessible to psychotherapy.

Some patients whose pain was not actually changed "seemed to be more relaxed and less reactive to their pain," Drs. Max S. Sadove, Myron J. Levin, Raymond F. Rose, Lester Schwartz, and Frederick W. Witt, Chicago, stated. Side effects other than drowsiness were "minimal."

Urology Award

An annual award of three prizes totaling $1,000 for essays on the result of some clinical or laboratory research in urology has been announced by the American Urological Association. Competition is limited to urologists who have been graduated not more than ten years and to those who are in training to become urologists. Additional information may be obtained from the executive secretary, William P. Didusch, 1120 North Charles Street, Baltimore.

CASE REPORTS

HUMAN RABIES CAUSED BY BAT BITE

S. EDWARD SULKIN, Ph.D., and MARION J. GREVE, M.D.,
Dallas, Texas

RABIES was first discovered in the vampire bat (Desmodus rotundus murinus Wagner) in the state of Santa Catarina in southern Brazil during investigations of an epizootic paralytic disease of cattle and other livestock called mal de caderas. Carini[2] in 1911 demonstrated Negri bodies in the brains of cattle dying of this paralytic disease and suggested that vampire bats which had been seen biting livestock might be transmitting the disease to cattle. Following the isolation of the rabies virus from the brain of a bat a few years later, Haupt and Rehaag[6] also concluded that the repeated epizootics of a paralytic disease that had occurred among livestock in southern Brazil were due to rabies transmitted by vampire bats. The livestock disease continued to spread until by 1930 it was found in many South American countries as far north as Venezuela.

In 1925 a paralytic disease of livestock occurred in the area of Port of Spain, Trinidad, B.W.I., killing several thousand animals. During the course of this epidemic, which was also traced to the bite of the vampire bat, 55 human cases of rabies were reported.[4, 7, 10] In 1944, in the Pacific Coast states of Mexico, a paralytic disease of livestock called derriengue also was proved to be rabies with the source demonstrated to be vampire bats.[8] Similar observations have been made in Honduras[12] and Venezuela.[1]

Other than the human cases of rabies reported in the Trinidad outbreak, there has been no record of human infection from bat bite. Venters and his associates[13] recently reported an experience in Florida in which a child was bitten by a lactating female Florida yellow bat (Dasypterus floridanus) from which an agent identified as rabies virus by neutralization and complement fixation tests was recovered. Pasteur treatment prevented the development of the disease in this child. Witte[14] tells of a woman in Pennsylvania bitten by a hoary bat (Lasiurus cinereus) which was proved to be rabid. In this instance, also, antirabies therapy was effective. More recently, Grimes and his associates[5] demonstrated Negri bodies in the brain of a free-tailed bat (Tadarida mexicana) which had bitten a 9 year old boy in Austin, Texas, on May 19, 1954. The child received Pasteur treatment.

From the Departments of Microbiology and Internal Medicine, Southwestern Medical School of the University of Texas.

Because of these experiences, together with the current interest in bats and bat rabies in certain areas in the United States,[3, 5, 9, 11, 13] it seems desirable to report a fatal human case of rabies which presumably resulted from the bite of a bat. To our knowledge, this is the first human case of rabies resulting from a bat bite in the United States.

CASE REPORT

In October, 1951, a 43 year old white housewife was admitted to the Parkland City-County Hospital in a comatose state with a diagnosis of bulbar poliomyelitis. Three weeks prior to admission and sixteen days prior to the onset of her illness, the patient had stopped to investigate what was apparently a dead bat on the roadside. The animal, however, was not dead, and on investigating at close range the patient was bitten on the left forearm. Unfortunately, the bat was not made available to us for identification and further study.

The patient continued to feel well until five days prior to admission when she complained of aching in her left arm and had a temperature of 103 F. The following day the fever continued; she had nausea, vomiting, and generalized aching and was unable to move her left arm. She was treated for influenza but became progressively more ill and on October 29 was admitted to a hospital in West Texas. It is reported that at this time she had high fever and inability to move her left arm. She was given intravenous fluids and on the following day was observed to have inability to swallow the secretions. A lumbar puncture revealed a total cell count of 24 and a protein of 74 mg. per 100 cc. At this time the patient was tranferred to Dallas. The patient was considered to have bulbar poliomyelitis, although the possibility of rabies could not be excluded. She remained comatose to semicomatose throughout her hospital stay and did not attempt to speak at any time. On the fourth hospital day the blood pressure slowly fell to the unobtainable level, mottled cyanosis appeared, and the patient died quietly about three hours after onset of hypotension and cyanosis.

A post-mortem examination was done by Dr. George H. Wahle, Jr. The primary pathologic diagnoses follow: "encephalomyelitis with demonstrable Negri bodies in central motor neurons compatible with rabies" and "perivascular lymphocytic infiltration of regional capillaries and motor neuron area, with destruction of anterior motor neurons and neuronophagia; also meningeal perivascular infiltration with endarteritis." The history together with the histopathologic findings strongly suggests that the bat bite was the source of the rabies infection.

SUMMARY

A fatal case of human rabies due to bat bite is reported. This experience suggests that the extent of rabies in bats in certain areas of the United States

should be explored thoroughly in order to establish the significance of the bat in the ecology of this disease in the United States.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.
Postgraduate Medical Assembly of South Texas. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.
State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.
Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

FOUR POSTGRADUATE COURSES

The University of Texas Postgraduate School of Medicine, Houston, will sponsor a fourteen-week course on functional neurology, to be held each Thursday evening, September 9 through December 16. This is the second in a series of courses designed by the Department of Medical Psychology of the M. D. Anderson Hospital and the Tumor Institute for those interested in medical psychology. Twenty-eight credit hours will be given. The tuition fee is $15, with no fee charged to residents or trainees. Instructors will be Dr. George J. Ehni, Dr. Edmund M. Fountain, Dr. J. B. Trunnell, Dr. William S. Fields, and Dr. Abe Hauser.

Early in October will be begun a course of twenty-four one-hour lectures once a week on radiologic physics. The course is designed for trainees and residents in radiology and physicians interested in the use of radiation as applied to the treatment of malignant disease.

A course in industrial medicine will be given each Tuesday evening from October 12 through November 16 with Dr. V. C. Baird in charge. After each scientific presentation will be a question and answer period.

Practical electrocardiology will be the topic of a course to be presented in Houston by Dr. Demetrio Sodi-Pallares, chief of the Department of Electrocardiology of the National Institute of Cardiology of Mexico City. The lectures will be given each evening, December 6-10, under the auspices of the University of Texas Postgraduate School of Medicine, Baylor University College of Medicine, and the Houston Heart Association. Emphasis will be on tracings commonly encountered in practice. Individualized instruction interpretation of specific tracings will be given.

Details about all courses may be obtained from the postgraduate school, Texas Medical Center, 1400 Outer Belt Drive, Houston 25.

GERIATRICS SOCIETY TO MEET

The Texas Geriatrics Society will meet on September 4 at the Texas Medical Association headquarters building, Austin. Business on the agenda for this meeting according to Dr. Henry H. Niehuss, Longview, president, includes the selection of an official journal for the society, preparation of an outline for the fall scientific meeting, and adoption of the constitution and by-laws.

The committee which drew up the constitution and by-laws is composed of Dr. Martin S. Buehler, Dallas, chairman; Dr. Don G. Kilgore, Dallas; Dr. W. S. Horn, Fort Worth; Dr. V. R. Hurst, Longview; Dr. B. E. Pickett, Sr., Carrizo Springs; Dr. S. W. Thorn, Houston; Dr. Hugh P. Reveley, San Antonio; Dr. Charles T. Stone, Galveston; and officers of the society.

Prior to the business meeting, speakers will be Dr. Stone, University of Texas School of Medicine, and Dr. Buehler, president of the Texas Academy of Internal Medicine, who will have recently returned from the International Academy of Gerontology in London.

Applications for membership may be addressed to the Texas Geriatrics Society, Longview.

PERSONALS

Dr. H. Jaworski, Waco, described the Waco plan for mass civilian casualties before the Industrial Medical Association in Chicago in April.

Dr. Daniel E. Jenkins, Houston, was elected vice-president of the American Trudeau Society at the meeting of the group in Atlantic City, May 18.

Dr. John A. Trautman, Bethesda, Md., has been appointed officer in charge of the Public Health Service Hospital, Fort Worth.

Dr. Albert W. Hartman, Jr., San Antonio, returned to his office in July after serving for several months in Europe as a civilian surgical consultant to the United States Army.

Dr. Henry A. Cromwell, Houston, has been appointed to the board of directors of Texas Industrial Trust, Inc.

Dr. E. R. Cox, Dallas, has been chosen recently as a board member of the Lakewood State Bank.

Dr. Francis T. N. Hood, Jr., Sweetwater, and Miss Patsy Louise Wofford, Cleburne, were married June 6, in Cleburne.

The wife of *Dr. Ralph E. Donnell,* Plainview, died on June 5. Mrs. Donnell was a member-at-large of the Third District Auxiliary.

The wife of *Dr. Arnett D. Ladd* died on June 8 in a Fort Worth hospital after a long illness. Mrs. Ladd was a member of the Tarrant County Woman's Auxiliary.

The wife of *Dr. Robert W. Holton, Sr.* died June 4 at their home in Terrell.

WORLD CARDIOLOGY CONGRESS

The Second World Congress of Cardiology will be held September 12-17 in Washington, D. C. The scientific sessions, which last for five days, will include formal papers, panel discussions, clinical pathologic conferences, and visits to several medical centers in Washington and Bethesda, Md.

The congress will include banquets, sight-seeing tours, and post-congressional visits and conferences at some of the leading cardiac clinics in the United States and Canada.

The registration fee will be $25 for members and $15 for associate members (wives and children). Additional information may be obtained from the secretary-general, Dr. L. W. Gorham, 44 East 23rd Street, New York 10.

LSU ALUMNI ASSOCIATION

The Louisiana State University Medical Alumni Association of Texas was organized at a May 3 meeting in San Antonio. Dr. Mildred Ward, San Antonio, presiding officer, introduced a special guest, Dr. B. H. Beard, Fort Worth, former professor of biochemistry at the medical school. It was decided to meet annually at the time of the convention of the Texas Medical Association, and the following officers were elected: Dr. Sam F. Hartman, Beaumont, president; Dr. A. A. Tisdale, Austin, vice-president; Dr. J. R. Dupre, San Antonio, secretary; and Dr. Ward, treasurer.

Regional Rehabilitation Meeting

At the Southwest Regional Conference of the National Rehabilitation Association held in Fort Worth May 31-June 2, three members of the Texas Medical Association were speakers. Addressing the group on "Dynamics of Counseling" was Dr. David Wade, Austin. Dr. Robert H. Mitchell, Fort Worth, was moderator of a panel discussion "Cardiac in Industry," and Dr. Joseph F. McVeigh, Fort Worth, participated on the panel as the physician member.

In addition to Texans on the program, there were representatives from Louisiana, New Mexico, and Oklahoma and guest speakers from Washington, D. C.

Southwestern Surgical Congress

The Southwestern Surgical Congress will hold its sixth annual meeting September 20-22 at Oklahoma City. The program will include scientific papers, panel discussions, round table luncheons, and entertainment.

Guest speakers include Dr. John M. Waugh, Rochester, Minn.; Dr. W. Alton Ochsner, New Orleans; and Dr. Zeph J. R. Hollenbeck, Columbus, Ohio. In addition, Dr. Michael E. DeBakey, Dr. Denton A. Cooley, and Dr. Oscar Creech, all of the Baylor University School of Medicine, Houston, will present a paper on "Surgical Considerations of Disease of the Aorta." "Effects of Various Shock States and Their Treatment on: Pulmonary Function; Hepatic Function; Renal Function" will be the topic of Dr. Ben J. Wilson, Dr. Morris J. Fogelman, and Dr. Jerry A. Stirman, Southwestern Medical School of the University of Texas, Dallas. Dr. F. M. Lingenfelter, Dr. Ernst Lachmann, Dr. Frank E. Darrow, and Dr. Ray H. Lindsey, University of Oklahoma School of Medicine, Oklahoma City, will present "Inguinal Hernia—Anatomical Considerations, Statistical Analysis and Surgical Technique."

Entertainment will include a barbecue, a dinner and dance, and special entertainment for the ladies.

Further information may be had from the congress, 207 Plaza Court Building, Oklahoma City 3.

PHYSICAL MEDICINE AND REHABILITATION

The thirty-second annual session of the American Congress of Physical Medicine and Rehabilitation will be held September 6-11 in Washington, D. C. Scientific and clinical sessions will be given beginning on September 7, and all sessions are open to doctors who are members of the American Medical Association. Annual instruction seminars will be held also. These lectures will be open to physicians and therapists who are registered with the American Registry of Physical Therapists or the American Occupational Therapy Association.

Additional information may be obtained from the executive offices, 30 North Michigan Avenue, Chicago 2.

NORTH TEXAS-SOUTHERN OKLAHOMA CLINIC

The North Texas-Southern Oklahoma Fall Clinical Conference will be held in Wichita Falls on September 22. The scientific program will include Dr. Edward L. Pratt, Dallas, "Management of Meningitis in Children"; Dr. Elmer L. Sevringhaus, Jersey City, N. J., "Use of Sex Steroids in General Practice" and "Prescribing of Adequate Nutrition in General Practice"; Robert L. Faulkner, Cleveland, Ohio, "Ectopic Pregnancy" and "Early Diagnosis of Cancer of Cervix and Corpus"; and Robert Sparkman, Dallas, "Common Fallacies in Gallbladder Disease."

William Alan Richardson, Rutherford, N. J., editor of *Medical Economics,* will speak on "How to Liquidate Your Poor Relations" at the evening dinner. The registration fee of $8 for doctors includes meals and a cocktail party; a fee of $4 for the ladies covers the evening meal and cocktail party.

Heart Symposium

The Red River Valley District Heart Association presented on June 6 in Sherman a one day symposium on "Diseases of the Heart and Circulation" under the auspices of Southwestern Medical School of the University of Texas in cooperation with the Fort Worth Laboratory for Surgical Research. Participants in the program were Dr. Albert M. Goggans, Dr. Clive Johnson, Dr. John Marietta, Dr. Robert H. Mitchell, and Dr. O. J. Wollenman, Fort Worth; and Dr. Alfred Harris, Dr. John A. Osborne, Dr. Howard Heyer, and Dr. Maurice Scurry, Dallas. In addition to the scientific papers, three panel discussions were presented at he meeting.

World Medical Association

The World Medical Association will convene in Rome, Italy, for its eighth general assembly from September 26 through October 2. Information about the meeting may be obtained from the secretary-general, Dr. Louis H. Bauer, 345 46th Street, New York 17.

LIBRARY SECTION

SNAKES OF TODAY

There are more than 2,000 kinds of snakes, ranging in size from the 30 foot python to the midget of only 6 inches. Fortunately a large majority of snakes are nonvenomous. Only one-eighth of all known venomous species have highly developed poison-conducting fangs, and of this number not more than 60 per cent are deadly to man. According to Ditmars, in the United States there are over 100 kinds of nonvenomous snakes, and close to 20 poisonous species. At least 40 varieties of the poisonous snakes are found in the Southwest.

Rattlesnakes are found only in the New World, being most abundant in the southwestern United States, where more than a dozen kinds occur. Texas rattlesnakes range in size from the 18 inch western ground rattlesnake to the 7 foot diamondback rattlesnake, one of the most dangerous snakes in North America.

Snakes found in Texas have been the topic of many interesting papers, and the various species collected in the state are to be found in many museums throughout the world. As early as 1853 Dr. Benno Matthes, a Silesian physician, went to Galveston to collect naturalia for the cabinet in Dresden. From the published works of Dr. Matthes it is found that he made a study of the coral snakes. He noted that the Elaps had immovable fangs, were poisonous, and could open their jaws wide enough to swallow other snakes as large as themselves. He noted also that snakes frequently devour their own species.

Although there are few deaths annually from snake bites in the United States, it is well known among snake bite authorities that more people die from snake bites in Texas than in any other state. The problem of a bite from a poisonous snake can be complicated still further by the fact that distances are great between towns, and since frequently the patient is far from help when he is bitten, considerable time may elapse before treatment is available.

The Memorial Library of the Texas Medical Association has available the following publications on the subject of snakes:

Apology to Texas, J. Pediat. *43:*120 (July) 1953.

MEDICAL LIBRARY ASSOCIATION

At the fifty-third annual meeting of the Medical Library Association in Washington, D. C., in June, Miss Pauline Duffield, Librarian, Texas Medical Association, was elected treasurer. Other officers elected were Miss Wilma Troxel, Chicago, president; Mr. Wesley Draper, Brooklyn, vice-president (president-elect); Dr. E. H. Cushing, Washington, D. C., honorary vice-president; Miss Esther Judkins, New York, secretary; and Miss Clara S. Manson, San Francisco, and Mr. Robert T. Lentz, Philadelphia, members of the board of directors. The next meeting of the group will be at Marquette University School of Medicine, Milwaukee, in June, 1955.

Wolstenholme, G. E. W.: Peripheral Circulation in Man, Ciba Foundation Symposium, Boston, Little, Brown and Company, 1954.

CONTRIBUTIONS TO THE LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Bexar County Woman's Auxiliary, San Antonio, 10 volumes of Transactions of the Texas Medical Association.

Dr. G. E. Brandes, Austin, 97 journals.

Dr. S. N. Key, Jr., Austin, 32 journals.

Dr. L. H. Reeves, Fort Worth, 4 journals.

Dr. W. D. Roberts, Austin, 36 journals.

Dr. N. L. Schiller, Austin, 27 journals, 7 pamphlets.

MOTION PICTURES FOR LOAN

Surgical Treatment for Splenic Flexure Carcinoma with Solitary Liver Metastasis

16 mm., silent, color, 40 minutes. By Dr. Philip Thorek, Chicago.

Part one contains an exceptionally good illustration of the McBurney incision and will be of interest to any physician who might use this incision. An excellent illustration of the method of doing a cecostomy is included. Part two deals with the resection of the carcinoma in the splenic flexure. It is superb for the surgeon who has occasion to perform colon resections. Part three follows the pattern of reel two and contains the closure of the cecostomy. Remarkable hemostasis is noted throughout the three reels. The color is excellent.

Surgical Treatment for Coarctation of the Aorta

16 mm., silent, color, 30 minutes. By Dr. Philip Thorek, Chicago.

This film is beautifully done and well edited, with remarkable true color rendition. It is of interest to cardiologists and those interested in cardiac conditions amenable to surgery. It is highly specialized and only of academic interest to most physicians.

Hemicolectomy for Carcinoma of Right Side of Colon

16 mm., silent, color, 22 minutes. By Dr. Philip Thorek, Chicago.

This is an excellent color rendition, with the material well organized. The film presents a good demonstration of the technique of ileocolostomy and is recommended for any physician who might encounter the necessity of this procedure. The film will be of most interest to surgeons.

BOOK NOTICES

Speech Problems of School Children

A symposium co-sponsored by the Divisions of School Psychologists and of Educational Psychology of the American Psychological Association, the American Speech and Hearing Association, and the National Society for Crippled Children and Adults, Inc. 61 pages. $1.25. Chicago, National Society for Crippled Children and Adults, 1953.

[1]Basic Principles of Cancer Practice

ANDERSON NETTLESHIP, M. D., *Professor of Pathology, University of Arkansas, Fayetteville, Ark. 397 pages. $7. Williams and Wilkins, Baltimore, 1952.*

This volume was prepared for the general practitioner and the medical student. In an introductory exposition of his purpose and reasons for writing the book the author states the need for a text to deal broadly with the subjects of diagnosis, prognosis, and treatment of cancer in humans. Most of the book's nineteen chapters are so divided and in that order. The larger divisions of the subject are made according to the part of the body in which the neoplasms occur rather than by tumor classification. There are additional materials of interest on the subjects of occupational cancer, trauma, biochemistry, medicolegal aspects, and psychological implications. Dr. Nettleship gives seven principles of treatment, and his approach to the whole theme is instructive, as noncontroversial as the nature of the subject permits, and practical.

An attractive feature of this volume is the illustrative matter included. There are 109 photographs, drawings, and charts (not separately indexed), and case histories are cited in some detail. The bibliographies are at the ends of the chapters and are both up-to-date and full. From the literature the author has selected well over 300 bibliographic items for recommended further reading. Another favorable factor for quick reference usage is his practice of summarization of each chapter at its conclusion.

[2]Practical Management of Diabetes

EDWARD TOLSTOI, M. D., *Associate Professor of Clinical Medicine, Cornell University Medical College; Attending Physician and Chief, Diabetic Hospital, New York Hospital, New York. 93 pages. $3.25. Springfield, Ill., Charles C Thomas, 1953.*

This ninety-three page manual consists of nine chapters on various aspects of the management of diabetes—some new, some old. As many reviewers have noted, it is "a defense of glycosuria," and one of the newer points is the author's opinion that glycosuria and hyperglycemia are harmless as long as the patient is symptomless and without acetonuria. This undoubtedly will be strongly challenged in many areas since the generally accepted aim in treatment of the diabetic is to keep the blood sugar approximately normal and the urine relatively sugar free.

From a critical standpoint, there is no mention of diet calibration nor are there any food tables except in weight reduction. Desired weight gain is regulated by insulin dosage rather than food intake and this deviates considerably from accepted practice.

Favorable points are that the arrangement and typography are good. In general, however, this book serves only to present one point of view which will provoke many arguments.

[3]Handbook on Diseases of Children

BRUCE WILLIAMSON, M. D. *(Edin.)*, F.R.C.P. *(London), Physician, Children's Department, Royal Northern Hospital, London, and Lecturer, North London Post-Graduate Institute. Seventh edition. 467 pages. $5. Edinburgh and London, E. & S. Livingstone, 1953. Distributed by Williams and Wilkins, Baltimore.*

This handbook gives a detailed and comprehensive description of the signs and symptoms of diseases of children and the underlying physiology. It is a book designed for the general practitioner and busy pediatrician as a quick ready reference for clinical information that can be utilized in making a diagnosis without an exorbitant expenditure of the patient's funds on costly laboratory procedures.

The author discusses pathognomonic as well as groups of significant symptom complexes and signs helpful to an immediate bedside diagnosis. No great emphasis is made on laboratory findings or specialized diagnostic procedures.

Description of the course of each disease is illuminating and interestingly simple. It is easy to follow the author's viewpoint in his vivid portrayal of the child with the disease.

It is a handy reference for medical students, busy practitioners, and pediatricians. The disease entity is presented in an orderly manner with a brief discussion of the pertinent diagnostic tests and modes of treatment of practical value. This handbook is a valuable addition to any practitioner's set of reference books and to that of allied specialists.

[4]Experimental Atherosclerosis

LOUIS N. KATZ, M. D., *Director Cardiovascular Department, Medical Research Institute, Michael Reese Hospital, Chicago, and* JEREMIAH STAMLER, M. D., *Research Associate, Cardiovascular Department, Medical Research Institute, Michael Reese Hospital, Chicago. 375 pages. $10.50. Springfield, Ill., Charles C Thomas, 1953.*

This monograph presents a study of human atherosclerosis and a review of the vast and sometimes conflicting experimental work in this field. The authors define atherosclerosis as intimal arteriosclerosis or amorphous lipid accumulation in the intima.

The effect of world dietary habits upon the incidence of atherosclerosis and elevated cholesterol plasma levels is noted as is the decreased incidence of atherosclerosis on an enforced low fat diet, demonstrated during World War II. Diabetes mellitus, nephrosis, chronic nephritis, hypothyroidism, biliary obstruction, hypertension, hyperadrenocorticism and familial hypercholesterolemia are accompanied by an increased incidence of atherosclerosis.

The relationship of the plasma lipoprotein colloidal complex (the state of aggregation of cholesterol in plasma) is considered the most important single factor in atherosclerosis.

The final chapter reviews experimental animal work particularly with chickens. The authors conclude that "altered cholesterol metabolism plays a key role in human atherogenesis."

The monograph is a good review of experimental atherosclerosis. Because of the insertion of many references in the text and inclusion of conflicting evidence, the work is necessarily rather cumbersome as regards readability.

[5]Salmonellae and Shigellae; Laboratory Diagnosis Correlated with Clinical Manifestations and Epidemiology

ALFRED J. WEIL, M. D., *Department of Bacteriology, Bronx Hospital, New York, and* IVAN SAPHRA, M. D., *Department of Bacteriology, Beth Israel Hospital, New York. 247 pages. $7.75. Springfield, Ill., Charles C Thomas, 1953.*

The purpose of this book, as quoted by the authors in the preface, is to assemble, conveniently, the information necessary for handling the laboratory aspects of Salmonellae and Shigellae infections. Furthermore, it was written to supply the link for adequate cooperation between bacteriologist, clinician, and epidemiologist in controlling these diseases (typhoid fever, paratyphoid fever, and bacillary dysentery).

[1]*Clifton D. Howe, M. D., Houston.*
[2]*H. C. Powell, M. D., Austin.*
[3]*Joe C. Rude, M. D., and Pura Santiago, M.D ., Austin.*
[4]*Gretchen Runge, M D., Austin.*
[5]*H. C. Powell, M. D., Austin.*

The book is divided into fifteen chapters which deal with the various aspects of Salmonellae and Shigellae from laboratory, clinical, and therapeutic standpoints. There are fourteen illustrations, all of which are good except figure 14, which does not demonstrate clearly the testing for antibiotic sensitivity of the disk method.

The best chapters on the laboratory procedures and evaluation are the ones dealing with properties, methods of isolation, cultural methods, and the Widal test. Clinical viewpoints are best expressed in the chapters on clinical features and epidemiology, natural and immune resistance, bacteriophages for diagnosis and treatment, and, again, cultural methods. Treatment is summarized and emphasized well in the chapter on sulfonamides and antibiotics. Epidemiology is thoroughly brought out, both in the localized and the generalized form of the diseases.

This book serves as a handy review of the Salmonellae and Shigellae infections and is food for thought when unexplained fevers and diarrheas need explaining.

[6]The Psychiatrist, His Training and Development

Report of the 1952 Conference on Psychiatric Education held at Cornell University, Ithaca, New York, June 19-25, 1952, organized and conducted by the American Psychiatric Association and the Association of American Medical Colleges. 214 pages. Baltimore, Lord Baltimore Press, 1953.

This report is focused primarily on training and development of career psychiatrists, so the discussion begins with the development of residency training. There is much succeeding discussion, pro and con, of the contents of the ideal residency training program.

The report of the special commission on psychodynamic principles is given verbatim, and the conference as a whole apparently preferred to accept the report.

Considerable detail in the discussion is given on the ideals and practices in the training of residents, recruitment and selection of residents, and the resident's personal problems.

The chapter on training centers discusses the approved training program and lists the approved residencies in psychiatry for one, two, and three years. The roles of psychoanalysis and of child psychiatry in residency training were discussed thoroughly.

The chapter on some special fields includes memoranda submitted to the conference on special fields or subspecialties for which hospital residency training provides scanty orientation. Psychiatry in the training for other specialties, such as pediatrics, internal medicine, surgery, and public health, was discussed at the conference.

The statements on psychiatry and the nation's health are good and reveal to a great extent the need for psychiatrists and allied psychiatric personnel throughout the nation. There is also a realization of the need for the residency programs to prepare the psychiatrist to grasp the opportunities for preventive psychiatry and to make the most of them in the rapidly expanding field of promoting mental health.

This report has made an excellent book, and it should be recommended for many individuals. Some parts of the book are somewhat difficult reading for individuals not familiar with psychiatry, but, in general, this book is recommended and specially for psychiatrists and physicians who are interested in becoming psychiatrists.

[6]*J. C. Strong, M. D., Dallas.*

ORGANIZATION SECTION

TEXAS MEDICAL ASSOCIATION

EXECUTIVE COUNCIL TO MEET

Meetings on September 3 and 4 of councils and committees of the Texas Medical Association will precede the fall Executive Council meeting September 5 at the headquarters building in Austin. Dr. A. L. Thomas, Ennis, is to be presented with the plaque for the General Practitioner of the Year of Texas, and reports of the various councils and committees of the Association will be accepted at the September 5 meeting.

The Board of Trustees will meet Friday evening, September 3, and again the next day. Friday at 8 p. m. there will be a meeting of the Committee on Infringements of Medical Practice. Meetings scheduled for Saturday, September 4, include the following: Advisory Committee to the President at 8:30 a. m.; Committee on Blood Banks, 1 p. m.; Committee on Rural Health and Doctor Distribution, 1 p. m.; Council on Medical Education and Hospitals, 1 p. m.; Committee on Library Endowment, 2 p. m.; Council on Medical Defense, 4 p. m.; Council on Medical Economics, 4 p. m.; Council on Medical Jurisprudence, 7 p. m.; Council on Scientific Work, 7 p. m.; and Committee on Mental Health, 8:30 p. m. Other meetings may be scheduled at a later date.

Sunday morning, September 5, at 8 a. m. the Council on Scientific Work will meet jointly with the officers of the scientific sections for the 1955 annual session and representatives of various specialty societies, and the Executive Council will be called to order at 9 a. m. at the Texas Medical Association headquarters building.

The Executive Council, ex-officio, is composed of the President as chairman, the President-Elect, Vice-President, Secretary, Executive Secretary, Treasurer, Speaker of the House of Delegates, Vice-Speaker of the House of Delegates, Board of Trustees, Board of Councilors, Texas Delegates to the American Medical Association, chairmen of all councils, members of the Council on Medical Jurisprudence, and chairman of the Committee on Public Relations.

Officers, Councils, and Committees

Following are the officers, councils, and committees of the Texas Medical Association for the year 1954-1955 with the year in which their terms of office expire indicated in parentheses:

OFFICERS

F. J. L. Blasingame, Wharton, President.
J. Layton Cochran, San Antonio, President-Elect.
J. C. Terrell, Stephenville, Vice-President.
J. M. Travis, Jacksonville, Secretary (1956).
N. C. Forrester, Austin, Executive Secretary.
T. H. Thomason, Fort Worth, Treasurer (1956).
Hobart O. Deaton, Fort Worth, Speaker of the House of Delegates.
Charles P. Hardwicke, Austin, Vice-Speaker of the House of Delegates.

BOARD OF TRUSTEES

R. W. Kimbro, Cleburne, Chairman (1957).
G. V. Brindley, Temple, Vice-Chairman (1955).

Troy A. Shafer, Harlingen, Secretary (1959).
Denton Kerr, Houston (1958).
Sam N. Key, Austin (1956).

Board of Councilors

First District, J. Leighton Green, El Paso (1955); C. E. Oswalt, Jr., Fort Stockton, Vice-Councilor.
Second District, R. B. G. Cowper, Big Spring (1957); Chester U. Callan, Rotan, Vice-Councilor.
Third District, Frank B. Malone, Lubbock (1956); H. H. Latson, Amarillo, Vice-Councilor.
Fourth District, H. L. Locker, Brownwood (1955); O. H. Chandler, Ballinger, Vice-Councilor.
Fifth District, J. J. Hinchey, San Antonio (1956); D. E. Packard, Kerrville, Vice-Councilor.
Sixth District, Franklin W. Yeager, Corpus Christi (1956); Stanley W. Bohmfalk, Weslaco, Vice-Councilor.
Seventh District, David Wade, Austin (1957); Vacancy, Vice-Councilor.
Eighth District, James H. Wooten, Jr., Columbus (1957); John L. Otto, Galveston, Vice-Councilor.
Ninth District, J. T. Billups, Houston, Secretary (1957); A. M. Dashiell, Houston, Vice-Councilor.
Tenth District, L. C. Heare, Port Arthur (1957); Stephen B. Tucker, Nacogdoches, Vice-Councilor.
Eleventh District, C. E. Willingham, Tyler (1955); Lynn Hilbun, Henderson, Vice-Councilor.
Twelfth District, J. Wilson David, Corsicana (1956); Howard O. Smith, Marlin, Vice-Councilor.
Thirteenth District, R. G. Baker, Fort Worth, Chairman (1955); L. J. Webster, Abilene, Vice-Councilor.
Fourteenth District, Mayo Tenery, Waxahachie (1955); L. W. Johnston, Terrell, Vice-Councilor.
Fifteenth District, H. O. Padgett, Marshall (1956); Vacancy, Vice-Councilor.

Delegates to the American Medical Association

A. C. Scott, Jr., Temple (1956).
John K. Glen, Houston (1956).
Robert B. Homan, Jr., El Paso (1956).[1]
T. C. Terrell, Fort Worth (1955).
M. O. Rouse, Dallas (1955).
J. B. Copeland, San Antonio (1955).
Delegate Designate, James H. Wooten, Jr., Columbus (1956).

Alternate Delegates to the American Medical Association

John L. Otto, Galveston (1956).
Robert W. Kimbro, Cleburne (1956).
L. C. Heare, Port Arthur (1956).
J. C. Terrell, Stephenville (1955).
Troy Shafer, Harlingen (1955).
George Turner, El Paso (1955).
Alternate Delegate Designate, L. H. Reeves, Fort Worth (1956).

Executive Council

Ex-officio, President (Chairman), President-Elect, Vice-President, Secretary, Executive Secretary, Treasurer, Speaker of the House of Delegates, Vice-Speaker of the House of Delegates, Board of Trustees, Board of Councilors, Texas Delegates to the American Medical Association, Chairmen of all Councils, Members of the Council on Medical Jurisprudence, and Chairman of the Committee on Public Relations.

[1]*Appointed May 10, 1954, to fill the vacancy created by the resignation of Dr. E. A. Rowley, Amarillo, on May 7, 1954.*

Council on Medical Defense

Charles L. McGehee, San Antonio, Chairman (1955).
John H. Wootters, Houston (1959).
Joe Nichols, Atlanta (1958).
P. M. Kuykendall, Ranger (1957).
Harold M. Williams, Austin (1956).
F. J. L. Blasingame, Wharton (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Jurisprudence

J. B. Copeland, San Antonio, Chairman (1957).
G. W. Cleveland, Austin (1959).[2]
J. W. Rainer, Odessa (1958).
Robert D. Moreton, Fort Worth (1956).
John K. Glen, Houston (1955).
F. J. L. Blasingame, Wharton (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Scientific Work

May Owen, Fort Worth, Chairman (1957).
John C. Kennedy, Houston (1959).[3]
Clyde A. Stevenson, Temple (1958).
L. Bonham Jones, San Antonio (1956).
Kleberg Eckhardt, Corpus Christi (1955).
F. J. L. Blasingame, Wharton (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Economics

Harvey Renger, Hallettsville, Chairman (1957).
Gail Medford, Lufkin (1959).
E. W. Jones, Wellington (1958).
A. G. Barsh, Lubbock (1956).
Raleigh R. Ross, Austin (1955).
F. J. L. Blasingame, Wharton (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Education and Hospitals

John L. Matthews, San Antonio, Chairman (1957).[4]
S. W. Thorn, Houston (1959).
G. N. Aagaard, Dallas (1958).[5]
Truman G. Blocker, Jr., Galveston (1956).
W. S. Barcus, Fort Worth (1955).
F. J. L. Blasingame, Wharton (ex-officio).
N. C. Forrester, Austin (ex-officio).

War Council

Ex-officio, President (Chairman), President-Elect, Vice-President, Secretary, Executive Secretary, Treasurer, Speaker of the House of Delegates, Board of Trustees, Board of Councilors, Chairmen of all Councils, and Chairman of the Committee on Public Relations.

Committee on Cancer

Porter Brown, Fort Worth, Chairman (1958).
Charles Phillips, Temple (1959).
C. T. Ashworth, Fort Worth (1957).
R. E. Windham, San Angelo (1956).
R. Lee Clark, Jr., Houston (1955).

Committee on Medical History

Tate Miller, Dallas, Chairman (1958).
Felix P. Miller, El Paso (1959).

[2]*Appointed July 26, 1954, to fill the vacancy created by the resignation of Dr. Sam N. Key, Jr., Austin, on June 8, 1954.*

[3]*Appointed May 13, 1954, to fill the vacancy created by the resignation of Dr. Charles D. Reece, Houston, on May 11, 1954.*

[4]*Appointed chairman May 4, 1954, to fill the vacancy created by the resignation of Dr. M. O. Rouse, Dallas, on May 4, 1954.*

[5]*Appointed May 13, 1954, to fill the vacancy created by the resignation of Dr. John S. Chapman, Dallas, who was appointed to fill the unexpired term of Dr. Rouse.*

W. E. Whigham, McAllen (1957).
L. H. Reeves, Fort Worth (1956).
A. A. Ross, Sr., Lockhart (1955).

COMMITTEE ON PUBLIC RELATIONS

William M. Crawford, Fort Worth, Chairman.
A. F. Clark, Jr., San Antonio.
Glenn D. Carlson, Dallas.
Raleigh R. Curtis, Temple.
H. M. Anderson, San Angelo.
Van D. Goodall, Clifton.

COMMITTEE ON TUBERCULOSIS

W. D. Anderson, San Angelo, Chairman (1956).
William D. Seybold, Houston (1959).
Orville E. Egbert, El Paso (1958).
John A. Wiggins, Fort Worth (1957).
Ralph E. Gray, Lake Jackson (1955).

COMMITTEE ON LIBRARY ENDOWMENT

B. E. Pickett, Carrizo Springs, Chairman (1957).[6]
Jack G. Kerr, Dallas (1959).
Joe T. Gilbert, Austin (1958).
V. R. Hurst, Longview (1956).
R. D. Little, Wharton (1955).

COMMITTEE ON MENTAL HEALTH

Hamilton Ford, Galveston, Chairman (1958).
Andrew S. Tomb, Victoria (1959).
Dorothy Wyvell, Midland (1957).[7]
A. B. Cooper, El Paso (1956).
Abe Hauser, Houston (1955).

COMMITTEE ON PUBLIC HEALTH

Hugh Welsh, Houston, Chairman (1956).
M. O. Rouse, Dallas (1959).
H. H. Latson, Amarillo (1959).
T. A. Fears, Beaumont (1958).
William E. Lockhart, Jr., Alpine (1958).
John F. Pilcher, Corpus Christi (1957).
Arthur G. Schoch, Dallas (1957).
H. D. Gilliam, McAllen (1956).
Thomas H. Diseker, San Antonio (1955).
H. K. Brask, San Angelo (1955).

COMMITTEE ON BLOOD BANKS

E. E. Muirhead, Dallas, Chairman (1956).
D. A. Todd, San Antonio (1959).
W. J. Emerson, Laredo (1958).
O. J. Wollenman, Jr., Fort Worth (1957).
T. M. Oliver, Waco (1955).

Committee on General Arrangements for the 1955 Annual Session (all of Fort Worth).—William M. Crawford, Chairman; James D. Murphy; Robert D. Moreton; Dolphus E. Compere; R. V. Brasher.

Committee on Memorial Services.—L. H. Reeves, Fort Worth, Chairman; R. G. Baker, Fort Worth, Vice-Chairman; Irving W. Moody, Houston; Herbert Donnell, Waxahachie; E. H. Lindsey, Beaumont; A. C. Bennett, Marlin.

Committee on Scientific Exhibits.—E. T. Smith, Houston, Chairman; J. W. Birdwell, Tyler; S. S. Evans, McAllen; Olin B. Gober, Temple; S. L. Witcher, Clifton.

Advisory Board to Texas Society of Medical Technologists.—W. O. Russell, Houston, Chairman; J. H. Childers, Galveston; M. S. Hart, El Paso.

Committee on Rural Health and Doctor Distribution.—C. U. Callan, Rotan, Chairman; C. E. Oswalt, Jr., Fort Stockton; Stephen B. Tucker, Nacogdoches; J. H. Harris, Marshall; George Bruce, Baytown; G. V. Edgar, Levelland.

Committee on Revision of the Constitution and By-Laws.—John F. Thomas, Austin, Chairman; Robert B. Homan, Jr., El Paso; Hobart O. Deaton, Fort Worth; J. J. Hinchey, San Antonio; J. Charles Dickson, Houston.

Committee on Nursing Care.—A. C. Scott, Jr., Temple, Chairman; R. D. Holt, Meridian; R. A. Neblett, Canyon; G. E. Brereton, Dallas; Joseph F. McVeigh, Fort Worth.

Committee on Negro Medical Facilities.—W. L. Marr, Galveston, Chairman; L. C. Powell, Beaumont; G. V. Pazdral, Somerville; J. A. Neely, Bellville; R. D. Little, Wharton.

State Council on National Emergency Medical Service.—R. E. Gray, Lake Jackson, Chairman; W. H. Hamrick, Houston; Henry A. Holle, Austin; J. W. Hill, Dallas; A. W. Hartman, Jr., San Antonio.

Advisers to Texas Chapters of the Student American Medical Association.—W. L. Marr, Galveston; William D. Seybold, Houston; J. P. McNeill, Dallas.

Committee on Liaison with State Bar of Texas.—John E. Skogland, Houston, Chairman; Earl Gaston, Kingsville, Vice-Chairman; James W. Rainer, Odessa; J. B. Copeland, San Antonio; R. W. Kimbro, Cleburne; R. G. Carpenter, Dallas; David M. Cameron, El Paso.

State Committee for American Medical Education Foundation.—S. W. Thorn, Houston, Chairman; V. R. Hurst, Longview; F. L. Butte, Dallas; J. A. Little, Wichita Falls; Raleigh R. Curtis, Temple; Stephen B. Tucker, Nacogdoches; S. D. Coleman, Navasota; M. A. Forbes, Jr., Austin; S. W. Bohmfalk, Weslaco; O. H. Chandler, Ballinger; Joe R. Donaldson, Pampa; T. D. Young, Sweetwater; Charles E. Oswalt, Jr., Fort Stockton; Harold M. Northington, Wharton.

Telephone Postgraduate Broadcast Committee (Special Committee of Council on Medical Education and Hospitals).—Joe Kopecky, San Antonio, Chairman; C. T. Stone, Galveston; Henry M. Winans, Dallas; Mavis P. Kelsey, Houston; James D. Murphy, Fort Worth; Raleigh R. Ross, Austin; Asher R. McComb, San Antonio.

Joint Committee on Health Costs.—M. C. Overton, Jr., Pampa, Chairman; Tom B. Bond, Fort Worth; J. H. Wootters, Houston; James W. Rainer, Odessa.

Committee for Liaison with Workmen's Compensation Insurance Companies.—Sam N. Key, Jr., Austin, Chairman; Frederick C. Rehfeldt, Fort Worth; R. G. Carpenter, Dallas; M. H. Morris, San Antonio; Wendell H. Hamrick, Houston.

Appointees to Cooperate with the Board of Nurse Examiners.—A. C. Scott, Jr., Temple; G. E. Brereton, Dallas.

Committee on Infringements of Medical Practice.—J. T. Billups, Houston, Chairman; Neil D. Buie, Marlin; Franklin W. Yeager, Corpus Christi; E. A. Rowley, Amarillo; Mal Rumph, Fort Worth.

Texas Joint Commission for Improvement of Care of the Patient.—A. C. Scott, Jr., Temple; Joseph F. McVeigh, Fort Worth; Truman G. Blocker, Jr., Galveston; G. E. Brereton, Dallas; F. J. L. Blasingame, Wharton (ex-officio); N. C. Forrester, Austin (ex-officio).

Committee on Maternal Mortality.—Garth L. Jarvis, Galveston, Chairman; A. L. Dipple, Houston; G. F. Goff, Dallas; D. M. Gready, Houston; F. P. Helm, Austin; E. K. Blewett, Austin; W. H. Jondahl, Harlingen; R. E. Moon, San Angelo; William F. Mengert, Dallas.

Advisory Committee to the President.—President-Elect, Vice-President, Speaker of the House of Delegates, Chairman of the Board of Trustees, Chairmen of all Councils, Chairman and Secretary of the Board of Councilors, Chairman of the Texas Delegates to the American Medical Asso-

[6] *Appointed chairman April 20, 1954, to fill the vacancy created by the resignation of Dr. J. M. Travis, Jacksonville, on April 1. 1954.*

Lone Star State Medical Association.—R. D. Little, Wharton.

Louisiana State Medical Association.—L. C. Heare, Port Arthur.

Arkansas Medical Society.—H. O. Padgett, Marshall.

Texas State Dental Society.—Herbert Donnell, Waxahachie.

New Mexico Medical Society.—C. E. Webb, El Paso; G. H. Jordan, El Paso, Alternate.

Texas Polio Planning Committee.—J. Edward Johnson, Austin.

Private Clinics and Hospitals Association of Texas.—J. C. Terrell, Stephenville.

OFFICERS OF SCIENTIFIC SECTIONS

SECTION ON GENERAL PRACTICE

Van D. Goodall, Clifton, Chairman.
John M. Smith, San Antonio, Secretary.

SECTION ON INTERNAL MEDICINE

John R. Winston, Temple, Chairman.
Mavis P. Kelsey, Houston, Secretary.

SECTION ON SURGERY

Robert F. Short, Jr., Dallas, Chairman.
Norman Duren, Beaumont, Secretary.

SECTION ON OBSTETRICS AND GYNECOLOGY

S. Foster Moore, San Antonio, Chairman.
Dennis M. Voulgaris, Wharton, Secretary.

SECTION ON EYE, EAR, NOSE, AND THROAT

Oliver W. Suehs, Austin, Chairman.
Robert Marion Johnson, Houston, Secretary.

SECTION ON RADIOLOGY

Delphin Von Briesen, El Paso, Chairman.
David H. Allen, Wichita Falls, Secretary.

SECTION ON PUBLIC HEALTH

Austin E. Hill, Houston, Chairman.
L. P. Walter, Austin, Secretary.

SECTION ON CLINICAL PATHOLOGY

J. L. Goforth, Dallas, Chairman.
John H. Childers, Galveston, Secretary.

SECTION ON PEDIATRICS

Robert A. Gardner, Houston, Chairman.
B. H. Williams, Temple, Secretary.

LOCAL COMMITTEES

Alumni and Fraternity.—J. H. Grammer, Chairman; John W. Garnett; T. L. Lauderdale; George Y. Siddons; Walter B. Petta; W. F. Armstrong; J. W. Tottenham, Jr.; J. R. Cochran; Cuvier P. Lipscomb; Charles H. McCollum, Jr.; L. H. Reeves.

Halls and Lanterns.—William E. Flood, Chairman; J. T. Tucker, Jr.; Cyrus L. Worrall; Richard V. Price; Joe B. Ellis.

Hotels.—R. V. Brasher, Chairman; Robert C. Barker; M. H. Crabb.

Information.—James F. Campbell, Chairman; Frank J. Daugherty; I. L. Van Zandt; Leo N. Roan.

Memorial Services.—L. H. Reeves, Chairman; R. G. Baker, Vice-Chairman; Truman C. Terrell; C. P. Schenck; L. O. Godley; Nelson Dunn; Webb Walker; Mrs. Tom B. Bond.

Publicity.—Joseph F. McVeigh, Chairman; Hersel F. Willis; Thomas J. Coleman.

Scientific and Technical Exhibits.—James D. Murphy, Chairman; Thomas L. Shields; W. S. Lorimer, Jr.; John H. Richards.

Social.—James O. McBride, Chairman; Robert D. Bickel; James W. Short; J. A. Hallmark; H. T. Jackson; Adolph F. Kauffmann.

Sports.—Dolphus E. Compere, Chairman; Randall D. Nyman; Harold D. Shelley; Drue O. D. Ware; James H. Hook; Fred B. Aurin.

Transportation and Finance.—W. D. Marrs, Chairman; Robert C. Stow, Jr.; James B. Boone; Robert H. Mitchell.

Public Lectures.—Robert D. Moreton, Chairman; Mal Rumph; James N. Walker; Ernest D. Rogers; J. H. Steger.

Local Tours and Sightseeing Trips.—Rex Z. Howard.

VISITATIONS FOR SEPTEMBER

Visitations have been scheduled to seven county medical societies for September. Those groups to be visited are Hopkins-Franklin Counties, September 2; Ellis County, September 8; Falls County, September 13; Grayson County, September 14; Angelina County, September 16; La Salle-Frio-Dimmit Counties, September 21; and Kleberg-Kenedy Counties, September 21.

Officers and staff representatives participating in the programs for September are Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association; Dr. J. L. Cochran, San Antonio, President-Elect; Dr. Robert W. Kimbro, Cleburne, chairman of the Board of Trustees; Dr. R. G. Baker, Fort Worth, chairman of the Board of Councilors; Dr. Harvey Renger, Hallettsville, chairman of the Council on Medical Economics; and C. Lincoln Williston, Austin, assistant executive secretary.

AMERICAN MEDICAL ASSOCIATION

AMA SCIENTIFIC EXHIBIT AWARDS

Texans won three scientific exhibit awards at the convention of the American Medical Association in San Francisco. The highest scientific exhibit award given by the AMA, the Hektoen award, comprising three gold, silver, and bronze medals, was awarded to a Texas group.

For an exhibit on "Aneurysms and Thrombo-Obliterative Disease of the Aorta: Surgical Considerations," Dr. Michael E. DeBakey, Dr. Denton A. Cooley, and Dr. Oscar Creech, Jr., Houston, received a Hektoen gold medal.

A certificate of merit for diseases of the chest went to Dr. G. V. Brindley, Jr., Temple, for his exhibit on "Bronchogenic Carcinoma Simulating Benign Pulmonary Diseases." Winning a certificate of merit for laryngology, otology, and rhinology were Dr. J. Dudley Singleton, Dr. Louis E. Adin, Jr., Dr. Ralph S. Clayton, Lewis B. Waters, and Patricia O'Neill, Dallas. This exhibit was on "The Temporal Bone—An Anatomic and Clinical Study."

COUNTY SOCIETIES

Armstrong-Donley-Childress-Collingsworth-Hall Counties Society

May 19, 1954

(Reported by Carter Holcomb, Secretary)

Obstructive Diseases of Children—William Pickett, Dallas.

Armstrong-Donley-Childress-Collingsworth-Hall Counties Medical Society met with the woman's auxiliary on May 19

for a dinner in Wellington. E. W. Jones, Wellington, gave a report on the recent meeting of the Texas Medical Association, which he attended as delegate.

The scientific part of the program was given as outlined above with an open discussion from the floor following the presentation by Dr. Pickett.

Bee-Live Oak-McMullen Counties Society

April 26, 1954

Condition of Hip—J. E. Upshaw, Corpus Christi.

The Bee-Live Oak-McMullen Counties Medical Society met on April 26 at Beeville for a short business meeting. Dr. Upshaw gave the above paper, showing slides with the presentation.

Bell County Society

June 9, 1954

(Reported by F. M. Hammond, Secretary)

Diagnosis and Treatment of More Common Malformations of Heart—Dan G. McNamara, Houston.

At the June 9 meeting of the Bell County Medical Society in Temple, I. D. Ellis, Troy, and J. G. Jenkins, Temple, were elected honorary members of the society. The following committee was appointed to study the feasibility of establishing a permanent roentgen-ray unit for Bell County: Harry Frey, Belton, chairman, and W. O. Arnold, E. E. Seedorf, James Wilson, Joel H. Johnson, and James Moore, all of Temple.

The scientific program as outlined above was presented.

Brazoria County Society

May 27, 1954

(Reported by Carlos E. Fuste, Jr., Secretary)

Vaginal Pruritus—Karl John Karnaky, Houston.

Brazoria County Medical Society met May 27 at Freeport for dinner and to hear the scientific program as presented above. The next meeting of the group will be in September.

Cameron-Willacy Counties Society

May 17, 1954

(Reported by Harry A. Miller, Executive Secretary)

Diagnosis and Treatment of Gastric Ulcer—F. C. Pannill, Houston.

The Cameron-Willacy Counties Medical Society met in Harlingen on May 17 for dinner with the woman's auxiliary. After the dinner and a short business meeting in which James Clarke, Harlingen, was named medical director for the Southwest Blood Bank, the above scientific program was heard. Dr. Pannill showed slides with his paper.

Cass-Marion Counties Society

May 13, 1954

Diseases of Thyroid Gland—Henry Carney, Texarkana.

Cass-Marion Counties Medical Society met with its woman's auxiliary on May 13 for dinner at Texarkana. Following the dinner Dr. Carney addressed the society on the above subject.

Dallas County Society

May 11, 1954

(Reported by Glenn D. Carlson, Secretary)

Changing Concepts in Management of Pulmonary Tuberculosis—D. O. Shields, McKinney.

Nephropathy Following Medical Treatment of Peptic Ulcer—Joseph C. Ogle, McKinney.

The Dallas County Medical Society met at the Baylor Hospital Auditorium in Dallas on May 11. After hearing medical economics news, the above outlined scientific program was presented by Dr. Shields and Dr. Ogle, members of the staff of the Veterans Administration Hospital, McKinney. Doctors newly elected to membership in the society are Kenneth W. LaRue, Dallas; Marvin H. Bartlett, Garland; Robert A. McCall, Dallas; Warren E. Hancock, Dallas; Stanley L. Gilbert, Dallas; Ward George Dixon, Dallas; and James R. Phillips, Grand Prairie.

June 8, 1954

(Reported by Glenn D. Carlson, Secretary)

Panel Discussion: Concurrent Disease in Pregnancy

Diabetes Mellitus—William F. Mengert, moderator, George M. Jones, Howard K. Crutcher, and Douglas M. Haynes, Dallas.

Rubella—Don G. Harrel, moderator, Stewart A. Fish, Jack H. Kamholz, and Joe V. Moody, Dallas.

Dallas County Medical Society met on June 8 at the Methodist Hospital, Dallas, with members as dinner guests of the medical staff of the hospital. The above outlined scientific program was presented after medical economics news and announcement of the following new society members: James E. Ensey, Robert George Budd, Alexander B. Humes, Milam B. Pharo, Glendon A. Hoffman, Marion Jack Williams, and Irene Marie Stayer.

East Harris County Society

May 4, 1954

Diseases of the Ear, Nose, and Throat—John H. Barrett, Houston.

East Harris County Chapter of the Harris County Medical Society met on May 4 in Houston. An open discussion of the Salk poliomyelitis vaccine was held before the presentation of the above program.

Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Society

May 18, 1954

Surgical Conditions of Chest—Roy T. Lester, Abilene.

Medical Conditions of Chest—M. C. Bessire, Abilene.

Eastland - Callahan - Stephens - Shackelford - Throckmorton Counties Medical Society met on May 18 in Breckenridge for dinner with the woman's auxiliary. After a business meeting, the above scientific program was heard.

Hale-Floyd-Briscoe-Swisher Counties Society

May 11, 1954

(Reported by John C. Long, Jr., Secretary)

Hale-Floyd-Briscoe-Swisher Counties Medical Society met in Amarillo on May 11. "Coarctation of the Aorta," a motion picture, was shown and discussed by a member of the surgical service of Plainview Hospital and Clinic.

Nueces County Society

May 11, 1954

(Reported by G. S. Ahern, Secretary)

Recent Advances in Vascular Surgery—Denton Cooley, Houston.

Nueces County Medical Society held a joint meeting with the medical officers of the United States Naval Air Station on May 11 at the Naval Air Station hospital auditorium, Corpus Christi. The combined group heard the above scientific program.

Tarrant County Society

May 20, 1954

(Reported by S. W. Wilson, Secretary)

Present Status of Artificial Insemination—Robert P. McDonald, Fort Worth.

Tarrant County Medical Society met in Fort Worth on

May 20 to hear the above scientific program and a report from the delegates to the Texas Medical Association on the recent convention.

During the meeting tribute was paid to E. H. Bursey, Fort Worth, who died on May 11.

Tom Green-Eight County Society

May 10, 1954

(Reported by Joe L. Cornelison, Secretary)

Common Sense in Peripheral Vascular Disease—William J. Block, San Antonio.

Tom Green-Eight County Medical Society met in San Angelo on May 10 and heard the above scientific program. Prior to the presentation of the program a business meeting was held. John E. Ballard, San Angelo, was elected chairman of the military affairs committee. A permanent disaster committee composed of Robert A. Morse, chairman; Lacey Smith, Gus F. Eckhardt, Harry F. Round, William H. McCaw, Sam Gainer, and Edward Sattenspiel, was appointed.

The Tom Green County Crippled Children's Society requested the medical society to invite the Crippled Children's Division of the State Health Department to hold a clinic in San Angelo this fall, and the society voted to do so.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

May 11, 1954

(Reported by S. E. Thompson, Secretary)

Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society met May 11 at New Gulf with thirty-six members and the woman's auxiliary present. They heard Mr. Williams, federal narcotics agent, speak on narcotics and its problems as related to the physician.

DISTRICT SOCIETIES

Seventh District Society

June 18, 1954

(Reported by William F. McLean, Secretary)

William F. McLean, Austin, was elected president of the Seventh District Medical Society at its June 18 meeting at Green Shores on Lake Austin. Roy H. Morris, Jr., Elgin, was elected vice-president, and John Rainey, Austin, was elected secretary-treasurer. The doctors and their wives had a boat ride on the Riverboat Commodore for their annual summer meeting.

Fourteenth District Society

June 1, 1954

(Reported by L. W. Johnston, Secretary)

Feeding Problems of Infancy and Childhood—Logan U. Mewhinney, Dallas.
Treatment of Common Dermatoses in General Practice and in Pediatrics—J. B. Howell, Dallas.
Amenorrhea—C. F. Hamilton, Dallas.
Carcinoma of Endometrium—J. B. Griffin, Dallas.
Disorders of Back—Paul C. Williams, Dallas.
Carcinoma of Tongue—Charles L. Martin, Dallas.

The Fourteenth District Medical Society met on June 1 in Denton to hear the above program which was sponsored by Southwestern Medical School of the University of Texas, Dallas. Speakers at a noon meeting with the auxiliary were F. J. L. Blasingame, Wharton, President of the Texas Medical Association, and Mrs. Mark H. Latimer, Houston, President of the Woman's Auxiliary to the Texas Medical Association.

Newly elected officers of the district are J. David Thomas, Denton, president, and D. W. Freeman, Denison, vice-president. L. W. Johnston, Terrell, was reelected secretary-treasurer.

AUXILIARY SECTION

COUNTY AUXILIARIES

The *Galveston County Auxiliary* had a program for future nurses on April 20, which was designated by the president, Mrs. Andrew J. Magliolo, Dickinson, as "Career in Nursing Day" in Galveston County. Future nurses were models for a style show "Cavalcade of Nursing Stars," and honor guests were mothers of the girls.

Cass-Marion Counties Auxiliary met in Hughes Springs on March 10 and heard Mrs. Eva Robitaile, American Red Cross nurse, speak on "Home Nursing."

Ellis County Auxiliary heard Mrs. E. W. Coyle, San Antonio, President of the Woman's Auxiliary, at the March 16 meeting. Mrs. B. C. Wallace, Jr., and Mrs. Herbert Donnell, both of Waxahachie, were elected delegates to the state convention; Mrs. W. P. McCall, Ennis, and Mrs. Mayo Tenery, Waxahachie, were elected alternates. Mrs. Coyle also spoke to the *Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Auxiliary* at a meeting in Eagle Pass on March 12. Mrs. L. M. Cartall, Del Rio, was installed as president.

Travis County Auxiliary heard a program on "Know Your Community" at the March 16 meeting in Austin. Representatives of the Vocational Rehabilitation Division of the Texas Education Agency, the YWCA, and two hospital auxiliaries explained the work of their organizations in helping those in distress.

Cherokee County Auxiliary honored the society with a dinner on March 23 for Doctor's Day. Dr. Hardy Kemp, Baylor University College of Medicine, Houston, spoke on "Education for Professional Responsibility." *Andrews-Ector-Midland Counties Auxiliary* met with the society on March 18 for dinner, and each doctor was presented a boutonniere in observance of Doctor's Day. New president of the auxiliary is Mrs. M. J. Loring, Midland. Another group honoring the society for Doctor's Day was the *Jasper-Newton Counties Auxiliary,* which had a dinner at the home of Dr. and Mrs. A. J. Richardson, Sr., Jasper, on March 17. Mr. Ward Markley, county attorney, spoke to the group about phases of juvenile delinquency.

April 2 guest speaker for *Grayson County Auxiliary* was Dr. Edgar S. Ezell, Fort Worth, who spoke on "Juvenile Delinquency."

The Port Arthur unit of the *Jefferson County Auxiliary* was honored on March 16 by members of the Otwitanda

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. E. W. Coyle, San Antonio; President-Elect, Mrs. Mark H. Latimer, Houston; First Vice-President (Organization), Mrs. John D. Gleckler, Denison; Second Vice-President (Physical Examinations), Mrs. Cecil O. Patterson, Dallas; Third Vice-President (Today's Health), Mrs. Ralph B. Payne, Amarillo; Fourth Vice-President (Program), Mrs. Guy Knolle, Houston; Recording Secretary, Mrs. Paul Brindley, Galveston; Corresponding Secretary, Mrs. Charles L. McGehee, San Antonio; Treasurer, Mrs. Oscar M. Marchman, Jr., Dallas; Publicity Secretary, Mrs. Allen H. Neighbors, Jr., Austin; Parliamentarian, Mrs. H. S. Renshaw, Fort Worth.

Campfire Girls. This group sponsors the Campfire Girls in Port Arthur.

Tarrant County Auxiliary met on May 14 in Fort Worth for a demonstration of corsage making and installation of officers.

The *Navarro County Auxiliary* met in the home of Dr. and Mrs. S. J. Barron, Corsicana, on May 7 to hear Mrs. Paul H. Mitchell and Mrs. C. L. Gary, Jr., report on the convention in San Antonio. The auxiliary met in the home of Dr. and Mrs. William Miller, Corsicana, June 4. Included in the business session was a discussion of the coming Twelfth District meeting, which will be in Corsicana, and a legislative report. It was reported that fifty-three men in homes for the aged would be remembered by the auxiliary on Father's Day. Mrs. Ben Griffin, Frost, gave two Louis Bromfield readings for the entertainment portion of the program.

At the April 20 meeting of the *Kleberg-Kenedy Auxiliary* held in the home of Dr. and Mrs. W. A. Ewert, Kingsville, Mrs. Ewert was elected president. Mrs. F. B. Higgins, Kingsville, was elected secretary and Mrs. L. E. Ramey, Kingsville, was elected treasurer.

McLennan County Auxiliary heard J. A. Moore, executive assistant in physical medicine rehabilitation service at the Veterans Administration Hospital, Waco, speak at the April 28 meeting in Waco. Mr. Moore outlined the modern pattern of treatment of mentally disturbed persons. Mrs. Eldon Fine, Waco, was named delegate and Mrs. J. C. Dunlap, Waco, alternate delegate.

Mrs. Haskell D. Hatfield was installed as president of the *El Paso County Auxiliary* at the May 10 meeting in El Paso.

The May 11 Temple meeting of the *Bell County Auxiliary* featured Judge J. K. Evetts, Belton, as guest speaker. Judge Evetts' talk, which was on juvenile delinquency, stressed the obligations of parents to provide their children not only with material necessities, but with the giving of time, companionship, and understanding.

Kerr-Kendall-Gillespie-Bandera Counties Auxiliary has chosen Mrs. Russell Guill, Kerrville, as president for the coming year.

Hutchison County Auxiliary honored the graduating seniors of the Future Nurses Clubs of their county on May 23 with a tea.

The *Bexar County Auxiliary* met at the Medical Library, San Antonio, on April 9, and had over one hundred guests for its annual guest day. Presidents of local civic organizations and presidents of auxiliaries of the surrounding counties were invited. Judge Raymond Gerhardt spoke to the group on "Juvenile Delinquency." Bexar County Auxiliary met on May 21 in San Antonio for installation of officers.

Potter County Auxiliary hosted the District 3 Auxiliary when it met in Amarillo on April 14. Mrs. W. C. Barksdale, Borger, was elected district council woman.

Cooke County Auxiliary celebrated Doctor's Day on March 30 with a buffet dinner in honor of the Cooke County Medical Society in the home of Dr. and Mrs. Vincent C. Cirone, Gainesville.

Dawson-Lynn-Terry-Gaines-Yoakum Counties Auxiliary held a business meeting after the April 7 dinner with the society in Brownfield. Mrs. C. Skiles Thomas, Tahoka, was elected president.

Angelina County Auxiliary honored the society with a dinner on April 14 in Lufkin.

EXECUTIVE BOARD AND WORKSHOP

The fall Executive Board meeting and Workshop for County Presidents will be held in Austin at the Texas Medical Association headquarters building, September 22-23. On September 22, state committee meetings are scheduled for the morning, and the Executive Board meeting is scheduled for that afternoon, with county presidents invited to attend.

The Workshop for County Presidents will be given the morning of September 23, and a luncheon and showing of films will be at noon. Round-table discussions will be held that afternoon.

A ten mile ride up Lake Austin on the Riverboat Commodore with dinner at the Green Shores picnic grounds is planned for the evening of September 22.

Everyone planning to attend is asked to make hotel or motel reservations as early as possible.

DEATHS

H. G. GARRETT

Dr. Henry Grady Garrett, Dallas, Texas, died at his home on June 28, 1954, of myocardial infarction.

The son of J. O. and Elizabeth Garrett, Dr. Garrett was born August 18, 1890, in Kosse. He attended Trinity University, then at Waxahachie, and was graduated in 1919 from Baylor University College of Medicine, then in Dallas. Dr. Garrett interned at Parkland Hospital, Dallas, and did postgraduate work at Polyclinic, Chicago, in 1921, and Charity Hospital of Louisiana, New Orleans, in 1936. He practiced in Pilot Point from 1920 until 1922, when he moved to Dallas. He was a general practitioner, specializing in pediatrics and obstetrics.

A member of the Texas and American Medical Associations through Denton County and Dallas County Medical Societies continuously throughout his career, Dr. Garrett was also a member of the American Academy of General Practice and Dallas Southern Clinical Society. He was a member of the Masonic Lodge, being a Shriner, and the Kiwanis Club. Dr. Garrett was an elder in the St. Andrew's Presbyterian Church. He received the 1954 Alumni Service Award from Trinity University of San Antonio.

Dr. Garrett and the former Miss Bernice Ewing were married on October 2, 1919, in Dallas. She survives, as do a daughter, Mrs. J. Averett Waller, Dallas; a sister, Mrs. J. L. Parks, Amarillo; five brothers, Leonard Garrett, Guy Garrett, and Sanford Garrett, of Marlin, R. L. Garrett of Irving, and Ross E. Garrett of Lubbock; and two grandsons.

W. DEATHERAGE

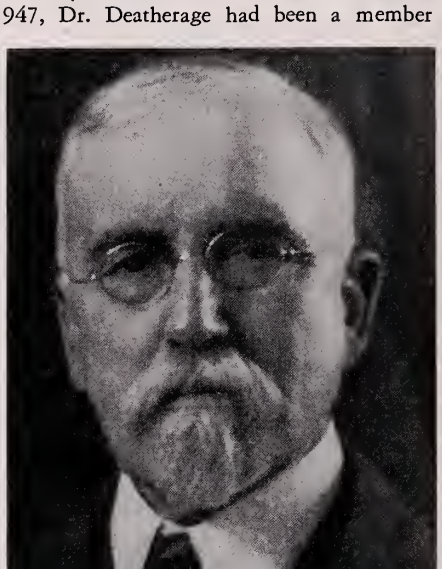
Dr. William Deatherage, Dallas, Texas, died June 10, 1954, in a local hospital after a two-year illness.

Born in Grayson County, near Bonham, on August 8, 1860, Dr. Deatherage was the son of John English and Hannah (Campbell) Deatherage, who had come to Texas from Tennessee in a covered wagon in 1852. In the days when a man became a doctor by studying as an apprentice,

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

Dr. Deatherage began his study of medicine and later attended the old Eclectic Medical College, Cincinnati, Ohio, from which he was graduated in 1886. After practicing for several years in Bells, where he made most of his calls on horseback, Dr. Deatherage returned to school and was graduated in 1895 from the Marion-Sims College of Medicine, which later became the St. Louis University School of Medicine. He then moved to Dallas and practiced there until 1950, when he went into semiretirement. He had a stroke in 1952 and had been bedridden since that time.

An honorary member of the Texas Medical Association since 1947, Dr. Deatherage had been a member of the



Dr. William Deatherage

Texas and American Medical Associations through Dallas County Medical Society almost continuously since 1907. He was a member of the Methodist Church. The saddlebags which Dr. Deatherage used in his early career were on display at the Texas Centennial at Dallas in 1936.

Dr. Deatherage and the former Miss May W. Cole were married in 1893 in Dallas. Mrs. Deatherage died ten days after the death of her husband. Surviving are a daughter, Mrs. Paul Taylor, Dallas; a son, Dr. W. R. Deatherage, Lubbock; three grandsons; and two great-grandchildren.

G. W. SCOTT

Dr. George Warren Scott, Irving, Texas, died of bronchogenic carcinoma on April 1, 1954, in that city.

Born in Indianola, Iowa, on December 25, 1911, Dr. Scott was the son of Mr. and Mrs. John Scott. He attended Morningside College, Sioux City, Iowa, and the State University of Iowa, Iowa City. He attended the State University of Iowa College of Medicine, Iowa City, and the University of South Dakota School of Medical Sciences, Vermillion, and was graduated from the University of Arkansas School of Medicine, Little Rock, in 1937. Dr. Scott interned at the Charity Hospital, Shreveport, La. He practiced in Waxahachie and Hamilton for a short time before moving in January, 1939, to Tishomingo, Okla. While in the United States Army Medical Corps in Honolulu, Dr. Scott served a residency in surgery in 1943.

Dr. Scott was a captain in the United States Army Medical Corps from 1941 to 1946, serving in the Pacific area for forty-four months during World War II. He was battalion surgeon and assistant chief of surgery with the Twenty-Fourth Division at Oahu and served as battalion surgeon with the Fortieth Division. Dr. Scott was awarded the bronze star, medical combat badge, Philippine liberation ribbon with one bronze star, Asiatic-Pacific ribbon with three battle stars, bronze arrowhead for three assault landings, American defense ribbon, victory ribbon, and seven overseas bars for his service during World War II.

Dr. Scott returned to Tishomingo in 1946 and moved to Irving in 1952. He was a member of the Texas and American Medical Associations through the Dallas County Medical Society while practicing in Texas. Dr. Scott was a member of Phi Gamma Delta fraternity, the Masonic Lodge, and the Presbyterian Church.

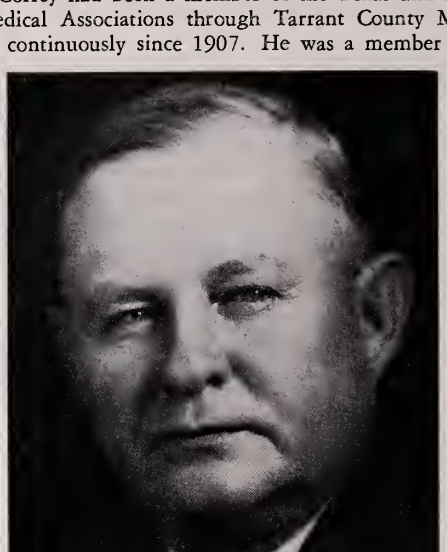
Dr. Scott and Mrs. Elizabeth Broyles were married April 22, 1938, in Shreveport, La. He is survived by his wife; a daughter, Mrs. Frank W. Cole, Conroe; and a brother, Clark I. Scott, Southbury, Conn.

A. COFFEY

Dr. Alden Coffey, Fort Worth, Texas, died at his home of a heart attack on May 26, 1954.

Born in Farmersville on February 16, 1884, Dr. Coffey was the son of William H. and Annice (Cooper) Coffey. He attended the old Fort Worth Medical School and was graduated from Vanderbilt University School of Medicine, Nashville, in 1906. He did postgraduate work in Paris in 1925.

Dr. Coffey had been a member of the Texas and American Medical Associations through Tarrant County Medical Society continuously since 1907. He was a member of the



Dr. Alden Coffey

Thirteenth District Medical Society and the Fort Worth Academy of Medicine. He was a fellow of the American College of Surgeons, and a member of Phi Beta Pi medical fraternity and the Congregational Church. Dr. Coffey organized the Coffey Clinic in 1924. He had been district surgeon for the Texas and Pacific Railway, Pullman Company, and Fort Worth Transit Company. He was senior surgeon emeritus at St. Joseph's Hospital. Dr. Coffey, an active golfer until 1940 when he suffered a heart attack, is considered the "father of Fort Worth golf." He was instru-

mental in bringing the National Open Golf Tournament to Fort Worth in 1941, and he had been president of the Fort Worth Golf Association for three years. He was past president of River Crest Country Club and a member of the Fort Worth Club, Exchange Club, and Colonial Country Club.

On June 12, 1906, Dr. Coffey and the former Miss Maud Polly were married in Wichita, Kan. He is survived by his wife; two sons, William R. Coffey, Weatherford, and Alden Coffey, Jr., Palos Verdes, Calif.; a sister, Mrs. W. E. Bush, Harlingen; and a brother, W. Herman Coffey, Orange.

C. A. AULT, JR.

Dr. Charles Aaron Ault, Jr., Dallas, Texas, died in a local hospital of a heart attack on April 1, 1954.

The son of Mr. and Mrs. Charles A. Ault, Sr., Dr. Ault was born in Houston on October 30, 1913. He attended Rice Institute and was graduated from Baylor University College of Medicine, Dallas, in 1937. He interned and took his residency in medicine at Baylor Hospital, Dallas, after which he practiced in Dallas for one year prior to entering the Army Medical Corps in 1941. He served as a lieutenant colonel in the South Pacific during World War II and returned to Dallas in 1946, practicing there until the time of his death.

Dr. Ault had been a member of the American and Texas Medical Associations through Dallas County Medical Society since 1940. He was a member of Alpha Omega Alpha

DR. CHARLES A. AULT, JR.

honorary medical fraternity, Phi Alpha Sigma medical fraternity, and the Christian Church.

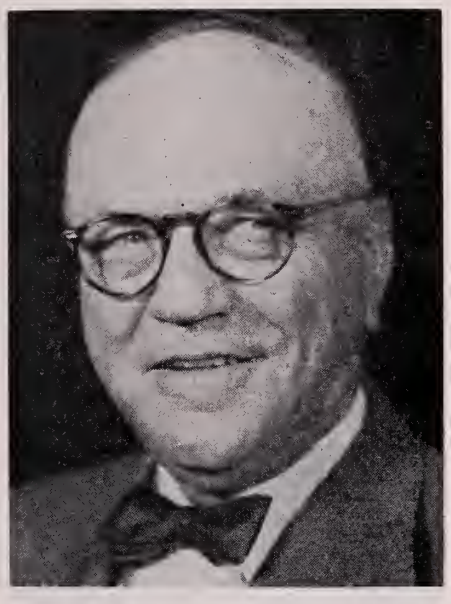
Dr. Ault and the former Miss Lenora Robertson, a graduate of Baylor University School of Nursing, were married on June 20, 1939. Dr. Ault is survived by his wife and a son, Charles Aaron Ault, III, Dallas, and his parents, Houston.

C. C. NASH

Dr. Cleveland Crumby Nash, Dallas, Texas, died on June 14, 1954, in Dallas of a ventricular fibrillation.

Born on April 14, 1884, in Limestone County, Dr. Nash was the son of Thomas Monroe and Nancy (Pearce) Nash. He attended Sam Houston State Teachers College, Huntsville, and was graduated from the Washington University School of Medicine, St. Louis, in 1907. He interned at the Barnard Free Skin and Cancer and St. Louis City Hospitals for two years and began his practice in Palestine in 1909. Dr. Nash had practiced in Dallas since 1922.

A member of the Texas and American Medical Associations almost continuously since 1904, Dr. Nash had belonged to the Jefferson, Anderson, and Dallas Counties Medical Societies and served as councilor of the Eleventh District in 1915 and the Fourteenth District from 1941



DR. C. C. NASH

through 1948. He was a member of the American Academy of Neurology and the Texas Surgical Society. He belonged to the Masonic Lodge, Knights Templar, and Shrine, and was a member of the Baptist Church. He was a charter member of the Dallas Athletic Club.

He and the former Miss Jewell Middlebrook were married on February 9, 1911, at Hope, Ark. She survives, as do two sons, Cleve C. Nash, Jr., Ph. D., Syracuse, N. Y., and Dr. Tom Nash, Dallas; two daughters, Mrs. Joe Belden, Dallas, and Dr. Jane Nash Higbee, Austin; two brothers, H. E. Nash, Austin, and Jeff D. Nash, San Antonio; two sisters, Mrs. S. W. Puckett, Dallas, and Mrs. W. E. Pitts, San Antonio; and ten grandchildren.

J. C. THOMAS

Dr. John Calhoun Thomas, Austin, Texas, died at his home of hepatic insufficiency on May 17, 1954.

Dr. Thomas was born June 26, 1884, in Rogers, the son of James E. and Annie (Berry) Thomas. He attended Rogers public schools and was graduated from the University of Texas School of Medicine, Galveston, in 1908. He practiced at Temple from then until 1914, when he moved to Taylor, where he built and operated the Taylor Sanatorium until 1917. Dr. Thomas was a captain in the Army Medical Corps from 1917 to 1919, serving with a base hospital in France. In 1919 he entered private practice in Austin.

Dr. Thomas had been a member of the Texas and American Medical Associations almost continuously throughout his career. He was elected an honorary member of the state organization in 1953. A charter member of the present

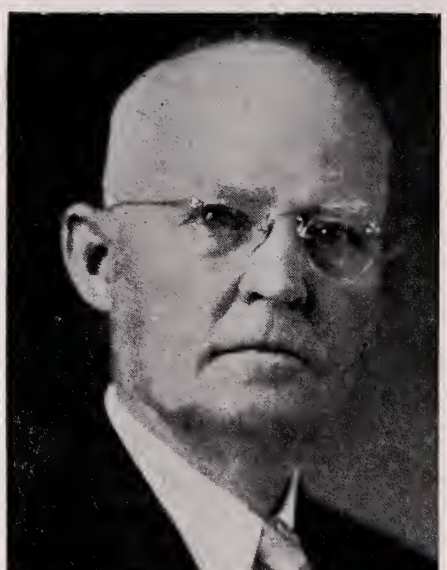
Travis County Medical Society, he was secretary in 1921-1922 and president in 1943. He also belonged to the Seventh District Medical Society. He was a former fellow of the American College of Surgeons. He was a member of Alpha Omega Alpha honorary medical fraternity. Dr. Thomas was an avid supporter of and worker for the new St. David's Hospital in Austin, which is now under construction.

He is survived by his wife, the former Miss Mary Fulton, whom he married in Temple on November 5, 1911. Also surviving are a daughter, Mrs. Brown Booth, Houston; a son, Dr. John F. Thomas, Austin; his mother, Rogers; a sister, Mrs. Byron Hammersmith, Belton; a brother, Mike Thomas, Temple; and nine grandchildren.

D. PRICE

Dr. Don Price, Athens, Texas, died on April 20, 1954, at his home of cancer.

The son of William P. and Martha (Rouse) Price, Dr. Price was born on October 12, 1875, at Kosse. He attended the Limestone County schools and entered the old Trinity University, Fort Worth, in 1894. He was graduated from the Baylor University College of Medicine, then in Waco, in 1904, later taking special courses in eye, ear, nose, and throat at Tulane University of Louisiana School of Medicine, New Orleans. Beginning his practice in Centerville, he practiced in Concord, Seale and San Antonio before moving in 1919 to Athens, where he practiced until the time of his death.



DR. DON PRICE

A member of the Texas and American Medical Associations since 1905 with the exception of a few years, Dr. Price was the secretary of Henderson County Medical Society from 1936 until 1952, when he served as president. He had been city health officer of Athens for ten years, Henderson County health officer for fifteen years, chairman of the local American Red Cross for several years, and examining physician of the Selective Service board in Henderson County. For this he received four certificates of appreciation from the President of the United States and one medal from Congress. A member of the Masonic Order, Knights Templar, and Shrine, he was past commander of the Taylor Commandery. He was a member of the Baptist Church.

Dr. Price is survived by his wife, Mrs. Rena (Matthews) Price; one son, Myrl Price, Athens; two daughters, Mrs. Kirk Willingham, Austin, and Mrs. Emrys Jones, Dallas; one brother, J. R. Price, Dallas; and one sister, Mrs. Howard Ruland, Dallas.

E. H. BURSEY

Dr. Ernest Harmon Bursey, Fort Worth, Texas, died there May 14, 1954, of rheumatic heart disease with acute pneumonia.

Dr. Bursey was the son of William Allen and Amanda Bursey and was born August 27, 1887, in Fort Worth. He went to the old Polytechnic College there, attended the University of Texas, Austin, and was graduated from the University of Texas School of Medicine, Galveston, in 1914. Dr. Bursey did postgraduate work at Harvard Medical School,

DR. E. H. BURSEY

Boston, and the Mayo Clinic, Rochester, Minn. He began his medical career in 1914 in Weatherford, where he was city health officer one year, and moved in 1916 to Fort Worth, where he practiced until the time of his death.

Affiliated with the Texas and American Medical Association through Tarrant County Medical Society continuously since 1916, Dr. Bursey was a member of the Thirteenth District Medical Society and Southern Medical Association also. He was a fellow of the American College of Surgeons, a member of the Fort Worth Academy of Medicine, and on the staffs of Harris and St. Joseph's Hospitals. He belonged to the Phi Chi medical fraternity, Masonic Lodge, Knights of Pythias, and Presbyterian Church. Dr. Bursey was a golfing enthusiast, being a charter member of the Colonial Country Club in Fort Worth. He felt close to the soil because of his boyhood on a farm and owned cattle ranches first near Springtown and then near Keller, where he bred registered Herefords. He was especially interested in soil and water conservation.

Dr. Bursey and the former Miss Florence McDonald Blunt were married on June 1, 1914, in Galveston. She survives; as do three children, Mrs. W. Kent Mitchell, Ernest Harmon Bursey, Jr., and William Fred Bursey; five grandchildren; and two brothers, J. W. Bursey, and A. P. Bursey, all of whom live in Fort Worth.

President's Page

FINANCING MEDICAL EDUCATION

The financing of medical education is an issue of major importance to our Association and to each of us as an individual physician.

The growth in modern scientific medicine has been phenomenal; teaching and research have required an increase in manpower and physical facilities. To bring about this needed increase, more than $100 million in 1954 will be spent in capital investments for the nation's medical schools.

At the national level, the Council on Medical Education and Hospitals has the largest budget of any council or bureau of the American Medical Association. In our State Association we have a similar council which studies the problems of education and hospitals as related to medical teaching and practice in Texas.

A modern medical school is considered to be needed for each 2 to 2½ million people, and we are fortunate to have three medical schools in Texas. Baylor University College of Medicine is supported totally by philanthropy and tuition, whereas the two state schools are supported by taxation and income from public lands, gifts, and tuition. It is my understanding that approximately 50 per cent of the plant investment and expenditures of the University of Texas is given over to medical and allied facilities.

The three medical schools in Texas had an enrollment of undergraduate students of 1,354 last year. Each of our medical schools is about as large as is usually considered appropriate for the best teacher-student relationship. If our state population continues to increase, as we have reason to expect, consideration in the not distant future will have to be given to the establishment of another medical school in Texas.

The National Fund for Medical Education recently estimated the average cost per student per year in the larger medical schools to be $3,339. The average cost in the three Texas schools is about $3,500, according to information recently furnished.

It is estimated that currently $16 million additional funds annually are necessary to assist the medical schools to meet reasonable needs in teaching and research.

To help meet this need, the American Medical Education Foundation was organized by the AMA in 1951 to contact the medical profession for funds. These have been added to funds gathered from business and industry by the National Fund for Medical Education, which was incorporated by the last Congress and given the prestige of a charter similar to the American Red Cross. Since the formation of these organizations three years ago, approximately $7 million has been disbursed to the medical schools of our country, including grants in Texas totaling $270,540. These funds, not restricted like tax monies, are available for immediate purchase of audiovisual equipment and other special purposes at the two state medical institutions, and Baylor has found its grant equal to the amount necessary to operate its library for the year.

If funds are not forthcoming to help meet needed expenses, federal funds may be sought for support. Thus, another item will be added to the federal tax load, coupled with the possibility of governmental controls and regulation.

It is disappointing to learn that physicians of Texas are not contributing their proportionate share toward the support of medical education. In 1953 Texas physicians donated $21,411 by contributing $8,930 to the AMEF and $12,481 directly to the nation's medical schools, according to the AMEF annual report. Less than 10 per cent of the physicians of Texas supported medical education by contributions in 1953; in contrast 22.5 per cent of the physician population of the United States contributed.

I believe that Texas physicians will want to give their fair share when the facts are better understood. Each physician owes a debt to society for his training, and he should express for it his gratitude by contributing personally to the financing of medical educational facilities. I should like to suggest that you consider a contribution to the American Medical Education Foundation. The gift is tax deductible and can be earmarked for the medical school of your choice or for the Foundation's general fund.

T. J. L. Blasingame, M.D.

Give to the American Medical Education Foundation

REPORT OF COMMITTEE ON PUBLIC RELATIONS: During Executive Council meeting, Austin, September 3 through 5, the Committee on Public Relations met and saluted new chairman, Dr. William M. Crawford of Fort Worth. Dr. Crawford succeeds Dr. Troy A. Shafer, Harlingen, who became member of Board of Trustees during annual session last May.

The committee, including Drs. Van D. Goodall, Clifton, and H. M. Anderson, San Angelo, welcomes the following new members: Dr. A. Fletcher Clark, Jr., San Antonio; Dr. Glenn D. Carlson, Dallas; and Dr. Raleigh R. Curtis, Temple.

Interesting sidelight of Executive Council week end was Friday night meeting of inter-professional representatives, including key officials of the Texas Dental Association, the Texas Pharmaceutical Association, the State Department of Health, the Texas Graduate Nurses Association, the Texas League for Nursing, the Chiropodists Society of Texas, Inc., the Texas State Veterinary Medicine Association, the Group Hospital Service, the Texas Public Health Association, and the Texas Joint Commission for the Improvement of the Care of the Patient. The group heard Dr. F. J. L. Blasingame, host-association President, and other officers and members of the Texas Medical Association express the desire and belief that such meetings could do much to strengthen inter-professional relationships between all members of the health profession in the state of Texas. Recommended areas which might be explored for cooperative action included legislation, inter-professional grievance procedures, the exchange of information, and programs designed to improve the care of the patient.

Highlighting the Council meeting was the presentation to Dr. A. L. Thomas, Ennis, of one of the highest honors that Texas doctors can bestow upon a fellow member of their profession. Dr. Mayo Tenery, Councilor of

District 14, presented Dr. Thomas with the plaque naming him Texas' General Practitioner of the Year.

Now available from the central office are two sets of drop-card presentations which illustrate and form outline for members of the Speakers' Bureau. The presentation, entitled "Expanded Services for You," is a complete resume of the Association, its facets and services to societies and to the individual doctor.

In addition to the Speakers' Bureau, the central office can provide Audio-Digest tapes, select scientific films, and telephone broadcasts to implement the programs of county societies. List of available topics sent upon request.

FROM OVER THE STATE: The Smith County Medical Society sponsored a thirteen week radio series during the summer called "June, July, and August." The public information program spotlighted emergency measures to take during the summer months when injury and accidents so frequently occur--explained treatments for insect bites, fever, and summer diseases.

Success inspired another sequence entitled, "Tea for Three." This AMA radio series contains thirteen question and answer programs of public interest. Topics discussed include nail biting, allergies, the common cold, overweight, and graying hair.

Soon to celebrate its one hundred and first anniversary, the Travis County Medical Society is launching a vigorous public relations program. Eight monthly television programs will feature panel discussions covering every phase of medicine and will acknowledge allied professions with representatives as guest panelists.

Public health forums to be launched in late October bid for keen lay interest with such titles as "Why Do People Die in Austin?" Initial forum will set off health fair, open house, and anniversary special newspaper section.

TIP OF THE MONTH

Psychologically, there's a jagged break in the ideal doctor-patient relationship when a patient with a minor ailment is dispatched with a prescription after one visit to the doctor. "How can the doctor tell whether the medicine helped me or not?" wonders the patient. Many doctors solve this problem by handing such patients self-addressed post cards, asking them to report on their condition in a day or two. It's a friendly "let me hear from you" gesture.

NURSES TO BE HONORED

Although the total number of active nurses and students enrolled in schools of nursing is greater than ever before in history, there remains a shortage of nursing personnel.

To help meet a major problem facing an increasingly health-conscious America, that of bringing the supply of nursing personnel into better balance with the demands for nursing service, a resolution designating October 11-16 as National Nurse Week passed both houses of Congress and was signed by President Eisenhower on August 23.

As a means to interpret nursing more fully, serve as a basis for a wide variety of community projects throughout the nation, stimulate student nurse recruitment, and dramatize the service which nurses are performing in all types of health and hospital programs, the observance will honor the professional nurses of America on the one hundredth anniversary of Florence Nightingale's historic service to the sick and wounded in the Crimea.

Emphasis will follow the positive approach, pointing out the contributions nursing personnel is making to the nation's health, welfare, and defense, but the week affords an excellent opportunity to spearhead recruitment. Activities in connection with the annual affair will be coordinated by a committee composed of representatives of the sponsoring organizations, American Medical Association, American Nurses Association, National League for Nursing, American Hospital Association, and the United States Department of Defense, Department of Health, Education, and Welfare, and Veterans Administration.

What can the individual physician do to help the nursing situation? The Committee on Careers of the National League for Nursing recommends that physicians keep at hand up-to-date information about the opportunities for nurses, the types of educational programs, and other important facts so that they may counsel patients or the sons and daughters of patients who turn to their doctors for advice about entering nursing. Also, having available nursing career materials in the patients' waiting room

is an effective aid to recruitment. Members of women's auxiliaries have similar responsibilities in disseminating nursing information and in recruitment.

Even though the nursing supply of the nation has been increasing steadily each year, it is estimated that between 50,000 and 65,000 professional nurses are needed immediately to meet essential demands for nursing service.

In the five years from 1948 to 1953, the number of professional nurses in hospitals and schools of nursing increased 12 per cent, and with an increase of 46 per cent in the number of practical nurses and auxiliary workers, there were approximately 30 per cent more nursing personnel caring for hospitalized patients in 1953 than in 1948. However, physicians are well aware of the effect on the nursing situation created by the increase in the population of the United States, the greater number of persons who go to hospitals, the more rapid turnover of patients, the expansion of hospital facilities, the increased number of physicians in the nation, the extension of public health service, the requirements of military services and other government agencies, the shorter working hours for nurses, and the like.

The need for more and better nursing care in our hospitals and health agencies is acute, and it is a problem touching every person who uses nursing service, whether directly or indirectly. The first National Nurse Week not only will focus attention on the achievements of nurses but also will spotlight the desirability of adding qualified persons to that profession.

BETTER TO SERVE YOUR COMMUNITY

Many people feel that members of the medical profession have held themselves aloof from civic organizations. Some are very active, but the doctors who do not participate in service groups have given the impression that doctors as a whole are interested only in persons providing a means of income or those sharing their profession.

Although a doctor is one of the busiest professional men, there are those who find time to enter wholeheartedly into civic, church, and service fields without hurting their practice. Belonging to these organizations is not only beneficial public relations–wise, but the doctor can find that rather than draw him away from his family, joining certain groups can actually help strengthen family ties. Boy Scouts, school boards, alumni associations, YMCA, and YWCA are a few which can help the professional man keep up with interests which he and his children can and should share.

Finding time not only to join groups but to participate enthusiastically and accept positions as officers is a challenge to some. Still others make such good officers of local groups that they are elected to official jobs in statewide organizations. There are members of the Texas Medical Association who have served and are serving as mayors of their cities. In almost any city or town, regardless of size, there is one large entertainment program each year, whether it is a parade, a livestock show, a cotton or strawberry festival, or something else. A few physicians head committees or help organize and back the shows on these occasions.

By sharing common interests with persons who are unable to discuss professional experiences, a hobby club can provide a means of activity in which a doctor can make new friends.

Veterans organizations feel that members of the medical profession who share their background of service to their country have not accepted their responsibility in the organization and formulation of policy of veterans' associations. Doctors have failed to realize that, by taking no part in the management and membership of a group, they cannot expect it to be run the way they feel it should be. Because of the doctor's educational background and responsibility as a citizen, he should strive to help guide others about health needs and problems.

A large number of physicians are members

and officers of lay bodies of their chosen churches. In most instances this affords an excellent opportunity for the doctor and his wife to work together.

Of course, a doctor cannot join a lot of organizations and expect to keep up with his practice and medical societies. It is better for him to be an active member of two groups than to be an inactive member of five. To be a member of a group and not attend meetings and participate in the activities can be worse public relations than not being on the roll of any. Holding an active interest in not only the medical world but also in the civic, religious, and service world can assure the layman that the doctor has accepted his responsibility to his community as both a physician and a citizen.

TIME FOR GIVING

Autumn brings united community drives for funds to operate certain services which deserve general support. As has been pointed out, community chests and united funds are safeguards against too much governmental control; they provide means to take care of ourselves and our neighbors without looking to government for help. If this independent and localized solution to health, welfare, and character building problems is to suffice, however, each person must feel some responsibility to share in it.

The budgets for united campaigns are arrived at after careful study not only by the benefiting agencies but also by volunteer civic leaders familiar with community needs and resources.

For those who choose to handle their philanthropy individually, the community fund drive is a reminder that they have a responsibility and privilege to share in charitable activities and that they should reach some decision as to what contributions they wish to make during the year. For most, the community fund itself is a welcome answer to much of the question because of the care that has marked its budgeting, the reduction of overhead expense possible through a single campaign, and the saving of time otherwise lost in a multiplicity of solicitations.

PROGRAM HELPS AVAILABLE

County medical society presidents and secretaries this month are receiving a brochure outlining some of the specific program aids which the Texas Medical Association is prepared to offer, including speakers, recordings of scientific material, and motion pictures.

Many county medical societies of medium or small membership recently have indicated that they would welcome assistance in the development of good programs, and the brochure is an effort to meet this expressed need. Although most of the facilities listed in the brochure have been available for some time, special committees have reviewed them and have chosen topics and materials of special current interest for consideration by program committees in the county societies.

The first section of the brochure calls attention to a speakers bureau operated by the Texas Medical Association in cooperation with the larger county medical societies and the University of Texas Postgraduate School of Medicine. A speaker on almost any scientific or socio-economic topic related to medicine as well as on any phase of medical organization can be obtained on thirty days' notice.

A series of tape recordings of lectures prepared by the Audio-Digest Foundation of California have been added to the collection of the Memorial Library of the Texas Medical Association, and additional tapes will be obtained as they become available. Nonillustrated lectures require only a standard tape player accommodating twin-track material at 3.75 inches per

second. Some of the recordings are accompanied by 2-by-2-inch illustrative slides.

Recordings of nine postgraduate broadcasts transmitted by telephone in 1952, 1953, and 1954 under auspices of the Council on Medical Education and Hospitals of the Texas Medical Association and two additional discussions arranged by the council also are available, either on tapes as described in the preceding paragraph or on disks playing at 33⅓ r.p.m.

Fifty-six select motion pictures chosen by a special committee of Travis County Medical Society from the collection of the Memorial Library are recommended in the program brochure. These and other 16 mm. films, silent or sound, black and white or color, may be borrowed by county medical societies or individual members.

The only expense to county societies taking advantage of the Texas Medical Association program helps is the payment of shipping charges one way on recordings and motion pictures.

Recognition by county medical society officers of the program facilities available to their groups from the state organization and fullest use of these facilities may help solve some problems. Requests for further information will be answered promptly by the central office staff.

CURRENT EDITORIAL COMMENT

THE DOCTOR AND ACCIDENT AND HEALTH INSURANCE

What kind of accident and health insurance protection is most suitable for a doctor?

A doctor's earning span starts later, is therefore shorter, and is more intensified than that of most other persons. At middle age a doctor is working harder and usually under more strain than persons in most other pursuits. Likely it will take him several years longer than the reasonably successful business man to reach an economic peak.

People in active productive life face three principal dangers: premature death or dying too soon; economic death, which may result from living too long; and disability due to accident or sickness.

Inevitable death and taxes can be prudently provided for through life insurance and sound financial planning. But, just as a birth certificate means an eventual death certificate, for most people a life span also includes the uncertainties of accident or illness.

At a time when the doctor is increasingly productive and his personal responsibilities mount at a rapid rate, he often is too heavily burdened with work and too lightly thoughtful in regard to security. A physician in this position, if he should be stricken by accident or illness that curtails his practice, usually stands in much graver economic jeopardy than a patient who is a corporation official and whose ulcers may be said to be an occupational hazard.

Chances are, the business executive has a salary continuation plan where he works or an individual income protection policy with an insurance company. Or if he's incapacitated, his business may continue to pay him a monthly return. But could the average doctor face his own occupational hazard with the same financial equanimity?

Statistics indicate how much a physician is worth in earning power. The American Medical Association's Bureau of Medical Economic Research says the average net income from medical practice for doctors amounted to $11,058 in 1949, or just under $1,000 per month. Being laid up for two years would mean a loss of income of nearly $24,000. Even being disabled

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and others closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions preferably should be between 300 and 500 words in length.*

for two months would mean a $2,000 earning loss.

Assuming complete recovery, chances are, savings or investments would be substantially dipped into—if there were no income protection present.

A doctor doesn't stumble on an insurance program by accident. It is carefully tailored to fit him. Some doctors develop their own programs, buying a number of policies that will give adequate protection when put together. Others prefer to put the programming in the hands of a competent insurance man or broker.

With either approach there are some basic facts about disability insurance a physician should know.

Many professional medical organizations have group accident and health plans in which the doctor may participate. This form of group accident and health insurance has the fewest restrictions and the lowest premiums. Chances are, however, the physician will want and need some additional tailor-made protection.

If this is the case, there are noncancellable and cancellable individual income protection policies on the market. A noncancellable policy costs more, but it is guaranteed renewable up to 60 or 65 years of age. As long as the premiums are paid, the company can neither cancel nor refuse to renew.

Both the noncancellable and cancellable are good policies. In addition to loss of income benefits, both types usually pay lump sums for accidental death or dismemberment. Monthly or weekly benefits for sickness are usually paid for from two to five years—in some cases longer—and for lifetime when an accident is the cause of total disablement.

So that insurance is not, in effect, written on a "burning house," exclusions are necessary for a person with an ailment existing at the time the policy is taken out. There is sometimes a waiting period, in the case of illness, before the beginning of benefit payments. Mental disease is often excluded. In many policies distinction is made between total and partial disability, the benefits being greater if disability is total. In partial disability a further distinction is made regarding the ability of a person to perform in his own occupation or any gainful occupation. There is often a difference in benefit payment depending on whether the disability is confining or nonconfining.

With a few noncancellable policies, a medical examination is necessary. All answers on the application generally become a part of the contract, and, of course, falsification regarding the status of the applicant's health may lead to cancellation. After an accident or during an illness, proof of disability statements must be sent to the insurance company.

Overinsurance is as undesirable as underinsurance. Usually, 75 per cent of net income is considered optimum. Some companies will attempt to determine this on the application form, and if an individual is overinsured or would tend to make a profit on a disability, the company will not issue the policy or will limit it. Since benefits are not taxable, up to 75 per cent of net income will enable the physician's family to maintain the essentials of its living standard.

These facts and principles, with a few exceptions, apply as well to many other forms of health insurance with cash benefits—hospitalization, surgical benefits, medical payments, major medical expense, and accident policies.

The theory of such insurance is simple. The elements are a risk; a group of people, either individually or collectively, who want security; and an organization to collect, safeguard, and disburse the premiums. Insurance, or security in action, means a steady flow of money to pay bills and maintain a standard of living.

HEALTH INSURANCE COUNCIL,
Chicago, Illinois.

Acute Diseases of the Liver

JOHN R. KELSEY,* M.D., Houston, Texas

VARIOUS acute diseases of the liver and their treatment are discussed in this paper.

VIRAL HEPATITIS

Viral hepatitis is the most frequent form of acute liver disease. Of these viral agents, the most common is that of infectious hepatitis. This disease is recorded as occurring in epidemic form during almost every military engagement in history. It is spread by fecal contamination of food. The disease is endemic in certain areas and occurs in epidemic form in as high as 50 to 75 per cent of the personnel when troops are moved into endemic areas.

Homologous serum jaundice occurs as a result of parenteral transmission of virus through either whole blood or pooled serum. Unsterilized or poorly cleansed syringes can inadvertently transmit the infection. Sborov,[6] in a study conducted in the Korean hostilities, found that serum hepatitis occurred in more than 20 per cent of the wounded soldiers receiving blood and plasma. Neefe,[5] in a recent study of blood donors who had no known history of hepatitis, demonstrated asymptomatic blood carrier state in 5 persons. The proof of the carrier state of serum hepatitis in blood donors indicates the great need for careful screening of donors, as well as the need for new screening methods.

TABLE 1.—*Differences Between Infectious and Serum Hepatitis.*

	Infectious	Serum
Fever	+	Rare
Incubation period	20-45 days	45-150 days
Transmission by ingested feces	+	—
Parenteral transmission	+	+
Homologous immunity	+ (1 yr. +)	+ (18 mo. +)
Heterologous immunity	—	—
Gamma globulin protection	+	—
Carrier state	+	++
Mortality rate	0.01-0.20	0.2-20.0%

Adapted from Snell, A. M.: Viral Hepatitis and Public Health, California Med. 67:69-77 (Aug.) 1947.

The difference between infectious and serum hepatitis is outlined in table 1.

Infectious mononucleosis is thought to be a virus infection. The hepatitis which occurs in this disease is seldom of primary importance. Of these patients 20 to 40 per cent develop abnormal liver function, and 5 to 10 per cent develop physical signs of hepatitis.

Yellow fever is a virus infection which is now extinct in this country. Hepatitis associated with this disease accounted for a high mortality rate in epidemics of the past.

Clinical Forms

As it is impractical to identify the offending viral agent causing hepatitis, the diagnosis is made on the basis of clinical manifestations and nonspecific liver function tests.

Without respect to the causative agent, several clinical patterns of acute viral hepatitis are seen. The typical form has an onset similar to influenza, lasting a few days to two weeks before the appearance of jaundice. Anorexia, malaise, generalized aching, and right upper quadrant discomfort are the characteristic early symptoms. The development of dark urine, light stools, and jaundice brings the patient to the doctor. Low grade fever and generalized pruritus are occasional symptoms. Physical examination often reveals an enlarged, tender liver. In about 20 per cent of the patients there is a palpable spleen and in some cases ascites can be demonstrated. The white blood cell count ranges from 3,000 to 10,000 per cubic millimeter. The Bromsulphalein excretion test is the first liver function test to become abnormal. Bilirubinemia develops; then the thymol turbidity and cephalin flocculation tests become positive. The disease usually lasts from two weeks to two months with recovery in almost every case.

Anicteric hepatitis is another form of acute viral hepatitis. The clinical manifestations are similar to the previous form except clinical jaundice is absent. Detection is dependent upon laboratory tests. The flocculation tests are abnormal, but the serum bilirubin is only slightly elevated. This form is benign and is commonly seen in children and young adults.

Cholangiolitic hepatitis is another form of viral hepatitis which usually runs a more chronic course. The laboratory findings are similar to those of extrahepatic obstruction with elevation of serum alkaline phosphatase and decreased fecal urobilinogen. The flocculation tests which are positive in hepatocellular disease are commonly normal in this form. For this

Presented before the Texas Society of Gastroenterologists and Proctologists, San Antonio, May 3, 1954.

*Clinical Assistant Professor of Medicine, Baylor University College of Medicine.

reason, the diagnosis is often confused with extrahepatic biliary obstruction, and surgery may be erroneously prescribed.

Rarely viral hepatitis may progress rapidly to death in a few days. This form, which was described previously as acute yellow atrophy, probably represents a fulminating form of acute viral hepatitis.

BACTERIAL DISEASES

Bacterial infections of the liver occur secondary to intra-abdominal infections. Suppurative hepatitis is a septic disease, and the manifestations of liver disease are of secondary importance. With the advent of antibiotic drugs, these conditions are seen frequently.

SPIROCHETAL DISEASES

Leptospiral infections have become increasingly important as causative agents in liver disease. Leptospira icterohaemorrhagiae (Weil's disease), Leptospira canicola (canicola fever), Leptospira pomona (swineherd's disease), and other strains have been identified in the United States.[9] Rodents, dogs, swine, cattle, and horses are animal carriers of the Leptospira. Water, food, and moist soil contaminated by urine from infected carriers may contain pathogenic Leptospirae after a period of several weeks. The infection occurs through mucous membranes, cuts, or skin abrasions. The digestive action of gastric juice or pasteurization destroys Leptospirae. This disease is an occupational hazard of dock workers, veterinarians, butchers, and sewer workers. Epidemics have occurred in swimmers bathing in contaminated water.

The classical type of Weil's disease has an incubation period of eight days with early clinical features of malaise, fever, and influenza-like syndrome. Darkfield demonstration of the spirochete in the blood will establish the diagnosis. Later, hepatomegaly and jaundice develop and the blood agglutinations become positive. The mortality of the disease is 15 to 20 per cent in the icteric cases. In milder forms of the disease, 50 per cent are anicteric. Some show neurologic, cutaneous, or pneumonic features.

Leptospirosis is frequently missed as the diagnosis is made by laboratory means. Gochenour[2] described the difficulty encountered in laboratoty tests and pointed out that too few laboratories in the United States offer these facilities. These diseases are more common in this country than is generally believed. I have had occasion to see 3 leptospiral infections in the Veterans Administration Hospital in Houston during last year.

PARASITIC INFESTATIONS

Amoebic hepatitis occurs in approximately 5 per cent of the cases of amoebiasis. Onset is sudden with severe pain and tenderness in the liver area. A septic course with fever to 104 F. with a leukocytosis up to 30,000 leukocytes per cubic millimeter is common. Frequently there is a history of amoebic infection of the bowel. These patients characteristically respond to emetine or chloroquine therapy.

Amoebic abscesses of the liver differ from amoebic hepatitis in their clinical symptoms. These abscesses may be single or multiple. The onset is often vague with poorly localized physical signs. Pain in the liver area may be dull or sharp with characteristic percussion tenderness. There is elevation and immobilization of the diaphragm radiologically. Jaundice or other signs of liver failure are unusual, as there is only focal involvement of the liver rather than a diffuse hepatic cellular damage. About one-third of patients with amoebic abscesses may present themselves for diagnosis after the abscess has extended to the pleura or pericardium or to an adjacent abdominal viscus. The diagnosis of amoebic abscesses of the liver is often difficult. Complement fixation tests for amoebiasis are difficult to obtain and unreliable. A therapeutic test with chloroquine or emetine when an amoebic abscess is suspected is an important diagnostic procedure.

Hepatitis occurs commonly in malarial infections. It has been observed in malarial patients who have had only a single febrile bout. Jaundice in malarial patients in the past was thought to be due to blood hemolysis caused by the malarial parasite. Now it is apparent in some cases that the jaundice was on the basis of hepatitis. With the advent of new rapidly acting antimalarial drugs, it has become evident that the treatment of the hepatitis is as important as eradication of parasitemia. Hepatitis should be looked for in all cases of malaria.

TOXIC AGENTS

Acute liver disease may be produced by a variety of toxic agents as outlined in table 2. The clinical manifestations of toxic hepatitis may be similar to those of viral hepatitis. There is usually a shorter prodromal period and more intense gastrointestinal

TABLE 2.—*Agents Capable of Producing Toxic Hepatitis.*

Category of Agents	Examples
Chemical agents	
Therapeutic drugs	Arsphenamine
	Cinchophen
	Chloroform
Industrial hazards	Carbon tetrachloride
	Trinitrotoluene
Household poisons	Chlordane
	Phosphorus
Bacterial toxins	Pneumococcus
	Salmonella
Biological toxins	Mushroom toxins
	Snake venom
	Incompatible sera
Unidentified toxins	Toxemia of pregnancy
	Toxemia of burns

symptoms. Symptoms of respiratory or central nervous system involvement are common. Diagnosis is dependent upon a history of exposure to one of the toxic agents.

It is of current interest and importance that the newer insecticides and agricultural chemicals can produce toxic hepatitis. Household insecticides containing chlordane may be ingested accidentally by children, producing toxic hepatitis. In Houston chlordane spray is used to combat insects. Commonly groups of children follow trucks down the street bathed in a fog of chlordane. One would expect toxic effects if sufficient exposure occurs. Several roach poisons containing phosphorus are household hazards. Toxic hepatitis from this source is commonly encountered by Houston pediatricians.

VASCULAR CATASTROPHES

Lastly, acute liver disease may be on the basis of an occlusive vascular phenomenon. An acute infarct in the liver may result from inadvertent surgical ligation of the hepatic artery, or it may be secondary to a disease process involving the hepatic artery, such as mycotic aneurysm or periarteritis.

Another vascular catastrophe which can occur in the liver is thrombosis of the hepatic veins. This condition described by Chiari usually occurs in polycythemia or is secondary to cirrhosis or metastatic liver disease. Thrombotic occlusion of the portal vein, pylephlebitis, is fatal in most instances as the liver is deprived of its principal source of blood supply. With the advent of antibiotics, this condition is rarely seen, but in the past it was a common cause of the fatal outcome of acute appendicitis or other intra-abdominal infection. The vascular phenomena accounting for acute liver disease, though unusual, are frequently diagnosed today before death and actually can be proved by newer catheterization techniques.[7]

TREATMENT

Because acute diseases of the liver are similar in nature and no specific treatment has been found to be singularly effective, treatment is centered around symptomatic, nonspecific measures.

Nonspecific Therapeutic Measures

Rest is one of the most important treatments. Inactivity allows a greater volume of blood circulation to the liver. The reduced metabolic demands from inactivity also play a large part in the therapeutic value of bed rest. Routinely, I advise bed rest with bathroom privileges until jaundice is cleared and liver function begins to return to normal. Ambulation is usually allowed at this time. It is desirable for the liver function tests to return to normal before the patient resumes his usual activities.

Diet is equally important in the treatment of liver disease. Patients have varying degrees of anorexia. The degree of anorexia often serves as a prognostic sign of the patient's outlook. A patient with deep jaundice and severely deranged liver function who has a fair appetite has a good chance for complete recovery. I use every influence to encourage these people to eat more. I ask them to try to eat even if it brings tears to their eyes. Although there has always been some dispute about the composition of the liver diet, I believe that the quantity is the most important aspect. One should use as an aim 3,000 calories intake in five or six feedings. Approximately 80 to 100 Gm. of fat is necessary to make the diet palatable and maintain biliary drainage. In liver failure, conversion of ammonia to urea is impaired. On this basis, some have advocated omitting meat products and nitrogenous substances, particularly where serious derangement of liver function is suspected.

Vitamins, protein digests, choline, and methionine are supplementary dietary agents commonly given to patients with liver disease. An adequate, well balanced diet undoubtedly contains sufficient amounts of these substances so that additional amounts are of no real value except for psychological effect. Choline and methionine preparations, brewer's yeast, and occasionally multivitamin preparations are offensive to the patient and may reduce their food intake. When the patient finds them disagreeable, they are best omitted.

Vitamin K therapy is indicated in the presence of prothrombin deficiency. The basis of the deficiency may be poor absorption of the fat soluble vitamin K. A water soluble oral preparation or parenteral administration of 5 mg. daily will correct this defect. I routinely use one of the multivitamins which contains vitamin K. If the prothrombin deficiency is on the basis of poor assimilation due to liver damage, as large a parenteral dose as 72 mg. daily may fail to restore the blood clotting mechanism.

ACTH and cortisone recently have been used in the treatment of acute liver disease. The early reports indicated favorable improvement of the clinical symptoms and decrease in the serum bilirubin. This was not borne out in later reports of larger series studied. In a series of 32 treated patients and a similar group of control patients studied at the Veterans Hospital at Hines, Ill., there was no difference in the duration of the disease. In a few instances it was believed that the hormone was of immediate temporary value in increasing the food intake. It was felt that the routine use of hormones in the treatment of hepatitis was contraindicated, as some of the complications of therapy with ACTH are more severe and threatening to

life than hepatitis. I have reserved the use of this drug for selected severely ill patients whose food intake has been poor.

Sulfonamides, morphine, and barbiturates are poorly tolerated in patients with liver damage. It is advisable to exercise caution when they are given and avoid their use when practical.

Aureomycin and other antibiotics have been used as nonspecific therapeutic agents in liver disease. Although the early reports were largely favorable, they have not proved to be of value except in specific bacterial infections of the liver.

Specific Therapeutic Measures

Certain specific therapeutic agents are indicated in the treatment of some acute liver diseases.

Antibiotics may be curative in suppurative hepatitis. The effectiveness of an antibiotic depends upon the sensitiveness of the infecting bacteria.

Penicillin was claimed to be of therapeutic value in the treatment of leptospiral infections, but in a study of 79 cases treated with antibiotics singularly and in combination, Hall[3] concluded that none of them used were of any value. Despite the questionable value of antibiotic treatment of leptospiral diseases, they are usually employed on the basis of their proven in vitro effectiveness. Therapy is instituted early in the course of the disease, which requires initiation of therapy before leptospirosis has been proved by laboratory tests.

Emetine and chloraquine are specific agents to be used in amoebic infestations of the liver. Chloraquine has replaced emetine in therapy as it is more effective than emetine without the toxicity of emetine. It is important to use in combination therapy for intestinal amoeba when present.

Quinine and pentaquine are effective in the treatment of malarial hepatitis. It is important not to overlook the fact that nonspecific therapeutic measures also are indicated.

The treatment of toxic hepatitis is primarily the prophylactic avoidance of exposure to known toxic agents. When toxic hepatitis occurs, it is imperative to remove the person from the source of exposure. If the exposure is due to accidental ingestion, ridding the gastrointestinal tract of the offending agent is indicated. BAL is of value in toxic hepatitis due to metallic intoxications of arsenic, gold, and bismuth.

HEPATIC COMA

Hepatic coma occurs in cases of severe liver failure and represents the end stages of acute liver disease. Drastic alterations of the body physiology occur similar to those described by Mann and Bollman in animals in which the liver has been surgically removed. Treatment consists of parenteral alimentation with large amounts of glucose and vitamins. Hypokaliemia occurs and as much as 120 milliequivalents of potassium parenterally may be needed each day. Oxygen and blood are given. Antibiotics and cortisone are used occasionally. Nursing care and close attendance by the physician are imperative. It is wise to avoid nitrogenous substances, as there is a characteristic rise in the blood ammonia in hepatic coma. Sodium ion exchange resins containing ammonia likewise should be avoided. Recently Walshe[8] has reported the favorable effect of glutamic acid administration to patients with hepatic coma. It is thought that glutamic acid binds ammonia to form glutamine which is metabolized without liberating ammonia. Adequate clinical evaluation of the use of glutamic acid is not yet available.

Despite the most vigorous and careful treatment, the outlook of hepatic coma remains very poor. About 90 per cent of such patients have a fatal outcome.

SURGERY ON DIABETICS

Dr. Charles R. Shuman, Temple University Hospital and School of Medicine, Philadelphia, said in the June 12 *Journal of the American Medical Association* that surgery has become as safe for the diabetic as for the nondiabetic. He reported on a three-year study of 340 patients who underwent 373 operations while under the supervision of the hospital diabetic service.

There were no deaths directly resulting from diabetes or its treatment, Dr. Shuman said. Complications of diabetes were more frequent in this study because most of the patients were more than 45 years old.

CHOLECYSTIC DISEASE AND ITS COMPLICATIONS

R. L. SANDERS,* M. D., LL.D., F. A. C. S., Memphis, Tennessee

WHEN a surgeon is confronted with a patient whose symptoms suggest an upper abdominal disorder, his first thought is often of cholecystitis. In the vast majority of cases its presence can be proved or disproved easily, whereas in the remainder he may be in doubt even after an exhaustive study. Once the diagnosis of cholecystic disease is made, however, his second thought concerns the treatment. From an observation of more than 4,000 private patients with cholecystitis, of whom more than 1,200 were treated surgically, I have found that several considerations are involved in the choice between medical and surgical management. This is especially true of the chronic type of the disease.

CHRONIC CHOLECYSTITIS

Although indigestion and epigastric colic are the outstanding symptoms of chronic cholecystitis, they are by no means universal. Some patients, particularly those in the younger age group, have colic but good digestion between attacks. Others have indigestion but no colic. Yet another group do not have colic but, instead, a more or less severe and constant ache in the epigastrium, generally with distress after meals.

The distinction between calculous and noncalculous cholecystitis is rarely possible by the history and physical examination. Patients with the noncalculous type may have colicky pain, though usually not like typical gallstone colic. In the typical case of calculous cholecystitis, the pain is severe, beginning either suddenly or, more often, gradually, and radiating from the right costal margin to the back, to the right, or even to the left side of the flank. Not infrequently, the colicky attacks are accompanied by some degree of jaundice. Approximately 20 per cent of my patients have observed this condition.

On physical examination, deep tenderness in the right upper quadrant may be the only positive evidence of either calculous or noncalculous cholecystitis. As a rule, the gallbladder is impalpable, especially in obese persons. Even though a mass is discovered, it may represent an enlarged liver or right kidney, a distorted and thickened omentum, a tumor of the colon or pancreas, or some other pathologic condition. The diagnosis, therefore, must rest upon the history and roentgenogram.

The chief diagnostic problem lies in those cases wherein the symptoms are not clear and the roentgenogram fails to reveal positive evidence of gallbladder disease. Not infrequently, the clinical picture suggests some other disorder. For example, cholecystitis which is accompanied by pain on the right side of the ilium is likely to be confused with appendicitis, and that which produces epigastric pain and discomfort after meals is easily mistaken for duodenal ulcer. If either appendicitis or an ulcer is associated, a correct evaluation of the mixed history and findings may be impossible. This is also true of a coexistent gastrointestinal irritability, pancreatitis or hepatitis, or diaphragmatic hernia.

In a number of cases cholecystitis gives rise to pain in the left upper quadrant, leading one to suspect heart disease. A helpful point in the distinction between the two conditions is the fact that the pain of cholecystitis is not related to effort, as is usually true of angina pectoris. In heart disease, moreover, local tenderness is not elicited on abdominal palpation. The electrocardiographic tracings are useful in clarifying the question, although not conclusive, since an abnormal tracing may be observed in cholecystitis. It is well to remember, too, that the diagnosis of cholecystitis may be obscured by some type of concurrent cardiac lesion.

Treatment

The choice between medical and surgical treatment in chronic cholecystitis rests largely upon the presence of stones. As a rule I do not recommend surgery for patients with chronic noncalculous cholecystitis, having found that the results often are disappointing. Probably an average of 35 per cent of those who have a noncalculous gallbladder removed are troubled later with biliary dyskinesia or the so-called postchlecystectomy syndrome.

The postoperative symptoms at times may be produced by overlooked stones in the ducts or reformed stones in the cystic duct remnant, or by an associated cholangitis, hepatitis, or pancreatitis. More often, they are due to removal of the gallbladder on no other basis than poor function. Although the poor function may arise from a disturbance of the sphincteric mechanism, the underlying cause probably will be found in a psychogenic disorder, some abnormal constitutional state, or an organic disease outside the gallbladder. However, if a total loss of gallbladder function is demonstrated and is accompanied by definite, severe, and persistent symptoms; if jaundice is present or the patient gives a history of jaundice; or if pathologic changes in the liver or pancreas are suspected, one may feel justified in removing the

*Senior Surgeon, Baptist Memorial Hospital.

gallbladder despite the fact that no stones are shown in the roentgenogram. Not infrequently in such cases stones will be found in the gallbladder or obstructing the duct or both.

In my opinion, the presence of gallstones is itself ample indication for cholecystectomy. This is true even though the patient has little symptomatic evidence of cholecystitis and the function of the gallbladder is essentially normal. Left undisturbed, the stones may be expected sooner or later to give rise to complications which materially increase the dangers of operation and may even permanently impair the patient's general health.

ACUTE CHOLECYSTITIS

Since the vast majority of attacks of acute cholecystitis are induced by stones in the cystic duct, the possibility of this complication alone is a strong argument for removal of the calculous gallbladder. In the exceptional case, the acute attack is provoked either by angulation of the duct or by strangulation and edema from a chemical reaction, at times with a superimposed infection. In the latter type, the chemical reaction may be incited by a reflux of pancreatic secretion into the duct, though a concentration of bile salts in the biliary system is more likely to be responsible. In any event, an acute seizure of chemical origin frequently will subside under medical management, whereas one produced by obstruction of the cystic duct by a stone usually requires surgical treatment.

The diagnosis is made by the symptoms of upper abdominal pain generally radiating to the subscapular or interscapular region, nausea and vomiting, fever, and tenderness with rigidity over the gallbladder. A history of previous symptoms of cholecystitis, supplemented by the roentgen demonstration of a nonfunctioning gallbladder or stones, will assist in establishing the diagnosis.

Treatment

On the whole, the principles of treatment of acute cholecystitis do not differ from those of other acute abdominal disorders. In that small group of cases wherein the process is fulminant from the beginning, operation is obviously an emergency. In the less severe attacks, I believe that operation is performed best within the first forty-eight hours after the onset of the disease, in that the risk is usually slight and convalescence proceeds without incident. Since one cannot always tell from the clinical picture the exact status of the pathologic process, early operation may preclude a perforation and peritonitis. If, on the other hand, the patient is observed after forty-eight hours and the symptoms are not severe, the attack will be more than likely to subside under conservative treatment. If no evidence of abatement is apparent within seventy-two hours, however, surgery should be undertaken without further delay.

The findings which I regard as demanding immediate operation are (1) sustained pain; (2) the persistence of a palpable, tender mass in the right upper quadrant, with abdominal rigidity; (3) a systemic reaction evidenced by an elevation of temperature and a rising leukocyte count; and (4) lack of clinical improvement despite the use of supportive therapy. Sustained pain, abdominal rigidity, and a tender mass point to impending perforation and thus are positive indications for surgery. At times, the gallbladder may be so high under the costal margin that a tender mass is not palpable; even so, other manifestations will suggest the need for exploration.

COMPLICATIONS

Malignant degeneration is always a potential development in prolonged cholecystitis and particularly in the presence of stones. Various estimates have placed the incidence of carcinoma of the gallbladder in association with stones at 5 to 6 per cent of all calculous gallbladders. The average incidence is probably about 2 per cent. This is by no means a negligible figure, being, in my experience, higher than the mortality rate of cholecystectomy for chronic cholecystitis. It is in itself sufficient reason for removal of the gallbladder containing stones.

The most commonly observed complication of gallbladder disease is obstruction of the ducts by stones or inflammatory edema and consequent changes in the architecture of the biliary tree. If the obstruction is allowed to persist, the inevitable outcome is damage to the liver; the peripheral ducts and intercellular canaliculi become distended and rupture, the parenchyma undergoes degeneration, and gradually the liver cells throughout are distorted by the pressure, thus becoming atrophic. Ultimately, a state of hydrohepatosis is reached, a situation analogous to the hydronephrosis which follows blockage of the ureter. These same changes may take place in the presence of a functionless gallbladder incident to long standing chronic cholecystitis, with or without stones, wherein the ducts have taken over the gallbladder function and become enlarged.

In a like manner, obstruction of the ducts may lead to a more or less severe form of pancreatitis. I have observed pancreatitis in a large number of cases, at times so advanced as to be chiefly responsible for the symptom complex.

Because of the frequent association of duct obstruction with cholecystitis, and especially cholelithiasis, and its damaging effect upon the ducts, liver, and pancreas, the question of whether or not chole-

dochotomy should be performed often presents itself in operations upon the gallbladder. The ducts in 17 per cent of the cholecystectomies I have performed were opened and duct stones found in 73.5 per cent of the choledochotomies. The criteria for opening the ducts have been as follows: (1) a palpable stone in the duct; (2) abnormal dilatation of the duct; (3) a contracted gallbladder containing stones; (4) multiple small stones in the gallbladder and an enlarged, patent cystic duct; (5) flocculent bile, as determined by aspiration; and (6) jaundice or a history of jaundice.

Abnormal dilatation may indicate that the duct has taken over the function of the gallbladder following occlusion of the cystic duct, though more often it arises from obstruction of the distal end of the common duct. In other cases it may be secondary to a gallbladder infection and thus amenable to relief by cholecystectomy alone.

When one encounters a thick-walled gallbladder no larger than the thumb, one may be sure of a long standing disease. Even though the organ does not contain stones, they probably will be found in the ducts. Again, in the presence of multiple stones in the gallbladder and an enlarged, patent cystic duct, it is more than likely that small stones will have passed into the common duct.

Both flocculent bile and jaundice suggest an occlusion of the distal end of the duct by a stone, though other conditions, such as stricture, pancreatitis, spasm of the sphincter of Oddi, or a tumor, may produce a similar situation. Or, the jaundice may be intrahepatic in origin; this point, however, may be determined by laboratory studies and the history. Intrahepatic jaundice is not associated with colic, chills, and fever, as is usually true of jaundice incident to duct obstruction.

If the duct is to be opened, two precautions should be observed. First, the gallbladder should be removed prior to the choledochotomy; otherwise, stones may escape into the duct during manipulation of the gallbladder. Second, every possible means should be employed to clear the ducts at the time of exploration. The hepatic as well as the common duct should be searched thoroughly and the ampulla explored with scoops. After this procedure, I pass dilators through the distal end of the common duct to insure its patency, then insert a T tube and allow it to remain in situ for ten days to two weeks or longer.

An abnormal dilatation of the common duct arising from simple stricture of the distal end may require additional surgery to sidetrack the bile into the intestine. Even though the stricture may be incomplete, it is difficult to dilate the end of the duct sufficiently at the time of choledochotomy to insure continuous and ample drainage. Moreover, the dilated area tends to contract again and bring about another impediment to the flow of bile. This leads to a recurrence of the same pathologic condition; the original clinical picture is reproduced, and a second operation becomes necessary.

I have found that the obstruction in these cases is best relieved by choledochoduodenostomy. The procedure not only is comparatively easy from the technical standpoint but is physiologic in principle. All the bile is immediately made available in that part of the intestine where it normally empties, and intestinal function is restored soon. The first requisite to the operation is sufficient dilatation of the duct to permit a large stoma. By incision of both the duct and the duodenum in the longitudinal direction and side to side anastomosis, the stoma may be made of adequate length to preclude contraction and permit continuous bile drainage. Ascending cholangitis of an appreciable degree has not been observed following any of the operations of this type which have been performed by our clinic surgeons. The procedure also is applicable to obstructions by malignancies when resection is not feasible.

CONCLUSIONS

The complications of cholecystitis, that is gallstones, acute cholecystitis, perforation and malignancies of the gallbladder, duct obstructions, and damage to the liver and pancreas, are all the result of long standing disease. In addition to their permanent systemic effects, they increase the difficulty and dangers of operation and directly or indirectly are responsible for the vast majority of postoperative deaths. Early removal of the calculous gallbladder and the nonfunctioning, noncalculous gallbladder which produces severe symptoms affords protection against these complications and solves most of the problems of treatment before they arise.

ALFALFA SEED TEA NO CURE

Dr. William H. Kaufman, Roanoke, Va., warned against the drinking of alfalfa seed tea as a cure for arthritis in the July 17 issue of *The Journal of the American Medical Association*. The doctor stated that the two patients reported on suffered skin eruptions as a result of the home remedy and that 4 other possible cases have been found. He expressed belief that the custom of drinking the tea for curing arthritis, diabetes, and related disorders is apparently widespread but most patients will not admit that they have used it. Dr. Kaufman reported that the Council on Pharmacy and Chemistry of the AMA has received numerous questions about the value of alfalfa preparations in treating arthritis and diabetes and can find no evidence that alfalfa seed in any form will help.

CHEMOTHERAPY OF GONORRHEA
Clinical Observations in 201 Cases

HENRY E. MENDELL, Capt. (MC) USAF, Houston, Texas; CHRISTIAN G. WORNAS, Capt. (MC) USAF, Philadelphia, Pennsylvania; and DONALD L. FOXWORTHY, Capt. (MC) USAF, MacDill Air Force Base, Florida

THIS report concerns the chemotherapy of 201 cases of gonorrhea in military service personnel. All patients were observed and treated by us on an out-patient basis, in a general dispensary on Okinawa. Each case was followed for two months after completion of therapy. The successful use of penicillin,[3] streptomycin,[6] chlortetracycline (Aureomycin),[1] and oxytetracycline (Terramycin)[1] in the treatment of gonococcal urethritis has been recorded previously. A study using various dosage schedules of the antibiotics was adopted to compare the therapeutic effectiveness of each. An attempt was made to demonstrate resistance of the gonococcus to varied antibiotics by clinical means and to interpret the role of nongonococcal organisms in gonococcal urethritis.

METHOD

Two hundred one cases of gonococcal urethritis were selected at random and alternately treated with penicillin (crystalline penicillin G), streptomycin (streptomycin sulfate), chlortetracycline (Aureomycin), and oxytetracycline (Terramycin) using varied dosage schedules. In all cases, gram-negative intracellular Diplococci were demonstrated in the purulent discharge. We frequently checked the laboratory diagnosis. All nongonococcal urethritis was excluded. Treatment schedules of antibiotics using increasing total dosage were employed arbitrarily to ascertain the minimal total dose that would result in a 100 per cent cure rate and to demonstrate resistant gonococci in vivo by clinical means. The presence of nongonococcal organisms was reported routinely on all urethral smears to evaluate the role that they might play in gonococcal urethritis.

TABLE 1.—*Penicillin Treatment Schedules for Gonorrhea.*

Penicillin (IM)	No. Cases	Bacteriologic Relapse	Cures
300,000 U	14	5	9
300,000 U for 2 days	15	3	12
300,000 U for 3 days	14	0	14
600,000 U for 3 days	23	1	22
Total	66	9	57

Four penicillin schedules were used in 66 cases (table 1) ranging from one dose of 300,000 units of penicillin intramuscularly to 600,000 units intramuscularly for three days. All treatment failures with any of the penicillin schedules received 600,000 units of penicillin intramuscularly for three days.

Five streptomycin schedules were used in 54 other cases (table 2), ranging from 1 Gm. of streptomycin intramuscularly to 1 Gm. intramuscularly for five days. All treatment failures with these streptomycin schedules received 1 Gm. of streptomycin intramuscularly for three days.

TABLE 2.—*Streptomycin Treatment Schedules for Gonorrhea.*

Streptomycin (IM)	No. Cases	Bacteriologic Relapse	Cures
1 Gm.	13	2	11
1 Gm. for 2 days	14	3	11
1 Gm. for 3 days	18	1	17
1 Gm. for 4 days	5	0	5
1 Gm. for 5 days	4	0	4
Total	54	6	48

Three chlortetracycline (Aureomycin) schedules were used in 43 cases (table 3). These ranged from 250 mg. four times a day for one day to 250 mg. four times a day for three days. All treatment failures in the chlortetracycline (Aureomycin) group were given the 3 Gm. total dose.

TABLE 3.—*Aureomycin Treatment Schedules for Gonorrhea.*

Aureomycin	No. Cases	Bacteriologic Relapse	Cures
250 mg. q.i.d. for 1 day	6	3	3
250 mg. q.i.d. for 2 days	16	3	13
250 mg. q.i.d. for 3 days	21	0	21
Total	43	6	37

Three oxytetracycline (Terramycin) schedules were used in 38 cases (table 4): 250 mg. four times daily for one day; 250 mg. four times daily for two days; and 250 mg. four times daily for three days. All treatment failures received the 3 Gm. total dose.

RESULTS

Table 1 summarizes the number of cases treated with various penicillin dosage regimens, the number of bacteriologic relapses, and the number of cures. In the discussion, reference is always made to the total dose of antibiotic employed. There were cures in about two-thirds of the cases with a single 300,000 unit dose of penicillin. This increased to four-fifths

when 600,000 units was given, and to 100 per cent when 900,000 units was employed. The paradoxical relapse of 1 case treated with 1,800,000 units is unexplained (table 1). Repeated inquiry into this case brought continued denial of new sexual exposure. This case responded to another course of similar dosage. All cases of relapse responded to 600,000 units of penicillin given intramuscularly for three days. Cures in more than four-fifths of the 66 cases treated with penicillin are not significantly different from the results obtained with the other antibiotics.

Table 2 reveals that cures occurred almost uniformly when 3 Gm. of streptomycin was given and reached 100 per cent when 4 or 5 Gm. of streptomycin was given. All cases of relapse responded to 3 Gm. of streptomycin.

The results of treatment with chlortetracycline (Aureomycin) are shown in table 3. The use of 1 Gm. of chlortetracycline (Aureomycin) resulted in cures in one-half the cases. This increased to 100 per cent in cases treated with 3 Gm. All cases of relapse responded to 3 Gm. of chlortetracycline (Aureomycin).

The results of treatment with oxytetracycline (Terramycin) are shown in table 4. When a 1 Gm. dose

TABLE 4.—*Terramycin Treatment Schedules for Gonorrhea.*

Terramycin	No. Cases	Bacteriologic Relapse	Cures
250 mg. q.i.d. for 1 day	9	4	5
250 mg. q.i.d. for 2 days	12	1	11
250 mg. q.i.d. for 3 days	17	0	17
Total	38	5	33

was employed, there were cures in half the cases; with 3 Gm., 100 per cent cures. All cases of relapse responded to 3 Gm. of oxytetracycline (Terramycin).

Acute gonococcal urethritis studied in this group of 201 cases revealed many other bacteria on the gram stain smear. The gonococcus was seen alone in 29.5 per cent of the cases. It was associated with gram-negative rods in 37 per cent of the cases, gram-positive cocci in 16.5 per cent of the cases, and gram-negative rods and gram-positive cocci in 17 per cent. In 70.5 per cent of the group, bacteria other than the gonococcus were demonstrated on the same smear.

DISCUSSION

The plan was to treat an equal number of cases with each antibiotic dosage schedule, so that the comparative survey would have more statistical significance. The necessary elimination of many cases because of improper follow-up or other irregularities made this impossible. Also, we felt an obligation to the patient to adhere to the larger dosage schedules when relapses occurred with the smaller doses. Although 201 cases of acute gonococcal urethritis were treated, the actual number of cases treated with each dosage schedule was small. Nevertheless, it is thought that certain useful information was gained from the study.

Most urethral discharges that persist after adequate antibiotic therapy are not the result of bacteriologic relapse due to the gonococcus. In this group, many were due to the mechanical irritation of frequent urethral stripping and associated conditions such as stricture and prostatitis. The presence of a mixture of bacteria prior to antibiotic therapy is an interesting observation, and gram-negative rods and gram-positive cocci were observed to remain in urethral discharges after antibiotic therapy had eliminated the gonococcus. It is conceivable that such surviving bacteria may be the cause of persistent discharge, similar to a nongonococcal urethritis de novo. This emphasizes that careful smears should be made for gonococcal and nongonococcal organisms before one incriminates antibiotic failure. The administration of penicillin, streptomycin, chlortetracycline (Aureomycin), and oxytetracycline (Terramycin) resulted in rapid cessation of the purulent discharge, usually within twenty-four to forty-eight hours. At times a scanty mucoid discharge persisted for several days, but disappeared spontaneously. There was no significant difference in cure rates for the various drugs used, and no distinct therapeutic superiority of any one drug was noted (table 5). The low per-

TABLE 5.—*Comparison of Relapse Rates of Gonococcal Urethritis Treated with Various Antibiotics.*

Treatment	No. Cases	Cases of Bacteriologic Relapse	Cures
Streptomycin	54	6	48 (88.9%)
Terramycin	38	5	33 (86.8%)
Penicillin	66	9	57 (86.4%)
Aureomycin	43	6	37 (86.0%)
Total	201	26	175 (87.0%)

centage of total cures in this study (87 per cent) perhaps may be attributed to the smaller doses of antibiotics used initially. This was done to determine the minimal total dose that would result in a 100 per cent cure rate and as a clinical method to suggest bacterial resistance to the antibiotic.

From the data it appears that such optimal dosage is 900,000 units for penicillin; 4 Gm. for streptomycin; and 3 Gm. for chlortetracycline (Aureomycin) and for oxytetracycline (Terramycin). Penicillin and streptomycin resistant strains of gonococci have been produced in vitro.[4] There are case reports of gonococcal urethritis that failed to respond to large doses of penicillin.[2] Reports in the literature do not mention resistant strains of gonococci with

regard to chlortetracycline (Aureomycin) and oxytetracycline (Terramycin). A definite correlation was noted between the use of a larger total dose of antibiotic and an increase in the cure rate. This suggests variation in the sensitivity of the gonococcus to the antibiotic. However, when a large enough dose of penicillin, streptomycin, chlortetracycline (Aureomycin), or oxytetracycline (Terramycin) was employed, there were no bona fide cases of bacteriologic relapse by smear and stain technique.

When four equally effective antibiotics are available for therapeutic use, the choice other than from incidence of side reactions and economic considerations may depend upon other factors. Therapeutic masking of coexistent venereal disease is probably the most important factor in the treatment of gonorrhea. Where gonorrhea and a penile ulcer coexist, the use of streptomycin would neither mask nor interfere with the clinical and laboratory diagnosis of a syphilitic chancre, in distinction to the other three antibiotics. It is acknowledged that in 3 cases, Willcox has shown streptomycin to have some action on the Treponema pallidum in sustained dosage,[7] but it is certainly minimal in comparison with the other antibiotics mentioned. Scott stated that chlortetracycline (Aureomycin) in total dosage not exceeding 3 Gm. does not interfere with the serologic or dark field tests for syphilis.[5] Gonorrhea and chancroid would both respond to streptomycin, chlortetracycline (Aureomycin), and oxytetracycline (Terramycin). Penicillin used for the treatment of gonorrhea would not appreciably affect a chancroidal ulcer.

SUMMARY

Two hundred one cases of gonococcal urethritis were treated with penicillin, streptomycin, chlortetracycline (Aureomycin), and oxytetracycline (Terramycin) with varied dosage schemes.

In this study, the optimal total dose of penicillin for a 100 per cent cure rate was 900,000 units; streptomycin 4 Gm.; chlortetracycline (Aureomycin) 3 Gm.; and oxytetracycline (Terramycin) 3 Gm.

No distinct therapeutic superiority of any one drug was noted when adequate dosage was employed.

Persistent discharge was usually not the result of bacteriologic relapse. Careful smears should be made for gonococcal and nongonococcal organisms before one incriminates antibiotic failure.

Strains of gonococci vary in their sensitivity to penicillin, but no penicillin resistant organisms were encountered. This also applies to streptomycin, chlortetracycline (Aureomycin), and oxytetracycline (Terramycin).

The authors gratefully acknowledge the aid of Col. William Patient (MC) USAF, Col. Claude White (MC) USAF, and Dr. Ellard Yow in editing the manuscript.

Number of Physicians in 1953

The 218,522 physicians licensed to practice in the United States in 1953 set an all time record, according to figures from the fifty-second annual report on medical licensure of the American Medical Association's Council on Medical Education and Hospitals. The report lists 7,276 persons added to the medical profession during 1953; and 3,421 physician deaths were reported to the AMA headquarters. This gives a net increase of 3,855 in the physician population of the United States. In 1952, the increase was 2,987.

Of the 5,646 graduates of approved medical schools in the United States to take examinations, only 3.8 per cent failed. However, of the 1,463 graduates of foreign medical faculties examined, 45.5 per cent failed.

Physicians engaged in private practice in 1953 were 156,333; those in full time research and teaching, 6,677; interns or residents or physicians engaged in hospital administration, 29,161; 9,311 were retired or not in practice; and 17,040 were in government service.

DISEASE OF WAR PRISONERS

Schistosomiasis japonica, also known as Katayama disease, is a disease believed to have affected approximately 2,000 Americans during World War II, and they have never been treated, according to two Coral Gables, Fla., physicians. Dr. John L. Wolford and Dr. John M. Rumball reported in the July 17 *Journal of the American Medical Association* on 1 case discovered in a former Japanese prisoner of war and expressed their belief that the discovery of the disease after ten years stresses "the importance of looking for the disease in similar persons."

The disease attacks man through free-swimming larvae developed in snails, the larvae burrowing into the skin usually during swimming or bathing. The former prisoner of war treated by the Florida physicians had labored in rice paddies for two years, and these areas are known to be infested with Schistosoma larvae.

PATHOLOGY OF SPONTANEOUS ABORTION

II. Relationship of Decidual Hemorrhage to Spontaneous Abortion and Vitamin C Deficiency

CARL T. JAVERT,* M. D., New York, New York

DECIDUAL hemorrhage can occur at any time during pregnancy and become manifest clinically as antepartum bleeding. When it occurs in the first half of gestation it is called a threatened abortion. There is little controversy as to the occurrence of the bleeding, yet contention exists as to whether decidual hemorrhage is of primary cause or a secondary effect of the spontaneous abortion. The views of both schools of thought have been summarized by Eastman[9] as follows: "Until recently it was generally accepted that the decidual hemorrhage was the primary lesion and the death of the embryo secondary. However, modern studies have demonstrated that the reverse is usually true. The death of the embryo is primary and the decidual hemorrhage is secondary." Our own preliminary observations on the pathology of 1,500 abortion patients favor the older concepts, on which it is the purpose of this article to report.

MATERIALS AND METHODS

Mall and Meyer[19] pointed out in 1921 the lack of information regarding the decidua in spontaneous abortion. This was due (and still often is) either to the conservative management of patients with incomplete abortion, namely no curettage, which resulted in little or no decidua for histologic examination, or to the failure of the pathologist to examine adequately the specimen. However, for the purpose of an extended study of spontaneous abortion still in progress and to be reported more fully when a total of 2,000 cases is reached, it has become our practice to intervene early, and as a result completion of the incomplete abortion was performed in 75 per cent of our patients. To date, 1,334 patients have had a complete gross and histologic examination of the decidua, either on the expelled specimen or on the products removed in the operating room or on both. All specimens were examined microscopically without prior knowledge of the clinical or laboratory course of the patient, with the result shown in tables 1 and 2.

TABLE 1.—*Condition of Decidua in 1,334 Spontaneous Abortion Specimens as Compared with Control Group of 361 Cases.*

Fasting blood plasma vitamin C determinations were performed on a series of 420 normal, untreated (no forced vitamin C therapy), obstetric patients at various stages in their pregnancies, using the Mindlin and Butler[20] technique. A graph of the average values is plotted in figure 1. Approximately half of the total number had been previously reported.[11] Pregnant patients with values of 0.5 mg. per 100 cc. or less were considered deficient since they were often found associated with clinical manifestations of idiopathic bleeding from the nose, gums, anus, and vagina and of an easily bruised skin. Some investigators

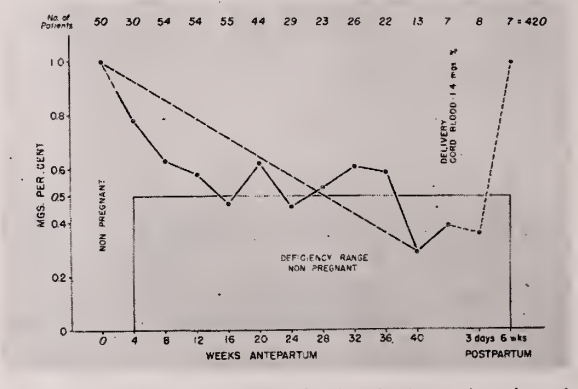

FIG. 1. Average plasma vitamin C values in 420 patients in various weeks of pregnancy. The number of patients studied in each four-week period of pregnancy is indicated at the top of the graph.

Read before the Texas Association of Obstetricians and Gynecologists, February 19, 1954.

prefer 0.4 mg. per 100 cc. for nonpregnant patients, a level which may not be applicable to pregnant patients. Table 3 gives data for 237 patients in the first half of their untreated pregnancies (all of whom also are included in figure 1) and on other cases of nontreated and threatened and spontaneous abortion.

With decidual hemorrhage	53	0.49	30	56.6
Without decidual hemorrhage	47	0.76	15	31.2
Grand total	354			

*No forced vitamin C therapy.
†0.50 mg. per 100 cc. or less.

Plasma vitamin C determinations were obtained on 103 normal, nonpregnant, gynecologic patients, as shown in table 4. Some of these had menorrhagia and some did not. Correlation was made with the plasma vitamin C determinations and the presence and absence of decidual hemorrhage in table 5. Another group of 25 normal, obstetric patients had vitamin C determination made before and during forced vitamin C therapy, consisting of a daily intake of 350 mg. of vitamin C in citrus fruits and 150 mg. as Hesperidin C (National Drug Company) with the results shown in table 6.

*Mindlin and Butler technique.

Clinical application of the possible relationship of forced vitamin C intake for the prevention of decidual hemorrhage was employed on 100 habitual abortion patients and the results have been published elsewhere.[16] It had been determined previously from 67 specimens of such patients that decidual hemorrhage existed in 54 per cent. A diet rich in citrus fruits provided a daily intake of 350 mg. of vitamin C, and Hesperidin C supplement provided 50 mg. three times a day for a daily total of 500 mg. Vitamin K was also employed, and the rest of the regimen consisted of no diethylstilbestrol or progesterone, no coitus, no bed rest except for threatened abortion, thyroid extract only when indicated, psychotherapy, and sedation as indicated. The results obtained with this regimen are shown in table 7.

RESULTS

The decidua was normal in only 6 per cent of the 1,334 spontaneous abortion specimens and abnormal in 94 per cent, whereas the control group of 361 therapeutic and unintentional abortion specimens yielded values of 74.2 and 25.8 per cent respectively for these two conditions (table 1). The abnormal conditions found in the decidua are given in table 2, with decidual hemorrhage as the commonest lesion in 61 per cent of the specimens; only 9 per cent of the control group had this lesion.

Figure 1 gives the average plasma vitamin C concentration of the 420 obstetric patients. Some of these had several tests repeated in the various months of pregnancy. There is a gradual decline from an average value of 1.0 mg. per 100 cc. in the nonpregnant patient to 0.29 mg. per 100 cc. at term. Prior to this, low points were reached in the sixteenth week of gestation, by which time most of the spontaneous abortions have occurred, and in the twenty-

fourth week. The low value at term may be one of the etiologic factors in premature separation of the normally implanted placenta.

Table 3 presents data on 354 obstetric patients who had blood determinations made at the time of the first antenatal visit, at the time of hospital admission for threatened abortion, and at the time of admission for spontaneous abortion. Most of these patients had received little or no dietary instructions or vitamin C therapy prior to being studied. The average plasma C value of 0.58 mg. per 100 cc. for normal pregnancy is slightly higher than for patients with threatened and spontaneous abortion with decidual hemorrhage, these patients having values of 0.49 mg. per 100 cc., whereas the group without decidual hemorrhage had a higher value of 0.76 mg. per 100 cc. The percentage incidence of vitamin C deficiency was 56.6 per cent in the group with decidual hemorrhage and only 31 per cent in the group with no hemorrhage. The figures in table 3 also approximate the pathologic incidence of decidual hemorrhage as a cause for the abortion (table 2) as well as the incidence of other causes responsible for the miscarriage.

However the duration of a chronic vitamin C deficiency in the spontaneous abortion patient is unknown. It can be seen that less than one-third of nonpregnant, gynecologic patients without menorrhagia (table 4) and of nonpregnant, obstetric patients (fig. 1) are deficient in vitamin C, as compared with almost half of the patients in normal pregnancy. The difference represents those who have developed an acute deficiency because of the increased requirements of pregnancy. Even so, it is well known that 0.00 plasma levels can exist for months before clinical bleeding develops.

Table 4 gives the vitamin C concentration of 103 nonpregnant, gynecologic patients. Those with menorrhagia had an average vitamin C level of only 0.48 mg. per 100 cc., within the scorbutic range, and 16 patients had an actual vitamin C deficiency. This is of interest and particularly significant since some of these very patients turned up later with spontaneous abortion.

A distinct correlation was found between vitamin C deficiency and decidual hemorrhage (table 5). When there was a maternal deficiency in vitamin C, decidual hemorrhage was found in two-thirds of the

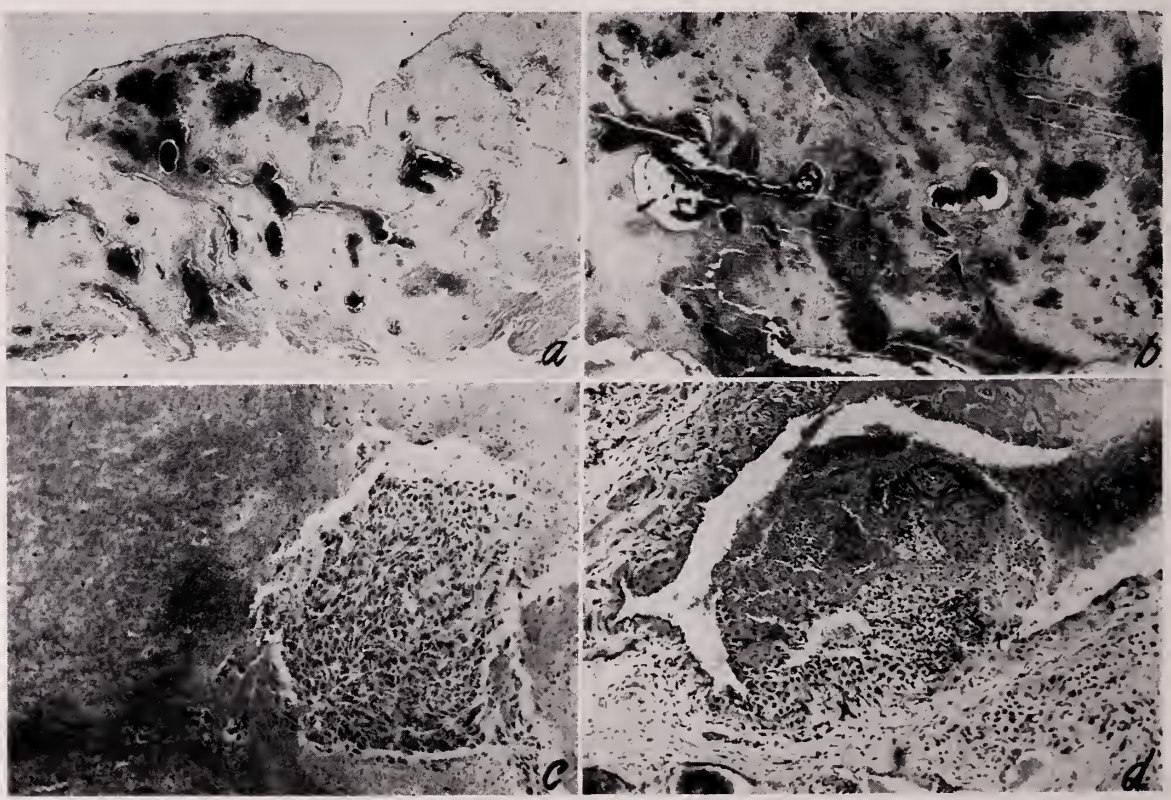

FIG. 2a. Histologic section, low power, of well preserved decidua, which was expelled spontaneously by a patient with "threatened abortion." Note hyperemia and decidual hemorrhage.

b. Decidua of spontaneous abortion specimen. The patient had symptoms of "threatened abortion." Note extensive hyperemia and decidual hemorrhage. Plasma vitamin C concentration of the patient was 0.00 mg. per 100 cc.

c. Erosion of a vein in the decidua basalis by the trophoblast accompanied by distinct decidual hemorrhage on the left side of the curettage specimen as pictured.

d. Curettage specimen showing erosion of a vein in the myometrium by the trophoblast directly beneath the implantation site of the placenta.

abortion specimens. Nevertheless, when there was a sufficiency of vitamin C, decidual hemorrhage was still observed in two-fifths of the specimens. Probably this group of patients have either uterine contractions, stretching or trophoblastic invasion of decidual veins (fig. 2c and d), vitamin K deficiency, afibrinogenemia, hormone deficiency, or other causes of decidual hemorrhage.

The evidence in table 6 suggests that the daily requirement of vitamin C during pregnancy is far in excess of the 100 mg. per day stated by the National Research Council.[28] Thysell found that this amount was necessary to produce a blood level of 1.0 mg. per 100 cc. in nonpregnant persons.

Further clinical experience with vitamin C therapy was obtained from 100 patients with "habitual abortion" (table 7). The treatment outlined previously yielded a successful outcome of the pregnancy in 91 per cent of these patients.[16] Decidual hemorrhage was a common factor in these patients, since it was found in 54 per cent of the abortion specimens of previous pregnancies not so treated. It was found in only 5 per cent of the treated habitual abortion patients.

DISCUSSION

Vaginal bleeding in early pregnancy has received considerable attention in the literature, but seldom has vitamin C deficiency been mentioned as a causative factor. However, it is well known that a person may have no plasma vitamin C for months before developing scurvy. Tissues important to pregnancy which contain much vitamin C are the corpus luteum, the adrenal gland and the pituitary gland, according to Rosenberg[24] and Bicknell and Prescott,[4] as well as the placenta. The occurrence of hemorrhage in the decidual portion of the placenta may be a manifestation of maternal scurvy.

The daily requirement of vitamin C can be obtained easily by following a diet rich in citrus fruits, which, according to Krehl and Cowgill,[17] "remain as one of the most practical sources of ascorbic acid in the nutritional economy." They found virtually no difference in the ascorbic acid content of fresh and frozen citrus juices. The average ascorbic acid content of orange juice was approximately 40 mg. per 100 cc. and of citrus salad (orange and grapefruit sections mixed) 30 mg. per 100 Gm. The amount of vitamin C required to maintain sufficient blood plasma levels is definitely increased in pregnancy. When patients have had repeated abortions, a total of 500 mg. is provided daily. A high citrus diet provides 350 mg., and vitamin C supplement or Hesperidin C provides an additional 150 mg. Occasionally, some patients with values of 0.00 mg. per 100 cc. respond poorly to oral vitamin C and require 1,000 mg. intravenously, after which adequate levels usually can be maintained by the oral medication.

Vitamin C in pregnancy is required for the rapid growth of the products of conception. Obviously any protoplasmic mass, whether plant or animal, requires adequate nutrition, including ample amounts of vitamin C. At the end of the first half of gestation (22 weeks) the average fetus weighs 500 Gm., which represents an increase of more than 1,000 times the initial weight of the previllous embryo. In the last 18 weeks of pregnancy the infant grows from 500 Gm. to approximately 3,500 Gm., an increase of only seven times.

Some of our pregnant patients with slight vaginal bleeding have given a history of idiopathic bleeding from the nose, gums, anus, and skin ecchymoses, with no specific pathologic conditions to account for the hemorrhage. Our studies on such patients often revealed a low blood plasma vitamin C concentration, ranging from 0.00 mg. per 100 cc. to 0.35 mg. per 100 cc. Forced vitamin C therapy raised the blood values to normal and controlled this bleeding tendency in the majority of the patients. Neiwert, Engleberg, and Pirk[21] studied 104 patients with nosebleeds and nearly half of these had no apparent cause for the bleeding. Yet 65 per cent had vitamin C levels less than 0.5 mg. per 100 cc., which responded to vitamin C therapy. These authors concluded that vitamins C and K have a definite place in the management of idiopathic nasal hemorrhage. Some of our gynecologic patients with menorrhagia had low vitamin C levels (table 4), which responded to therapy with vitamins C and K. A few of these patients were not so treated, and they developed spontaneous abortion in a subsequent pregnancy.

Pathologic studies have shown that there are many fetal and maternal factors that cause spontaneous abortions. These have been summarized by DeLee and Greenhill[8] as diseases of the amnion, chorion, placenta, cord, and fetus. Each of these factors was correlated with vitamin C deficiency and only decidual hemorrhage had a high incidence (61 per cent) in the 1,334 spontaneous abortion specimens (table 2).

The decidua usually degenerates and atrophies progressively with the endometrium so that at term much of it is cast off with the placenta, where it can be seen in the histologic sections. However, in early pregnancy it is usually in a better state of preservation, and after spontaneous abortion much of it remains within the uterus, as determined by a study of the curettage specimens, especially when the fetal death has followed extensive decidual hemorrhage or premature separation of the placenta. On the other hand, when the fetus has died in utero of a cord com-

plication[15] with delay in expulsion as in a "missed abortion," the decidua is usually degenerated as in a term pregnancy and is not hemorrhagic.

Occasionally a patient with a threatened abortion will expell "tissue" which is sent to the laboratory for study. Histologic section of it usually reveals degeneration and/or extensive decidual hemorrhage (fig. 2a). Frequently the abortion becomes inevitable and completion becomes necessary. Decidual hemorrhage is usually found in the curettage specimen of such patients (fig. 2b), which reveals a degree of hemorrhage even more extensive than was observed in the decidua expelled spontaneously (fig. 2a). Clinical experience teaches that antepartum bleeding interpreted as threatened abortion is not always followed by spontaneous abortion. In a study of 439 patients with bleeding in the first trimester of pregnancy, Stander[26] found that 67 per cent subsequently had a premature or full term delivery, as did 70 per cent of 1,570 such patients observed by Colvin, Bartholomew, Grimes, and Fish.[6] Perhaps some of these patients had vaginal bleeding not from the decidua but from a cervical polyp or an erosion, either of which could have been detected by speculum examination.

Many of the recent studies suggest that 60 per cent of the abortion specimens have pathologic ova, embryos, and fetuses. However, the incidence of such fetuses was only 22 per cent in our 1,500 consecutive cases studied to date. These data are suggestive of the occurrence of decidual hemorrhage as a primary factor in spontaneous abortion rather than the intrauterine death of the fetus as mentioned by Eastman.[9] Moreover, decidual hemorrhage was found in only 9 per cent of the control patients, most of whom had a therapeutic abortion, which excludes trauma of the curette as the cause of the decidual hemorrhage as some have contended.

Decidual bleeding in early pregnancy is also affected by certain interrelated physiologic, biologic, chemical, physical, and pathologic factors. There is difficulty in arriving at these factors, for only rarely does one have the human conceptus sufficiently intact with the surrounding uterus for the determination of the various conditions causing the abortion. In other words, the uterus and decidua remain in the patient and often only the castoff fetal products of conception, in various stages of preservation, are available for pathologic examination. Consequently, few studies have been made of the decidua in utero and the work of Rutherford[25] in 1942 is outstanding. He obtained decidual biopsies on 100 consecutive patients with threatened abortion and found "decidual apoplexy," consisting of hemorrhage, necrosis, cellular infiltration, and vascular thrombosis, similar to that shown in figure 2a and b. He attributed these pathologic changes in many of the cases that subsequently aborted to progesterone deficiency and therefore advocated corrective endocrine therapy.

At about the same time Javert and Stander[11] postulated that deficiency in vitamins C and K also caused decidual bleeding and offered this theory as a factor in the pathogenesis of spontaneous abortion. They presented laboratory evidence of hypovitaminosis C and K and offered clinical data on their therapeutic value. Meanwhile, pathologic studies of the relationship of vitamin C deficiency and decidual hemorrhage were initiated but were postponed because of World War II. These studies were recently resumed and form the basis for this report.

Barnes[2] made assays of vitamin C of the placenta in 1947, and Holzaepfel and Barnes[10] found the greatest concentration of vitamin C in the syncytial layer of the villi, which is of fetal origin. This is in agreement with the high fetal values found in the fetal cord blood by Javert and Stander;[11] Teel, Burke, and Draper;[27] Abt, Farmer, and Epstein;[1] and Braestrup.[5] The decidua is the only maternal part of the placenta and the vitamin C concentration of this tissue has yet to be studied thoroughly. Meanwhile, in 1948 Power[22] reported 13 patients with a degenerated decidua which he regarded as a cause of the decidual bleeding and he questioned the value of endocrine therapy. Javert and Finn[13] in a preliminary study in 1950 of 500 consecutive spontaneous abortion specimens found evidence of decidual hemorrhage in 45 per cent. They suggested preventive measures such as a diet rich in citrus fruits and the use of vitamin C and K supplements.

Ramsey[23] found in the rhesus monkey that the spiral arterioles of the myometrium and endometrium uncoiled like a rubber hose as the pregnant uterus increased in size. However, the veins were usually straight and distended and became stretched as the uterus enlarged. Here then, is another normal physical factor which may cause decidual hemorrhage if the veins become hyperemic, engorged, and overstretched to the breaking point and the bleeding and clotting mechanism is not in balance.[16] Add to this the biologic factor of trophoblastic erosion of both decidual and myometrial veins (fig. 2c and d) and the stage is set for slight bleeding, which is to be regarded as a normal physiologic process since it is often recognized clinically as the "placental sign" or as "implantation bleeding." However, when such bleeding becomes more extensive, it is pathologic and one has either a partial or a complete premature separation of the placenta (decidual hemorrhage) in the first half of gestation. The relationship of capil-

lary fragility and vitamin C deficiency to these events seems rather obvious.

Finally, as stated in table 5, decidual hemorrhage was found in 22 of 55 spontaneous abortion patients with a sufficiency of vitamin C, signifying that there are other causes of such bleeding. Although investigation of the other causes of decidual hemorrhage were not within the scope of this study, conditions other than those mentioned previously may cause it, namely, premature uterine contractions, placenta previa, vitamin K deficiency, afibrinogenemia, surgical excision of the corpus luteum in early pregnancy, and increased maternal blood volume.

CONCLUSIONS

A pathologic study of 1,334 patients with decidua present in their spontaneous abortion specimens revealed decidual hemorrhage in 61 per cent.

In cases in which the mothers had a plasma vitamin C deficiency, two-thirds of the abortion specimens had decidual hemorrhage. Decidual hemorrhage was found in more than half of 67 habitual abortion specimens.

The plasma vitamin C concentration decreases in normal pregnancy from an average nonpregnant value of 1.0 mg. per 100 cc. to 0.29 mg. per 100 cc. at term. This decline is due to the growing protoplasmic mass of the fetus and the nausea and vomiting of the mother.

The obstetric patient was considered deficient in vitamin C when the plasma vitamin C value was 0.50 mg. per 100 cc. or less since abnormal bleeding occurs more frequently from the nose, gums, anus, and vagina and into the skin under such circumstances.

Approximately 45 per cent of three groups of obstetric patients, those with normal pregnancy and with threatened and spontaneous abortion, had plasma vitamin C deficiency. This is in contrast to deficiency in less than one-third of the normal nonpregnant women.

When the spontaneous abortion specimens had decidual hemorrhage, maternal deficiency was found in 56.6 per cent and when there was no decidual hemorrhage, the incidence was only 31 per cent.

Avitaminosis C was eliminated in all but 2 patients with forced vitamin C therapy in 25 pregnant patients. Their average plasma vitamin C value of 0.42 mg. per 100 cc. was raised to 1.26 mg. per 100 cc. during pregnancy by a diet rich in citrus fruits providing 350 mg. of vitamin C and a Hesperidin C supplement of 50 mg. three times daily for a total of 500 mg. daily.

Prepartum and antepartum therapy with vitamins C and K in 100 patients with histories of habitual abortion yielded successful outcome in 91 per cent. Decidual hemorrhage occurred in only 5 per cent of these treated pregnancies.

Histochemical studies of vitamin C should be made on the decidua.

Decidual hemorrhage was found in two-fifths of the specimens when there was a maternal sufficiency of vitamin C, so that other interrelated physiologic, biologic, chemical, physical, and pathologic factors, such as premature uterine contractions, stretching and trophoblastic erosion of decidual veins, increased maternal blood volume, placenta previa, vitamin K deficiency, afibrinogenemia, and surgical excision of the corpus luteum, may also cause its production.

Unusual Heart Operations Reported

Dr. Michael E. DeBakey and Dr. Denton Cooley, Houston, report in the August 14 *Journal of the American Medical Association* surgical success with a blood vessel graft during which the flow of blood was stopped for an hour.

The Houston physicians, in perhaps the first operation of its kind, stopped a patient's circulation for an hour while a new section was grafted into a faulty main artery just above the heart. The patient suffered no apparent damage to the spinal cord or vital organs which usually follows stoppage of circulation for even a few minutes. "Freezing" the patient by gradual cooling for several hours before the operation prevented damage, the doctors report.

Grafts have been used on straight portions of vessels in similar cases of aneurysms, but the doctors believe this to be the first successful graft on the aorta where it arches over the heart.

In the same issue of the journal, two additional unusual operations near the heart are described. Two New York doctors, Dr. Cranston W. Holman and Dr. Israel Steinberg, tell of a successful operation on a patient for gradual closure of a blood vessel. Drs. William J. Potts, Paul H. Holinger, and Arthur H. Rosenblum, Chicago, report that they successfully cut and relocated a misplaced vein which pressed against the windpipe and aorta of a five month old baby.

'Cancer Cure' Only Cough Medicine

The American Medical Association's Bureau of Investigation reported in the June 12 *Journal of the American Medical Association* that the only "pharmacologically active" ingredient in the so-called Hoxsey "cancer tonic" is a drug which is used mainly in cough medicine. The bureau reported that the drug "is without therapeutic merit in the treatment of cancer" and that it sees no reason for the AMA further to investigate the remedy.

TREATMENT OF ACUTE OPHTHALMIC INJURIES

HAL W. MAXWELL, M. D., Dallas, Texas

EXCEPT for the injuries from a lateral direction, nature has provided moderately good protection for the eye and the adnexa by the brows, lids, and bony orbital margins.

An American College of Surgeons news bulletin stated that in time of war, eye injuries could be expected to represent about 5 per cent of all hospital admissions for battle wounds and 10 per cent or more of all accidental, noncombat-incurred injuries. This should hold true for mass civilian casualties in any future war.[1]

Abrasions of the cornea and conjunctiva, with or without superficial foreign bodies (nonpenetrating), are probably the most common ocular injuries seen, either in civilian or military life.

Intra-ocular foreign bodies are not considered in this paper, other than to suggest that a flat roentgenogram should be taken if in doubt and an intra-ocular localization should be done after referring the patient to a competent eye surgeon for treatment. Fractures of the bones of the orbit are not discussed.

After checking the visual acuity, if possible, 1 per cent Pontocaine Hydrochloride and 2 per cent fluorescein should be used in the conjunctival sac to determine the extent of the injury. If there is a foreign body present, it should be removed gently and carefully by washing with saline, by using a saline dampened cotton pledget, or by using a spud. If the foreign body is metallic and has been present a few hours, the rust stain also should be removed with a spud or by means of a small rounded dental bur (held in the fingers or by a small handle) by an ophthalmic surgeon.

Provided the visual acuity is adequate in the opposite eye, I prefer to patch firmly most of these abrasions after first instilling medication, repeating this daily until healing has occurred as indicated by failure of the epithelium to take a stain. Swan[13] showed that medication used in the conjunctival sac, to be effective, should be used in a proper vehicle.

It was shown that some medications in ointment form retarded epithelial healing more than they did in solutions. As suggested by Leopold,[6] I prefer one of the antibiotics (bacitracin, neomycin, Polysporin, and the like) which is not used systemically as are penicillin, Terramycin, Aureomycin, and others. In case of sensitivity the latter drugs may be used for generalized infections. He also stated that Gantrisin and sulfacetimide (15 per cent, half strength), either in ophthalmic solution or ointment, were the topical sulfonamides of choice. Depending on the severity of the lesion, the age, and the ocular tension, cycloplegics (2 per cent homatropine and 1 per cent atropine) may or may not be used to splint the iris and ciliary body.

Read before Section B (Surgical), Texas Medical Association. Annual Session. San Antonio, May 4, 1954.

CONTUSIONS

Contusions are injuries that do not cause a break in the surface structures. "B-B" guns are one of the worst offenders, accounting for the loss of several eyes each year. Hogan[3] stated that compared with other ocular injuries, contusions were not common in either civilian or military life.

Eyelid contusions ("shiner," "mouse"), due to the thin skin and loose subcutaneous tissues, are characterized by marked edema and ecchymosis. The edema usually subsides with or without cold compresses or a piece of "raw meat." The blood pigments undergo their color changes (red, blue, yellow, green) until the tissues have returned to their previous state and color (within one to three weeks).

Occasionally the fluid in the lids may have to be incised and drained. Antibiotics and sulfonamides are indicated to prevent infection. Conjunctival contusions require little if any treatment, though hot compresses will hasten absorption of the blood. If the hemorrhage does not stop, cold compresses might be used. When the conjunctiva protrudes over the lid margin, an incision might be considered.

Unless there is a tear in Descemet's membrane, corneal contusions respond to rest, firm patching, and mydriatics. With a rent in the glass membrane, the cornea may become hazy with edema and may even become blood stained from blood in the anterior chamber.

Limbal and scleral contusions may cause rupture of the eyeball with little damage to the interior of the eye. Where possible, these ruptures should be sutured (black silk or catgut) after excising protruding tissue and covering with a conjunctival flap. If the globe has collapsed, the eye should be enucleated.

Temporary iridoplegia from contusions of the eye may occur with or without iridodialysis. Bed rest and mydriatics may be required at the time of the injury. Later (two to three weeks) a surgical repair of iridodialysis may be done by pulling the iris into the limbal section and either suturing it or touching it with a diathermy needle. A conjunctival flap should cover the limbal section. Contusions which

tear the ciliary body are best treated by bed rest and cycloplegics.

Thygeson and Beard[14] have recently brought out the importance of the hyphemia resulting from tears of the ciliary body and base of the iris. They stressed the importance of absolute bed rest, bilateral patching, homatropine five times daily, and 100 mg. of vitamin C and 60 mg. of rutin three times daily (there is no clinical proof of the value of vitamin C and rutin). Lock[7] of England advocated the repeated use of homatropine. Fralick and others used miotics to pull the iris away from the angle.

According to Thygeson and Beard, with secondary hemorrhage (three to ten days, usually from the ciliary body rather than from the iris) the visual function of the eye may be impaired or the eye may be lost. Repeated paracentesis with removal of blood, if possible, to prevent staining of the cornea and to lower intra-ocular tension, and miotics along with bed rest and patching of both eyes are imperative.

Contusions of the eyeball may cause tears in the choroid and retina with hemorrhage into the vitreous. Bed rest, patching, and cycloplegics or Cortone or ACTH systemically are indicated. Vitreous opacities have been reported as responding to lipotropic substance.[2]

Contusions of the lens may cause subluxation, luxation, or various types of opacities. These injuries usually require no immediate treatment, but later the lens may have to be removed and the ocular tension controlled by surgery.

Optic nerve injuries from contusions are not common. Papilledema may result from a contrecoup lesion. If hemorrhage occurs into the nerve or nerve sheath and vision does not improve when the edema subsides, treatment is of little value. Aside from the injuries caused by fractures of adjacent orbital bones, contusions of the head may cause intra-orbital hemorrhage and proptosis. This hemorrhage usually subsides with no treatment. The extra-ocular muscles that may be temporarily paralyzed from contusions usually return to normal function without treatment unless there is a fracture or intracranial injury. The detachment of the oblique pulley may require surgical reattachment.

LACERATIONS

Scheie has recently discussed the importance of proper treatment of lacerations of the eye and adnexa.[11] First aid for lacerations of the eyelid should involve sterile dressings and protection of the eyeball, if exposed. The wound edges should be cleansed with sterile saline and all foreign bodies removed. Because of the excellent nutrition of the tissues, little débridement is indicated. The cornea, if exposed by an extensive laceration, should be protected by an ophthalmic ointment or a conjunctival flap.

The general condition of the patient should always be observed. Intra-ocular damage, orbital injuries (fracture), and intracranial lesions should be ruled out before extensive surgery is attempted. General anesthesia and a tetanus booster or antitoxin, with or without antibiotics, are indicated. A great deal of hospital time and needless plastic procedures could be prevented if the primary eyelid surgery could be done by a competent ophthalmic surgeon.

Where the laceration extends through the lid margin, early repair is imperative. After seven to ten days the results of surgery are not as good, and notching due to fibrosis and retraction of the margins is the rule.

One of the better methods of repair was described by Wheeler as follows: the skin and orbicularis muscle are cut back on one margin of the laceration and the tarsus and conjunctiva are trimmed an equal amount and sutured with a 3-0 plain or chromic catgut, burying the suture and closing the skin with a 5-0 black silk, thus giving a lattice-like closure and preventing notching. Hughes sometimes uses a tongue and groove closure of the inner half of the lid with a long skin flap covering the inner sutures so that the suture lines will not be superimposed. He stressed the importance of firm pressure for one to two weeks.

Still another method is direct closure in layers with especial attention to the lid margin by suturing with silk in the greyline. If some of the lid tissue is lost, the defect may be repaired by canthotomy and undermining the skin to cover the defect or Hughes' halving procedure may be used along with a tarsorrhaphy. Healing is usually by primary intention due to the excellent blood supply of the lids. Though the eyeball may be lost, the lids should be repaired over a conformer so that a prosthesis can be retained and worn.

Lacerations of the lid that tear through the canaliculus are a definite problem. The loose areolar tissue between the tarsus and canthal ligament makes it difficult to find the cut ends of the ligament, and sutures frequently pull out because of the pull of the orbicularis muscle. The canaliculus is a small canal consisting of two epithelial layers, and the two cut ends are usually difficult to identify.

Scheie described one of his methods for repairing the lower lid. He took a piece of the lower border of the tarsus leaving the medial end attached, passed it under previously undermined skin to the anterior lacrimal crest, and sutured it after the canaliculus had been identified and catheterized with a nylon suture which was then brought out through the lacrimal sac and skin. The tarsal tongue relieved the tension. The

subcutaneous tissues and skin were closed with catgut and silk sutures. Silk or nylon tubing also has been used in repairing these injuries.

Another method of relieving the tension is to use mattress sutures tied over rubber pegs anchoring them to the periosteum, then brought out through the skin and again tied over rubber pegs. Sutures (tarsorrhapy) between the two lids further reinforce the lacerated lid.

In lacerations of the eyeball, Scheie believed that it was safer to use atropine than to worry about the undesirable side effects that sometimes occur. Antibiotics and tetanus toxoid should be given. Examination of the lacerated eye should be made by a competent eye surgeon, using the proper instruments and anesthesia to prevent further trauma by the patient squeezing his lids.

The type of surgery depends on the condition of the eye, that is, whether there is hemorrhage, foreign body, present loss of vitreous, and the like. Lacerations of the cornea, if small and with no protrusions of the ocular contents, may be treated with atropine and antibiotics. Otherwise the protrusion should be excised and the cornea closed with fine 6-0 silk and a conjunctival flap pulled over the wound. Limbal and scleral wounds should be sutured and covered with a flap. Topical and systemic Cortone should be considered along with the previously mentioned medications. The eye should be observed closely at frequent intervals for one year for evidences of sympathetic ophthalmitis, secondary infection, and glaucoma.

With damage to the lens, endophthalmitis phacoanaphylactica should be kept in mind. Cortone both topically and systemically has helped in preventing and treating this condition. Scheie stressed the fact that if there is doubt as to the development of sympathetic ophthalmitis, the eye should be enucleated during the first two weeks.

BURNS

The general systemic condition of any patient with a burn of the eye should receive prompt attention to combat shock and loss of fluids. If indicated, systemic Cortone, morphine, whole blood, plasma, or saline, along with antibiotics to prevent infection, may be given.

Thermal Burns

Leahey[5] stated that thermal burns of the upper face, besides endangering sight, cause more cosmetic defects than burns of similar extent elsewhere. Skin burns of the eyelids should be cleaned gently without débridement and covered with thin Vaseline gauze and a gentle pressure dressing.

First degree burns require little treatment other than boric acid ointment or one of the other soothing preparations (boric acid when used on extensive burns has been reported as causing toxic symptoms). Superficial second degree burns may heal in two weeks without scarring. Dressings, if they are clean and dry, may be left on seven to ten days. However, second and third degree burns usually soak through the dressing, and it must be changed daily. Besides using bandage to hold the pressure dressing in place, stockinet has been used.

Deep second degree and third degree burns usually require prolonged treatment before all the necrotic tissue is removed and before the tissue is ready for either split or full thickness skin grafts, with a base from infection. Split thickness grafts usually take more readily than full thickness ones, but scarring is more marked. Skin grafting should be done as early as possible to prevent further scarring and ectropion, but it is usually three weeks or more before this is feasible.

When third degree burns are small, they may be excised and a full thickness graft done immediately for good cosmetic result. If the eyeball is not damaged, a tarsorrhaphy may be done to immobilize the lids further.

Fortunately, because of the wink reflex, relatively few burns of the eye occur. Shenk, Silcox, and Godfrey reported only 12 per cent (27) as having burns of the cornea in a series of 212 burns of the eyelids.

Thermal burns of the conjunctiva and cornea from a welder's arc are quite painful, especially about midnight. Cold compresses and ophthalmic ointment with or without patching usually relieve the patient. If 1/2 per cent Pontocaine is used, the eyes should be patched. Goggles are the best prevention.

Severe burns involving the palpebral and bulbar conjunctiva should have at once a graft taken from the other eye or from the mouth, to prevent formation of a symblepharon. Daily separation with ointment and a glass rod may help prevent this formation if a mucous graft is not done. Plastic conformers are not too satisfactory. Deep bulbar conjunctival burns should be immediately grafted.

In severe burns of the cornea or the sclera, the eye may perforate in one to four weeks. Sometimes the conjunctiva may heal before the cornea perforates. Suturing the lids may splint them enough to allow the cornea to cicatrize without rupture and without the formation of symblepharon.

Chemical Burns

McLaughlin[9] suggested that all employees in chemical plants should receive instruction as to first aid for chemical burns of the eye. Such patients should be instructed to wash the eye for five minutes with

tap water, using a fountain covered with a rubber tip to prevent further injury; and they should be sent then to the dispensary where the treatment consists of the instillation of 1/2 per cent Pontocaine followed by 2 per cent fluorescein. All foreign bodies are removed, and the eye is washed for fifteen minutes. Stain is reapplied and flushed. If stain is retained, another fifteen minutes of washing with warm saline follows. If stain is retained after reapplying fluorescein and flushing, the eye is considered to have a chemical burn. The eye is snugly patched, and the patient is sent to an ophthalmologist at any hour of the day or night. Unfortunately, patients outside of chemical plants do not always get such excellent care.

McLaughlin stated that after again staining with fluorescein the eye should be studied with a biomicroscope to determine the extent of the injury. Mechanical removal with a sterile cotton swab after instilling 4 per cent cocaine to soften the epithelium is done to all the damaged tissue. The swab is passed over the conjunctiva and caruncle, down into the fornices, and over the lid margins in an effort to remove all of the chemical from the eye. If the chemical involves Bowman's membrane, scarring usually results.

The after care consists of the use of antibiotics with or without mydriatics, cortisone, and patching. If healing has not resulted within forty-eight hours, the eye should be treated daily for infection.

Corneal opacities have been treated with 1 per cent choline chloride with some favorable results.

In spite of the work done by Swan and others, McLaughlin stated that healing was not retarded chemically by the use of ointments (bacitracin and Aureomycin).

Also, in a series of cases studied using Hydrosulphosol,[8] McLaughlin proved to his satisfaction that the drug was no more effective than his denuding method and certainly more irritating to use. It is imposisble for this substance to neutralize each and every chemical.

Hughes[4] stated that conservative treatment was effective for mild and moderately severe alkali burns. This consists of (1) immediate irrigation of the eye with water or any bland solution, (2) removal of all alkali particles and instillation of a buffer solution (pH 4.5), (3) use of mydriatics, (4) use of 10 per cent neutral ammonium tartrate (or lactate) as a corneal bath after lime burns, (5) use of antibiotics to prevent secondary infection, and (6) prevention of symblepharon. (Hughes suggested the use of 2.9 cc. of glacial acetic acid, 6.8 cc. of sodium acetate, pH 4.5 in 100 cc. of distilled water.)

For severe burns, immediate conjunctival graft (Denig) within the first six to eight hours was suggested by Hughes. He emphasized that alkali burns are progressive and late complications may occur. Spaeth,[12] quoting Würdemann,[15] stated that in chemical burns the physical and chemical alteration of the tissues is the most important factor. Attention is called to the penetration of chemicals into the interior of the eye, causing further damage. Pichler[10] practiced immediate paracentesis of the cornea for ammonia burns.

Various solutions are recommended to neutralize the chemicals that get into the eye, but McLaughlin believed that copious irrigation with saline was the best treatment rather than awaiting the preparation of a specific solution.

CONCLUSIONS

All eye injuries should be carefully examined and treated by a competent surgeon.

This treatment, provided the patient's general condition is satisfactory, should be done within the first forty-eight hours.

The attending physician or surgeon, if inexperienced with treating eye injuries, should call an eye surgeon for consultation.

ABSTRACT OF DISCUSSION

DR. JAMES P. ADERHOLD, San Antonio: Early evaluation of the extent of the injury with prompt attention to its proper care is urgently indicated by Dr. Maxwell.

I would stress the early repair of lid lacerations, particularly those through the margins. These may be readily repaired soon after injury with a good functional and cos-

metic result, but after a week or more, contractures occur which make the procedure a formidable one.

In chemical burns involving the bulb, copious irrigations should be carried out as soon as possible after the accident. Tap water which is usually available is a good irrigant. There is considerable controversy as to the efficacy of neutralizing solutions, but I believe that after a thorough lavage with either tap water or normal saline, one may use either acid or alkaline solutions as indicated. It should be remembered that organic chemicals, many unorganic ones, and alkalies act slowly on the eye. Acids act rapidly and completely before first aid can be administered. In each case early removal of damaged superficial cells, leaving a mechanical abrasion to heal, is indicated.

The management of traumatic hyphema is a matter of controversy among many capable ophthalmologists. Drs. Thygeson and Beard have approached the subject in a manner that appeals to me. Because of the incidence of secondary hemorrhage in two to five days after the first, which they believed comes entirely from ciliary body damage, they advised the following: complete bed rest, sedation, bandaging of both eyes, and the use of 5 per cent homatropine five or six times daily. A pressure bandage may be used, and various drugs influencing capillary fragility may be of value. The delayed secondary bleeding is unexplained and is serious, usually precipitating glaucoma or corneal staining. At this time of course the treatment is changed to strong miotics and paracentesis as indicated. The prognosis is poor, however. It is thought that approximately 25 per cent of patients with traumatic hyphema will have a residual vision of less than 20/40 Snellen and that the poor results will be in those cases with secondary hemorrhage.

Finally, I believe it is advisable to make a roentgenogram if there is any doubt of the presence of a foreign body in the eye.

MANAGEMENT OF RECENT NASAL FRACTURES

WILLIAM K. WRIGHT, M. D., and FRED R. GUILFORD, M. D., Houston, Texas

FRACTURES of the nasal pyramid are frequently mishandled or overlooked entirely because of the presence of swelling, hemorrhage, and ecchymosis. The resulting malalignment of structures may cause cosmetic deformities and functional nasal impairment necessitating rhinoplastic procedures, reconstruction of the nasal septum, or submucous resection.

While good results are obtained with these late procedures, proper recognition and handling of the acute fracture is a simpler and easier method requiring less specialized technique. This paper concerns only the acute aspect of this problem.

PITFALLS

Failure to recognize a fracture. It may easily happen that a physician fails to recognize a fracture. The usual epistaxis may have been minimal or in a greenstick fracture, absent. Deformity is masked by rapidly developing swelling and ecchymosis; crepitus and palpation of fragments may be missed because of tenderness; and roentgen rays fail to reveal a fracture almost 50 per cent of the time. Avoiding this frequent pitfall is equally easy. A physician should not commit himself to the patient and should not tell him for sure that he does not have a fracture until after five to seven days when the swelling is down. At this time the patient should be reexamined for deformity, crepitus, and residual tenderness or swelling of both the external nose and the septum. The patient may be reassured during this interim that the ideal time for reduction of nasal fractures is just after the swelling has subsided.

Too early an attempt at reduction. There is a period of thirty to sixty minutes after trauma during which there is relative anesthesia with easily palpable fragments. This is the ideal time to reduce a nasal fracture. Unfortunately, reduction is seldom possible during this time, and once swelling and ecchymosis occur, accurate approximation of fragments cannot be made for four to seven days. Nasal fracture reductions are exacting, and an asymmetry of even one-sixteenth of an inch is definitely noticeable. If a reduction is done too early, residual deformity may be noted when the swelling has completely subsided.

Delaying reduction too long. If the patient consults a physician early and is properly followed, reduction never will be delayed too long. Actually, this period is a relative one. Preliminary healing is by fibrous union, and by the application of slightly increased pressure, fractures three and four weeks old often can be reduced. This fibrous healing may be permanent, but even if bony healing occurs, we have reduced fractures three and four years old by making intranasal incisions, elevating the soft tissues, and using a chisel to open the fracture lines.

Failure to recognize associated facial fractures of the orbit, malar bone, superior maxilla, and mandible. Roentgen rays are useful on patients with facial fractures of the orbit, malar bone, superior maxilla, and mandible. Postero-anterior and verticomental views of the skull and dental films are especially helpful. Palpation of all structures and checking of the occlusion also should be done. The management of these frac-

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

tures is not discussed in detail in this paper, but proper recognition and care of these associated fractures, of course, are necessary.

Improper care of associated lacerations and compounded bone fragments. All open wounds should be carefully cleansed of foreign material to prevent tattoo marks and irrigated with saline to reduce contamination. We use a pHisoderm preparation on the entire area. Bone and cartilage chips are cleansed and replaced as nearly as possible in their proper locations under direct vision. The wound is carefully closed with fine sutures.

Débridement should be conservative with careful preservation of all possible structures; completely evulsed skin is trimmed of fat, cleaned, and sutured back in place. Intact portions of the nose (as tip or alae) are treated likewise. Full thickness skin losses are replaced with full thickness grafts from behind the ear. Only in cases of infected wounds are the lacerations left open, and in such cases secondary closure is done as soon as possible to prevent scarring.

Improper reduction technique. Each nasal fracture is individual and different, depending upon the force and direction of the blow, the degree of ossification, and the thickness of the bones and cartilage. Each case must be treated slightly differently, but a classification of types with associated techniques is helpful.

The general management consists of a pHisoderm preparation on the face and nose including the vestibule. The patient is draped. General anesthesia is used in children, but local anesthesia is preferable in adults because of the reduction of the bleeding. The local anesthesia consists of 10 per cent cocaine with Adrenalin applied to the nasal mucosa with applicators. The external structures are anesthetized with 2 per cent Novocain with 1 cc. of Adrenalin per ounce. This is injected to anesthetize the infra-orbital inferior and superior trochlear and external nasal nerves.

The instruments used in reducing nasal fractures consist of the Joseph elevator, a curved Kelly forceps, and the Asch or Walsham forceps. The tips of these instruments are wrapped in cotton or thin rubber tubing to prevent excessive trauma of the mucosa. Fixation consists of packing the nose loosely with one-half inch Vaseline gauze. A Stent modeling compound splint padded with felt is moulded to the outside of the nose and taped in place. If the septum is excessively comminuted, dental wax is placed on each side and held in place with mattress sutures.

MANAGEMENT

Greenstick fractures. No bleeding is encountered in the greenstick fracture. There is a depressed fragment at the junction of the maxilla, and the septum is bent away from the blow. If the deformity is slight, roentgen ray may show nothing. Reduction is accomplished by elevating the depressed bone from within with a Joseph rasp or elevator and applying pressure on the septum on the convex side in the reverse direction of the blow with the Asch forceps or Joseph rasp.

Linear fractures. No displacement is visible after ice packs have reduced the swelling, and roentgen ray may be the only way of demonstrating the fracture.

Lateral fractures. There is a depression of the nasal bone on the side of the blow, a separation of the nasal bones, and an overriding of the maxillary process by the opposite nasal bone. The fractured septum deviates to the side opposite the blow. Reduction is achieved by elevating the depressed segment and by molding the two nasal bones together in the midline. Occasionally the depressed segment must be unlocked by a downward pressure on the maxillary process with the fingers. If the septum is not brought into the midline by this procedure, it is straightened with the Asch forceps, or if dislocated, it is replaced in its groove.

Frontal fracture. A frontal fracture may result in separation and depression below the maxillary processes of the thin lower portion of the nasal bone. In more severe cases there is also depression of the upper portion of the nasal bone and infraction of the maxillary processes themselves. This type of fracture should be reduced early as scar tissue present after late reduction tends again to pull down the fragments. A crushed septum and associated fracture of the zygoma and maxillary bone are frequently present in this type of fracture. Reduction is accomplished by elevation of the fragments with the Joseph elevator from within, or the fragments may be rotated out with the Asch forceps. Pressure against the nasofrontal process of the maxilla at the base of the nose is important. If there is a failure of the fragments to maintain their position, it may be necessary to use the Kanzanjian head splint, the Brown method of through and through wire fixation through lead plates on either side of the nasal pyramid, or the Hilger method of fixation with a Kirchner wire. In some cases maintenance of elevation is almost impossible, and a later rhinoplasty must be carried out with implantation of cartilage along the depressed nasal dorsum.

Laterofrontal fractures. In the first of the two types of laterofrontal fractures, the nasal bone on the side of the blow overrides the opposite nasal bone and is locked under the frontal bone. In reducing this, it is necessary to depress further the superior portion of the nasal bone while applying pressure downward to unlock it from beneath the frontal bone. In another variation the nasal bone on the side of the blow may be depressed under the nasal processes and maxilla

with separation of the nasal bone. In this case the fracture may be treated as a lateral fracture. The opposite nasal bone is always depressed beneath the maxilla and usually can be elevated from within the nose while applying pressure on the maxillary process. In some cases the Asch forceps must be used to rotate the depressed nasal bones from beneath the maxillary process.

Fracture from below. Fracture from below results in a separation of the nasal bones which also override the frontal bone, resulting in an obliteration of the glabellar notch. Occasionally underriding occurs with increased glabellar angle. It is reduced by grasping the fragments with the Asch forceps, pulling them down, and molding them together with the fingers.

Recently an open reduction method by the rhinoplastic approach has been advocated for the therapy of all nasal fractures. This is done without waiting for swelling and acchymosis to subside. We have always been interested in any contribution which might better our method of handling cases and have tried this method. We believe that it has merit in certain severely comminuted cases, but in general there is no particular advantage in using it routinely, and it should be considered only occasionally in the therapy of fractures.

SUMMARY

Nasal fractures are one of the most common fractures encountered and are frequently poorly handled. Generally speaking, failure of perfect reduction is much more obvious than in any other type of fracture. In the management early reduction is always desirable. However, if the fracture is masked by swelling, late reduction is satisfactory, with delay as long as one week being perfectly permissible except in cases of children. It is desirable to apply internal and external fixation in all cases to prevent curling of the cartilage secondary to hematoma. Associated complications such as intracranial injuries, cerebrospinal rhinorrhea, and associated fractures of the maxilla and zygoma should always be looked for. Proper reduction and maintenance of fixation is almost always possible by the methods outlined. Finally, late reduction is possible by making intranasal incisions and breaking up osseous or fibrous union along the fracture lines with a chisel.

ABSTRACT OF DISCUSSION

DR. CHARLES F. ENGELKING, San Angelo: We are all aware of the general principles in the treatment of nasal fractures, but I would like to emphasize them again. Seldom is hemorrhage an alarming factor, but it should be controlled by adequate pressure, external application of ice, use of intranasal tampons, or, if necessary, ligation. After hemostasis has been secured, the skin of the nose and face is cleansed with soap and water and wiped with ether, which I think is as good as pHisoderm, which the authors use, and may be more readily available than pHisoderm. I wish to stress again that all embedded foreign bodies or material such as road dust, grease, and tars should be carefully removed to avoid permanent tattoo marks after healing has taken place.

As the authors mention, all small bone and cartilage fragments should be preserved and should not be removed as they help to maintain the nasal contour and seldom undergo sequestration because of the good blood supply of the nose. The nasal fossae should be carefully cleaned and all blood clots and loose foreign bodies irrigated out with warm boric acid or a hydrogen peroxide solution. Displaced or even detached soft tissues should be carefully cleansed, returned to their normal locations, and sutured in place.

Superficial wound margins should be approximated with a Dermalon or an intradermic suture to minimize the final scar. If the skin loss is too extensive to permit direct approximation, the raw area may be covered with a skin graft taken from behind the ear, as the authors suggest, or I have used skin from the upper eyelid. In one instance where the ala of one side of the nose was completely absent and could not be found, I used the lobule of the ear for the defect and later strengthened it with a preserved septal cartilage implant with satisfactory results. In the case of a through and through wound opening into the nasal cavity, the mucous membrane and perichondrium require separate approximation. When the full thickness of the nose has been destroyed and skin grafts cannot be used, the skin should be sutured to the mucous membrane to prevent subsequent contraction and distortion.

Wounds seen after twelve hours are drained for twenty-four hours, after which time they are sutured, provided signs of infection are absent. The danger of infection should be controlled through the use of adequate sulfonamides and antibiotics given internally or locally.

If the patient is not observed until after marked edema and ecchymosis have set in, rather than subject the tissues to further trauma and predispose them to infection, it is advisable to wait three or four days for the swelling to subside. Cold compresses may hasten the process. If at all possible reduction of the fractured bones should not be delayed for more than seven to ten days, since after this period preliminary ossification will have taken place. It is true that fractures three or four weeks old can be reduced, as the authors state, but if fibrous union is present, it will require more than slightly increased pressure to overcome the pull of this fibrous union as well as the prolonged period of fixation and immobilization through the use of the Stent mold, head splints, or wire fixations. Repositioning of the cartilages, however, may be postponed for as long as three weeks if necessary, inasmuch as organization of these structures does not proceed as rapidly as that of bone.

The patient in shock certainly should be treated by appropriate measures simultaneously with the other factors besides his nasal fractures. Tetanus antitoxin and gas gangrene serum should be used in the same manner as for wounds in other portions of the body.

Other complications for which a physician should watch are osteomyelitis, abscess, and necrosis of the bones and cartilages. Should the emphysema and swelling persist for more than a week or ten days, a search should be made for

foreign bodies or sequestrums, which, if formed, must be removed.

Fractures of the septal cartilage are probably the most frequent and common fractures of the nose, and I believe the most important thing is to see if swelling of the septum is present and then to differentiate between the hematoma and septal abscess. Wide incision of the mucosa and mucoperichondrium is made in either case and a drain inserted for twenty-four hours and kept open daily with a spreading hemostat until swelling subsides. If this care is not given, the pressure may cause a necrosis of the cartilaginous septum and consequent sloughing. Of course if this occurs, a rhinoplasty with cartilaginous or bony implants will have to be done at a later date. Recently I have had 2 such cases of fracture of the cartilaginous septum with abscess formation, and in 1 the cartilage had completely sloughed except for a small margin along the dorsum. These patients were referred to me because of continued nasal obstruction several weeks following trauma to the nose.

ENDOSCOPIC OBSERVATION IN VARIOUS TYPES OF BRONCHIAL OBSTRUCTION

A Study of 50 Cases

HERBERT H. HARRIS, M. D., Houston, Texas

THERE are times when early bronchial obstruction does not manifest itself either subjectively or objectively. The degree of obstruction usually is a gauge as to the severity of the symptoms. When obstruction does manifest itself clinically, it does so in one of two ways, obstructive emphysema or obstructive atelectasis in the affected lung area supplied by that bronchus. This might be called effect rather than cause. So it is that the results of bronchial obstruction can be determined but the disease or disease entity producing the obstruction is not always apparent, though at times the history is almost entirely diagnostic.

Pasteur's[2] original contributions in 1890 on atelectasis started an almost continuous study which led to the present clarification of the subject. Jackson[7] added much to understanding the mechanism by which this condition developed.

Atelectasis may be conveniently divided into the following three separate types:[10] first, the compression state as occurs in pneumothorax, fluid and pus in the pleural cavity, or any condition preventing the lung or a portion of the lung from expanding; second, chronic inflammatory conditions preventing air from entering the lung due to fibrous tissue binding and contracting the lung; third, obstructive conditions which may be divided into two types. These types are peribronchial conditions as occur in tumors or lesions outside the bronchus but cause pressure on it, and endobronchial obstructive conditions as are found in foreign bodies, inflammations, new growths, or plugs of mucus in the bronchus.

Presented before the Texas Society of Ophthalmology and Otolaryngology, Fort Worth, December 4, 1953.

From the Department of Otolaryngology, Baylor University College of Medicine and affiliated hospitals.

In order to understand the mechanism of this phenomenon developing in the lung as a result of bronchial obstruction, a little of the physiology of the tracheobronchial tree must be reviewed. The tracheobronchial tree is lined by a ciliated columnar epithelium. Hilding[3] has shown in experimental work on the trachea of chickens that this ciliary beat can produce a vacuum equal to 35 mm. of water when normal mucus occluded the trachea. From this experiment it is concluded that abnormal secretions retained in the bronchi may produce atelectasis by the constant pumping out of the air due to the ciliary beat, as well as by the fixed plugging and absorption of air below the area. Experimental atelectasis[1] has been produced in animals by tying the bronchus. Oxygen was absorbed in forty-five minutes, whereas it took nitrogen twenty-four hours.

The fact that the tracheobronchial tree has many normal movements (respiratory, pulsatory, deglutitory, and bechic[9]) differs from the fundamentals in the mechanics of engineering. Also the fact that we are dealing with gases, solids, and liquids at the same time makes the description as well as understanding more complicated. The fact that the trachea and bronchi elongate and dilate on inspiration and shorten and contact on expiration, increasing with the extent and force of respiration, tends to make this problem more complex than ever.

Emphysema of the segment, lobe, or lung may be the first sign of bronchial obstruction, and this phenomenon can occur only when the inlet to air is not obstructed but the outlet is either partially or completely obstructed. The next phase of obstruction is that of complete obstruction which always ends in atelectasis below the obstruction. Many times the

obstruction is the check valve type which does not permit air to enter the lung. More frequently, however, ingress to the flow of air does not occur until the cohesiveness and adhesiveness of secretions produce the complete bronchial obstruction. Bronchial obstruction producing atelectasis can be present from the onset.

The cough reflex or the "watch dog of the lungs"[6] is a further force which changes the mechanism. The normal forces which try to drive out exogenous and endogenous intruders from the lumen of the lower air passages are ciliary wafting, tussive squeeze, and bechic blast.

Again the impairment of these by destruction of the cilia, oversedation, paralysis of normal muscles of respiration, cerebral anesthesia due to toxicity, or general weakness due to debility increases the hazard in addition to the existing bronchial disease.

In the diagnosis of bronchial obstruction Holmes[5] stressed in addition to a complete history and physical findings, fluoroscopy and roentgenograms made with the patient upright at full inspiration and expiration as well as lateral films of the chest. He believed that the earliest sign is diminished density distal to the obstructed area.

Foreign bodies have offered the earliest and most interesting study of this subject. Jackson[8] was one of the first to recognize the mechanics of both obstructive atelectasis and emphysema.

REVIEW OF CASES

A review of 50 selected cases I treated is analyzed in this study to determine if there are any newer clinical concepts of bronchial obstruction (table 1).

TABLE 1.—*Types of Bronchial Obstruction in This Review.*

Types of Cases	No. Cases
Foreign body of the bronchus	
Seen within twenty-four hours	10
Seen from forty hours to nine months	7
Bronchogenic carcinoma	12
Mediastinal tumors	2
Tuberculosis of the bronchus and lung	4
Postoperative atelectasis	4
Inflammatory obstruction	5
Asthma	3
Post-tracheotomy	3
Total	50

Foreign Body of the Bronchus.—Of the cases of foreign bodies of the bronchus, 10 patients were seen within the first twenty-four hours; 6 of these showed emphysema of the affected side by roentgen ray, 2 showed atelectasis, and 2 did not show either atelectasis or emphysema, though 1 showed a radiopaque foreign body. All of these patients were children 5 years of age or younger.

Seven cases were seen from forty hours to nine months following the aspiration of the foreign body. Six of these cases were of children 3 years or younger and 1 of a 70 year old woman. Four of these patients showed atelectasis, 2 emphysema, and 1 no change on roentgen-ray study.

In the first group, when roentgen-ray evidence was that of emphysema or there was no apparent change in the aeration of the affected side over the unaffected side, the endoscopic findings always showed a bronchus free of inflammation and secretions. The foreign body did not completely or uniformly fill the lumen. This was especially noticed on inspiration. Frequently the foreign body moves to a lower level on inspiration and to a higher level on expiration until the bronchus clamps around it. In some instances of incomplete obstruction, the foreign body did not move at all.

One case is worthy of special mention since a tracheotomy was necessary to deliver the foreign body, a bean. Unquestionably, there must have been some swelling of the bean as it appeared to have been uncooked or only slightly so. This problem does not occur often, and I would not have believed it possible for swelling to occur to such an extent that the bean would not come through the subglottic larynx had not the forceps' hold been examined and an attempt made to remove it through the larynx after tracheotomy.

From the study of the 7 patients seen forty hours or later after aspiration, only 2 showed evidence of inflammation of the bronchus and only 1 of these showed real suppuration. All of those with atelectasis did show thick secretions in the region of the foreign body.

Another of these also offered a special problem because of the repeated stripping of the foreign body. It is believed that death was due to anoxia and a prolonged bronchoscopy. Reassembling the foreign body offered some explanation for the repeated stripping, which is believed to have been due to improper grasping of the foreign body.

A niche broken out of the side before aspiration allowed the half of a peanut to lie almost transversely with the niche fitting over the carina. This presented the problem of accurately aligning the foreign body with the bronchoscope. No doubt the foreign body was grasped slightly transversely rather than in a longitudinal manner. In retrospection, turning the peanut so that the niche would have been to the right would have made alignment better for grasping.

Roentgen-ray evidence is not always present in cases of foreign body in the bronchus. Sometimes the obstructive emphysema is so slight that it cannot be detected on expiratory or inspiratory films. In cases in which the clinical picture and the history are strongly suggestive of obstructive emphysema and the

roentgen ray does not confirm the suspicion, a bronchoscopy should be done.

Bronchogenic Carcinoma.—In the group of 12 cases of bronchogenic carcinoma, 5 were definitely diagnosed as carcinoma by bronchial biopsy before thoracotomy. All of these were in the major bronchi. Though all cases showed considerable bronchial obstruction, the amount of atelectasis noted by roentgen ray was surprisingly small. Little study by the roentgen-ray department was undertaken to determine the amount of segmental emphysema. It seems from the findings that as a bronchus becomes more rigid, even though the lumen diminishes in size, it does not decrease in size with expiration as does the normal bronchus.

Seven cases showed definite bronchial obstruction of the segmental lobe bronchi, but no tissue was seen or recovered which represented tumor. One of these cases, however, was of a large bronchus, but no tumor tissue was recovered. This lung showed evidence of emphysema with an increase in density of the hilar mass. All the other cases showed atelectasis of varying degrees, as one would expect from the bronchoscopic findings in which the segmental bronchus appeared to be completely occluded. In 4 of the cases a study of the lung, after it was removed surgically, bore out the endoscopic findings.

Mediastinal Tumors.—Two cases representing mediastinal tumors caused partial bronchial obstruction. In both of these there was definite pressure on the main stem bronchus, not of sufficient degree to produce atelectasis but enough to produce emphysema. One of these was proved at surgery to be lymphoblastoma; the other was thought to be some type of malignant lymphoma by clinical response to roentgen-ray therapy. The rather rounded type of projection into the lumen was almost entirely diagnostic of a mediastinal tumor.

Tuberculosis of the Bronchus and Lung.—Two cases showed a definite endoscopic picture of bronchial obstruction due to peribronchial disease as well as endobronchial disease. In spite of the suspected tuberculosis, it could not be proved by either multiple sputum examination or endoscopic biopsy in either case. Presumably in most of these cases with peribronchial masses and obstruction, secondary infection involves the bronchial mucosa in the major bronchi and obscures the deeper disease.

Two other cases are interesting because of the early age of the patient with tuberculous involvement. In both, the physical findings of bronchial obstruction were manifested clinically by emphysema of the affected side. In 1 case the obstruction was due to a caseous mediastinal lymph gland eroding into the bronchus, and in the other the findings were that of bronchitis. The underlying disease causing the obstruction was not suspected in either case until the bronchoscopy was done.

Postoperative Atelectasis.—Sometimes known in the past as "ether pneumonia," postoperative atelectasis is still common in spite of the frequent use of intratracheal anesthesia followed by aspiration of the tracheobronchial tree. Four cases are typical examples of postoperative atelectasis. In several instances no doubt atelectasis was due to surgery following too closely an acute bronchitis. The findings endoscopically are typical when there is massive collapse. The bronchus is usually filled with a rather thick type of secretion. Ordinarily when this secretion is removed and marked sedation, as was manifested in these cases, is discontinued, there is no recurrence. In all of these cases in which the affected lung had become atelectatic, even on coughing, there was some movement of the secretion seen at endoscopy, but never enough to dislodge it into the trachea.

Inflammatory Obstruction.—Two cases represent the so-called unresolved pneumonia described by Holinger.[4] Typical of the endoscopic picture, especially in 1 of these, was the thick globule of mucus which on expiration bulged out into the main stem lumen and disappeared on inspiration. In the other there is a question as to the cause except to call it inflammatory in nature. Too much time had elapsed from the onset to make the picture clear. An inflammatory exudate, however, filled the segmental bronchus.

Another case also represents an inflammatory lesion at the time of endoscopy, though the age of the patient and history were strongly suggestive of a carcinoma.

There were 2 cases of aspiration of irritating fluids which caused an inflammatory reaction of many of the smaller bronchi as well as the major bronchi. This was sufficient to cause definite expiratory wheezes as evidence of bronchial obstruction. The endoscopic picture showed a reddened mucosa throughout with edema of the orifices of some of the secondary bronchi.

Asthma.—The crescent shaped bronchus seen on expiration in the asthmatic patient was demonstrated in 3 cases, all of which were of chronic asthma patients. In 1 of these, in addition to the asthma, the patient had a massive atelectasis. The red mucosa was indicative of a secondary infection.

All of these cases showed considerable mucus in the larger bronchi, but most of the secondary bronchi, especially the orifices, were swollen.

Post-Tracheotomy.—Bronchial obstruction after tracheotomy, in acute laryngotracheobronchitis, ordinarily does not and should not occur. Sometimes,

however, when the factor of humidity is not well controlled, because of nursing laxity and poor humidification equipment, severe symptoms appear as a result of crusting. One case represents a problem of partial pneumothorax with increasing respiratory difficulty. The differentiation could not be made between emphysema and pneumothorax until bronchoscopy revealed the crusts which had produced an obstructive emphysema on the opposite side of the pneumothorax. The obstruction could be seen on expiration through the bronchoscope when the bronchus closed around it. Another case showed practically the same findings on each side and was identical except for the absence of pneumothorax.

The last case represents a type of atelectasis which develops in those persons who have lost the muscular power to breathe or those poliomyelitis patients who have bulbar paralysis as well as the respiratory form and must have a tracheotomy. These patients, especially if they have a great deal of secretion, frequently develop atelectasis on the left side because the tracheal suction nearly always enters the right main bronchus. Any patient who has been doing well and for some unexplained reason shows sign of cyanosis even with all mechanical equipment in order, must have a bronchoscopy to eliminate early bronchial obstruction on the left side. A number of these cases have been observed.

SUMMARY

A study of 50 cases of bronchial obstruction is presented.

Early cases of obstruction by foreign bodies are likely to produce an obstructive emphysema. Foreign bodies that have been present for some time are likely to produce an obstructive atelectasis due to secretions which form secondary to infection.

Tumors also are likely to produce obstructive emphysema early rather than atelectasis. A surprisingly small number of patients had a positive biopsy. Bronchial obstruction could be seen in all patients, either directly or by the right angle telescope. Papanicolaou smears and washings were entirely disappointing in these cases, though the pathology department was not well equipped at that time to do exhausting studies.

Tuberculosis of the lung in the child, when causing bronchial obstruction, may be due to primary disease of the mediastinal glands or bronchus. Two such cases are summarized.

Postoperative atelectasis, inflammatory obstruction, asthma, and post-tracheotomy bronchial obstruction offer no new bronchoscopic problems. Poliomyelitis patients who show signs of increasing difficulty are in respirators after having been tracheotomized and should have a bronchoscopy to rule out a left side obstruction due to secretion.

It is recommended that all early patients with suspected primary bronchial obstruction or segmental bronchial obstruction have roentgenograms made on inspiration and expiration. This may give some early evidence of bronchial obstruction manifested by emphysema.

MIGRAINE HEADACHES IN BABIES

A New York physician says in the July *American Journal of Diseases of Children* that babies as young as two weeks old can suffer migraine headaches. Dr. Jerome Glaser, Rochester, stated that symptoms of infant migraine headaches are much like those for adults, but a positive diagnosis cannot be made until the child is old enough to describe his feelings. He said that in children the condition may be due to an allergy, particularly to such foods as chocolate, eggs, wheat, and milk.

Dr. Glaser said that a child may be unusually restless the night before a headache and show a gradual temperature rise up to 104 degrees in the morning. Other symptoms he listed are distended abdomen; dizziness; bad breath; and a definite change of behavior to sadness, excessive gaiety, or definite irritability. Even though one of the most common causes is eye trouble, Dr. Glaser said that many suffer because of allergy to certain foods.

Long-Acting Penicillin for Infections

One shot of a new long-acting penicillin can replace multiple injections of penicillin, tests on patients with infections from burns, compound fractures, and surgery show.

Dr. John F. Hankins and George H. Yeager, Baltimore, have tested 46 patients and report in the August 7 *Journal of the American Medical Association* that the one-shot treatment controlled infection in all of the patients. Benzathine penicillin G has already been found useful for treating infections accompanying rheumatic fever, for children with streptococcic infections, and for gonorrhea, the physicians say.

CASE REPORTS

A New Uretero-Intestinal Anastomosis for Use in Pelvic Evisceration

ROBERT L. SEWELL, M. D., F.A.C.S., and JOHN H. SEWELL, M. D.,
Fort Worth, Texas

THE operation of total pelvic evisceration has been employed by us since 1949.[1] The majority of the patients suffered from advanced carcinoma of the cervix that had not responded to adequate irradiation. Pelvic evisceration entails the removal, in one large mass, of the uterus, tubes, ovaries, broad ligaments, all lymph node bearing tissue, the bladder, the lower ureters, the rectum, the pelvic diaphragm, the levator muscles, the vagina, the anus, and the external genitalia. Of 9 patients subjected to exploratory procedures, 2 were inoperable because of massive involvement of the aortic chain, invasion of the iliac vessels, or both.

Of the remaining 7 patients, 3 have since died from recurrence of their disease. The remaining 4 are alive and apparently free of disease at the present time. The longest time elapsed is four years, and the least, one year.

The techniques used in these procedures have varied for reasons of expediency. Some measures have evolved from the work of others in this field. In the diversion of the urinary stream, our inclination had been to implant the ureters into the sigmoid colon 5 inches from the colostomy opening on the abdominal wall. This left the patient with a "wet" colostomy which was managed by a Rutzen bag.

In the long-term after-care of these women, repeated episodes of urinary infection of varying intensities have occurred, usually manifested by chills and fever, and at times accompanied by pain in the flank.

This brief report is prompted by the satisfactory results obtained in 1 of these patients who was operated upon in July, 1952. In this instance, after division of the sigmoid colon was done, the open end of the proximal segment was closed, and a loop 10 inches from this cut end was brought out through a separate incision in the left midabdomen as a double-barrelled colostomy over a glass rod. The ureters were then implanted into the side of the sigmoid distal to the colostomy (fig. 1). Although this still leaves a "wet" colostomy, the fecal stream no longer passes over the ureters, thus minimizing the opportunity for retrograde urinary infection. The small pouch of bowel just distal to the colostomy now acts as a minor reservoir for the urine, and does allow the patient some freedom from the use of the Rutzen bag while bathing, changing clothes, and cleaning the colostomy equipment. Because of the relatively small absorptive surface of the colonic pouch, not enough reabsorption of nitrogenous end-products has occurred to alter the nonprotein nitrogen or the chloride concentration in the blood.[2]

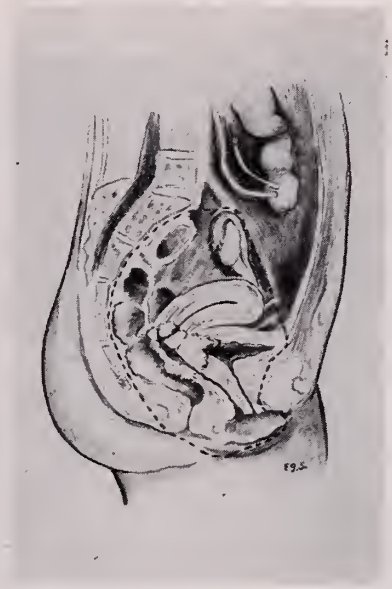

FIG. 1. The ureters are implanted into the blind sigmoid pouch. The area resected is outlined by a dotted line.

CASE REPORT

Mrs. R. E. S., a 41 year old woman, was first known to have a carcinoma of the cervix in May, 1950, when a biopsy was made of an ulcerating cervical lesion. She received irradiation, exact amount not known, but the lesion did

Presented before the Texas Surgical Society, San Antonio, April 6, 1953.

not completely regress. Five months later she received further irradiation by the insertion of radium needles.

Because of persistence of the ulcerated lesion, the finding of a mass in the soft tissues of the pelvis, and the further formation of a rectovaginal fistula, an exploration was done in July, 1951. At this time the growth was considered inoperable, and a colostomy done.

When first seen at the Fort Worth Clinic, the patient was emaciated, weighed 71 pounds; had a profuse, irritating vaginal discharge; and was using daily 2.5 grains of morphine, which still failed to relieve completely her pain. Two biopsies failed to show the carcinoma, but because of the attendant radionecrosis, this was not surprising.

A roentgen-ray survey of the chest, pelvis, and kidneys was done. No metastatic involvement was found, but bilateral hydro-ureter was noted. An advanced microcytic anemia was present. Serologic studies were positive for syphilis. There was a moderate decrease in the circulating blood volume. The remaining laboratory results were normal.

On July 28, 1952, after the usual preparation of the bowel and correction of the diminished circulating blood volume, a total evisceration was done with removal of the uterus, ovaries, tubes, broad ligaments, bladder, lower ureters, lower sigmoid colon, pelvic diaphragm, levator muscles, vagina, anus, and external genitalia.

After division of the sigmoid colon, the proximal end was closed, and the ureters were implanted into the side of the bowel, distal to the colostomy. A short tunnel was formed through the muscular coats of the colon, and the ureters were left with more than .25 inch projecting within the mucosa of the bowel.

The pathologist reported areas of viable carcinoma in the broad ligaments, the urinary trigone, and at the site of the rectovaginal fistula.

The postoperative course was in no way unusual for this operation. There was a sustained fever of 103 F. the first two days and considerable bloody drainage through the large perineal defect, but severe shock was not encountered. Five pints of blood were used during the operation, and a pint on each of the first two postoperative days.

Morphine requirements from the first day did not exceed 1 grain total, less than half of the preoperative need. In three weeks codeine was substituted. The patient has used no narcotics of any kind since April 12, 1953. Her perineal wound closed at that time.

Ten months postoperatively, on May 20, 1953, blood studies were normal, and pyelograms (fig. 2) were almost normal. Shortly after this visit the patient returned to work. At no time in the entire course has there been an episode suggestive of pyelitis.

SUMMARY

An instance of pelvic evisceration is presented in which the ureters were implanted into the blind loop of sigmoid distal to the double-barrelled colostomy.

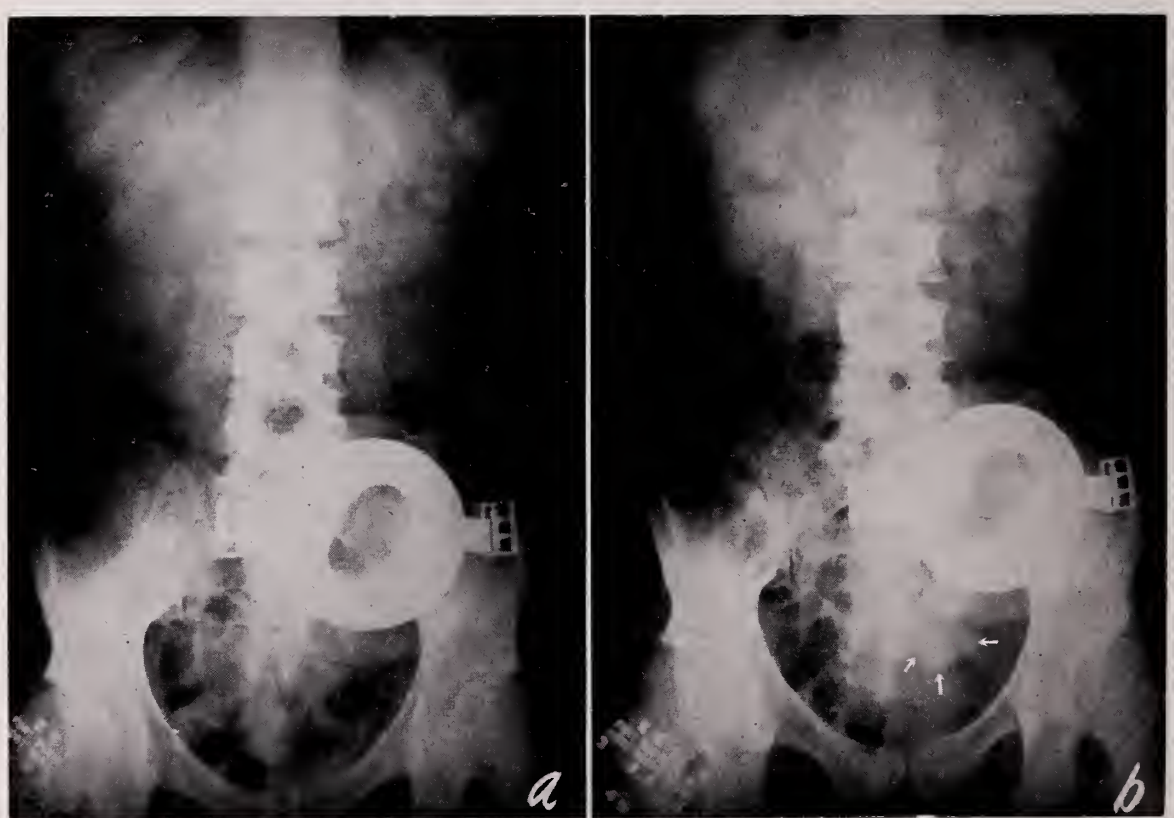

FIG. 2a. A plain kidney, ureter, and bladder roentgenogram of the abdomen, with the Rutzen bag in place, made eight months postoperatively.

b. The blind pouch of sigmoid into which both ureters drain can be seen as a lobulated mass just below the Rutzen bag. This intravenous pyelogram also indicates the function of both kidneys.

Management of the colostomy was facilitated and no urinary infections have appeared in one year's time. There has been no disturbance of nitrogen or chloride levels in the blood. The patient is well, working, and without evidence of recurrence as of March 25, 1954.

International Medical Assembly of Southwest Texas, San Antonio, Jan. 24-26, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 7-10, 1955. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference, Wichita Falls, Sept. 22, 1954. Dr. L. N. Simmons, 1518 Tenth St., Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin, Oct. 22-23, 1954. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

American Fracture Association

The annual meeting of the American Fracture Association will be in Houston, October 11-14. Dr. Henry W. Meyerding, Rochester, Minn., president, will preside. Formal essays, panel discussions, and group round table discussions on various phases of fracture treatment will be included on the program.

Texas Hospital Association

The silver jubilee convention of the Texas Hospital Association was held in Houston, May 18-20. Officers elected were Boone Powell, Dallas, president-elect; D. S. Riley, Big Spring, vice-president; and H. M. Cardwell, Lufkin, treasurer. John G. Dudley, Houston, was installed as president.

Among the speakers were Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association; Dr. Everett C. Fox, Dallas; Dr. Frank R. Bradley, St. Louis; Dr. Edwin L. Crosby, Baltimore; and Dr. Merrill F. Steele, Cincinnati.

Other organizations meeting at the time of the Hospital Association were the Texas Association of Medical Record Librarians, Texas Association of Nurse Anesthetists, Texas Conference of the Catholic Hospital Association, and Texas Association of Hospital Auxiliaries.

Southwest Cancer Conference

Immediately preceding the meeting in Fort Worth of the Texas Pediatric Society, the Eighth Annual Southwest Regional Cancer Conference will be held on October 21 with "Tumors of Infants and Children" as the subject. Except for a clinic which will be held at the Fort Worth Academy of Medicine building at 8 p. m., the conference is scheduled for the Hotel Texas from 9 a. m. to 5 p. m., including a luncheon and round table discussion.

Guest speakers will be Dr. Robert M. Moore, professor of surgery and chairman, Department of Surgery, University of Texas School of Medicine, Galveston; Dr. Edith L. Potter, pathologist, Chicago Lying-In Hospital, and pathologist-in-chief, Chicago Health Department, Chicago; and Dr. Martin H. Wittenborg, assistant clinical professor of radiology, Harvard Medical School, and radiologist, Children's Hospital, Boston.

Dr. Moore will speak on "Congenital Teratomata" and "Surgical Management of Tumors in Children." Topics to be discussed by Dr. Potter are "Tumors of Childhood" and "Resumé of Selected Tumor Cases." Dr. Wittenborg's discussions will be on "Radiological Aspects of the Diagnosis of Tumors of Infants and Children" and "Radiological Aspects of the Treatment of Tumors of Infants and Children."

The evening clinic will consist of the presentation and discussion of tumor cases by the guest speakers and by visitors.

There is no registration fee for the conference, the program for which was planned by Dr. John L. Wallace, chairman of the Tarrant County Cancer Committee.

Physician-Owned Pharmacies Decried

The Board of Councilors of the Texas Medical Association has given its wholehearted approval to a resolution adopted by the Texas Pharmaceutical Association at its diamond jubilee convention in San Antonio, July 25-28. The resolution, reflecting the attitude of the 3,000 members of the druggists' organization, follows:

"*Whereas,* the principles of medical ethics provide that an ethical physician does not engage in barter or trade in the appliances, devices, or remedies prescribed for patients, but limits the sources of his professional income to professional services rendered the patient, and

"*Whereas,* the Judicial Council of the American Medical Association has ruled that it is unethical for a physicain to have a financial interest in a pharmacy in the area in which he conducts his professional activities and where he profits directly or indirectly from the sale of devices or remedies prescribed for his patients, and

"*Whereas,* this is particularly true when the services of other reputable pharmacies are readily available, and

"*Whereas,* the question of rental of space to a pharmacist in a clinic or office building owned or leased by physicians, when such space is rented to pharmacists on a sliding scale or a percentage of the income received by the pharmacy, is equivalent to receiving a rebate from the prescription and is, therefore, unethical in accordance with the ruling of the Judicial Council of the American Medical Association, and

"*Whereas,* the continued trend of physician-owned clinic pharmacies is disruptive to the long cherished necessity for cooperation between the healing arts, therefore,

BE IT RESOLVED, by the 75th Annual Convention of the Texas Pharmaceutical Association that physician-owned clinic pharmacies are not considered to be ethical or in the best interest of medicine and pharmacy in Texas, and that a copy of this resolution be forwarded to the Texas Medical Association for promulgation to its membership, and that copies of the resolution also be forwarded to drug industry publications for dissemination to all registered pharmacists in this State."

PERSONALS

Dr. R. K. Daily, Houston, and *Dr. Gaynelle Robertson,* Texas City, recently presented papers at the Interim Congress of the Pan American Association of Ophthalmology in Sao Paulo, Brazil. They also spoke in Buenos Aires at the meeting of the Argentina Oto-Neuro-Ophthalmological Association.

Commemorating the fiftieth anniversary of the voluntary tuberculosis control movement, *Dr. W. M. Brumby,* Houston, organizer of the Texas Tuberculosis Association in 1908, was honored with a bronze medallion by the board of directors of that group at their July 25 meeting.

Dr. Elliott Mendenhall, Dallas, has been appointed to the advisory board of the American Trudeau Society. Dr. Mendenhall is currently vice-president of the Texas Tuberculosis Association and chairman of its committee on public information.

Dr. Edmond K. Doak, Houston, recently has been appointed to represent Texas on the newly-created Board of Governors of the American Diabetes Association.

Dr. Joseph F. McVeigh, Fort Worth, was given a watch as a momento of appreciation and devotion for twenty-six years as adviser to the faculty of St. Joseph's Hospital's School of Nursing in a surprise ceremony during July.

Dr. John Tunnel, Taft, spoke to the Aransas Pass Lions Club on "Snakes" recently. Dr. Tunnel has studied snakes as a hobby since his boyhood.

Dr. Joe D. Nichols, Atlanta, spoke to the San Antonio Rotary Club on "Some Occupational Diseases of Business Executives" on July 23.

Dr. James Holman, Dallas, and Nancy Jane Holmes, D. D. S., were married July 19 in Dallas.

Dr. and Mrs. J. C. Watkins, Harlingen, were honored with a dinner-dance by the Cameron-Willacy Counties Medical Society on June 29, commemorating the couple's golden wedding anniversary and the doctor's fiftieth year of practicing medicine.

The bulletin of the Alumni Association of the University of Texas Medical Branch, Galveston, lists *Dr. and Mrs. C. R. Goodwin,* Nederland, as recent parents of a girl, and *Dr. Leon Kopecky and Dr. Ina Moodie Calhoun Kopecky,* San Antonio, as parents of a boy, born May 23.

Miss Elizabeth Dingham and *Dr. Felix Shepley,* Wichita Falls, were married on August 6 in New York City.

"Military forces are not a substitute for civil defense. We regard civil defense as a co-equal partner with the military in the defense of the nation."—Secretary of Defense Robert A. Lovett.

Oklahoma City Clinic

The Twenty-Fourth Annual Fall Conference of the Oklahoma City Clinical Society will be held October 25-28. Lectures and discussions by sixteen guest speakers and an address by Dr. Walter B. Martin, Norfolk, Va., President of the American Medical Association, are included in the four day postgraduate teaching program. General assemblies, panel discussions, and daily luncheon round table question and answer sessions will also be included. Dinner meetings, a dinner-dance, and a stag smoker will constitute the entertainment planned for the members. All physicians who are members of a county medical society are invited to attend the clinic.

The guests participating in the teaching program are Dr. George C. Adie, New Rochelle, N. Y.; Dr. Herbert S. Alden, Atlanta; Dr. L. Henry Garland and Dr. Ralph Soto-Hall, San Francisco; Dr. Arnold S. Jackson and Dr. William S. Middleton, Madison, Wis.; Dr. William O. Johnson, Louisville; Dr. Russell J. Blattner, Houston; Dr. William J. Dieckmann, Chicago; Dr. Lloyd G. Lewis, Washington, D. C.; Dr. John J. Modlin, Columbia, Mo.; Dr. James L. Poppen, Boston; Dr. William G. Sauer and Dr. K. M. Simonton, Rochester, Minn.; Dr. David E. Smith, St. Louis; and Joseph F. Volker, D.D.S., Birmingham, Ala.

Additional information may be obtained from the executive secretary, 503 Medical Arts Building, Oklahoma City.

TUMOR SEMINAR

The annual Tumor Seminar sponsored by the San Antonio Society of Pathologists in conjunction with the College of American Pathologists and the Texas Division of the American Cancer Society will be held on November 6 at Brooke Army Hospital, Fort Sam Houston.

The meeting will be devoted to the pathology of bone tumors, brain tumors, and genitourinary tumors, and radiation reaction. The speakers will be from the Armed Forces Institute of Pathology and will include Gen. Elbert DeCoursey, director, who will discuss radiation reaction; Dr. Webb E. Haymaker, chief of the neuropathological section; Dr. Lent C. Johnson, chief of the orthopedic pathology section; and Dr. Fathollah K. Mostofi, chief of the genitourinary pathology section.

Dr. A. O. Severance, Baptist Memorial Hospital, San Antonio 2, can give details concerning the meeting.

POLIOMYELITIS CASES

Poliomyelitis cases nationally are running 7 per cent behind the total reported through July of last year, the United States Department of Health, Education, and Welfare has announced.

For the first seven months of this year, 9,185 reported cases compare with 9,840 cases for the same period in 1953. Both years are below the 10,582 record number of cases reported during the first seven months in 1952.

More than one-third of the cases have been in three states this year. They are California, 1,525 cases; Texas, 1,400; and Florida, 619. By the same time in 1952, Texas had reported more than 2,000 cases.

Druggists to Meet in Houston

The first convention in Texas of the National Association of Retail Druggists will be held in Houston October 10-12. This will be the fifty-sixth annual meeting of the association. Among the speakers will be Congressman Sam Rayburn, Democratic leader of the House of Representatives, and Mr. C. W. Crawford, Commissioner of Food and Drugs, United States Department of Health Education, and Welfare.

Postgraduate Study at San Angelo

The University of Texas Postgraduate School of Medicine, San Angelo Division, is offering a series of courses to be held the second Sunday of each month from September through May, 1955. Part one of the program, the first hour, is a clinical pathologic conference, with case material supplied from the M. D. Anderson Hospital and Tumor Institute, Houston. Taught by Dr. Lloyd R. Hershberger, San Angelo, part one gives nine credit hours. Part two, clinical seminars, offers fourteen hours' credit.

On September 12, the subject for the second part of the course was "Management of Peripheral Vascular Disorders." The remaining schedule for the second hour is as follows: October 1, "Recognition and Management of Common Hematological Problems by the General Practitioner"; November 14, "Care of the Newborn"; and December 12, "Head Injuries." The 1955 subjects and dates will be January 9, "Management of Fractures in General Practice"; February 13, "Obstetrical Emergencies"; March 13, "Management of Burns in General Practice"; April 10, "The Use and Abuse of Antibiotics"; and May 8, "The Acute Abdomen."

Dr. John E. Ballard, San Angelo, will be the radiologist in charge of part three of the program, fundamentals of roentgen-ray interpretations. September and October programs are on the chest; November and December, gastrointestinal tract; January, urology; February, skull; March, spine; April, extremities; and May, therapy.

SOUTHWESTERN POSTGRADUATE COURSE

Southwestern Medical School of the University of Texas and the Dallas Southern Clinical Society will sponsor a postgraduate course for physicians on "Recent Advances in Internal Medicine." The course will be held October 4-6 at Dallas, with meetings from 9 a. m. to 5 p. m., and twenty-one credit hours will be given members of the American Academy of General Practice.

Instructors for the program will be Drs. Carleton B. Chapman, Alfred W. Harris, H. M. Winans, Sr., Donald W. Seldin, D. O. Shields, William F. Miller, John S. Chapman, and E. E. Muirhead.

Also there will be Drs. Donald A. Sutherland, Paul J. Thomas, A. I. Braude, Charles B. Shuey, Albert M. Tocker, William C. Grater, James B. Howell, Arthur G. Schoch, and W. Grady Reddick. Drs. Howard C. Coggeshall, Leonard L. Madison, John S. Bagwell, T. Haynes Harvill, Cecil O. Patterson, and M. O. Rouse will also teach the course.

Registration for the course is $5, and tuition is $25. The fees should be sent to the office of the dean, Southwestern Medical School, 2211 Oak Lawn Avenue, Dallas 19.

HOUSTON POSTGRADUATE COURSE

Baylor University College of Medicine and the University of Texas Postgraduate School of Medicine will offer a course in "The Growth and Development of the Child in Relation to Parents and Physicians," November 5-7. The course will be taught by Dr. Frances L. Ilg, co-director of the Gesell Institute of Child Development, and Dr. Harry Backwin, a psychiatric pediatrician and head of the Department of Pediatrics of New York University.

The Institute will be held at the Texas Children's Hospital Auditorium, Texas Medical Center, Houston, with sessions from 10 to 12 a. m. and 8 to 10 p. m. on November 5, 6, and 7. Each afternoon from 2 to 4 p. m. local psychiatrists and members of ancillary professions will take up detailed and specific questions that may arise. Dr. Russell Blattner, Dr. David Mendell, and Dr. David Vinson, Houston, are the local group directing the course, and Dr. Mendell will be the moderator for the panel and group programs.

CONTAGIOUS DISEASES IN CHILDREN

Basing his conclusions on a twelve-year study of children from 125 New York families, Dr. Nathan Epstein reported in the May *American Journal of Diseases of Children* that children are more likely to get contagious diseases at about 5 years of age than any other time.

However, the children experience upper respiratory infections at an even rate from birth to 12 years, Dr. Epstein said. The study shows that a child has about one out of five chances of being free from upper respiratory infections during any year, but between the ages of 10 and 12 the chance is one in three. He stated that 2 of 3 children experienced one or more mild upper respiratory infections during any year. Of the 200 children studied, each averaged one or two mild and one severe infection a year, regardless of age, the physician stated.

Hospital Grants

The status of all Hill-Burton hospital construction in Texas on June 30 included ninety-nine projects completed and in operation, thus providing 5,852 additional hospital beds. The total cost of $82,636,456 was supplemented by $28,525,286 in federal funds. Twelve projects under construction at that time will provide 2,193 beds, for a total cost of $27,052,656. The federal government contributed $8,924,875 to these projects. One hospital, which is designed to supply 744 additional beds but is not yet under construction, has been approved for the total cost of $15,600,000, including $1,500,000 in federal funds.

FELLOWSHIPS OFFERED

The National Foundation for Infantile Paralysis is now offering a limited number of senior fellowships to physicians interested in study and research in the teaching of preventive medicine. These are being offered in order to increase the number of well trained teachers in the field.

Stipends ranging from $4,500 to $7,000 a year, depending on marital status and number of dependents, will be given for one or more years. The program of study may be taken at an approved medical school of public health or in a department of preventive medicine of an approved medical school.

Candidates, who must have completed at least one year of internship and who must have had not less than two years of additional training and experience, will be selected on a competitive basis by the Clinical Fellowship Committee of the National Foundation for Infantile Paralysis.

The foundation's Division of Professional Education, 120 Broadway, New York 5, is in charge of applications, which can be submitted any time during the year.

Medical and Research Grants

Among the recipients of medical division grants to support clinical studies made by Sharp and Dohme were Baylor University College of Medicine, Houston, and the University of Texas School of Medicine, Galveston. The University of Texas, Austin, was one of the ten recipients of the research division grants, which totaled $17,900. Research and clinical studies grants totaling $43,100 have been made by the company since January 1 of this year.

LIBRARY SECTION

THE BUSINESS SIDE OF MEDICAL PRACTICE

Many doctors have realized that they must depend upon their own initiative to develop satisfactory business procedures in their offices. While they may have a natural dislike of business details, closer attention to the development of efficient and complete business records and practices can result in a saving of time and money as well as improvement of relations with the patient. Professional ability and service are of primary consideration, but they need to be implemented by efficient and productive business procedures.

Choosing a location can have an important effect on the financial success of the physician. Outlying districts and rural areas may be desirable for a doctor beginning practice because of the ease of getting started. The area that needs a doctor the most may be the most lucrative because of the assurance of an adequate practice. In urban areas, sharing an office location with other physicians can decrease overhead and be mutually beneficial financially.

The efficiency and appearance of the doctor's office play an important part in the doctor-patient relationship. The reception and consultation rooms and the laboratory, if any, should be arranged efficiently, on the advice of an architect when possible.

Competent office assistants are not easy to obtain. Often the doctor must train a receptionist, nurse, and technician or a combination of the three. The ability and attitude of these assistants may be the determining factors in establishing a successful business operation. Salaries should be large enough to permit employees to maintain adequate standards of living. If a feeling that they are a part of the professional practice can be instilled in the assistants' minds, they will be more inclined to do their best work and to be satisfied with their jobs. The manner in which office assistants treat the patients is an important part of maintaining a proper professional relationship.

Financial records need not be extensive or complicated but should reflect essential information completely. The system should be thoroughly understood by the doctor, and he should examine the records to keep himself informed. There is no one correct type of bookkeeping or record system. In most cases the records should be tailored to meet the needs of the individual practitioner. There are innumerable bookkeeping systems that have been devised by commercial concerns, but practices, particularly the specialties, vary greatly as to the type and extent of services rendered. Attention should be given to complete records of patients' accounts and accurate records for income tax purposes. Most physicians maintain patients' accounts on an accrual basis to record the amount of work performed but report their income for tax purposes on a cash basis. This is, of course, completely ethical since this choice is permitted by law.

Care should be taken in preparing case records. In addition to furnishing background material to the physician in his treatment, they possibly may be required as evidence in court. Printed forms are available for these records, but an evaluation of individual needs should govern the selection of the forms. Many doctors use dictating machines of the disc, cylinder, or wire recorder type to save time. The records of treatment and the accounting records are related and should be kept in a manner that will make this relationship easy to trace. Accurate, well kept files will save the doctor's time and permit him to find needed information quickly.

To reduce the number of delinquent accounts, they should be given early attention. When possible, payment for major

operations and extended treatment should be discussed with the patient in advance. Collection measures which antagonize the patient should be avoided. If collection is turned over to an outside agency, the doctor should be sure that the methods they use will not impair public relations or his professional standing. Collection letters should be written in the same manner that the physician uses in speaking to his patients. Installment payments may be successful if adhered to. The method of payment should be agreed to mutually by the patient and the doctor or his assistant.

The physician should familiarize himself with the legal aspects of his contractual relationship with the patient and of maintaining records for tax purposes.

In general, attention to the establishment of adequate records and routines can become an investment of the doctor's time that will result in a larger income and better patient relationships.

If a physician has a problem with records or business procedures, the business office of the Texas Medical Association will be pleased to discuss it with him and make suggestions. The business office also would be interested in receiving any suggestions on methods to improve its business services.

Dr. N. L. Schiller, Austin, 15 journals, 13 reprints.

BOOK NOTICES

Cure Your Nerves Yourself

LOUIS E. BISCH, M. D., Ph. D. *247 pages. $3.50. New York, Wilfred Funk, Inc., 1953.*

In this volume, written for the lay public, the author has assumed that those individuals with minor emotional problems can help themselves.

The book is written in simple language and is readable. Each chapter deals with a specific problem that people face in their everyday living. The book should be helpful to many who have minor adjustment problems and are completely open minded about their problems, willing to discard their old habits and make new adjustments. The book cannot replace the aid of a psychiatrist.

[1]French's Index of Differential Diagnosis

Edited by ARTHUR H. DOUTHWAITE, *London,* M. D., F.R.C.P., *Senior Physician, Guy's Hospital; Honorary Physician, All Saints' Hospital for Genito-Urinary Diseases. Seventh edition. 1,046 pages. $20. Baltimore, Williams and Wilkins Company, 1954.*

The main signs and symptoms of disease are meticulously dealt with and in comparison with the former edition there is more conciseness and less repetition. It is simple in its usage because its articles on the various symptoms are arranged in alphabetical order.

More important than the alphabetical order of symptoms is the discussion of differential diagnosis in connection with the symptom or symptoms involved. To use this book effectively, it must be realized that the body of the book deals with symptoms, whereas the index gathers these together under the headings of the various diseases in which they occur.

Extensive use of the general index will keep the reader from missing a number of places in which the diagnosis of the disease or diseases in question is discussed. Even though each symptom is discussed only once, each disease is likely to come under discussion in a number of places under several of its more important symptoms.

It is called to the attention of the early users of the

[1]*Joe C. Rude, M. D., Austin.*

book that borderline headings and various signs such as von Graefe's and Stellwag's are found in the index and that use of the index speeds up the usage of this compact volume.

Treatment, pathology, and prognosis as indicated in the preface to the volume are not dealt with except insofar as they bear upon differential diagnosis; for example, the use of salicylates in distinguishing rheumatic from other types of arthritis.

The illustrations are well chosen, and the colored ones add a great deal to the informative value of this work.

This book is an excellent index of differential diagnosis and is a valuable addition to any physician's reference book shelf.

Review of Physiological Chemistry

HAROLD A. HARPER, Ph. D., *Professor of Biochemistry, University of San Francisco; Lecturer in Surgery, University of California School of Medicine, San Francisco. Fourth edition. 328 pages. $4. Los Altos, Calif., Lange Medical Publications, University Medical Publishers, 1953. Spanish edition, Madrid, Spain, Ediciones Morata.*

Peripheral Nerve Injuries, Principles of Diagnosis

WEBB HAYMAKER, M. D., *Chief, Neuropathology Section, Armed Forces Institute of Pathology, Washington, D. C., and* BARNES WOODHALL, M. D., *Professor of Neurosurgery, Duke University School of Medicine, Durham, N. C. Second edition. 333 pages. $7. Philadelphia, W. B. Saunders Company, 1953.*

In the second edition of the Haymaker and Woodhall monograph the text has been thoroughly reworked and supported by references. New chapters and illustrations have been added. Many of the changes were in response to criticism of the previous edition. The authors describe the motor, sensory, autonomic, and reflex changes resulting from injuries of peripheral nerves, roots, and plexuses. The book, originally a product of World War II, was a guide for medical officers of the armed forces. Further experience with civilian and military nerve wounds has been the source of the new information. The book is excellently illustrated by photographs and line drawings. It should be a valuable reference book for all students and for physicians and surgeons who frequently treat traumatic cases.

The Mechanism of Inflammation

Edited by G. JASMIN, M. D., *and* A. ROBERT, M. D., *Institut de Medecine et de Chirurgie experimentales, Universite de Montreal. 308 pages. Montreal, Canada, Acta, Inc., Medical Publishers, 1953.*

At the Nineteenth International Physiological Congress in Montreal in 1953, a symposium was held by contemporary investigators in the field of inflammation. This was the first international symposium on the subject. Twenty-four papers were presented in written form, and a panel discussion was held. In this monograph the complete proceedings, the formal papers, the prepared remarks, and the free discussion are presented. There is a serious divergence of opinion among the investigators, the leading controversies being histamine and ground substance. The symposium was financed by pharmaceutical companies in the United States and Canada.

Conserving Human Resources

Proceedings, 1952 Annual Convention, National Society for Crippled Children and Adults, October 26-29, 1952, San Francisco. The Easter Seal Society Chicago. 107 pages. The National Society for Crippled Children and Adults, Inc., Chicago, 1953.

Disability Evaluation, Principles of Treatment of Compensable Injuries

EARL D. MCBRIDE, M. D., F.A.C.S., *Assistant Professor in Orthopedic Surgery, University of Oklahoma School of Medicine; Attending Orthopedic Surgeon, St. Anthony's Hospital; Chief of Staff, Bone and Joint Hospital, Oklahoma City, Okla. Fifth edition. 715 pages. $15. Philadelphia, J. B. Lippincott Company, 1953.*

As a pioneer in the field of disability evaluation, the author again has presented a comprehensive coverage of the field.

Since the publication of the first edition, doctors and lawyers have consulted this reference in formulating opinions. The relation of injury to disease is timely, and those forced with forming an opinion will find the material most helpful.

The variety and complexity of injuries make it difficult to establish a fixed schedule for ratings for all the known occupations.

This reference book will greatly assist the physician in preparing his testimony concerning disability, and should be considered a "must" for the orthopedist and industrial surgeon.

Treatment of Toxic Goiter with Radioactive Iodine

LINDON SEED, M. D., *Director, Isotope Laboratory, Grant Hospital; Clinical Associate Professor of Surgery, College of Medicine, University of Illinois, Chicago, and* THEODORE FIELDS, M. S., *Assistant Director, Radioisotope Laboratory, Hines Hospital, Hines, Ill.; Instructor in Radiology, Northwestern University Medical School, Chicago. Preface by George V. LeRoy, M. D., Associate Dean, Division of Biological Sciences, University of Chicago. 116 pages. $3.75. Springfield, Ill., Charles C Thomas, 1953.*

This monograph, written by a surgeon and a radiophysicist, is based on their experience with the treatment of toxic goiter. It should prove valuable to those who are interested in installing a small isotope laboratory. It gives the indications for isotope therapy as well as the results of the treatment and includes a discussion of the complications such as hypothyroidism, exacerbation of symptoms, local reaction, and exophthalmos. The authors prophesy that the present surgical treatment of exophthalmic goiter will be replaced by radioiodine therapy.

[2]Water, Electrolyte and Acid-Base Balance; Normal and Pathologic Physiology as a Basis for Therapy

HARRY F. WEISBERG, M. D., *Assistant Professor of Clinical Pathology and of Clinical Medicine, Chicago Medical School; Clinical Chemist, Mount Sinai Medical Research Foundation and Hospital; Associate Attending Physician, Cook County and Mount Sinai Hospitals, Chicago. 245 pages. $5. Baltimore, Williams and Wilkins Company, 1953.*

If the clinician is looking for an oversimplified formula to understand the principles of fluid and electrolyte balance and the treatment of alteration thereof, he will not find it in Dr. Weisberg's book. If he is looking for a detailed physiobiological-physiochemical treatise on the subject, here again he would not be satisfied. However, for those who want this problem explained in moderately applied physiological vernacular and want to gain a working knowledge encompassed in such a complex and still not completely understood pattern of exchange and interchange between cell membranes, he will have in this book the answer—albeit not a complete one—which will be of benefit to him and through him to his patients.

---

[2]*Bernard Willett, M. D., Austin.*

Dr. Weisberg takes his reader through a discussion of normal physiology and inculcates an understanding of it. This clarifies the essential fragments which are the working elements of this problem. He concisely explains and delineates the concept of body water and its analysis, he describes the function and place of the body electrolytes, and he combines them both into a clear explanation of acid-base balance.

With this information he takes the reader into an understanding of those deviations from normal which plague the surgeon, the internist, and the general practitioner. He presents clinical syndromes and the reason for them. Water imbalance and sodium, potassium, and other electrolytic deficiencies become clear in their relationships to one another. The migration of fluid and electrolyte across semipermeable membranes from one compartment into the next in response to body demands and endocrine stimuli becomes a picture almost as vivid as water flowing over a dam in response to gravity.

Lastly, he describes the various solutions which can be used to treat these aberrations (or to prevent them) giving rationale as well as logical deduction a predominant place in the proper use of them. Possibly Dr. Weisberg has not contributed to the medical literature an original idea or concept in this book, but he has contributed to the interested clinician the clearing of misunderstood and nonunderstood concepts of man's internal environment.

Physiological Methods in Clinical Practice

WILLIAM S. MIDDLETON, M. D., *Department of Medicine, University of Wisconsin Medical School, Madison. The Beaumont Lecture, Wayne County Medical Society, February 2, 1953. 40 pages. American Lecture Series, Number 216. $1. Springfield, Ill., Charles C Thomas, 1953.*

[3]The Ballistocardiogram; A Dynamic Record of the Heart Beat

JOHN R. BRAUNSTEIN, M. D., Ph. D., *Associate Professor of Biophysics and Assistant Professor of Medicine, University of Cincinnati. Publication 143, American Lecture Series. A Monograph in American Lectures in Circulation. 84 pages. $3. Springfield, Ill., Charles C Thomas, 1953.*

Dr. Braunstein has presented "a picture of this most challenging and rapidly moving field"—ballistocardiography. Functional tests of the heart are badly needed, and the present exercise test, often done with misgivings and many warnings as to possible danger, is not the answer. Now we have an instrument that promises to record safely the valuable information as to how well the heart is performing its vital function.

At present no segregation of facts is obtainable as to just how this functional output is obtained, but in time the complex will be worked out and be more valuable. Is the valve leaky? Does the ventricular musculature show damage? The present ballistocardiograph does not delineate each query but it does give the over-all picture and likewise does interpret the first failure of function—often long before the electrocardiogram. Perhaps in the future we can correlate pathology and this record of heart function now known as the ballistocardiogram.

The book is divided into an excellent history dating back to 1877 and shows various displacement ballistocardiograph machines. Modern instruments are presented, and both displacement and velocity machines are discussed. The velocity machine has the great advantage of ease of recording and simplicity of equipment. With the electromagnetic pick-up of the Dock type of instrument the patient is comfortably relaxed on the padded electrocardiograph table and the ballistocardiograph is taken "before they know it."

Next, the author discusses the normal ballistocardiogram followed by a chapter on the abnormal tracing. He shows the relationship to respiration and its effect on the ballistocardiogram.

Physics is brought into play in the chapter on cardiac output and again in the excellent appendix. This gives a clear understanding of the mechanics involved in the studies.

The next two chapters are on the clinical significance of the abnormal pattern and of the abnormal output.

Sixteen pages are devoted to the vectorballistocardiogram. The reviewer is of the opinion some of its electronic armamentariums will be more widely adopted to medical use in the near future.

Dr. Braunstein's small book is the beginning of a promising field. The instruments are quite easily constructed and are also available commercially. The reviewer has made several instruments for his friends.

A bibliography is attached at the end.

Third Annual Report on Stress

HANS SELYE, M. D., Ph.D. *(Prague)*, D.Sc. *(McGill)*, F.R.S. *(Canada), Professor and Director of the Institut de Medecine et de Chirurgie experimentales, Universite de Montreal, and* ALEXANDER HORAVA, M. D. *(Lausanne), Research Associate and Librarian of the Institut de Medecine et de Chirurgie experimentales, Universite de Montreal. 637 pages. Montreal, Canada, Acta, Inc., Medical Publishers, 1953.*

[4]The Action of Insulin

NEILS HAUGAARD, Ph. D., *Assistant Professor of Physiological Chemistry in Research Medicine, School of Medicine, University of Pennsylvania, Philadelphia, and* JULIAN B. MARSH, M. D., *Assistant Professor of Physiological Chemistry, Graduate School of Medicine, University of Pennsylvania, Philadelphia. 113 pages. $3.75. Springfield, Ill., Charles C Thomas, 1953.*

This is a well-written, well-edited, and well-printed monograph, which summarizes the present knowledge of the complex problems of the action of insulin in an adequate manner. The subject is discussed in eight chapters dealing successively with essentials of intermediary metabolism, the chemistry of insulin, the physiology of insulin action, experimental metabolism, the relationship of anterior pituitary and adrenal cortical factors to the action of insulin, some clinical aspects of the action of insulin, and the mechanism of action of insulin. The data are presented briefly and concisely. The bibliography appears to be adequate and well chosen. This reviewer feels that the authors have accomplished their aim: ". . . to present the results of recent investigations dealing with the problem of the mechanism of insulin action in a manner which might interest the clinician as well as the research worker."

Manual for Student Nurse Recruiters

Compiled by MRS. LILLIAN CHRISTENSEN GRIFFITH *under a grant from the National Foundation for Infantile Paralysis. 63 pages. Published by the Committee on Careers, National League for Nursing, New York, 1953.*

The manual is arranged for a community committee and is divided into three parts. The first outlines the plan of organization and the selection of the committee. The second part details the program; speakers; schools, radio, newspaper, and television publicity; and financing. The last two sections contain valuable suggestions for special programs

[3]*David R. Womack, M. D., Austin.*

[4]*George W. Parson, M. D., Texarkana.*

with the aid of doctors and nurses in the community and a list of aids available from the Committee on Careers of the National League for Nursing.

This should be a great help to the Auxiliary in its nurse recruiting program.

Rehabilitation Centers in United States

HENRY REDKEY, *Consultant on Rehabilitation Centers, Office of Vocational Rehabilitation, United States Department of Health, Education, and Welfare, Washington, D. C. 128 pages. $1.50. Chicago, National Society for Crippled Children and Adults, 1953.*

This publication is a compilation of information submitted by forty rehabilitation centers for the first National Conference on Rehabilitation Centers, held December 1-3, 1952, under the sponsorship of the National Society for Crippled Children and Adults and the Office of Vocational Rehabilitation, United States Department of Health, Education, and Welfare.

[5]Planning Guide for Radiologic Installations

By the Committee on Planning of Radiologic Installations of the Commission on Public Relations of the American College of Radiology, WENDELL G. SCOTT, M. D., *Chairman. 336 pages. $8. Chicago, Year Book Publishers, 1953.*

This book fills a much needed phase in the development of radiologists in private and hospital practice. The principles of adapting the radiologic facilities to the needs of the community and the demands made upon it cannot be too strongly emphasized. The planning of a department not only for its present work load but also for its future increase in duties is a good idea, and the fact is not overlooked that as the size increases so will the teaching and instruction responsibilities. Miniature sketches and pictures showing the flow of work through a department even depict the relationship of various workers in the roentgen-ray department with each other.

A good analysis of hospital radiologic practice bearing on the number of patients, number of examinations, and ratio of therapy to diagnostic work in relationship to the populations being served is presented. It is also helpful to find a discussion of the amount of floor space needed and of the team composed of the radiologist, administrator, trustees, and other professional staff members who are vitally affected by roentgen-ray and therapy plans.

The roentgen-ray and radium therapy section is well dealt with as to both size and arrangement for reception, treatment, and examination. A valuable section is devoted to the "don'ts" of construction and should be digested by not only the radiologist, but the administrator, trustees, and architect as well.

I was disappointed in the section on the construction and arrangement of dressing booths and lockers and had the feeling that more preparation and attention should have been paid to allowing patients access to their examining rooms instead of having to parade down corridors for examination.

The dark room section is well done. The discussion is especially good on film drying and the actual processing of films. Accessories, temperature control, and humidity all come in for their share of importance and discussion. Microfilming of overage films to save storage space and preserve records is stressed. In the case of photofluorography the point is well taken that it should be placed near the entrance and between the clinics and the roentgen-ray department to save time and confusion. The suggestion about electric outlets on all floors is good. Having fluoroscopic timers is an excellent suggestion and should be standard equipment in all such units.

The discussion of radiation protection has been well done by a battery of well trained people who have developed this section adequately, and it should be studied by anyone who has radiation duties, be they diagnostic or therapeutic. It is not within the scope of a book review or my ability to discuss this section in a short space. The protective requirements in particular for both patients and personnel cannot be stressed too much or too often.

A Handbook of Practical Bacteriology, Guide to Bacteriological Laboratory Work

T. J. MACKIE, M. D., LL.D., D.P.H., *Professor of Bacteriology, University of Edinburgh; Consultant Bacteriologist to the Royal Infirmary, Edinburgh, and the South-Eastern Regional Hospital Board, Scotland, and* J. E. MCCARTNEY, M. D. *(Edinburgh and Adelaide),* D.Sc. *(Edinburgh), Medical Bacteriologist, Institute of Medical and Veterinary Science, Adelaide, South Australia. Ninth edition. 677 pages. $5.50. Baltimore, Williams and Wilkins Company, 1953.*

Scientific Principles in Nursing

[6]Classics in Clinical Dermatology with Biographical Sketches

WALTER B. SHELLEY, M. D., Ph. D., *Chief, Clinic of Dermatology, University of Pennsylvania Hospital; Associate Professor of Dermatology and Syphilology, University of Pennsylvania, and* JOHN T. CRISSEY, M. D., *Instructor, Dermatology and Syphilology, University of Pennsylvania. Introduction by* JOHN H. STOKES, M. D., *Emeritus Professor of Dermatology and Syphilology, School of Medicine, University of Pennsylvania, Philadelphia. 467 pages. $10.50. Springfield, Ill., Charles C Thomas, 1953.*

In the course of the rather hectic task of trying to keep abreast of modern medical literature, the reader occasionally encounters a book which is a sheer pleasure for readability and enjoyment. Such an opus, to any who profess an interest in cutaneous medicine, is this book.

The book is a collection of first, or at least of early, definitive descriptions of the majority of important dermatologic entities recognized today. Usually the original description is given in toto; occasionally it is somewhat abstracted. With each description is given a short biographical sketch of the author thereof. Since almost all great clinicians of the past hundred years were keen clinical observers, it works out that the volume encompasses most of the great names of dermatology, and it is therefore in effect a practical Who's Who. Naturally, however, there are also a number of less familiar physicians whose names are immortalized by their having been the first to recognize an entity.

It is striking to notice how clear and how complete in their descriptions of a disease were some of the older authors especially, so that but little of importance can be added today after decades of further study. On the other hand, however, every dermatologist will note with interest that some of the original concepts have been enlarged and sometimes radically changed in modern times.

The paper is good and the typography is handsome; the illustrations are acceptable. One is impressed with the large amount of source research and translations the authors have had to do to bring out this excellent compendium.

[5]*Joe C. Rude, M. D., Austin.*

[6]*Morris Polsky, M. D., Austin.*

Dermatologists will be grateful to Drs. Shelley and Crissey for making available this belles-lettres dermatologica; and the general medical public will also read this with much interest and gain.

Electrical Methods of Blood-Pressure Recording

FRANK W. NOBLE, M.E.E., *National Heart Institute, National Institute of Health, Public Health Service, Federal Security Agency, Bethesda, Md. 56 pages. $3. Springfield, Ill., Charles C Thomas, 1953.*

[7]Salt and the Heart

EDWARD T. YORKE, M. D., *Attending Cardiologist, Alexian Brothers Hospital, and Associate Cardiologist, St. Elizabeth Hospital, Elizabeth, N. J.; Consultant in Medicine, Rahway Hospital, Rahway, N. J. 83 pages. $3.45. Linden, N. J., Drapkin Books, 1953.*

This new book covers an up-to-date subject in this modern era of medicine. The author introduces his subject with a typical case seen by the average physician in his office. From this, one sees the importance of questioning the patient as to what he is eating and how his foods are prepared.

Chapter two discusses the physiology of salt metabolism and excretion under normal and abnormal conditions. The current views of the author are well founded in that an excessive intake of salt cannot produce disease.

The author's views on hormones as a cause of premenstrual discomforts are still controversial. His physiologic explanation of congestive heart failure is basically simple the way he tells it. It should be heartening to the medical profession to hear that swollen ankles do not always mean heart trouble.

The chapter on reserve of the heart explains a lot of simple things which many physicians and medically minded people will appreciate. For example, he states that the heart muscle fibers can always stretch a little bit more to continue when the extra load placed upon them seems impossible.

In using low sodium restricted diets, every physician should be constantly on the alert for any symptoms of the low salt syndrome. At this time, the use of resins is not as popular, and their use in the future in regard to the use of salt with heart disease is very questionable. The author's view on salt and sodium in hypertension stimulates much thought. He will have a big following in the belief that overeating which includes an excessive amount of salt is more likely the damaging effect rather than purely excess salt.

The remainder of the book deals with foods containing high and low amounts of sodium. Physicians prescribing the use of a low sodium diet with heart disease should be able to discuss intelligently at least the foods high in sodium. The results obtained with the use of such diets depend upon the intelligence of the individual. One cannot expect many patients to understand the importance of a low sodium diet and the number of grams and milligrams necessary for restricted diets. These patients should be given a list of actual foods to eat.

A review of the subject from the standpoint of a cardiologist or physician dealing with heart disease is elementary but should be enlightening to those unfamiliar with the subject. I believe this book would be of definite value to a young physician, medical student, dietitian, or intelligent patient—with its understandable explanations of the basic physiology relative to salt in the body as a normal function as well as in disease related to the cardiovascular system.

[7]*Henry E. Mehmert, M. D., Greenville.*

ORGANIZATION SECTION

TEXAS MEDICAL ASSOCIATION

EXECUTIVE COUNCIL MEETING

The headquarters building in Austin was the scene September 3-5 of council and committee activities and the semiannual session of the Executive Council of the Texas Medical Association, the governing body between annual meetings of the House of Delegates. Dr. F. J. L. Blasingame, Wharton, President, presided over the Council on September 5, at which time Dr. A. L. Thomas was presented with a plaque as General Practitioner of the Year for Texas. Dr. Thomas, Ennis physician for almost fifty years, was voted to receive the honor by the House of Delegates at its May meeting in San Antonio. He accepted the plaque from Dr. Mayo Tenery, Councilor of the Fourteenth District.

Six past presidents of the Association were in Austin for the meeting. They are Dr. John H. Burleson, San Antonio; Dr. L. H. Reeves, Fort Worth; Dr. B. E. Pickett, Sr., Carrizo Springs; Dr. G. V. Brindley, Temple; Dr. T. C. Terrell, Fort Worth; and Dr. George Turner, El Paso. Dr. Reeves called attention to the Spanish oak tree planted at the entrance to the Association building which he presented in memory of Dr. Holman Taylor and Dr. R. B. Anderson, Jr. Dr. Turner commended Dr. Blasingame on his outstanding job as President, and the others expressed their pleasure at being able to accept Dr. Blasingame's invitation to attend the Council meeting.

Before most Association activities got under way, there was an interprofessional meeting on September 3 with approximately forty representatives present from the Texas Medical Association, Texas Dental Association, Texas Pharmaceutical Association, State Department of Health, Texas Graduate Nurses Association, Texas League for Nursing, Chiropodists Society of Texas, Texas State Veterinary Medicine Association, Group Hospital Service, Texas Public Health Association, and Texas Joint Commission for the Improvement of the Care of the Patient. The group decided that a committee should be appointed to make the necessary arrangements to form a permanent body for discussion of mutual problems and possible joint action where such seems indicated.

After a day of committee meetings September 4, reports were accepted by the Executive Council from the various councils and committees of the Association. Some of the many items of business discussed follow.

The visitation program, which was begun in June to aid county societies in strengthening their membership, attendance, and programs and to learn their needs, was praised by the Board of Trustees, the Board of Councilors, and the Committee on Public Relations. To date, visitations, made by officers and central office personnel, have been scheduled to approximately fifty county medical societies, and it is expected that many additional societies will respond with invitations during the year.

Malpractice insurance rates were studied by several councils. The Council on Medical Defense, in cooperation with the Council on Medical Jurisprudence and following a man-

date from the House of Delegates, is preparing for submission to the Texas Legislature a bill which will modify or exempt malpractice insurance rates from the single rating law to provide some relief for physicians from excessive malpractice insurance rates. As a result of the increased incidence of malpractice suits in Texas, the Council on Medical Defense is studying ways and means by which it can inform individual physicians of better ways to protect themselves and their patients.

Federal legislation concerning medicine was a major part of the report of the Council on Medical Jurisprudence. Status of such items as social security, Hill-Burton Hospital Construction Act, reinsurance, and medical tax deductions was given.

The 1955 annual session of the Association, scheduled for April 24-27 in Fort Worth, will add to its agenda thirty refresher courses taught by distinguished out of state and Texas physicians, it was reported by the Council on Scientific Work. At the time of its report fourteen guests had accepted invitations to participate in the program, and additional speakers were being invited to assure an outstanding program. The Committee on Public Relations commented that adequate publicity is essential to a successful meeting. To supplement the usual methods employed, the committee discussed placards in hospitals and public places, personal invitations from the Fort Worth area physicians, and sufficient publicity through the TEXAS STATE JOURNAL OF MEDICINE.

The Bar M. D. Ranch suite at the American Medical Association convention in San Francisco had more than 1,300 visitors in the three days it was open, according to a report from the Texas Delegates to the AMA. Two Texans were reelected to AMA offices.

Membership in the State Association has reached 6,785, the highest in the history of the Association, according to a report from the Board of Trustees. Texas membership in the AMA is 5,602 not counting exemptions. It is likely that membership in the AMA will exceed 6,000 this year, allowing an additional delegate for Texas.

The appropriation of funds sufficient to operate the Postgraduate School of Medicine on a basis in keeping with the other departments of the University of Texas was recommended by the Council on Medical Education and Hospitals as a resolution to be presented to the Texas Legislature in view of the fact that there is increasing enrollment in the postgraduate courses offered throughout the state.

The Library Endowment Fund has received only $20,214.80 in the past fourteen years, and the Library Endowment Committee is planning to encourage donations through reminders in the TEXAS STATE JOURNAL OF MEDICINE, the visitation program, and the Woman's Auxiliary.

Doctor distribution surveys have been completed in Districts 7 and 8, and a survey is under way in District 4. The Committee on Rural Health and Doctor Distribution plans to survey District 9 and then District 1 to determine the need for physicians.

Purchase of the lot adjoining the headquarters building has been completed by the Board of Trustees. The lot extends 219 feet on Nineteenth Street.

Executive Council to Meet January 22-23

Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association, has set January 22-23, 1955, as the dates for the next Executive Council meeting. Since the Legislature will be in session, it is advisable for those planning to attend to make hotel reservations early.

General Practitioner of Texas

Commemorating his selection as Texas' General Practitioner of the Year, Dr. A. L. Thomas of Ennis was presented with a bronze plaque at the September 5 meeting of the Executive Council of the Texas Medical Association. Dr. Thomas, the sixth Texas physician to be so honored, received the plaque from Dr. Mayo Tenery, Waxahachie, Councilor of District 14. He was elected by the House of Delegates at the 1954 annual session in San Antonio.

Born in Auburn, Ga., on August 7, 1875, Dr. Thomas moved to Ennis with his parents, Alfred N. and Amanda (Betts) Thomas, when he was 11 year sold. He attended country schools and was graduated from Polytechnic College, Fort Worth, after which he taught in a one room school in Bardwell in 1898. Receiving his medical education in Kentucky, Dr. Thomas was graduated from the University of Louisville School of Medicine in 1903.

Dr. Thomas began the general practice of medicine at Cryer Creek, Navarro County, in 1903, and he spent the next year at Terrell as an intern at the North Texas Hospital for the Insane, now the Terrell State Hospital. In

DR. A. L. THOMAS

January of 1905 he moved to Ennis and has practiced there continuously. Dr. Thomas was the first man in the county to do microscopic work, and he studied many specimens sent to him by neighboring physicians particularly to establish the diagnosis of tuberculosis. For some time he was the only anesthetist in the county, and he was the second doctor to own and operate an x-ray machine in the county. He has done postgraduate work in New York, Chicago, and New Orleans.

Dr. Thomas made his first calls by horse and buggy unless the roads were too bad; then he went by horse. He also has made calls on muleback and by railroad hand car as well as on foot. He did his first surgery in the homes on a portable table which he had brought in his buggy. The table was covered with a quilt and a sheet.

Although he is now 79 years old, the doctor is still operating, delivering babies, and helping the spiritual and mental as well as physical needs of his patients. He estimates that he has delivered moer than 3,000 babies since

he began practicing. Last year Dr. Thomas was honored by the Ellis County Medical Society on the completion of his fiftieth year of practice.

Health officer of Ennis for several years, Dr. Thomas has been active in civic work in that town. He is a past president of the Kiwanis Club, was the first person to be chosen "Citizen of the Year" by popluar poll sponsored by the Ennis Lions Club, and has been chairman of the board of trustees for the Ennis public schools for the past twenty years. Dr. Thomas was the first chairman of the library board and holds the first card issued, with which he checked out "The Life of Pasteur."

He joined the Methodist Church in 1882 and has been active in every phase of church work. He is a member of the board of stewards, many times chairman; a member of the choir; a teacher of the Men's Bible Class for many years; and a lay delegate to conferences of the Methodist Church.

A member of the Texas and American Medical Associations through Ellis County Medical Society continuously since 1908, Dr. Thomas served as president from 1941 until 1944. He is past president of the Weekly Doctors Luncheon Club of Ennis.

Dr. Thomas and the former Miss Edna May Williams of Decatur were married on October 26, 1905. In recent years the Thomases have visited Cuba, Guatamala, Hawaii, and Canada, from Quebec to Victoria. Last year they toured Alaska, and this year they took a 4,500-mile automobile trip through the northwestern part of the United States. They have four daughters, Mrs. Ralph Bell, Houston; Mrs. C. A. McMurray and Mrs. J. R. Jeter, Ennis; and Mrs. Eugene Epting, Athens, Ga.

The most recent honor bestowed upon Dr. Thomas was the insertion by Senator Lyndon B. Johnson in the Congressional Record of May 6 the Associated Press story on his selection as General Practitioner of the Year in Texas.

VISITATIONS FOR OCTOBER

Officers and members of the staff of the Texas Medical Association have scheduled visits to five county medical societies during October. They will also participate in the program of the Fourth District meeting at San Angelo, October 21. Societies scheduled to be visited are Bell County, October 6; Hale-Floyd-Briscoe-Swisher Counties, October 12; Williamson County, October 12; Bowie County, October 14; and Travis County, October 19.

AMERICAN MEDICAL ASSOCIATION

'A Life to Save'

The American Medical Association's newest film entitled "A Life to Save" and produced especially for use on local television stations by state and county medical societies, will be available for bookings October 1 through AMA's TV Film Library. The film is a story of how a woman's family doctor saves her life after a quack healer is exposed. The premiere showing was held at the third Medical Public Relations Institute in Chicago, September 1-2.

"Operation Herbert" Available

"Operation Herbert," an amusing motion picture film produced by the American Medical Association became available for showings at clubs, schools, fairs, and other meetings after September 1. The 16 mm. film, lasting 30 minutes and starring Jackie Kelk as a young hospital patient, demonstrates that an appendectomy costs less today than it did in 1937. The film may be reserved through Modern Talking Pictures Service, Inc., 45 Rockefeller Plaza, New York 20.

COUNTY SOCIETIES

Cameron-Willacy Counties Society

June 21, 1954

(Reported by Harry A. Miller, Executive Secretary)

Surgical Treatment of Duodenal Ulcer—Robert M. Moore, Galveston.

Cameron-Willacy Counties Medical Society met on June 21 at Brownsville with the woman's auxiliary for dinner and a business and scientific meeting. A committee was appointed to meet with the regional director of Blue Cross to discuss a proposed program for the society, and George Thurman was elected a member of the society. Dr. Moore presented the above scientific paper.

Hale-Floyd-Briscae-Swisher Counties Society

June 8, 1954

(Reported by John C. Long, Jr., Secretary)

Hale-Floyd-Briscoe-Swisher Counties Medical Society met in Plainview on June 8. C. Thomas Hill, Jr. was elected to membership.

A film on "Anemia" was shown to the group, and a discussion led by E. L. Dye, Jr., Plainview, followed.

Lubback-Crosby Counties Society

June 1, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Interpretation of the Electrocardiogram—Mike Scurry, Dallas.

At the June 1 meeting of Lubbock-Crosby Counties Medical Society in Lubbock, it was decided to begin a savings account for the society. The above scientific paper was heard, and a discussion followed by L. B. Smith, Allen T. Stewart, William H. Gordon, Sam G. Dunn, John Selby, and Roy Sheffield, Lubbock.

Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Society

June 11, 1954

Symposium on Pulmonary Tuberculosis—W. D. Anderson, San Angelo; Lloyd R. Hershberger, San Angelo; C. E. Rush, Sanatorium; and R. F. Allison, Sanatorium.

The Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Medical Society met on June 11 in Del Rio. After hearing the above scientific program, the doctors had dinner with the woman's auxiliary. Dr. and Mrs. George Cox, Austin, were special guests.

Nueces County Society

June 8, 1954

(Reported by G. S. Ahern, Secretary)

Some Health Unit Experiences in Tornado—D. R. Reilly, San Angelo.

After a short business meeting on June 8 of the Nueces County Medical Society, the above program was heard. A resolution expressing sympathy to the families of Dr. C. N. Meador and Dr. J. M. Cameron, Corpus Christi, was passed.

San Patricia-Aransas-Refugia Counties Society

June 2, 1954

Knee Injuries and Their Treatment—George B. Barnes, Corpus Christi.

The San Patricio-Aransas-Refugio Counties Medical Society met on June 2 in the home of Dr. and Mrs. W. A. Guynes, Mathis. After hearing the above scientific paper, a panel discussion on the subject was held. Preceding the program, Dr. and Mrs. Guynes and Dr. and Mrs. Daniel R. Baen, Mathis, were hosts to members of the society and auxiliary at a buffet supper.

Tarrant County Society

June 1, 1954

(Reported by S. W. Wilson, Secretary)

Symposium on "Headache"—T. J. Coleman, Ronald Smith, Bruce Beard, and William C. Hendrix, Jr., Fort Worth.

Tarrant County Medical Society June 1 meeting in Fort Worth included the scientific program outlined above and a short business meeting. S. W. Wilson, secretary, announced that members of the society had been invited to hear the founder of Alcoholics Anonymous speak and also announced that a party was to be given for members and their wives on June 2 by Mr. E. E. Weaver.

DISTRICT SOCIETIES

Fifth and Sixth Districts Society

July 8-10, 1954

Treatment of Adenomatous Polyps Based on Their Pathology—Lauren V. Ackerman, St. Louis.
Radioactive Iodine Therapy in Incapacitated Cardiac Patients—Edward Massie, St. Louis.
Management of Post-Phlebitic Limb—Davitt A. Felder, Minneapolis.
Rubella in Pregnancy—Stewart A. Fish, Dallas.
Surgery of Arteriosclerosis—Dr. Felder.
Tumors of the Parathyroid—Dr. Ackerman.
Anticoagulant Therapy in Coronary Disease—Dr. Massie.
Complete Perineal Laceration—Dr. Fish.
Medical Aspects of Surgical Therapy for Mitral Stenosis—Dr. Massie.
Pathologist's Responsibility in Diagnosis and Treatment of Cancer—Dr. Ackerman.
Amenorrhea—Dr. Fish.
Practical Method of Phlebography—Dr. Felder.

The Fifth and Sixth Districts Medical Society met July 8-10 in Corpus Christi. Included in the three day program were the above scientific presentations, and round table discussions, business meetings, and entertainment. Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association, addressed the group on the first day of the meeting.

New officers elected at the meeting are John J. Sloan, president; R. Gayle Spann, vice-president; and E. Jackson Giles, reelected secretary-treasurer. All three are from Corpus Christi.

Twelfth District Society

July 13, 1954

The Twelfth District Medical Society met in Corsicana on July 13. E. R. Hayes, Milton V. Davis, and Frank H. Kidd, all from Southwestern Medical School of the University of Texas, Dallas, participated in the scientific portion of the program. J. L. Cochran, San Antonio, President-Elect of the Texas Medical Association, and A. L. Thomas, Ennis, 1954 Texas General Practitioner of the Year, were guests and participated in the program also.

AUXILIARY SECTION

HIGH LIGHTS OF THE NURSE RECRUITMENT PROGRAM

The nurse recruitment program of the Woman's Auxiliary to the Texas Medical Association is a means of guiding young persons to become so interested in the prospects for service in the profession that they will choose nursing as a career.

During the past ten years there has been a growing recognition of the fact that just as the need for more nurses is a community problem, so is the recruitment of those nurses a community responsibility. No one group can solve the problem alone. The nursing profession and the medical profession must help by informing the youth of the opportunities and the fields of nursing, and the Woman's Auxiliary will continue to help. Doctors and their wives should serve as speakers on club, television, and radio programs so that the public will be better informed.

For a number of years the various county medical auxiliaries have been interested in securing more students to study nursing. The primary consideration is to counsel young men and women and give the best possible advice. Of course, the auxiliary members must be informed as to the opportunities, necessary training, and fields of nursing before any recommendations may be offered.

At present approximately fifty-two Future Nurses Clubs have been organized in Texas. It is vital that the medical auxiliaries and societies cooperate to the fullest extent with these groups and the Committee on Careers in Nursing. Future Nurses Clubs offer students an opportunity to have their own stimulating program through which, together, they can explore a shared, special interest—nursing.

Realizing that financial difficulties often cause the nursing profession to be deprived of fine nurses, the auxiliaries have established extensive scholarship and loan funds. It is hoped that these funds will continue to be available. There are approximately twenty-six funds established by various auxiliaries, five of which were made possible by securing money from other organizations. At the present time, approximately $6,000 is being made available in scholarship and loan funds by county auxiliaries in Texas.

This year the state Committee on Nurse Recruitment has the following objectives:

1. Publish and distribute a manual for members of Future Nurses Clubs. This manual will include basic information on how to organize a club, with suggestions for programs, projects, and services. It is the hope of this committee that the manual will enable clubs in Texas to become more standardized and also will be beneficial in organizing new clubs.

2. Distribute a pamphlet on available schools of nursing in Texas. Information on admission requirements, length of the program, affiliations, accreditations, and types of schools will be included.

3. Assist in organizing more Future Nurses Clubs in high schools.

4. Cooperate with the Committee on Careers in Nursing in planning the first state convention for Future Nurses Clubs.

5. Make a survey of the available scholarship and loan funds for nursing.

There is no auxiliary too large or too small to do a good job in recruiting professional and practical nursing students. All successful results will depend on the cooperation and long term planning of the members of the auxiliaries and nursing staffs in the community. Good public rela-

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. Mark H. Latimer, Houston; President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas; First Vice-President, Mrs. Mal Rumph, Fort Worth; Second Vice-President, Mrs. Harold Lindley, Pecos; Third Vice-President, Mrs. Howard R. Dudgeon, Jr., Waco; Fourth Vice-President, Mrs. Troy A. Shafer, Harlingen; Fifth Vice-President, Mrs. August J. Streit, Amarillo; Recording Secretary, Mrs. P. M. Kuykendall, Ranger; Corresponding Secretary, Mrs. William M. Palm, Houston; Treasurer, Mrs. J. C. Terrell, Stephenville; Publicity Secretary, Mrs. A. H. Neighbors, Jr., Austin; Parliamentarian, Mrs. John E. Hill, Marshall.

tions may be established in any community by carrying on a well organized nurse recruitment program. With the growing demand for more nurses, it is the auxiliaries' responsibility to see that pertinent information reaches the public.

Doctors and doctors' wives must do all they can to help those men and women who accept the challenge of human service. The Woman's Auxiliary must constantly assure them of the high rewards and everlasting satisfaction derived from being a nurse.

COUNTY AUXILIARIES

Henderson County Auxiliary met July 15 at the home of Dr. and Mrs. Nolen D. Geddie, Athens, and heard a review of the book, "A History of the Texas Medical Association, 1853-1953," by Dr. Pat I. Nixon, San Antonio. The book was presented to the Texas Medical Association Memorial Library in memory of Dr. Don Price, who recently died.

Bosque County Auxiliary met with the county medical society on July 7 at the home of Dr. and Mrs. Van D. Goodall, Clifton, and heard the society's guest speakers. They were Dr. Tom Lyles, Clifton; Dr. M. O. Rouse, Dallas, who spoke on medical jurisprudence; Mr. N. C. Forrester, Austin, executive secretary of the Texas Medical Association; and Mr. R. V. Voyer, Dallas, general director of the David Graham Hall Foundation for the betterment of Texas health. Mrs. S. L. Witcher, Clifton, gave a talk on the auxiliary's proposed projects.

Fifth and Sixth Districts Auxiliary

The Fifth and Sixth Districts Medical Auxiliary held a luncheon-style show in Corpus Christi on July 9 honoring Mrs. Mark H. Latimer, Houston, President of the Woman's Auxiliary to the Texas Medical Association. Mrs. Latimer addressed the group prior to a business meeting conducted by Mrs. June Yates, Corpus Christi, council woman for District 6. Mrs. E. Jackson Giles, Corpus Christi, president of Nueces County Auxiliary, presided at the luncheon.

About 150 motion picture films appropriate for audiences versed in medicine and 50 suitable for laymen may be borrowed from the Library of the Texas Medical Association, 1801 Lamar Boulevard, Austin.

DEATHS

L. MACKECHNEY

Dr. Laurie Mackechney, Wichita Falls, Texas, died at a local hospital on May 31, 1954, after a brief illness.

Born in San Augustine in 1870, Dr. Mackechney was the son of John and Martha (Scurlock) Mackechney. His father was born in Quebec, Canada, and moved to San Augustine when he was 12 years old. Dr. Mackechney attended school in San Augustine and was graduated from Tulane University of Louisiana School of Medicine, New Orleans, in 1895. He began practicing in San Augustine in 1909 and in 1913 moved to Wichita Falls. He practiced in Iowa Park from 1938 until 1951, when he returned to Wichita Falls. At that time he retired from active practice.

A member of the Texas and American Medical Associations continuously since 1908, through Shelby County and then Wichita County Medical Societies, Dr. Mackechney was elected an honorary member of the Texas Medical Association in 1951. He was one of the organizers of the Northwest Texas Clinic, which operated in Wichita Falls for about fifteen years, and later, during World War II, he was superintendent of the Wichita Falls State Hospital. He belonged to the Masonic Lodge, the Shrine, and the Episcopal Church.

Dr. Mackechney and the former Miss Lucy Bell were married in 1897. She died in 1902. He was also preceded in death by six brothers and one sister. Surviving are a son, John H. Mackechney, and three nephews, M. E. Mackechney, John Thomas, and J. S. Mackechney, all of Wichita Falls, and several nieces.

P. J. DOMINGUES

Dr. Polycarp Joseph Domingues, Kerrville, Texas, died on May 30, 1954, at his home.

Dr. Domingues was born in Iberia Parish, La., in 1869. He was graduated from the St. Mary's University in Lebanon, Ky., and from the Tulane University of Louisiana School of Medicine, New Orleans, in 1893. He practiced in Jeanerette, La., until 1898, when he moved to Kerrville. He had attended many patients in Kerr and adjoining counties when horse and buggy or riding horseback provided the only means of transportation. Dr. Domingues bought the first Ford automobile sold in Kerr County.

Dr. Domingues was formerly a member of the Texas Medical Association through Kerr-Kendall-Gillespie-Bandera Counties Medical Society.

Retiring from medical practice six years ago, Dr. Domingues remained active in his business interests until two months prior to his death when failing health forced him to give it up.

Dr. Domingues and the former Miss Evelyn Bowman were married in Jeanerette; she died in 1946. He is survived by a daughter, Mrs. Alice Jobes, and a son, Louis Domingues, both of Kerrville; eight grandchildren; and two great-grandchildren.

D. P. WALL

Dr. Dick Parker Wall died on July 18, 1954, of emphysema at his home in Galveston, Texas.

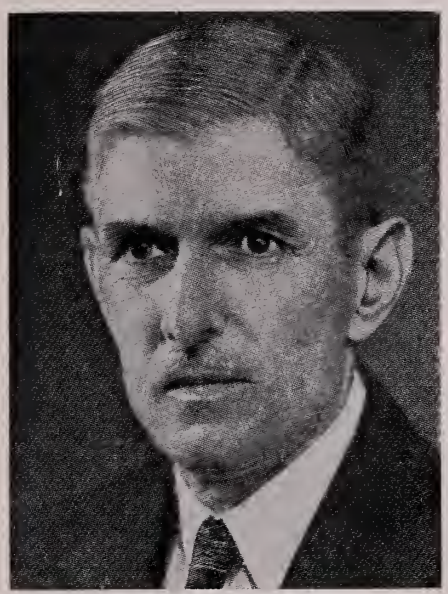
The son of Simeon Venable and Nancy Jane (Comer) Wall, Dr. Wall was born in Chapel Hill, Tenn., November 3, 1884. His father conducted a private school for boys in Franklin, Tenn., and later in Honey Grove, Texas, in which Dr. Wall received his early education. He was graduated from the University of Texas School of Medicine, Galveston, in 1913. After interning at John Sealy Hospital, Galveston, he began the general practice of medicine in Galveston in 1915, also teaching at the medical school. During World War I Dr. Wall served as a captain in the United States Army Medical Corps and was discharged as a major in the medical corps reserve. He did postgraduate work in eye, ear, nose, and throat in New York and St. Louis. From 1920 until his death he specialized in that field and was a professor of otolaryngology at the University of Texas School of Medicine from 1920 until 1943. For many years he was attending physician and surgeon of the United States Public Health Service Hospital, Galveston.

A member of the American, Southern, and Texas Medical Associations almost continuously since 1915, he was

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

president of the Galveston County Medical Society in 1938. Dr. Wall served as secretary of the Section on Eye, Ear, Nose, and Throat of the 1927 annual session of the Texas Medical Association, and in 1949 he was one of the members of the Association's Council on Medical Education and Hospitals selected to recommend a location for the new state medical school. He was a charter member of the Texas Society of Life Insurance Medical Directors. He was a member of the Association of Life Insurance Medical Directors of America, being medical director of the American National Insurance Company from 1943 until his death.

Dr. Wall belonged to Beta Theta Pi fraternity and Alpha Mu Pi Omega medical fraternity. He was a Scottish Rite



DR. DICK P. WALL

Mason and a vestryman and senior warden of the Trinity Episcopal Church.

On December 22, 1923, Dr. Wall and the former Miss Bessie Belle Tips were married in Seguin. He is survived by his wife; two sons, Dick Parker Wall, Jr., Galveston, and Robert Edward Wall, Austin; three grandchildren, Robert Edward, Jr., Laura, and Lisa Wall, all of Austin; and one brother, Robert Wall, Boyle, Miss.

G. P. STOKER

Dr. George Pinkney Stoker, Red Oak, Texas, died on July 23, 1954, at his home of a stroke at the age of 95.

A native of Lodi, Miss., Dr. Stoker was born on December 18, 1858. He was graduated from the Missouri Medical College, St. Louis, in 1887 and from the Hospital College of Medicine, Louisville, Ky., in 1902. He later did postgraduate work at the Polyclinic Medical College, New Orleans, and Tulane University of Louisiana School of Medicine, New Orleans.

A member of the Texas and American Medical Associations almost continuously since 1907, Dr. Stoker had practiced in Lodi before moving to Texas. He practiced in Archer City, Mount Pleasant, and Jacksonville before settling in 1919 in Red Oak, where he was a member of the Texas Medical Association through Ellis County Medical Society. Dr. Stoker was elected an honorary member of the Texas Medical Association in 1947. He was health officer of Archer County for five years. Dr. Stoker was a Mason for more than fifty years and was a member of the Methodist Church.

Dr. Stoker is survived by five sons, Allen Stoker, Floyd Stoker, and Dewey Stoker, all of Dallas; Clyde Stoker, Big Spring; and Lynn Stoker, Red Oak; three daughters, Mrs. Nancy Robbins, Dallas; Mrs. Mabel Friday, Uvalde; and Mrs. Grace Walters, West Beach, Fla.; two sisters, Mrs. Lundy Haynes, Cleburne, and Mrs. Susie Akin, Breckenridge; a brother, Bun Stoker, Mineral Wells; six grandchildren; and two great grandchildren.

L. L. ZARR

Dr. Luther Lynn Zarr died July 22, 1954, of acute myocardial infarction at his home in Houston, Texas.

The son of Mr. and Mrs. Luther Zarr, Dr. Zarr was born in Temple on January 1, 1911. He attended St. Mary's University of San Antonio; the University of Texas, Austin; and the University of Oklahoma, Norman. He was graduated from the Tulane University of Louisiana School of Medicine, New Orleans, in 1938. After interning at Scott and White Hospital, Temple, Dr. Zarr began his practice in Temple and in 1939 moved to Houston where be practiced until his death. He was on the staff of Heights Hospital for fifteen years.

DR. L. LYNN ZARR

A member of the Texas and American Medical Associations continuously since 1939 through Harris County Medical Society, Dr. Zarr was a member of the American Academy of General Practice, Alpha Tau Omega fraternity, Nu Sigma Nu medical fraternity, the Houston Country Club, Pine Forest Country Club, Lower Lake Hunting Club at Eagle Lake, and the Episcopal Church. He was an honorary member of the Rotary Club.

Dr. Zarr and the former Miss Elizabeth Sinclair were married on October 11, 1934, in Houston. Survivors include Mrs. Zarr, a son, Lynn Sinclair Zarr, and a daughter, Miss Lucy Ann Zarr, all of Houston; his mother, Temple; and a sister, Mrs. Edwin Bigbee, Palestine.

H. S. TAYLOR

Dr. Harvey Stokley Taylor died at his home in Dallas, Texas, of a heart attack on May 19, 1954.

Born on March 20, 1884, in Comanche County, the son of Mr. and Mrs. A. C. Taylor, Dr. Taylor was graduated from Southwestern University Medical College, Dallas, in

1911. As a general practitioner, Dr. Taylor practiced in Pickton from 1911 until 1922, in Winnsboro from 1922 until 1926, and in Kaufman from 1927 until 1947. He retired in 1947 and moved to Dallas.

Dr. Taylor had been a member of the Texas and American Medical Associations almost continuously since 1918, being a member first through Hopkins County, then Wood, Kaufman, and Dallas Counties Medical Societies. He was elected to honorary membership in 1952 and had been president of Kaufman County Medical Society in 1939. He was a member of the Baptist Church.

Dr. Taylor is survived by his wife and six daughters, Mrs. Dan Evans, Mrs. Carroll Kiser, Mrs. Kelton Ray, and Mrs. Stanley Heaps, all of Dallas; Mrs. C. T. Ashworth, Fort Worth; and Mrs. W. E. Peters, Garland. His father, A. C. Taylor, Winnsboro; a sister, Mrs. Z. T. Bridges, Winnsboro; and two brothers, W. S. Taylor, Winnsboro, and T. M. Taylor, Houston, also survive.

O. H. JUDKINS

Dr. Oscar Hunt Judkins, San Antonio, Texas, died in a local hospital of coronary thrombosis on May 27, 1954.

The son of Andrew Lafayette and Elizabeth (Bristow) Judkins, Dr. Judkins was born in Taylor County on October 5, 1883. He was graduated from the University of Texas School of Medicine, Galveston, in 1907. He did postgraduate work at Tulane University of Louisiana School of Medicine, New Orleans, and the University of Vienna.

A member of the Texas and American Medical Asosciations almost continuously since 1908, Dr. Judkins was a

Dr. Oscar Hunt Judkins

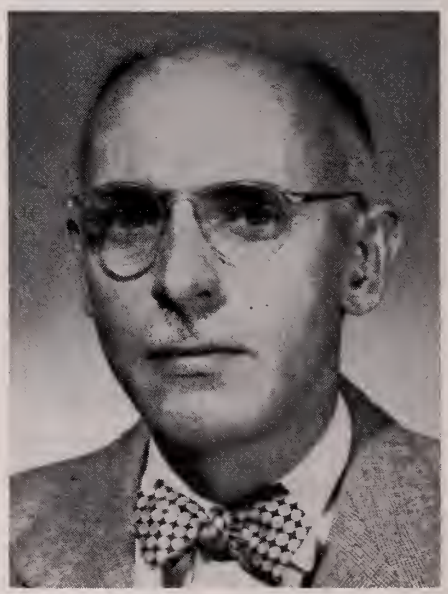
member first through Hale-Floyd-Briscoe-Swisher Counties, then LaSalle County, then Travis County, and from 1920 until 1954, Bexar County. He was secretary of the Section on Eye, Ear, Nose, and Throat for the 1925 annual session of the Texas Medical Association. Dr. Judkins was a fellow of the American College of Surgeons and a diplomate of the American Board of Otolaryngology. He was a member of the Conopus Club and the San Antonio Country Club.

Dr. Judkins and the former Miss Corrine Russell were married in San Antonio on October 20, 1917. Surviving are his wife; two daughters, Mrs. Joyce Judkins Braly, El Paso, and Mrs. Jean Judkins Horner, San Antonio; and two sisters, Mrs. T. R. Burnett and Mrs. Vernon Brandon, both of El Paso.

J. CARSWELL

Dr. James Carswell, Jr., McKinney, Texas, died on July 9, 1954, at a local hospital of septicemia.

Born in Glasgow, Scotland, on December 27, 1901, Dr. Carswell was the son of James and Agnes Carswell. His family came to the United States when he was young and settled in Streator, Ill., where his elementary education was completed. Dr. Carswell attended the University of Illinois, Urbana, and received his medical education at the University of Illinois College of Medicine, Chicago, having been graduated in 1927. He interned at the Swedish Covenant Hospital, Chicago, 1927-1928, and practiced in that city for a year. He practiced medicine and surgery in Camden, Maine, from 1929 until 1944 when he began a residency in thoracic surgery at the Herman Kiefer Hospital, Detroit. He was



Dr. James Carswell, Jr.

appointed to the staff of the Veterans Administration Hospital, McKinney, on January 1, 1947, and served as chief of the thoracic surgery section until the time of his death.

A member of the Texas Medical Association since 1948, Dr. Carswell also had belonged to the American Medical Association. He was president of Collin County Medical Society and a member of the Texas Surgical Society, the American Society of Thoracic Surgery, the American Trudeau Society, and the National Tuberculosis Association. He was a diplomate of the American Board of Thoracic Surgery and an active participant in the organization of the Bandera Conferences, later known as the Koppa Conferences at Hunt, Texas, which are dedicated to the control of tuberculosis in Texas. Dr. Carswell served as clinical assistant professor of surgery at Southwestern Medical School of the University of Texas, Dallas. He was a member of the vestry of St. Peter's Episcopal Church, McKinney.

Dr. Carswell is survived by his wife, the former Miss Agnes Chapman; his mother, Schenectady, N. Y.; and two sons, James Carswell, Chicago; and Ross Carswell, serving with the United States Marine Corps in Japan.

President's Page

LIAISON EFFORTS WITH ALLIED HEALTH GROUPS

At the annual session in San Antonio, I pointed out that one of my objectives as president was the improvement of our liaison efforts with allied health groups in Texas.

Several weeks ago a letter of invitation was extended by me in behalf of our Association to allied health organizations through their presidents, asking each of them to meet with us and bring several other officers of their respective associations. The following groups were invited to meet in Austin at our headquarters office: Texas State Department of Health; Texas League for Nursing; Texas Pharmaceutical Association; Chiropody Society of Texas, Inc.; Texas Graduate Nurses' Association; Texas Veterinary Medical Association; Texas Dental Association; Texas Joint Commission for the Improvement of the Care of the Patient; Group Hospital Service; Texas Public Health Association; and Texas Hospital Association. Letters of response were prompt, enthusiastic, and unanimous in accepting.

The meeting was held the evening of September 3. The attendance was excellent. I made a few preliminary remarks of greeting as did Dr. Robert Kimbro for our Board of Trustees and Dr. R. G. Baker for the Board of Councilors. An invitation was extended to all of the organizations to outline their objectives and current problems. A mid-meeting "break" for refreshments offered an opportunity for visiting and informal talk. The latter portion of the meeting was devoted to friendly and constructive discussion and to questions and answers.

It was pointed out that each organization is different in objectives and purposes and that if there were no problems, there would be no real purpose in meeting. The hope was expressed that much could be learned from each other in appreciating our differences. Perhaps one of the greatest benefits potentially is in this area. It would appear wise to talk over sincere conflicts in opinion where frictions are real or impending. Men of good will in an atmosphere of mutual respect can have benefits come out of such discussions.

Representatives at the meeting agreed that several common objectives are apparent, and much effective cooperation can be developed to benefit each of the health professions and the public. For example, at the time of this meeting, there was reported to be an outbreak of

equine encephalitis in one area of the state. Controlling this epidemic went beyond the simple doctor-patient relationship, involving also the State Department of Health, certain physicians, nurses, pharmacists, veterinarians, and perhaps others in the allied health professions.

For the general good, there should be cooperation in the field of legislation. Free discussions of problems may lead to the introduction of needed health legislation. Together, representatives may discuss potential legislative measures or pending bills and decide on a course of action that is mutually beneficial and in the public interest. Acting together, health groups can be felt politically, but in acting separately and without understanding, their legislative efforts may be ineffective and even confusing.

Joint effort in recruitment of personnel into the health professions offers an area of cooperation as do endorsement and encouragement of public health measures and their wider application by the public.

After it was generally agreed that a need exists for closer liaison between the allied health professions in our state, discussion turned to the mechanism of establishing a permanent organization. It was agreed by unanimous vote of those present that I should act as chairman of an interim committee which will consist of a representative of each of the groups. As soon as members of the committee are selected by their respective associations, another meeting will be held and consideration given to the permanent organization. Naturally, any permanent organization cannot be of consequence until it is approved by each of the represented groups.

A name for the proposed organization has been suggested as the Interprofessional Health Council of Texas. The facilities of our central office and staff have been offered such a council.

It is encouraging to note that several other states have found such councils of value. Inquiries are being made of the various councils already functioning as to organizational set-up, fields of service, composition, and limitations. Information thus gathered should be helpful in our planning.

It is hoped that this initial meeting will be the beginning of a permanent and effective liaison between the various health organizations in Texas and that each group and the public will benefit from the effort.

T. J. L. Blassingame, M.D.

PR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: The second annual Medical Students' Day project was launched in Dallas on September 10 with program at Southwestern Medical School of the University of Texas. Students, soon to take up a practice of their own, heard addresses aimed at the practical side of medicine.

Following a welcoming address by Dr. R. W. Kimbro, Cleburne, chairman, Board of Trustees, Texas Medical Association, the program included: "Your Practice and Public Opinion," Dr. William M. Crawford, Fort Worth, chairman, Committee on Public Relations, Texas Medical Association; "You and the Medical Society," C. Lincoln Williston, Austin, assistant executive-secretary, Texas Medical Association; "The Legal Aspects of Your Practice," Smith Pettigrew, Dallas, medical counsel; and "The Business Side of Your Practice," Dr. Harvey Renger, Hallettsville, chairman, Council on Medical Economics, Texas Medical Association.

Luncheon address to senior students was delivered by Dr. Hobart O. Deaton, Fort Worth, speaker, House of Delegates, who discussed "Present Legislative Problems of Texas Doctors."

Enthusiastic student response surpassed last year's overwhelming appreciation for program's material.

Medical Students' Day programs will be presented at the Baylor University College of Medicine, Houston, and the University of Texas School of Medicine, Galveston, in December.

High on the agenda for PR Committee meeting in Austin, October 31, will be county medical society attendance. Committee will study attendance-improvement survey results, discuss best approach to problem.

FROM OVER THE STATE: Travis County Medical Society reports present attendance has more than doubled last year's. Believes mass invitations

enlisting outside aid responsible. In addition to invitations alerting membership, the society urged doctors' wives to remind husbands to attend meetings - went step further and asked all doctors' secretaries to enter county society meeting dates in the doctors' calendars and to remind them several days before the meeting.

The Past Presidents of the Association's Woman's Auxiliary have presented the Memorial Library with a complete set of The Practitioner - includes all journals from 1869 to date.

Texas Medical Association's librarian reports average of 170 Texas doctors outside of Austin now using library facilities monthly. Have you used the library recently?

In an effort to bring their senior citizens back into a normal place in community activities, county societies are sponsoring "Senior Citizens' Hobby Shows" - find the shows stimulate community interest in geriatrics problems and revitalize this segment of population.

ON THE NATIONAL FRONT: Macon County Medical Society, Illinois, recognizing ubiquitous complaint that physicians are not interested in making their community a better place to live and that their projects are always keyed to organized medicine, set about short-circuiting such comments by their active participation in a bond issue campaign conducted by the local school board to provide additional schools for the area.

Physicians participated in radio and television programs, discussed the issue with patients, and promoted the campaign at society meetings and public gatherings. To round out the doctors' efforts, a resolution was adopted by the society and this, too, received wide newspaper publicity. Efforts resulted in statements like these: "If the society recommends it, the bond issue must be essential to the welfare of this city." "One of the best things that has happened to this community is the revival of the medical society's interest in public affairs."

TIP OF THE MONTH

Your Senators and Representatives are at home now. This would be a good time to pay them a visit or drop them a note of thanks for listening to medicine's viewpoint. They would appreciate it, and your contact with them would be strengthened.

HOSPITAL DISTRICTS TO BE VOTED ON

Texans interested in adequate hospital facilities and in the care of indigent patients on a local basis have a job to do before November 2. On that date, as a part of the general election, voters will decide whether or not to amend the state Constitution to permit the establishment of hospital districts in the larger counties.

Submission of the proposed amendment to the electorate was approved overwhelmingly by the Legislature last spring in the adoption of SJR 2. However, the tendency of voters always is to scratch an amendment if they are not fully acquainted with and sold on its provisions. The following points, if called to the attention of citizens before election day, may help secure passage of the amendment:

1. Creation of countywide hospital districts in counties with a population in excess of 190,000 and in Galveston County would be authorized but would not become mandatory.

2. A hospital district would be permitted to issue bonds and to assume bonded indebtedness already incurred for the acquisition, construction, maintenance, and operation of hospitals owned and operated by the county or jointly by the county and a city within the county and also to levy a tax not to exceed 75 cents per $100 valuation on all taxable property within the district provided that taxpaying voters in the county approve.

3. The hospital district would become responsible for providing medical and hospital care to needy inhabitants of the county, and thereafter the county and cities therein would not levy taxes for hospital purposes nor would the state make direct appropriation for the construction, maintenance, or improvement of the hospitals.

Voters face important choices regarding candidates for office and other constitutional proposals on November 2, but the amendment mentioned is especially dear to the thinking of those concerned with health care.

BE SURE TO VOTE NOVEMBER 2

LEGISLATORS AT HOME

Members of the medical profession and their wives are becoming accustomed to writing, wiring, or telephoning their representatives in Congress when measures detrimental to the public health are pending. But how many, expecting their wishes to be reflected in their Congressmen's voting, bother to talk with them when they are home?

United States Senators and Representatives are now in their home districts between sessions. This is the appropriate moment for physicians to introduce themselves personally to their Washington representatives, to thank them for past favors, and to explain the point of view of medicine. It should be remembered, too, that these conversations should be dialogues, not monologues; Congressmen have their questions and comments, their views to air, their problems to point out, and physicians can learn a lot if they will listen.

Although a meeting with a Congressman can be strictly business, it might be a pleasant gesture to converse over a dinner table or after a theater party with the representative and his wife as guests—not all the talk needs to be legislative.

It might be wise to become acquainted also with those who will enact laws in the Texas Legislature next January. Letters to Austin should be more effective if those who receive them can picture the persons behind the signatures.

The public relations "tip of the month" is to get in touch with Senators and Representatives while they are at home. It is a tip which may lead to an enjoyable contact and certainly should lead to a helpful one.

VIEWPOINT IS IMPORTANT

Society is built upon differences—differences in tastes and differences in abilities. Most of us can do one thing better than we can another, and some things we cannot do at all. So it is with the so-called physically handicapped, many of whom cannot do some things but can do others extremely well. Blindness, loss of an extremity, or a damaged heart, although creating more problems than most persons have to overcome, does not mean that a person is a being apart.

The first week in October annually is National Employ the Physically Handicapped Week. This observance is designed to focus attention on the fine job most handicapped persons can do if they are given an opportunity to use their unimpaired faculties.

Physicians are in an enviable position with respect to this nationwide program. It often is their privilege to bring back to near health those who have been stricken with disease or have suffered accident. It is their duty to instill in such persons the will to forget the past and to look forward to a productive and happy future. It is their responsibility to help these patients in overcoming residual physical and emotional barriers by informing them of the many agencies for rehabilitation ready to aid them in their readjustments. First, of course, physicians themselves need to learn what therapeutic, occupational, and financial assistance is available from private or public sources. It is their obligation, because of their understanding of the human body and its ability to be reeducated and to compensate, to interpret to reluctant employers the possibilities for using handicapped employees advantageously. Finally, of course, they may be able to hire a legless bookkeeper or a blind darkroom technician or otherwise heed directly the slogan, "It's good business to hire the handicapped."

The physically handicapped need to be viewed in positive perspective. No longer the subjects for extermination or ridicule as historically they were, these people next door deserve rehabilitation, encouragement, and a place in which they can contribute their fair share to society and in which they can achieve some personal satisfaction.

HEAL THYSELF

"Reason's whole pleasure, all the joys of sense,
Lie in three words—health, peace, and competence."
—Alexander Pope: *Essay on Man.*

For someone who preaches the importance of preventive medicine, the physician habitually is a sorry example. He drives himself too hard, seldom has a physical check-up until something obviously is wrong, and leaves his wife to keep up with her own annual examination and routine checks of their youngsters.

Up-to-the-minute statistics to prove those contentions are not at hand, but between 1938 and 1942, physicians in the United States 45 years of age and older had a slightly shorter life expectancy than the general white population. Physicians had a lower death rate from most infectious diseases, conditions treated surgically, and accidents, but a higher rate from the degenerative diseases and from suicide.*

The age at death of English physicians who died between 1897 and 1916 and who were listed in "Who's Who" averaged 69.5 years, whereas the average age at death of physicians whose obituaries were noted in *The Journal of the American Medical Association* from 1950 to 1952 was only 67.1 years.†

Dr. Merrill Shaw, Seattle general practitioner who was vice-president of the American Academy of General Practice at the time of its annual meeting last March, said he did not remember a single doctor ever coming to him for a physical examination during his twenty years of practice.

These facts are indicative, at least, of the doctor's inclination to look after the other fellow's health and let his own take care of itself.

The Academy of General Practice, sensing that physicians display a singular lack of interest in their patients (who want their doctors to stay alive, alert, and able) and in themselves (who could learn to taste better and longer the fruits of their labors) by ignoring some of the basic principles of staying healthy, are promoting a nationwide campaign to assure "A Family Doctor for Every Doctor's Family." The Woman's Auxiliary of the American Medical Association is cooperating in the project. In fact, the Auxiliary for a long time has been beating the drums for annual physical examinations for each member of the physician's household.

C. S. Lewis aptly pointed out: "The Future is something which everyone reaches at the rate of sixty minutes an hour, whatever he does, whoever he is."‡ What one does with those sixty minutes, however, determines to some degree what the Future may bring. For a long earthly Future as full of good health—physical and mental—as modern medicine can make it, a physician and his family need to take an occasional but appointed sixty minutes for a visit to a colleague and then need to follow his advice.

CURRENT EDITORIAL COMMENT

ABC'S OF ACCIDENT AND HEALTH INSURANCE

Social purpose combined with free enterprise has produced spectacular results in today's development of voluntary health and accident insurance. One out of every two persons today has some form of surgical insurance; ten years ago it was only one out of fourteen. One out of four today has medical insurance, most commonly to pay for in-hospital calls by doctors for nonsurgical treatment. This amounts to a tenfold increase in ten years. These figures indicate the remarkable growth in protection provided by Blue Cross and Blue Shield and the more than 800 insurance companies that sell accident and health insurance.

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and others closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions preferably should be between 300 and 500 words in length.*

With all this rapid growth, traditional relationships between doctor and patient have not been disturbed. During the 1930's it was often difficult for a doctor to get more than 60 per cent payment of his outstanding bills, but today an American Medical Association authority estimates doctors receive payment on more than 95 per cent of their patients' medical bills. From information supplied by the AMA and insurance personnel, it is conservatively estimated that on the average each doctor receives $2,500 a year in payments from insurance companies alone.

Payments to doctors as well as to hospitals are derived through three main types of insurance policies currently on the market. They are surgical insurance, which specified scheduled amounts for listed procedures or unlisted ones of like difficulty; medical insurance, which provides funds to help pay for calls made by the doctor or for visits to his office by the patient; and hospital insurance, which at times benefits the doctor indirectly in that it eases the financial load on the patient and thereby makes available for the payment of doctor bills money which the patient otherwise might have spent for hospital care. Hospital expense insurance pays for room and board charges up to a certain amount for a specified number of days, with an additional allowance to pay for other hospital charges.

These policies are often termed the basic coverages. Their purpose is to provide timely benefits in sufficient amounts to prevent financial hardship on the family in case of accident or sickness. Benefit payments, whether to the insured person or to the doctor or hospital by assignment, are running in the neighborhood of $2 billion a year.

Frequency of claims in accident and health is probably greater than in any other line of insurance. In fact, a health or accident benefit payment is made for approximately one out of every ten insured Americans every year. Insurance companies have to rely on doctors to prevent excessive use by the patient, one of the things that will most quickly make the policy too costly to buy.

Accident and health insurance does not manufacture funds to pay the cost of medical care. It allocates, saves, and distributes them. In a sense it is a method of prepayment by a group of policyholders, combined with protection and peace of mind for the insured.

So that one policyholder will not take advantage of the others, individual or family policies contain certain safeguards, including waiting periods, exclusions, and limitations on benefits. With group insurance, however, fewer safeguards of this kind are needed to protect the other policyholders since a reasonable number of healthy persons will be in the group.

From the viewpoint of price to the policyholder, group insurance has the advantage of wholesale merchandising over retail selling. But often a person will find that his benefits under group insurance are not adequate for his individual needs. Or he may not be a member of a group that offers insurance. Sometimes having an individual type policy is the only way he can get health and accident protection since there are certain legal and practical limitations on group insurance.

Through individual policies a person can purchase a selection of coverages closely tailored to meet his own objectives. Guaranteed renewable or noncancellable insurance can carry a policyholder up to a certain age, maybe 60 or 65 years. The company may neither cancel the policy nor refuse to renew it so long as premiums are paid when due or within the grace period. It is more expensive than the cancellable contract. The cancellable type falls into two categories. One type may be cancelled by the insurer without prejudice to any pending claim by written notice to the insured and the return of the pro rata premium. The other type may not be cancelled during the term for

which the premium has been paid and accepted by the company, but the insurer may refuse to renew on any premium due date.

Beyond hospital-medical-surgical insurance there are two additional types of protection that are going a long way toward helping pay the costs of ill health. Income replacement, sometimes called disability or loss-of-income insurance, is available individually or through groups. Funds are provided to help maintain a standard of living and to help meet bills (medical included) when the regular source of income is cut off. Monthly or weekly benefits are given for as long as two or more years when a person cannot work. Lump-sum benefits are provided for loss of sight or limb. Insurance companies are providing income replacement insurance for about 30,000,000 Americans today. The other type is major medical or catastrophe insurance, which provides protection against the huge bills that ordinarily could not be met by a person or family or for those bills that would throw the family budget out of kilter for several years.

Major medical expense insurance is a relatively new kind of protection, the first policies being written in 1949. Today, more than fifty companies are insuring 1,250,000 people under major medical contracts.

There are three important features about major medical expense insurance contracts. First, they are usually written with a $100 or $500 deductible clause, as in automobile collision insurance. Over and above the deductible amount, most policies pay 75 per cent of the bill, with the insured paying the remainder. This feature, called coinsurance, is the second important element of major medical contracts. Found in one form or another in some other types of insurance, it has the effect of keeping the individual from demanding excessive medical treatment and, at the same time, holding the premium at a level the average person can afford. With the increasing demand of patients for medical treatment, this feature becomes highly important. As a third feature, major medical policies have a top limit of payments sometimes as high as $2,500 or even $10,000.

Most major medical expense insurance is geared to over-all medical expense of the policyholder, regardless of whether it results from hospital care, home care, or medical treatment bills. It provides benefits to pay for medical specialists whose services are not now included under the regular medical-surgical policies.

Insurance leaders state that future objectives include programs in which a man with dependents can obtain a policy under which at least three-fourths of his expense for medical care would be covered, except for the minor items which could be provided more efficiently out of his own pocket rather than through insurance.

HEALTH INSURANCE COUNCIL,
Chicago, Illinois.

208 South LaSalle Street.

This is the second in a series of four articles prepared at the request of the Hospital-Insurance-Physicians Joint Advisory Committee of Texas. The final papers will offer suggestions about what to tell patients who ask for advice on buying and using voluntary insurance.

CANCER DEATHS

Persons who survive a cancer operation by several years have an encouraging life expectancy, according to a recently completed study by the Society of Actuaries. Included in a study of 725,000 policies covering persons with some known physical impairment were about 1,000 persons who had been operated on for cancer five years or more prior to acceptance for the insurance. The study covered the period from 1935 to 1950.

Among the cancer group, the ones who had been accepted as standard risks showed a mortality experience during the fifteen years about equal to standard. Those accepted for extra risk policies showed a death rate about twice the normal for standard risks, with all excess mortality due to recurrences of cancer. Analysis of the experience of persons reporting a family history of the disease showed, for all sites of cancer combined, no significant tendency for it to be hereditary.

"The Doctor"

A realistic drama depicting a day in the life of a middle-aged physician will be televised on the December 7 "Cavalcade of America" show. The show, entitled "The Doctor," stars Dean Jagger and is expected to duplicate the drama in every practicing physician's life and to win greater understanding by the public of the job he has to do.

A WORD IN FAVOR OF MORE THERAPEUTIC SKEPTICISM

WILLIAM H. GORDON, M. D., F.A.C.P., Lubbock, Texas

MEDICAL philosophies have changed during the past century, and whereas change is necessary for progress, it does not follow that all changes lead to progress. In the field of therapy there have been unbelievable changes. Most of them have been good changes; some of them have not been good. It would appear at times that we have completed a cycle of therapeutic practices, starting with the premise of empiricism, passing through a period of relative nihilism, only to return to more empiricism. We need, as Sir William Osler[1] stated, "a stern iconoclastic spirit which leads not to nihilism, but to an active skepticism—not the passive skepticism born of despair, but the active skepticism born of the knowledge that recognizes its limitations and knows full well that only in this attitude can true progress be made."

Dr. Osler could be regarded as the "father of modern scientific medicine." Before his time clinical medicine was on a shaky footing, not far removed from beliefs firmly entrenched in folklore, superstitions, and at times, quackery. His study of the patient, painstaking attention to details, and correlation of subjective and objective findings with postmortem findings, gave clinical medicine the impetus necessary to establish it on a firm scientific basis. This knowledge excluded the likelihood of benefit from indiscriminate drugging, as was practiced, and it brought about the concept of the difference between the giving of medicine and the treatment of disease.

Osler's death in 1919 occurred on the threshold of modern therapeutic advancement. During the subsequent thirty-five years, we have been deluged with so many alleged specifics—many of them actual—that the adherence to a "spirit of active skepticism" has been difficult. Nevertheless, its need is evident. One needs to view medical therapeutics objectively and to ask several questions. Have we slipped back into the practice of giving medicine rather than treating disease? Have we not, perhaps, stressed the administration of wide spectrum antibiotics to the detriment of accurate diagnosis? Now that we have so many good drugs with which to treat disease, have we not relied on shotgun management of the problem rather than finding which specific drug would do the job best? Finally, is this concept important?

One can cite the decline of the nation's mortality and morbidity figures, which surpasses that of any period in medical history. One can cite also the shortening of the average hospital stay. Is this all there is to the practice of medicine? If this is our only goal, we have been successful. Should we not ask ourselves if, by unrestrained practices of this sort, we are losing some of the scientific approach to treatment that was stressed by our medical forefathers and that is necessary for good medical practice?

Because of our excellent therapeutic agents, drugging is more effective now than it was in Osler's day, but this fact detracts little from his statement,[1] "in the fight which we have to wage incessantly against ignorance and quackery among the masses, and the follies of all sorts among the classes, diagnosis, not drugging, is our chief weapon for offense." Some of us are too prone to administer drugs first and to diagnose later, that is if the first salvo of drugging is ineffective.

Let us review some aims of medical therapy. An old medical axiom expresses the thought that physicians "cure sometimes, benefit often, and give comfort always." There are few of us who have not had our lecturers in therapeutics stress an obvious fact that in treatment if our measures do not benefit, they should do no harm. Every practicing physician is aware of the many patients who seek relief from functional complaints. Office psychotherapy has commonly been accompanied by some medicine that may not be specific in its actions, but it bolsters the belief that active treatment is being instituted. The old family physician brought about many miraculous cures through limitless understanding and bread pills. He was one of the first to use that which is now called psychosomatic medicine. The same philosophy is now practiced, but antibiotics, vitamins, hormones, and many other active and expensive agents are prescribed instead of bread pills. A physician should not lose sight of the fact that these may do harm, and he should wonder if they are always necessary.

Truly, the practicing physician is bombarded daily by requests for treatments of a self-diagnosed ailment, and pressure is put on the doctor to use some new wonder drug reported in the latest Digest of

Read as part of a symposium on therapeutics before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

World Affairs. Is the rationalization that "if I don't give it, someone else will" enough to cause the profession at large to relinquish its right to make medical decisions and to prostitute these expensive and, when properly used, marvelously effective agents? One must remember that when these agents are used without proper indication not only may they be ineffective but they actually may do much harm.

One should not be unreceptive to new ideas, but as Osler suggested, one should hold an active skepticism toward new methods and new agents. Simply because some investigator has made a glowing report of the effectiveness of an agent does not always lead to the fact that others can obtain the same effect. This is no reflection on the writer or his scientific honesty or ability. Rather, it is the recognition that enthusiasm at times may color judgment. It has been said that the effectiveness of the therapeutic agent is often proportionate to the personality of him who gives it.

Despite every attempt being made to the contrary, the fads creep into medical thinking and practice. These fads may pertain to diets, surgery, ambulatory versus bed management, and the use of this or that therapeutic agent. Without detracting from the great good that has been done by the commercial pharmaceutical houses, we should reserve judgment on the effectiveness of a new agent that is presented by a personable and enthusiastic representative until its worth has been well established.

SUGGESTIONS

To be more specific in our dedication of aims, the following suggestions are listed:

More time and more money spent on diagnostic procedures perhaps can shorten an illness and eliminate many expenses stemming from indiscriminate drugging.

A clear understanding of the patient's illness and of the pharmacodynamics of the agent to be used is necessary for proper treatment.

Recognition of uncomfortable side effects or actual dangers attending the use of a drug in comparison with the possible good that can be expected may alter the decision as to what agent is to be used.

Too early and indiscriminate surgery, roentgen-ray therapy, or drugging may cloud an already cloudy picture without benefiting either the clinical course of the patient or the understanding of the clinician.

Our modern philosophy that doing *something* is a step in the right direction does not always hold true. In certain instances, "tincture of time," an effective agent when properly used, might be encouraged.

More time spent in listening to the patient's story or examining him and less time used in writing prescriptions, giving shots, or writing orders on the chart probably will result in better medical practice.

Finally, therapeutic nihilism should not be our aim in this modern era in which we are blessed with so many things with which to do good; rather, we should remain steadfastly against their misuses. By so doing, our patients will be safeguarded, our profession will avoid criticism, and we physicians will gain in stature in the eyes of those who follow us.

CATASTROPHIC ACCIDENTS

Accidents killing five or more persons took less than half the number of lives in the United States during the first six months of 1954 as during the comparable period the previous year, statisticians of the Metropolitan Life Insurance Company report. There were slightly over 500 deaths during the first half of this year.

The greatest decrease in catastrophic deaths was in civilian aviation and in tornadoes. In general, the trend was toward increases in catastrophic deaths in military aviation and in dwelling and apartment fires.

The largest single catastrophe this year was the flood in Southwest Texas which cost twenty-three lives.

Thyroid Gland Essay

The best essay submitted concerning original work on problems related to the thyroid gland will win the Van Meter award of $300 from the American Goiter Association at its meeting in Oklahoma City, April 28-30, 1955. Two honorable mentions will also be awarded.

The essays, which may cover either clinical or research investigation, must not exceed 3,000 words and must be submitted by January 15, 1955, to Dr. John C. McClintock, Secretary, 149½ Washington Avenue, Albany, N. Y.

VITAMIN C IN ELDERLY PATIENTS

Elderly persons show a low level of vitamin C in their blood, it was noted in a study by three Boston physicians in the August issue of *Geriatrics*. The low vitamin C content in the foods they eat or the losses of the vitamin in food preparation are possible causes. One hundred and forty aged patients were observed in three mixed groups of well and chronically ill persons by Drs. Leo J. Cass, Willem S. Frederik, and J. D. Cohen. They reported the rapid rise in the vitamin C level when the patients received orange juice or ascorbic acid.

"Frozen concentrated orange juice, processed under low temperature evaporation, retains about 98 per cent of its vitamin C content and hence is an excellent source of this vitamin, equal to fresh orange juice," they added.

Industrial Medicine Course

The University of Texas Postgraduate School of Medicine is sponsoring a course in Industrial Medicine, given each Tuesday evening, October 12 through November 16, at the auditorium of the M. D. Anderson Hospital and Tumor Institute. Dr. V. C. Baird, Houston, is instructor in charge, and each program is composed of three thirty-minute speeches plus a question and answer period.

RECENT ADDITIONS TO THE THERAPY OF NEUROLOGIC CONDITIONS

F. KEITH BRADFORD, M. D., Houston, Texas

THE most striking annual progress in therapy in the fields of neurology and neurosurgery has occurred in the increased usefulness of antibiotics in combating infections of or threatening the central nervous system. Although newer antibiotics have increased our armamentarium, the improvement in mortality statistics has largely resulted from increasing and standardizing dosages of the older antibiotics. Sulfadiazine in adequate dosage is used in conjunction with the antibiotics when the organism is sensitive. Results are greatly improved by early diagnosis.

When reasonable probability of meningitis exists, spinal puncture should be used promptly to confirm the diagnosis. Cultures are often negative if antibiotic therapy is undertaken blindly before a specimen of cerebrospinal fluid is taken. Therapy is greatly hampered if the causative organism is not known. When the organism has been isolated, tests of sensitivity to various antibiotics can aid in selecting the most efficacious ones. When such steps are taken promptly, there need be no delay in initiating adequate provisional therapy, which can be altered as subsequent bacteriologic tests indicate.

A serious problem in diagnosis has resulted from the prevalent use of short term antibiotic therapy in treating symptoms of the upper respiratory tract. Among the many patients receiving such short term treatment are significant numbers of patients whose "respiratory symptoms" were prodromes of meningeal infections. Although cure without a diagnosis being made undoubtedly occurs, many other patients later develop a modified clinical picture of meningitis. In such instances the cerebrospinal fluid often will show a predominance of lymphocytes even though a pyogenic organism is responsible for the infection. Often bacteriologic cultures are negative, making sensitivity tests impossible and the choice of antibiotics difficult. Organisms may have developed resistance to antibiotics, and treatment is ineffectual or prolonged. Modified pyogenic infections often resemble tuberculous infections and are differentiated only with the greatest difficulty.

In treating meningeal infections, it is ideal to strike early and hard, usually with antibiotics and sulfonamides. Ideally, the infection is brought under control before any exudates can undergo organization and threaten obstruction of the cerebrospinal fluid pathways or loculation within the subarachnoid space. The response to treatment must be followed by careful, repeated spinal punctures. Unfortunately, there are physicians who have opposed repeated spinal punctures in the course of meningitis, probably as a result of the relatively certain response resulting from the treatment of meningococcic meningitis. Other organisms are not so tractable.

Intrathecal therapy with penicillin or streptomycin is not desirable in infections running a favorable course but may be necessary in others. Catastrophe from intrathecal injection per se is avoided if 10,000 units of penicillin or 0.01 Gm. of streptomycin is injected diluted to 10 cc. with normal saline or cerebrospinal fluid.[2] This, the adult dosage, probably can be doubled safely. Larger amounts, often ten or more times the recommended dosage, have been given as a result of erroneous calculation with death or paralysis resulting. Streptokinase-streptodornase mixtures have been used at times intrathecally with the intention of dissolving exudates to prevent organization. This use is still experimental and cannot be recommended.

Not infrequently there is a period of increased cerebrospinal fluid pressure following an otherwise satisfactory response to therapy. Often this state is due to no more serious complication than a temporary defect in the absorptive mechanism of the cerebrospinal fluid. Repeated spinal drainage usually prevents serious complications in such cases and results in the gradual return of pressure to normal.

Intracranial complications of acute otitis media, mastoiditis, and sinusitis are rare when the primary infection is treated adequately. However, a patient with chronic middle ear infection may develop a brain abscess years after the infection has become relatively dormant. Also, the type of frontal sinus infection which occasionally follows diving may produce osteomyelitis of the frontal bone and intracranial infection before its serious nature is recognized. With modern methods of treatment, acute brain abscesses may be aborted or may be permitted to wall off and become chronic. Although surgical drainage is much less frequently necessary with antibiotic therapy, the indications are unchanged. Mortality is greatly re-

Read as part of a symposium on therapeutics before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

duced even in acute brain abscess which must be operated upon when a fatal increase in intracranial pressure threatens. Multiple drainage of subdural abscesses, excision of involved bone in osteomyelitis, and other sound surgical methods still must be used and stand a far greater chance of success with the addition of the antibiotic drugs.

Favorable results have been reported in those cases of Guillain-Barré[1, 4, 6] paralysis following the malignant pattern of Landry's ascending paralysis. ACTH and cortisone administered in dosages up to 400 mg. in twenty-four hours have produced marked prompt improvement in paralysis. Relapses have occurred with withdrawal of the hormones, and prompt responses have followed resumption of treatment. Proper precautions and care are essential in administering either of these potent hormones. It appears likely that a fatal march of paralysis may be circumvented with the use of these hormones but that the course of the illness is not shortened. Promising results have been reported also by the early treatment of Bell's palsy with cortisone in similar dosage.[5] Treatment must be instituted within a few days of the onset. Six successive cases, treated early, followed courses much more favorable than would otherwise have been expected. The rationale of treatment is that cortisone reduces the swelling of the facial nerve or geniculate ganglion lying against it in the bony canal within the temporal bone. Neuralgia following herpes zoster has shown no improvement after ACTH or cortisone therapy. There is reason to hope that if such treatment is given early in the course of herpes zoster, post-herpetic neuralgia, which is so disabling in older individuals, might be averted.

The response of patients with trigeminal neuralgia (true tic douloureux) to 1,000 microgram daily doses of vitamin B_{12} administered subcutaneously has been notable enough to make it well worth a trial. Some patients with this condition respond well to oral doses of nicotinic acid sufficient to cause flushing and tingling of the skin (100 to 500 mg.). These two types of medical treatment have lessened the number of cases requiring alcohol injection or posterior root section. Unfortunately, the response of atypical facial neuralgias to either form of medical treatment (or to surgical treatment) is poor.

There is probably reason to be hopeful that the annual scourge of acute anterior poliomyelitis will be mitigated by the use of gamma globulin and vaccination.

There has been progress in the treatment of hydrocephalic children, but the outlook must be guarded. Cases first must be classified as carefully as possible. If the aqueduct of Sylvius is blocked, a tube may be placed connecting one lateral ventricle with the cisterna magna. In communicating hydrocephalus, the lumbar subarachnoid space may be connected to the peritoneal cavity or to one ureter after nephrectomy. In other instances, connection between the lateral ventricle and peritoneal cavity or ureter is elected. The growth factor will necessitate tube-lengthening procedures in the longer anastomotic tubes. Ureteral drainage appears to be the most satisfactory over a period of time. However, it has the disadvantages of sacrifice of one kidney, infections ascending to the meninges, and electrolyte loss, which is often critical in young children, by the free passage of cerebrospinal fluid into the bladder. Subdural accumulations of fluid, easily evacuated or drained, may be only one phase of a complex picture. Spontaneous arrest or unlearned factors may be the essential features leading to recoveries which are attributed to meddlesome procedures that have been performed. The extent of the problem is revealed in a recent article reporting 3 cases of hydrocephalic children who underwent a total of 16 operations with dubious results.[3]

I would like to emphasize tracheotomy, a procedure of great value and little risk which has demonstrated its increasing importance in the treatment of patients with obstruction of the airway, paralysis of the respiratory muscles, or aspiration complications affecting the bronchial tree. In patients with head injuries, brain tumors or abscesses, cerebral vascular accidents, bulbar poliomyelitis, ascending paralysis, or tetanus, tracheotomy is often life-saving. The need for tracheotomy should be anticipated hours before it becomes an immediate, urgent necessity. Local anesthesia is satisfactory. Proper instruments and cannulas are essential. Hemostasis must be complete and the cannula must be properly placed. Adequate suctioning of the cannula and upper respiratory tract must follow tracheotomy to obtain the full value of its use. Certainly, tracheotomy is often an essential part of an all out effort to enable a critically ill patient to survive.

SOME COMPLICATIONS OF ANTIBIOTIC THERAPY

JESSE W. HOFER, Ph. D., M. D., Houston, Texas

THE past decade has witnessed dramatic changes in therapeutics directed against diseases caused by bacteria and rickettsiae. These have followed the isolation and purification of the many presently and widely employed antimicrobial agents.

Prior to the advent of penicillin, pneumococcal pneumonia, acute mastoiditis, syphilis, and the like were seen and treated in large numbers. Now they are seen less frequently, if at all. Pneumococcal pneumonia was once the "captain of death" with a mortality rate of 30 per cent. This rate has fallen below 5 per cent. Acute mastoiditis is now only a medical curiosity. Large clinics and hospitals have difficulty finding even occasional patients with primary and latent syphilis for teaching purposes. The same can be said for many other infectious diseases.

Along with this fall in frequency of important infectious diseases, there is an associated widespread use of antimicrobial agents. More than one-half of all prescriptions written are for antibiotics of various forms. Furthermore, the search for new products and for an understanding of the mechanism of action of these agents continues unabated.

While many problems in the field of infectious diseases have been resolved, the widespread use of antibiotics has created new and perplexing ones. Among these are the side reactions or untoward effects, which may be allergic, toxic, or related to a specific biologic action of one or more of these agents.

The list of undesirable effects actually observed and attributed to antibiotics is long and not at all consistent for the entire group of antimicrobial agents. Penicillin usually provokes a cutaneous allergic or an immunological reaction while the untoward effects of the broad-spectrum antibiotics are rarely evidenced by cutaneous manifestations. Therefore, for convenience, the complications of the antibiotics are discussed in relation to various organ systems which may be affected.

CUTANEOUS MANIFESTATIONS

Systemic administration of antibiotics provokes in the skin a wide variety of reactions. Most of these probably are due to sensitization and often are accompanied by pruritus and fever. Such lesions frequently appearing during or after therapy are transient and disappear. They may increase in severity and may result in serious consequences if therapy is continued.

Read as part of a symposium on therapeutics before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

Penicillin is capable of causing the widest range of sensitivity and immunological reactions from a mild drug fever or a transient rash to exfoliative dermatitis and acute anaphylaxis. The cutaneous sensitivity eruptions of the mild and moderately severe type are frequently observed; fortunately, exfoliative dermatitis appears infrequently. Other reactions of hypersensitivity and immunological change include angioneurotic edema, serum sickness, and acute anaphylaxis. The severe anaphylactic reaction following penicillin does not occur unless the patient has been previously sensitized to this antibiotic. Use of penicillin in minor respiratory infection should be avoided in order to prevent hypersensitization. Presently penicillin is the most frequent single cause of this dangerous complication. The frequency of anaphylaxis is much higher than is being reported.

Contact dermatitis has been observed with many antimicrobial agents, especially penicillin and streptomycin. Persons who handle these agents but who have not been previously sensitized to them may have a dermatitis of the hands and face. This is usually accompanied by edema and vesiculation or eczema. It has been noted that the highest frequency of local and systemic sensitization occurs when these antibiotics are applied locally to the skin in ointments or oily suspensions. In any clinical situation the local application of these antibiotics in this manner should be considered carefully in order to avoid sensitization to future parenteral therapy.

Sensitization to the sulfonamides and penicillin has been suggested as one of the cardinal reasons for the evident increase in the diagnosis of periarteritis nodosa and acute disseminated lupus erythematosus. These diseases long have been suspected examples of severe diffuse sensitization reactions of the tissues to certain drugs, and the sulfonamides and penicillin are receiving increasing scrutiny as possible causes of some of the so-called acute collagen diseases.

ORAL LESIONS

Among the untoward reactions to the antibacterial agents, thirty-three different oral manifestations have been reported.[4] These are described as ulcerative or vesicular stomatitis and usually are provoked by the broad-spectrum antibiotics as follows: oxytetracycline (Terramycin), chlortetracycline (Aureomycin), tetracycline (Achromycin), and chloramphenicol. The chief symptoms are burning, dryness, soreness, and itching of the mouth and tongue. Examination reveals red and inflamed buccal mucous membranes, with or

without vesicles. The tongue may be red, smooth and shiny, swollen, furred, or denuded. Angular stomatitis (cheilosis) has been ascribed to riboflavin deficiency caused by broad-spectrum antibiotic administration. Yet the parenteral administration of massive doses of this vitamin with others of the B complex has usually failed to cure the lesion so long as the specific therapy was continued.

Distressing oral and gastrointestinal tract reactions are observed with greater frequency following the use of lozenges and troches than following oral or parenteral therapy. There may be some question as to whether treatment with lozenges and troches should be recommended for any purpose. This question is because of the frequency of these oral lesions, the danger of systemic sensitization, and the serious doubt that the antibiotic content in lozenges and troches is sufficient to be effective.

GASTROINTESTINAL DISTURBANCES

The broad-spectrum antibiotics administered orally often are followed by nausea, with or without vomiting, and by diarrhea of varying severity. These usually result from the direct irritating effect these agents have upon the gastrointestinal tract.

Severe diarrhea may present a difficult problem in management. Frequent liquid stools containing mucus and pus and often associated with high fever, weakness, and at times prostration upset the management of any infectious disease. Some cases of diarrhea are caused by coagulase-positive and hemolytic strains of Micrococcus pyogenes var. aureus (Staphylococcus aureus). This entirely new disease entity appeared following the introduction of broad-spectrum antibiotics. When these organisms appear in the stool in pure culture, they probably come from the upper respiratory tract and represent acute staphylococcal enteritis.

Acute colitis or chronic colitis, with the bowel flora consisting exclusively of Proteus, Pseudomonas, Monilia, and other less common organisms, have been recorded following the administration of the broad-spectrum antibiotics. These often resist the reestablishment of the normal bowel flora, even though the antibiotics are discontinued.

Acute monilial stomatitis, pharyngitis, vaginitis, and proctitis may accompany the administration of some of the antibiotics. More severe instances have resulted when these were administered over long periods or to debilitated patients.

Recently Reiner and his associates[5] presented evidence that Aureomycin is responsible for pseudomembranous colitis. Their studies of 49 necropsies indicated that 7 patients died of this specific condition. In many others there was microscopic evidence of the hyperproduction of tenacious mucus in the colon. In no instance could a specific enteric pathogen be cultured from the feces. Kleckner[3] and his coworkers reviewed the incidence of pseudomembranous colitis in a large clinic during the past decade. Since the widespread use of the broad-spectrum antibiotics, there has not been an associated increase in the frequency of this condition. Therefore, the possible relationship between the broad-spectrum antibiotics and pseudomembranous colitis remains undetermined.

EFFECT ON BLOOD FORMING ORGANS

The most serious hematologic reaction is the development of hypoplastic or aplastic anemia. This has occurred primarily in patients who have received repeated and prolonged courses of chloramphenicol. A number of deaths have resulted from this type of anemia, often caused by chloramphenicol used in the treatment of relatively trivial conditions. The bone marrow disclosed hypoplasia of all the marrow elements, and there was a reduction in the red blood cells, polymorphonuclear granulocytes, and platelets in the peripheral blood. The immediate cause of death has usually been hemorrhage, gastrointestinal or intracranial.

In my opinion chloramphenicol has been implicated severely and perhaps unnecessarily as a cause of hypoplastic anemia. The number of proven cases of this blood disease is small and not impressive as compared to the frequency of its successful use in therapy, especially where its employment is strongly indicated. The advantages of this antibiotic have been greatly weakened by the fear of this complication, and to avoid such complications, adequate blood studies should be made at regular intervals during treatment. Its casual use is not justifiable.

BIOLOGIC ACTION

Bacterial antagonism has been recognized since Pasteur first noted that a delicate balance existed in the environmental struggle between microorganisms. There is a constant struggle for survival exemplified best by the organisms in the soil. Bacteria, fungi, and Actinomyces become established when the environmental conditions (organic matter, acidity, physical and chemical properties, and the like) are most favorable to their growth. This established soil flora resists the entrance of other organisms by the production of toxic metabolites (antibiotics) which inhibit or destroy the invader before the new organism can become established. Many of the presently

employed antibiotics have been isolated and purified from these ubiquitous soil organisms.

Man also has an established flora of microorganisms in the skin, mouth, pharynx, vagina, and bowel. The administration of any antibiotic may upset this synergistic balance by depression or elimination of certain groups of organisms. Thus, agents that tend to inhibit gram-positive bacteria will allow the gram-negative microorganisms to flourish;[1] the opposite is also true. Under such circumstances the established flora becomes so altered that the microorganisms insensitive to the drug used become the predominant type. Such changes may not be significant, but occasionally a new or a superinfection results.[2] Whether these occur only because certain organisms normally present as saprophytes increase numerically to the extent that they may become invasive, whether there are tissue changes resulting from certain antibiotics that favor invasion of tissues by bacteria of low pathogenicity, or whether there is bacterial stimulation by the antibiotics remains obscure. It is significant, however, that a small percentage of patients treated by antimicrobial drugs become infected with different organisms from the one for which the therapy was originally given. Locally administered antibiotics, as in the eye or female genital tract, have a greater tendency to provoke new infections than when given for a specific systemic infection.

The organisms that have been observed to increase and occasionally to provoke a superinfection during antibiotic therapy are various species of Proteus, Pseudomonas aeruginosa, Micrococcus pyogenes var. aureus, Candida albicans, and Hemophilus influenzae (in children particularly).

Perhaps the most serious complication resulting from the widespread use of the antibiotics is the emergence of organisms that are becoming increasingly more resistant to most of the agents now commonly used. The great majority of important infectious agents have not become resistant. However, Micrococcus pyogenes var. aureus has developed an increase in resistance to all the antibiotics, including the most recent agent, erythromycin. I have observed this increase in resistance in a patient who was treated for a staphylococcal septicemia. This problem relates not only to the Staphylococci, for many other organisms previously considered less important infectious agents are capable of increasing their resistance to specific antimicrobial therapy. The number of antibiotics yet to be discovered may be limited, at which time the more adaptable pathogens may flourish at will and become capable of increasingly severe infections.

It is remarkable that none of the available antibiotics are free from the potentialities of untoward reactions. The most serious effects are the development of hypersensitivity, the increasing frequency of infections caused by antibiotic-resistant organisms, and, to a lesser extent, the development of superinfections by such resistant organisms.

The onset of untoward reactions to antibiotics during the course of therapy does not always warrant the prompt cessation of therapy. If the agent is the only effective one available for the purpose required, the type and severity of the reaction, its expected course, and the possibility of reducing its severity by proper management must all be weighed on the one hand against the hazard of the infection being treated. If there is a good prospect of favorably influencing that infection by continued therapy with this antibiotic, treatment may continue provided the drug hazard is not significant or can be managed and controlled.

SUMMARY

The untoward effects of antibiotics may appear insignificant compared to their great achievements toward conquering infectious diseases; yet the harmful sequelae of their use (particularly of their abuse) have not been given adequate prominence. The fact that harmful effects appear should not discourage any physician from their use when they are indicated. However, it should be remembered that when used casually for trivial or insignificant infections, severe and occasionally fatal complications may result. The employment of penicillin prophylactically in elective surgery and to treat noninfectious diseases should be strongly discouraged in order to reduce the hazard of hypersensitivity.

Bulletin on Rheumatic Diseases

The first four volumes of *The Bulletin on Rheumatic Diseases* have been bound and are now available to physicians. *The Bulletin,* issued nine times a year, is available without charge to all physicians and medical students who request it. The bound volume which contains all issues for the past four years is available for $1 from the Arthritis and Rheumatism Foundation, 23 West 45th Street, New York 36.

PENICILLIN REACTIONS

JAMES H. STRAUCH,* M. D.; WILLIAM C. BYRD,† Capt., USAF (MC); and GUNNAR O. ENG,‡ Capt., USAF (MC), San Antonio, Texas

THE introduction of the use of penicillin in 1943 provided the medical profession with a powerful weapon against an innumerable group of infectious diseases. The end of the penicillin decade, in spite of the introduction of many other antibiotics, still found penicillin in wider use than ever before. However, because of this increased usage, more and more allergic reactions have been noted, and it has replaced foreign serums as the most common cause of anaphylactoid shock and anaphylactoid deaths. Our purpose is to discuss these reactions and measures that may reduce their incidence.

The overall incidence of penicillin reactions is not high. It has been estimated at from 2 to 20 per cent by various authors.[1, 2, 3, 8, 9] The incidence is much higher in persons who have a history of allergy, such as asthma, hay fever, atopic dermatitis, and urticaria. Almost every type of toxic drug reaction has been described, encompassing a range in severity from asymptomatic dermatographia and urticaria of transient type to serum sickness type of reactions, exfoliative dermatitis, and anaphylactoid shock.[8, 12, 17] The duration of the reactions may be from a few days up to a year. In general, the more severe the reaction, the less reversible it is, and the reactions of periarteritis nodosa and allergic granulomatosis may proceed for a long time after the initiating allergen, such as penicillin, has been eliminated. Severe anaphylactoid reactions are more common than the published reports would indicate, and we have been given informal reports by six colleagues of 12 anaphylactoid reactions in the past year locally. Welch[19] undertook a survey of 95 large general hospitals, totaling a capacity of 51,000 beds. Over a two year period 59 anaphylactoid reactions to penicillin were reported in this survey, with 19 deaths due to penicillin reactions. Although most of the deaths were due to injections of procaine penicillin, one death followed the oral tablet of dibenzylethylenediamine dipenicillin G (Bicillin). Welch also investigated 25 cases of anaphylactoid reactions to penathamate (Neo-Penil), with 5 deaths. A history of asthma and other allergies was present in 26 of the total group of 84 patients. Two anaphylactoid deaths will be reported in this paper.

The following is a classification of penicillin reactions in order of increasing severity and rarity:

1. Dermatographia
2. Toxic erythemas (morbilliform, scarlatiniform, and so forth)
3. Vesicular dyshidrotic reaction
4. Urticaria
5. Erythema nodosum and erythema multiforme
6. "Serum-sickness" reaction
7. Bullous or pemphigoid reaction
8. Hemorrhagic reaction
9. Purpura and agranulocytosis
10. Periarteritis nodosa
11. Exfoliative dermatitis
12. Allergic granulomatosis
13. Anaphylactoid reaction.

This is admittedly only a partial list of the most common syndromes, and almost twenty other syndromes have been reported.[1, 2, 3, 8]

In all the above reactions the primary shock organ has been the vascular apparatus, in various degrees of severity. Thus in dermatographia exudation of water and electrolytes and probably some plasma occurs after only minor injury to the vessels.

In urticaria, plasma protein, water, and electrolytes pass out of the vessels spontaneously. In erythema multiforme and erythema nodosum the formed elements of the blood leave the vessels into the surrounding tissue, both the red blood cells and white blood cells. In purpura, which may occur with or without depression of the blood platelets, plasma and red blood cells enter the interstitial spaces. In periarteritis nodosa the damage to the blood vessels progresses to a stage of necrotizing arteritis, while in allergic granulomatosis the change is a granulomatous perivascular inflammatory reaction. In anaphylactoid shock, in addition to the smooth muscle of the vessels, the smooth muscle of the bronchioles and probably also the heart muscle are involved in an almost instantaneous reaction. The latter responses either are due to a direct antigen-antibody reaction in the tissue involved or may be secondary to a massive release of a histamine-like substance.

The treatment of these reactions also varies with the severity of the vascular reaction. Thus dermatographia may require no therapy or may respond to antihistamines. Mild urticaria often may be suppressed with the antihistamines. The more severe reactions are usually best treated with ACTH or corti-

Presented before the Texas Dermatological Society, San Antonio, May 3, 1954.

The majority of the case material was obtained from the Dermatology Service of the United States Air Force Base Hospital, Randolph Field, Col. Carl B. Stilson, USAF (MC), Commanding Officer.

costeroids[5] and are usually very resistant to antihistamine therapy. Anaphylactoid shock may require intravenous epinephrine, intravenous aminophylline to release bronchiolar constriction, and intravenous antihistamines. If time permits, ACTH or cortisone is given, and shock combated with plasma and oxygen therapy.[4, 8] In fatal reactions, actually little time is available, since Collins-Williams[2] in analyzing 16 fatal reactions found death occurred in from five seconds to two and one-half hours, with 10 dying in less than five minutes.

STUDY OF 33 CASES

We have studied in detail cases of penicillin reactions severe enough to warrant hospitalization. More hospital days were spent in treating this group than any other single dermatologic disease. With the exception of one dyshidrotic reaction, all of the cases belonged to the "serum sickness" type of reaction. Most of them had failed to respond to initial medication with various antihistamines. In addition to urticarial lesions of varying size, most of the patients also had swelling of the eyelids, hands, feet, knees, and elbows, with moderate arthralgia, fever, and elevation of the sedimentation rate. One case had hemorrhagic lesions, 1 had bullae, and 1 had electrocardiogram changes with incomplete bundle branch block. Albuminuria was noted in 1 case, and no L.E.-like phenomenon was found in the serum in 10 cases in which the test was performed.

Initial therapy included a vast variety of drugs, including Histadyl, Benadryl, Chlortrimeton, Pyribenzamine, and other antihistamines both orally and intravenously; Adrenalin, sodium salicylate, Pabalate, ephedrine, intravenous procaine, intravenous calcium gluconate, and intravenous Decholin; and sedation with barbiturates (Seconal, Nembutal, and phenobarbital) and analgesics (morphine and Demerol). Of this group 18 cases were satisfactorily relieved with one of the above medications. However, 15 patients continued with severe reactions with little or no response to therapy over a period of two to seven days. Fourteen of these severe cases responded promptly and dramatically to oral cortisone therapy with complete suppression of symptoms and lesions in forty-eight hours or less. One case was treated with ACTH with similar satisfactory results. The average length of therapy with cortisone was five days, with a variation of from two to seven days. Only sufficient cortisone to suppress the symptoms was given, usually not more than 200 mg. the first day, with rapid reduction as improvement occurred. No adverse reactions of any kind were noted to this short course of cortisone therapy. However, we should emphasize these were mostly healthy young men who were not known to have peptic ulcer, tuberculosis, diabetes, or psychotic tendencies.

In this series no recurrences of urticaria were noted. This is not the universal experience, however, as I have observed some cases in private practice in which recurrent reactions have occurred over as long a period as six months, responding only temporarily to corticosteroid therapy. The definite impression is gained, however, that early treatment of severe reactions with ACTH or cortisone not only gives prompt relief of all symptoms, but reduces the incidence of prolonged resistant reactions. As a result of this experience, it is our present policy to initiate cortisteroid therapy in all severe penicillin reactions from the onset, with the aim of both cutting short the reaction and reducing the duration of the reaction and hospitalization.

The indications for the use of penicillin in these cases was tabulated (table 1) and 25 different conditions were encountered. Diseases of the throat and respiratory system predominated. The validity of the indication was impossible to evaluate.

TABLE 1.—*Diagnoses Given as Indications for Penicillin Therapy.*

Diagnosis	No. Cases	Diagnosis	No. Cases
Upper respiratory infection	5	Urinary tract infection	1
Pharyngitis	2	Nonspecific urethritis	1
Acute sinusitis	1	Syphilis	1
Bronchitis	1	Impetigo	1
Acute tonsillitis	1	Carbuncle	1
Otitis media	4	Infected toe	1
Primary atypical pneumonia	1	Ingrown toenail	2
Granuloma of lung (preoperative)	1	Infection of gum	1
Orchitis	1	Sprained wrist	1
Mumps	1	Abrasion	1
Rectal abscess	1	Laceration	1
Anal fistula	1	Pain in side	1
		Infected tooth	1

In many of these cases the trouble with the penicillin reaction was more by far than the trouble with the primary disease.

CASE REPORTS

In addition to this group, I would like to report, with the permission of the physicians concerned, on 2 fatal anaphylactoid reactions which previously have been unreported.

CASE 1.—A 29 year old married woman complained of a cold of several days' duration and an injury to her left leg. She gave a past history of intractable asthma, for a year requiring Adrenalin constantly and almost biweekly visits to the doctor for relief of severe attacks with injection of intravenous aminophylline. She previously had had both penicillin and procaine with no reactions.

On examination the left leg presented a black and blue area 6 by 3 cm., with fluctuation in the center. The fluctuant area was incised and a small quantity of pus was evacuated. The patient was given procaine penicillin 300,000 units intramuscularly because of the abscess. Five minutes later the patient became cyanotic, tremulous, and speechless. She fell to the floor. Blood pressure and pulse could not be obtained, and she ceased breathing. Artificial respiration, oxygen, and intracardiac Adrenalin failed to resuscitate the patient. From the onset of symptoms of reaction to death was apparently only a matter of seconds.

CASE 2.—An infant, aged 6 weeks, had had a draining ear for four days. Examination revealed a profuse purulent discharge. No penicillin had been given previously. The family history was negative for allergies, and the mother had had penicillin without reaction. Procaine penicillin in aqueous suspension 300,000 units was given in the buttocks. No blood returned to the syringe on aspiration before injection. The baby cried for one minute, the breathing stopped, heart beats were not audible on auscultation, and the patient became cyanotic. Adrenalin and caffeine were injected. Within four minutes the chest was opened and cardiac massage started. Artificial respiration with oxygen was given for one and one-half hours. No resuscitation occurred. The father was a military medical technician and stated that he had observed two similar anaphylactoid deaths from penicillin while he was overseas.

Death was almost instantaneous in both cases, once the reaction started, and probably had occurred before treatment was started, prompt as it was. There was no evidence of intravascular injection. There is not absolute proof that penicillin and not procaine was the active antigen. However, the experience of Thomson[18] may be cited. A patient had a severe reaction to procaine penicillin from which he recovered. In the belief that the reaction had been caused by procaine and not penicillin, two months later the physician gave him an intramuscular injection of penicillin G. The patient was dead in fifteen minutes.

PREVENTION OF REACTIONS

Because of this increasing problem, various measures have been proposed to prevent reactions to penicillin. One obvious measure is not to give penicillin injections except for adequate indication. Certainly penicillin therapy has no place in the uncomplicated common cold and various other self-limited diseases on which penicillin has no direct effect. Because of the increased incidence and severity of reactions in persons who have allergies[2] such as hay fever, asthma, and atopic dermatitis, these persons probably are better treated with another antibiotic if possible. However, although the allergic reactions to other antibiotics are much less, they also have disadvantages, and each case must be individualized.

Another obvious preventive measure is a thorough history as to previous reactions on all patients given penicillin. Welch[19] found that in 84 cases of anaphylactoid reactions to penicillin, 16 had a history of penicillin sensitivity. Scratch tests have been proposed to predict sensitivities. However, Collins-Williams[2] found that out of 7 adults known to be penicillin sensitive, only 3 reacted to scratch and intracutaneous tests. At present they cannot be regarded as either practical or accurate and are not generally used. Kern and Wimberly[8] have suggested that the injection be made far enough down the arm or in the fascia lata, so that a tourniquet may be used to delay absorption in case of a severe reaction.

Various attempts have been made to modify penicillin to make the drug less active antigenically. White[20] found that oral penicillin tablets given as venereal prophylaxis were associated with a very low rate of allergic reaction. Out of 45,000 tablets of 500,000 units each, only 3 mild reactions occurred. The Navy has found few reactions to oral penicillin, and uses oral tablets for venereal prophylaxis in areas of high incidence. Various studies in oral penicillin for prophylaxis of rheumatic fever have indicated low reaction rates. For general use in nonfulminating infections, therefore, there is much to be said for the use of oral rather than parenteral penicillin in the prevention of allergic reactions. Penicillin O has been proposed because some penicillin reactors can tolerate this modified penicillin. However, Lyons[10] has stated that in 8 patients known to be sensitive to penicillin G, reactions were obtained in 4 with penicillin O also. Combination of the penicillin with an injectable antihistamine has been investigated. Jenkins[6] reported no reactions from 590 injections in 111 patients when penicillin 300,000 units was given with 10 mg. injectable Chlortrimeton in the same syringe. Simon[16] reported only 3 mild reactions when penicillin was given with pyribenzamine injectable in the same syringe in 1,237 patients, a reaction rate of 0.24 per cent. It would seem then that reactions could be diminished if oral penicillin were given more frequently and if those patients requiring immediate high levels of penicillin were given the drug in combination with an injectable antihistamine in the same syringe. In patients with an allergic tendency, it would be better to use one of the other antibiotics if possible.

To be prepared as fully as possible for any anaphylactoid reaction, an emergency kit should be kept close at hand at all times. This should include a syringe, needle, tourniquet, injectable epinephrine, aminophylline, an antihistamine, and cortisone or ACTH.[8]

The situation has been nicely summarized by Smith and Walker[17] in "Penicillin Decade." They stated that "by desensitization and the considered use of anti-histaminics or other detoxifying agents, surely the great number of reactions recorded in these pages need not be found in the literature of penicillin's second decade. While the actual toxicity of penicillin is almost negligible, its ability to sensitize and to cause serious and even fatal accidents should not be minimized. A grave responsibility rests upon the shoulders of the physician for its wise application in clinical practice."

SUMMARY

The increasing importance of allergic reactions to penicillin, in particular the "serum sickness—like re-

actions" and anaphylactoid reactions are discussed.

Features of 33 penicillin reactions requiring hospitalization are discussed, with favorable emphasis on the early use of ACTH and cortisone in therapy.

Two fatal anaphylactoid deaths due to penicillin are reported.

Preventive measures are presented, including the recommendation for avoidance of penicillin in allergic persons if possible, the increased use of oral penicillin, and the combination of penicillin with injectable antihistamine for parenteral use.

ABSTRACT OF DISCUSSION

LT. COL. MYLES P. MOURSUND, USA (MC), Fort Sam Houston: I have not seen a case of anaphylactoid shock from penicillin, but probably this is because I have become increasingly reticent and cautious in the administration of penicillin in recent years as a result of seeing innumerable cases of severe urticaria and angioneurotic edema from penicillin in the years from 1949 to 1951. Of course reactions to penicillin varying in degree are still occurring every day in the week, but fortunately the majority of them are mild. However, even a partial review of the literature and conversations on the subject have amazed me as to the number of reported as well as unreported instances of anaphylactoid shock and deaths resulting from penicillin injections. It certainly corroborates the statement by Dr. Strauch and his associates that this type of severe and even fatal reaction to penicillin is definitely on the increase and should be kept in mind when one considers the use of penicillin.

The value and use of penicillin when properly indicated cannot be denied, but the essayists bring out an especially good point, that with reckless abandon and no thought of the possible consequences, penicillin has been given and no doubt still is being given for such things as infection of the upper respiratory tract, sprained wrist, pain in the side, and abrasions. I tried, unsuccessfully I am sure, to convince one of our local general practitioners of the potential danger of indiscriminate use of penicillin, but he insisted it had become "routine treatment for colds and the flu." The large majority of the patients I have seen with a penicillin reaction have received their penicillin for a "cold" or some similar minor condition.

In addition to deciding that the patient has a definite indication for use of penicillin, one should take time to question him about allergy (asthma or hay fever in particular) and about previous penicillin therapy with any possible untoward effects from it. Then if penicillin is given, one should observe the patient closely following each injection for early evidence of anaphylactoid shock, which usually occurs within five to fifteen minutes after the injection. All of this is obviously time consuming but appears necessary in the present day use of penicillin.

Sterling* listed five cardinal symptoms which forewarn of anaphylactoid shock and stated that if any one or several of these symptoms appear, no further penicillin should be given. These symptoms are (1) syncope, mild to severe, at the time of injection, or a feeling of faintness recurring periodically for the following three or four hours; (2) sensation of burning or heat throughout the body, especially in the throat, palms, and soles (similar to sensation during intravenous calcium administration); (3) local or generalized pruritus within a few hours after the injection; (4) choking sensation in the throat; and (5) severe paroxysmal pain varying in location such as precordial, epigastric, or diaphragmatic. In all of the reports of anaphylactoid reaction to penicillin that I reviewed, one or more of these symptoms, especially the severe pain, usually precordial, were initial and more or less immediate symptoms of the reaction.

It is unfortunate that to date we have no simple means of determining penicillin sensitivity. Kern and Wimberley[8] have been strong advocates of skin tests, and Feinberg and others[4] stated, "It is practically a certainty that a skin test will be positive in all those persons who react anaphylactically to penicillin." Other observers have disagreed strongly with the value or efficacy of this test. For example, Capt. Bruno Eisen, resident in internal medicine, and Lt. Col. Arthur J. Berger, chief of the Allergy Service, Brooke Army Hospital, Fort Sam Houston, recently have skin tested (patch, scratch, and intradermal) more than 1,000 persons, including at least 100 known sensitive persons and have yet to see a positive test. Also such skin testing is not without danger. One of the persons tested had an immediate anaphylactoid reaction and required prompt treatment to prevent serious results. Her skin test

**Sterling, A.: Anaphylactic Shock Following Penicillin Therapy in Bronchial Asthma, J. Allergy 24:542-546 (Nov.) 1953.*

was negative. A complete summary of Eisen and Berger's findings will be published in the near future. Other reports of anaphylactoid reaction from penicillin skin tests are to be found in the literature.

Dr. Strauch and his co-workers advocate the use of oral penicillin, and a report by White[20] seems to substantiate the fact that few reactions occur from this method of therapy. However, severe and near fatal reactions have been described from intranasal instillation, aerosol, penicillin troches, and oral administration in other reports.

ACTH and cortisone definitely have proved their worth as adjuncts in the treatment of penicillin or other allergic reactions. However, a word of caution might well be reemphasized. It is a recognized fact that patients who have had steroid therapy within six months or perhaps even a year, and particularly those who have been receiving prolonged maintenance steroid therapy, may die suddenly from acute adrenal insufficiency if subjected to stress such as an injury or an operation unless cortisone is given to them immediately in adequate dosage (30 to 50 cc. aqueous adrenal cortex extract intravenously for immediate adrenal cortical support and 70 to 140 mg. of hydrocortisone per day or 100 to 200 mg. of cortisone per day orally depending on dosage prior to surgery or accident). Drug manufacturers (Upjohn for one) are now furnishing cards with instructions concerning this emergency for physicians to give to patients who have had or currently are receiving steroid therapy.

As for me, except in the treatment of syphilis and gonorrhea or when sensitivity tests reveal that penicillin is the only drug to which the organisms are susceptible, I am relying on the use of Terramycin, Aureomycin, Achromycin, or Erythromycin whenever I think antibiotic therapy is in dicated. But who knows how soon we will begin to see or hear of anaphylactoid reactions and deaths from these also?

HYDROCORTISONE OINTMENT IN THE TREATMENT OF DERMATOLOGIC DISORDERS

J. FRED MULLINS, M. D., and JOHN H. HICKS, M. D.,*
Galveston, Texas

SINCE the recognition of the anti-inflammatory action of the steroids, many dermatologic disorders have been treated with these compounds. Cortisone acetate was found to be relatively ineffective when used locally on the skin. However, hydrocortisone acetate (compound F) has definitely been assigned a role in the treatment of certain skin diseases. Sulzberger[2, 3, 4, 5] has reported the beneficial effects of both hydrocortisone free alcohol and hydrocortisone acetate in a series of 252 cases. The purpose of this paper is to evaluate the merits of topical hydrocortisone in 100 selected cases of dermatoses and to compare the response of these cases to 1 per cent (10 mg. per gram) and 2.5 per cent (25 mg. per gram) hydrocortisone acetate. These concentrations were incorporated into a vanishing cream type base, which we believe is of considerable significance in the therapeutic effect derived from the preparation.

METHOD

Where possible, cases were selected with symmetrical involvement in order that the ointment base could be utilized on one side and the specific preparation on the other. Also an attempt was made to compare the 1 per cent with the 2.5 per cent preparation on several of the same patients. The majority of the cases presented an erythematous weeping dermatitis; however, there were some cases of idiopathic pruritus of the anogenital region with no inflammatory involvement. Initially, the patient was requested to apply a thin film of the ointment four times daily; after definite improvement, the frequency of application was decreased. The nonhospitalized patients were observed at three to four day intervals.

RESULTS

Although the patients on whom we used the hydrocortisone free alcohol are not reported here, the results were not significantly different from those shown in tables 1 and 2.

There was little difference in the 1 per cent (table 1) and 2.5 per cent hydrocortisone acetate (table 2) in regard to the improvement noted in pruritus of the anogenital region. The criteria for improvement in these cases, as well as the subsequent ones, were less weeping, erythema, scaling, and pruritus. The duration of treatment in these cases was somewhat longer when the 1 per cent concentration was utilized; however, in all cases there was marked relief of pruritus within twenty-four to forty-eight hours and objective improvement within three days.

In the 10 cases of atopic dermatitis, the improvement was extremely satisfactory. Perhaps this is related to the duration of the disease as the majority of these cases were in infants and small children. In

Presented before the Texas Dermatological Society, San Antonio, May 3, 1954.

The hydrocortisone acetate used in this study was supplied by the Pfizer Company under the trade name of Cortril Acetate.
**Chairman and Director, Department of Dermatology, University of Texas Medical Branch.*

the cases of lichen simplex chronicus, there was significant improvement in the majority of the patients, especially in the alleviation of itching. However, it was found that the objective response to therapy was much slower than in cases of the remaining diseases and the duration of therapy was usually longer. A number of these patients are still under treatment and are showing progressive improvement.

In the 3 cases of herpes simplex, the response was favorable within a twenty-four hour period. However, the 1 case of herpes zoster was not benefited by this therapy. Localized neurodermatitis, particularly of the eyelid, responded exceedingly well to each concentration of the ointment. Eczematous contact dermatitis responded favorably, as did many cases of eczematous dermatitis associated with vesicular dyshidrosis.

In almost all of these patients there was significant relief of pruritus within forty-eight hours, and the conditions had shown marked clinical improvement by four to six days. The therapy as shown in the tables was carried out for longer periods of time in order not to allow an exacerbation of the condition. In many of the cases of pruritus of the eyelids, pruritus of the anogenital region, and lichen simplex chronicus, it was noted that if therapy was discontinued at the end of six or seven days, frequently there was a recurrence of the disease within three to four days. Many of the patients with pruritus of the anogenital region had been confronted with the disease for one to fifteen years. The therapeutic response seemed to parallel exactly the amount of lichenification present. This was particularly true of lichen simplex chronicus.

In none of these cases was there evidence of primary irritation, sensitization, or untoward systemic absorption effects. However, other investigators have reported distant beneficial effects from treatment of an unrelated site.[3] Infectious eczematoid dermatitis of the ears responded favorably to hydrocortisone acetate, but frequently it was necessary to eradicate the predominantly gram-negative organisms with antibiotic therapy before the administration of hydrocortisone ointment. There is no contraindication to the utilization of hydrocortisone ointment and various antibiotic preparations concomitantly or in combination.[1]

We had an opportunity to use the hydrocortisone acetate in a petrolatum-lanolin type base on approximately 20 patients, but it was believed that the results were less satisfactory, and the greasy base was not as well accepted by the patient as the vanishing cream type. This was particularly true of the thin skinned sites and the mucous membranes.

SUMMARY AND CONCLUSIONS

The results of therapy, following the use of hydrocortisone acetate ointment, in 100 selected, well controlled cases are reported.

Hydrocortisone acetate, 2.5 per cent, was somewhat superior to hydrocortisone acetate, 1 per cent. Each of these concentrations was in a vanishing cream type base.

If a good therapeutic response is to be expected from these preparations, it will be noted within six days. Frequently it is observed within the first twenty-four hours.

These agents appear to be much more effective at the sites of the body where the skin is thin, such as the eyelids, the nipple, and the axillary region, as well as the mucous membranes of the anogenital region and lips. This is probably due to the fact that there is better "absorption" at these particular areas.

Hydrocortisone acetate ointment commands a distinct role in the treatment of certain specific dermatologic diseases. It would seem to be the treatment of choice in atopic dermatitis of infancy, neurodermatitis of the eyelids, and essential pruritus of the anogenital region. The ultimate value of this preparation in conjunction with other well accepted therapeutic modalities is yet undetermined.

ABSTRACT OF DISCUSSION

DR. C. F. LEHMANN, San Antonio: My experience with this product has been limited as compared with other observers, and I have not become as enthusiastic about it. Possibly by further use of it my results will improve. The conditions which seem to respond best are atopic eczema, anogenital pruritus, and localized neurodermatitis. I concur in the reports that it is of value in atopic eczema, but in my experience the benefit in anogenital pruritus and localized neurodermatitis (such as on the nape of the neck or eyelids) has been disappointing. The incidence of improvement or relief of pruritus in these two latter conditions has been roughly 10 per cent.

Possibly three factors explain why I have not seen a high percentage of good results in my experiences with hydrocortisone ointment. First, I prescribed the ointment without in any way using the power of suggestion. It was just another prescription, not one that gave a lot of relief. (There was one exception. A stingy patient who could well afford to buy sufficient quantities of the ointment disappointed me after a two weeks' trial. He stated that it did not give his scrotal pruritus as much relief as carbolated Vaseline. In this case, I had lauded the product to the skies, hoping to impress upon him in some way the wonderful virtues of this new ointment.) I do not believe that many of us need go back very far long Memory's Lane to recall the value of suggestive psychotherapy in prescribing something new. I can recall the wonderfully high percentage of satisfactory antipruritic results from Thephorin Ointment when I first used it.

But I do not believe the poor responses to hydrocortisone ointment have been due to lack of salesmanship. I am more inclined to believe that it is due to paucity of its use. Until recently, I have instructed patients to massage it into the skin twice a day. (I note, however, that Rein's reports* are based on twice a day instructions when using it on large areas.) Massaging the ointment into the skin four times a day, as Dr. Mullins, Dr. Hicks, and others have have advised, is a fairer test of the product. The paucity in its use is no doubt also explained by the expense of the product. At the price charged for a 5 Gm. tube, we could not have expected many patients to agree to using enough of the ointment nor continuing its use for long. With the recent drop in price, I would expect better results if paucity of usage explains why I have not been enthusiastic about this product. I have considered having an ointment compounded by the pharmacist. If a patient can buy 20 Gm. now for $6, I hardly think that any pharmacist would compound the ointment from the hydrocortisone tablets for less.

It is gratifying to know from the presentation by Dr. Mullins and Dr. Hicks, as well as from other reports, that no case of sensitivity to hydrocortisone has been seen and also that no constitutional effect has been noticed from absorption of it through the epidermis. In this respect it promises to be a safe medicament.

Like every other new drug it is going to be applied to all sorts of conditions with and without any rationale. For instance, just a few days ago I saw a child with a wool irritation on a congenital keratosis pilaris (a mild ichthyosis) who had been using hydrocortisone ointment for three months without enough relief to justify the expense of the ointment. I predict that after another year or so we all will be better acquainted with its indications and limitations, and I anticipate that my enthusiasm will increase.

I do not mean to infer that I have not seen any good results from this preparation. I have seen it given a severe test, as in a case of long standing neurodermatitis on temple areas and upper eyelids, with a markedly lichenified skin. This case had received an array of various treatments. The itching was promptly relieved with hydrocortisone and the lichenification left after the rubbing and scratching stopped. However, from a limited experience I am not convinced that this ointment deserves the position of *sine qua non.* To justify such a position at the price of the ointment there should be 100 per cent marked improvement from its use. Until I am convinced that hydrocortisone ointment will give the patient an 80 per cent or better chance of marked, prompt benefit, in my hands it will be resorted to when other conventional medicaments have failed.

Accidental Falls Fatality

Accidental falls take approximately as many lives each year in the United States as tuberculosis; falls rank second only to motor vehicles as a cause of accidental death, the Metropolitan Life Insurance Company statisticians report.

Of the approximately 21,000 fatal falls each year, about two-thirds take place in and around the home. The death rate from accidental falls is higher among males at ages under 75 and higher in females after that time. More than half of all fatal falls occur at 75 years of age and over, a big proportion occurring while the victims are walking about the house. Below the age of 15 years, falls from porches, roofs, windows, and trees account for most of the deaths. Falls on stairs account for nearly a fourth of the deaths in the 25-44 group and close to a third in the 45-74 range.

SCREENING METHODS IN HEMATOLOGY
A Comparative Study

C. D. FITZWILLIAM, M. D.; C. T. ASHWORTH, M. D.; MARGARET MARTIN, B. A., M. T.; and DOROTHEA DETTMANN, B. A., M. T., Fort Worth, Texas

THE comparative inaccuracy of standard hematologic screening procedures has been well known for many years, yet clinicians and even some clinical pathologists have been reluctant to alter the time-honored methods used almost universally for admission hematologic studies. It was a realization of the fallacies of these procedures that prompted this investigation. Since many of the "normal values" in hematology are based on inherently inaccurate methods, we have directed our efforts toward study of the ease and simplicity and of the reproducibility of certain hematologic procedures rather than attempting to determine the degree of accuracy of each.

In a survey of admission hematology methods used in 21 hospitals throughout the state (table 1), it was found that in 13 of these, studies consisted of an erythrocyte count, leukocyte count, hemoglobin determination, and differential white cell count. A hematocrit determination was included as an additional procedure in 1 case. The erythrocyte count had been eliminated in 7 hospitals, being replaced by a hematocrit in 4 of these. In 1 hospital, no routine admission hematology work was done. Four pathologists indicated appreciable experience with photometric methods for erythrocyte counts; however, only one of these had had significant experience with the scatter photometric method. The direct erythrocyte count was considered to be an ideal screening procedure in only 7 instances, while the majority of pathologists preferred to substitute a hematocrit for the erythrocyte count. It immediately becomes apparent that not only is there a striking lack of uniformity of hematologic screening methods, but also an equally striking lack of uniformity of what various clinical pathologists consider to be ideal procedures for this purpose.

Unfavorable 1	

The various procedures considered in this investigation were the erythrocyte count by both direct and scatter photometric methods; hemoglobin concentration by Leitz and Haemoscope* instruments; packed cell volume by Wintrobe and capillary methods; and whole blood specific gravity by the Barbour-Hamilton "falling drop" method.

ERYTHROCYTE COUNTS

During the past few years an increasing interest in the possibility of photoelectric determinations of erythrocyte counts has become manifest. The basic principles, clinical application, and limitations of this method were outlined by Blum[2, 3] in 1945, and since that time many additional papers have appeared on this subject.

The photoelectric method involves the principle of turbidimetry and basically measures the amount of parallel light rays transmitted through a suspension of erythrocytes, but does not compensate for the influence of the size and shape of cells on the transmitted light. A novel method to eliminate partially this effect was described in the German literature in 1951, and was appraised by Brackett, Mattern, and Olson[4] in 1953. The principles of the instrument

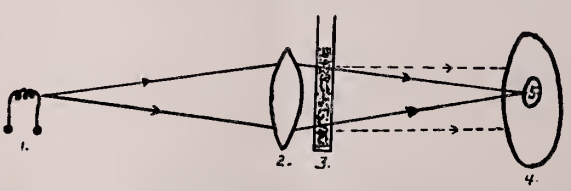

FIG. 1. Diagram showing the principle of the Haemoscope (scatterphotometer). A beam of light from the source (*1*) passes through the lens (*2*) and cuvette (*3*). The light rays are converged on the photoelectric cell (*4*) to the focal point (*5*); however, the photoelement has an aperture at that point so that no photoelectric current is produced by the focused image. Light striking the edges of the erythrocytes is diffracted from its original path to strike the sensitive portion of the element, and the current thus produced is measured.

Read before the Texas Society of Pathologists, San Antonio, May 3, 1954.

*Haemoscope Corporation, 230 Park Avenue, New York 17.

are quite simple even though the diffraction effect of anisocytosis and poikilocytosis on the light rays is poorly understood. The fundamental principle of the Haemoscope is based on measuring light diffraction as illustrated in figure 1.

The inherent errors of the direct erythrocyte counting method are well known and generally are considered to be as great as plus or minus 16 per cent.[1]

The results of a comparative study of erythrocyte counts done by direct and scatter photometric methods in 350 consecutive hospital admissions are shown in figure 2. It is apparent that most of the values fall within the normal range and that the majority of values obtained by the two methods are correlated within plus or minus 10 per cent. Although several low counts are represented in the scattergram, additional studies were made in the form of erythrocyte counts done on progressive saline dilutions of a single blood sample. The results shown in table 2 indicate satisfactory correlation, even in those bloods with especially low red cell counts. Comparable results were obtained on progressive concentrations of a single blood specimen.

			Average error: 7.2%			

Although numerous bloods showing a marked degree of microcytosis and macrocytosis were not available for this study, comparison of the two methods was made in 14 selected cases having a low color index (table 3). It is evident that in these cases values obtained by the photometric method are almost uniformly lower than those derived by the direct count with a maximum of 18 per cent deviation. Since the degree of error inherent in direct erythro-

TABLE 4.—*Comparison of Time Factor of Erythrocyte Counts by Haemoscope and Direct Methods.*

No. Cases	Direct				Haemoscope			
	Dilute	Shake	Count	Total	Dilute	Calibrate	Count	Total
1	1 min. 3 sec.	2 min. 23 sec.	3 min.	6 min. 26 sec.	1 min. 27 sec.	1 min. 30 sec.	47 sec.	3 min. 44 sec.
80	1 hr. 24 min.	31 min. 40 sec.	4 hr.	5 hr. 26 min.	1 hr. 57 min.	1 min. 30 sec.	1 hr. 4 min.	3 hr. 3 min.

cyte counts may be as much as 16 per cent, however, the magnitude of this variation becomes less alarming. It will be noted also that the average variation between the two methods was only 7.2 per cent, a figure that certainly falls within accepted limits and indicates a certain degree of compensation by the instrument. Nevertheless, the fact that the Haemoscope values were lower than those obtained by the direct method indicates an incomplete compensation by the instrument for reduced cell size and hemoglobin content.

The time factor involved in erythrocyte counts is of importance, although certainly less important than the accuracy and reproducibility of the procedures. A comparison of the time involved in photometric and direct erythrocyte counting methods is shown in table 4. Although less than three minutes per count are saved by use of the photometric method, this represents a 44 per cent saving and amounts to approximately two and one-half technician hours per day in an average sized hospital laboratory. Technologists using the instrument were favorably impressed with its adaptability to routine hematologic work and with the ease and simplicity of its operation.

As direct erythrocyte counts, in addition to inherent inaccuracies, are time consuming and since so many clinicians are reluctant to accept hematocrit values in lieu of actual cell counts, an attempt was made to estimate red cell counts from capillary hematocrit determinations and to correlate the values obtained

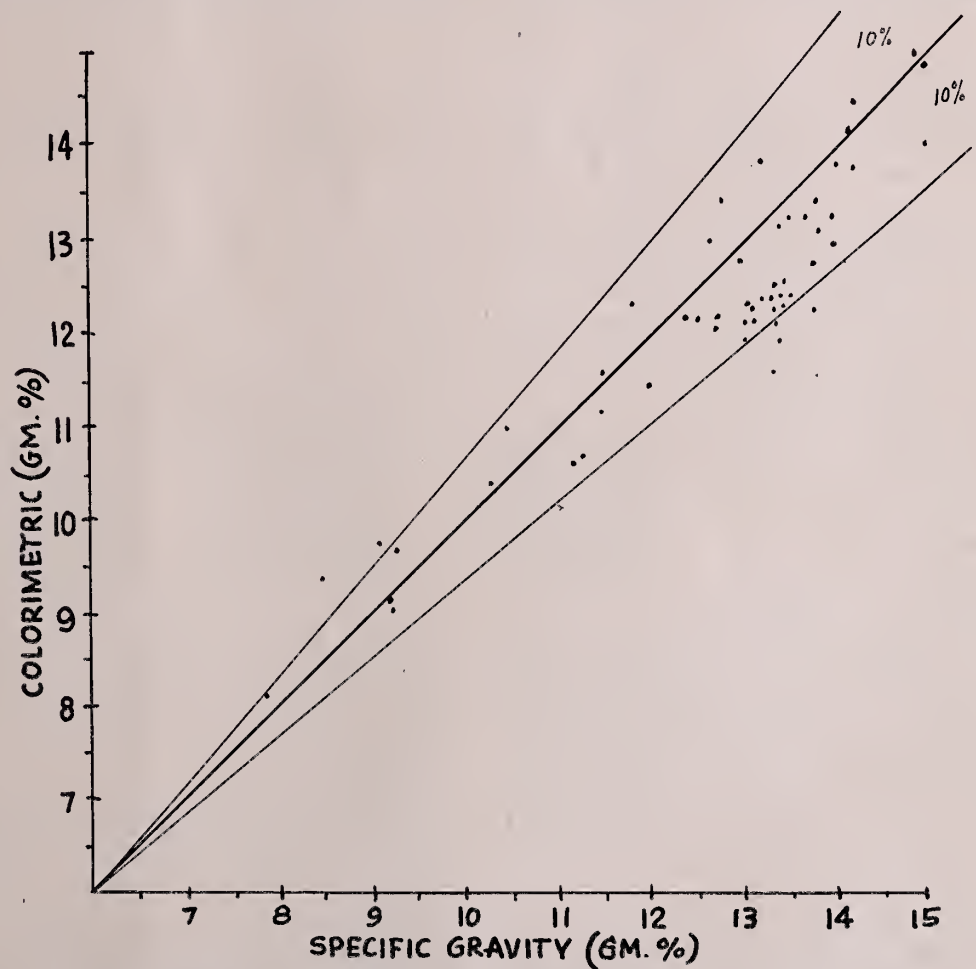

FIG. 5. A scattergram showing correlation between colorimetric (Leitz) and specific gravity (Barbour-Hamilton) hemoglobin determinations.

with those derived by the direct chamber method (fig. 3). It will be noted that nearly all of the values obtained by these methods showed a deviation of less than 10 per cent, indicating that an adequate estimation of the red cell count can be made, if desired, from the hematocrit. A comparison of results obtained by the Wintrobe and capillary methods of hematocrit determination indicates that estimation of the erythrocyte count by either method would be satisfactory as a routine screening procedure (fig. 4).

HEMOGLOBINOMETRY

In clinical hemoglobinometry, as in all other laboratory procedures, errors may be classified as instrumental and personal. The sources of instrumental errors are the colorimeter and the pipettes. The intrinsic error in well calibrated colorimeters is relatively small. The Sahli pipette, however, may be the source of large error as Sunderman has reported as much as minus 30 to plus 20 per cent error due to inaccurate calibration.[5]

Colorimetric hemoglobin determinations, using the Leitz-Rouy photometer, were compared with those done by the Barbour-Hamilton specific gravity method (fig. 5). It is noted that lower values were obtained in most cases by the colorimetric method, although most of the determinations showed a deviation of less than plus or minus 10 per cent. The hemoglobin values derived from whole blood specific gravity, however, were based on an arbitrary conversion factor which may not have been accurate.

REPRODUCIBILITY

In an attempt to evaluate the reproducibility of each of the procedures under consideration, six blood samples were subjected to repeated study by each procedure with determination of the range and standard deviation of the results (table 5). The direct chamber erythrocyte count showed a maximum range of 17 per cent with an average standard deviation of 169,000 cells per cubic millimeter. On the other hand, results obtained by the Wintrobe hematocrit showed only 1.8 per cent maximum range with an average standard deviation of 0.164 per cent.

Oxyhemoglobin determinations by the Leitz colorimeter showed a surprising failure of reproducibility, although pipettes were checked by the mercury-gravimetric method. Satisfactory hemoglobin reproducibility was obtained with the Haemoscope.

Concerning the relative accuracy of each procedure, we believe that they should be listed in the order indicated in table 6. It should be emphasized that this represents purely a personal impression and is not supported by any specific data, although it will be readily accepted, we are sure, that the routine direct red blood cell count is the least accurate of all the procedures considered.

The Wintrobe hematocrit method shows the greatest degree of reproducibility followed closely in order by the specific gravity, Haemoscope hemoglobin, Haemoscope red cell count, and capillary hematocrit procedures. Here again, the direct chamber erythrocyte counting method shows the least promising results.

Regarding the ease and simplicity of the procedures, the capillary hematocrit determination seems to be the easiest to perform. Certainly the direct red cell count technically is the most tedious and time consuming of all.

In following patients through the course of an illness, as a guide to possible blood loss, or to determine changes resulting from transfusion, the accuracy with which these measures of red cell and hemoglobin contents of the blood can be duplicated is a matter of as much importance as the inherent accuracy of the procedures. Hematocrit or whole blood specific gravity determinations appear to be the most accepta-

ble procedures from this standpoint, although it is doubtful that specific gravity determinations could be adapted to routine laboratory use.

CONCLUSIONS

It is thought that the relatively greater reproducibility of the Haemoscope red cell count, as well as its ease and simplicity of operation, certainly would justify the substitution of this type of procedure for the direct chamber count in routine admission work. It is recommended, however, that in detailed hematologic studies, in cases where there is evidence of pronounced microcytosis or macrocytosis in the stained smear, careful direct chamber counts be done in duplicate or triplicate using certified counting chambers and pipettes.

We believe that, in comparison, it would be no more costly nor time consuming to use a capillary hematocrit determination, Haemoscope erythrocyte count, Haemoscope hemoglobin determination, white cell count, and differential than to do the standard, accepted, and time-honored complete blood count, composed of a direct red blood cell count, photometric hemoglobin determination, white blood cell count, and differential. Certainly the former procedures would yield more accurate and reproducible results. The danger of overlooking significant alterations in cell size and hemoglobin content probably would be eliminated if direct chamber red cell counts were performed in those cases in which the stained smear showed a significant degree of microcytosis or macrocytosis. In 350 routine admission cases, we found 4 per cent to fall within this group.

Further Comments on Cobalt-Iron Therapy of Anemia of Prematurity

J. J. QUILLIGAN, JR., Dallas, Texas

IN THE May issue of the TEXAS STATE JOURNAL OF MEDICINE an article entitled "Effect of a Cobalt-Iron Mixture on the Anemia of Prematurity"[2] indicated that the use of a cobalt-iron mixture given to premature infants resulted in slightly higher hematocrit and hemoglobin values than in a control group. The 16 infants who received the cobalt-iron mixture were reported as showing no harmful effects despite the large doses. A somewhat similar study reported by Coles and James in the *Archives of Diseases of Childhood*[1] gave approximately the same results in 20 prematures. They were able to show that the administration of a cobalt-iron mixture for a very short period was able to keep such a treated group at a higher hemoglobin level than other control babies. They made no mention of harmful effects of the cobalt-iron preparations used.

Gross, Kriss, and Spaet from San Francisco, at the May, 1954, meeting of the American Pediatric Society reported the occurrence of thyroid hyperplasia in children with sickle cell anemia who were being treated with a cobalt-iron mixture. At the time of the presentation of this material before the pediatric group other physicians commented that they too had seen thyroid enlargement in patients receiving cobalt-iron mixtures. A recent experience here in Dallas has led me to concur in the belief that cobalt-iron mixtures can result in thyroid enlargement and consequently that whenever such medications are used such an effect should be looked for. A 4 month old baby who had received a cobalt-iron mixture since its premature birth developed a disease of the upper respiratory tract and then episodes of choking and cyanosis and had an enlarged thyroid gland; biopsy showed hyperplasia. In view of this finding plus the observations of others as noted earlier it is felt that cobalt-iron mixtures if given over a sufficiently long period may well result in enlarged thyroids.

However, the results of the group from England reported previously suggested that cobalt-iron mixtures need not be given for long periods. These authors were of the opinion that in the young infant, even more so than in the adult, cobalt is stored efficiently for long periods of time and that a small dose of cobalt, for perhaps no longer than three weeks, may give as beneficial an effect as cobalt administered over long periods.

Renal Hemodynamic Response to Acute Alterations of Blood Pressure with Vasopressor and Vasodepressor Agents

ROBERT G. McCONN, M.D.; H. LISTON BEAZLEY, M.D.; WARREN M. HUGHES, M.D.; and JOHN H. MOYER, M.D., Houston, Texas

AT PRESENT in clinical medicine there are available potent drugs which are capable of causing acute alterations of the blood pressure. Norepinephrine is one of the most potent agents for raising the blood pressure, and the ganglionic blocking agents are effective in lowering it. Although the blood pressure effects of these drugs are well known, it is of great clinical importance to observe the renal hemodynamic response to these agents which accompany sudden alterations in blood pressure. This presentation, which is divided into two parts, is a consideration of the renal hemodynamic effects of these drugs. In the first part we consider the effects accompanying the changes in blood pressure due to the use of the vasopressor agent norepinephrine for the treatment of shock. In the second part we consider some aspects of the renal hemodynamic responses accompanying the treatment of hypertension with ganglionic blocking drugs.

VASOPRESSOR AGENTS

In the treatment of acute clinical shock one should consider not only the restoration of blood pressure but also improvement of the circulation to special vascular beds such as the kidney. In the kidney, this is reflected in improvement of impaired renal function which may have been manifested clinically by oliguria or anuria. It has been observed that pressor agents such as norepinephrine are effective in restoring blood pressure to normal, but the effect of this agent on renal function is more obscure and has not been completely evaluated heretofore.

Methods

Studies were performed in both dogs and human beings in which norepinephrine was administered intravenously. The effect of this pressor agent on glomerular filtration rate and renal plasma flow was determined when normotensive dogs and humans were rendered hypertensive and when dogs previously rendered hypotensive by phlebotomy and humans in acute clinical shock were rendered normotensive.

Glomerular filtration rate was determined in the dogs by the creatinine clearance method and in the humans by the inulin clearance method. Renal plasma flow was determined by the use of para-aminohippurate. Methods and techniques have been described previously.[1, 2, 3]

Results and Discussion

It was demonstrated that when normotensive dogs were rendered hypertensive by the intravenous administration of norepinephrine, a significant reduction in glomerular filtration rate and renal plasma flow occurred. This effect can be seen in table 1. As the blood pressure increases to hypertensive levels, there is an initial reduction in renal plasma flow but not in glomerular filtration rate. As the rate of the norepinephrine infusion is increased and the blood pressure is raised further, both glomerular filtration rate and renal plasma flow are depressed.

TABLE 1.—*Effect of Blood Pressure Elevation to Hypertensive Levels with Norepinephrine in Normal Dogs.*

	Urine Volume cc./min.	Blood Pressure mm. Hg.	Glomerular Filtration Rate cc./min.	Renal Plasma Flow cc./min.
Control	5.0	115	52	348
Norepinephrine ...	6.0	140	53	248
Norepinephrine ...	2.0	170	16	118

TABLE 2.—*Response in Renal Blood Flow When Blood Pressure Is Increased to Hypertensive Levels in Human Beings.*

	Control	Norepinephrine	% Control
Mean blood pressure	97	132	136
Urine volume (cc./min.) ..	7.6	7.9	104
Glomerular filtration rate (cc./min.)	105	98	94
Renal plasma flow (cc./min.)	706	417	60

Comparable studies were done in 9 normotensive humans using norepinephrine (table 2). Here, too, a reduction in renal plasma flow occurred when these patients were rendered hypertensive, but glomerular filtration rate was not similarly reduced. It appears that vasoconstriction in the human kidney is not as prominent a response as it is in the canine kidney. If marked renal vasoconstriction occurred in patients in shock when the blood pressure was raised to normal by norepinephrine, it would tend to preclude its use since impaired renal function already exists in the shock state. However, clinical observations indicate that such an effect does not occur, for numerous oliguric and anuric patients in shock have been ob-

Presented before the Texas Heart Association, San Antonio, May 3, 1954.

served to have improved renal function as manifested by the onset of adequate urinary output following elevation of the blood pressure toward normal by means of the administration of one of the pressor drugs.

Coinciding with this clinical observation, it has been determined that in moderate controlled hypotension brought about by the use of the ganglionic blocking drug Arfonad,* the resultant depression of glomerular filtration rate and renal plasma flow can be elevated toward normal by the use of norepinephrine. However, since this is not comparable to acute clinical shock, a study was undertaken to determine if a similar effect could be produced in typical shock from various causes.

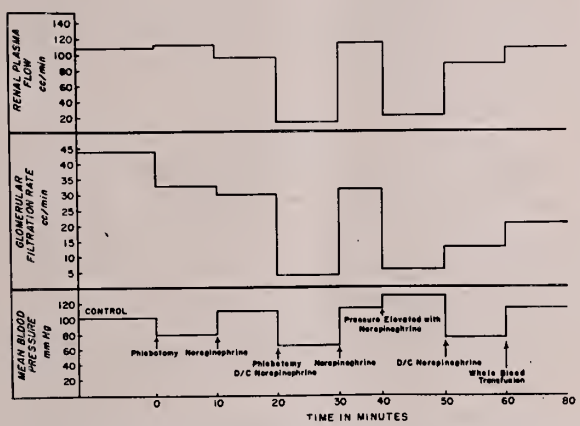

FIG. 1. The chart shows the renal hemodynamic response with the use of norepinephrine in a dog which has been rendered hypotensive by phlebotomy.

Preliminary studies were performed in dogs which were rendered hypotensive by means of phlebotomy. Figure 1 illustrates the response in 1 of these dogs.

TABLE 3.—*Renal Effects of Norepinephrine in Dogs Rendered Hypotensive by Phlebotomy.*

	Mean Blood Pressure mm. Hg.	Glomerular Filtration Rate cc./min.	Renal Plasma Flow cc./min.	Urine Volume cc./min.
Control	134	50	142	2.0
Phlebotomy	78	36	125	1.0
Phlebotomy	57	20	62	0.7
Norepinephrine	108	34	104	1.2
Norepinephrine	157	12	34	0.6

Following hemorrhage in the experimental animal, both glomerular filtration rate and renal plasma flow were depressed as the blood pressure fell. When the blood pressure was increased back to normotensive levels with norepinephrine, glomerular filtration rate and renal plasma flow increased. However, when the rate of infusion was too rapid and the blood pressure increased to hypertensive levels, glomerular filtration rate was depressed again as was the renal plasma flow.

Table 3 summarizes the mean values in this series of animal experiments. It can be seen that as the mean blood pressure is restored toward normal, there is considerable improvement in renal function. Also, as previously demonstrated in normal subjects, elevation of the mean blood pressure to hypertensive levels results in uniform reduction in glomerular filtration rate, renal plasma flow, and urine volume.

Following the preliminary animal studies, similar investigations were carried out in 9 patients in clinical shock. The etiology of the shock varied and included both normovolemic and hemorrhagic types. The effect produced in shock following myocardial infarction is depicted in figure 2. Following severe hypotension resulting from a myocardial infarction, glomerular filtration rate was depressed. When the blood pressure was increased toward normotensive levels, the glomerular filtration rate returned toward normal.

Although renal hemodynamics were frequently improved in hemorrhagic shock when pressor agents were used, if hemorrhage was too great, a similar degree of improvement was not observed. Under the latter circumstances, it was necessary to restore partially the blood volume before improvement of renal function was noted with norepinephrine.

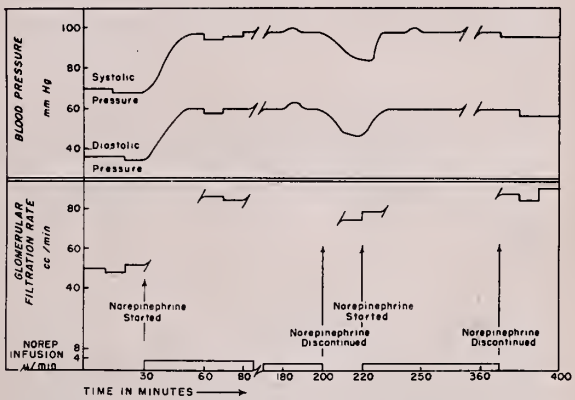

FIG. 2. The renal response to norepinephrine in shock accompanying myocardial infarction (recovery) is shown in the chart.

Figure 3 shows the effect of partial blood replacement on the response to norepinephrine. Although the blood pressure is initially raised by means of the vasopressor agent, there is no significant increase in the glomerular filtration rate and little increase in renal blood flow. However, after the administration of 350 cc. of whole blood, the subsequent administration of norepinephrine results in a significant improvement in renal blood flow and glomerular filtration rate.

Table 4 summarizes the mean values in the 9 shock

**Arfonad is d–3,4 (1',3'–dibenzyl–2'–keto–imidazolido)–1,2–trimethylene thiophonium d–camphor, which was furnished by Hoffman-LaRoche, Inc.*

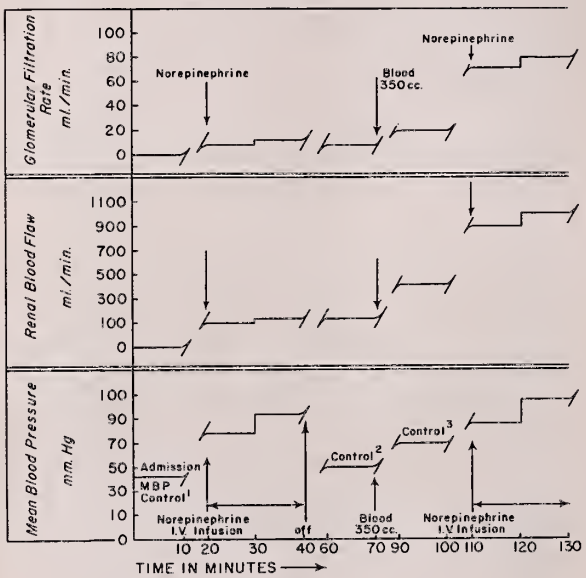

FIG. 3. Chart showing the effect of partial blood replacement on the renal response to norepinephrine in hemorrhagic shock.

patients studied. It is well to note again the improved glomerular filtration rate and renal plasma flow as the blood pressure is restored to normal levels. Following treatment, both glomerular filtration rate and renal plasma flow remain low for the group because some of the patients studied had primary renal disease.

TABLE 4.—*Renal Effects of Vasopressor Agents on Patients in Shock, Mean Values in 9 Patients.*

	Mean Blood Pressure mm. Hg.	Glomerular Filtration Rate cc./min.	Renal Plasma Flow cc./min.	Urine Volume cc./min.
Control	54	8	73	0.40
Vasopressor	73	53	404	1.40
Vasopressor	91	60	562	4.00

Comment

These observations appear to indicate that norepinephrine is effective in improving renal function in normovolemic shock and in some cases of hemorrhagic shock. There appears to be a fundamental difference between the renal response in normotensive patients when rendered hypertensive as compared to the response seen when patients in shock are rendered normotensive. In the former renal function is compromised, whereas in the latter it is improved.

VASODEPRESSOR AGENTS

In the treatment of hypertension with ganglionic blockade, it is desirable to provide sufficient blood pressure reduction to bring about improvement in cerebral and cardiac hemodynamics. At the same time renal effects of blood pressure reduction must be kept in mind since it is known that glomerular filtration rate and renal excretory capacity are dependent upon systemic blood pressure. If blood pressure reduction is excessive, renal decompensation can result. Because of this problem confronting the clinician, an attempt was made to see how far blood pressure could be reduced before producing significant reduction in glomerular filtration rate. If this could be ascertained, it would reveal a general range of blood pressure reduction which could be used clinically in the treatment of hypertension without further impairment of renal function by the therapeutic procedure.

Methods

Determination of glomerular filtration rate as related to mean blood pressure reduction was accomplished in 17 patients with untreated hypertension. Blood pressure reduction was achieved by the intravenous administration of the ganglionic blocking agent Pendiomide.* Glomerular filtration rate was determined in all patients by the inulin clearance method, and mean blood pressure was determined by intra-arterial femoral manometry. The ganglionic blocking drug was administered after three consecutive control periods in which determination of mean blood pressure and glomerular filtration rate was obtained. The mean blood pressure was reduced gradually in step-wise fashion, approximately 20 mm. of mercury at a time. With each reduction in the mean blood pressure, two terminations of glomerular filtration rate were made. After maximum mean blood pressure reduction was reached, the blood pressure was kept at this level for at least one hour, after which two additional determinations of glomerular filtration rate were made. The same study was performed in an additional 8 patients with the use of the ganglionic blocking drug Arfonad (table 5).

For comparison, a similar study was performed in 9 patients with normal blood pressure in whom Pendiomide was used to lower the blood pressure to hypotensive levels, and the resultant effect on glomerular filtration rate was determined.

Results and Discussion

It was noted that in both the hypertensive and the normotensive patients there was an initial decrease in glomerular filtration rate as the blood pressure was reduced. Following this, there was a rise in glomerular filtration rate in spite of continued reduction of the mean blood pressure and then a second decline in glomerular filtration rate which persisted

**Pendiomide is pentamethyl—diethyl—3—aza—pentane—1,5—diammonium—dibromide, which was furnished by Ciba Pharmaceutical Products, Inc.*

as the mean blood pressure was kept at the maximum reduction level.

Table 5 shows a comparison of the results obtained in the hypertensive patients and the normotensive patients. These average values show that in patients with hypertension when the blood pressure is lowered with Pendiomide into a normal range (mean blood pressure of 95 mm. of mercury) amounting to a 38 per cent reduction, the glomerular filtration rate is depressed far below the control value, amounting to a 26 per cent reduction. Similar results were obtained in the 8 hypertensive patients in whom blood pressure was reduced by means of Arfonad. When the mean blood pressure was lowered to 91 mm. of mercury, the glomerular filtration rate showed a 25 per cent reduction. In comparison, when the blood pressure of the normotensive group is reduced to a hypotensive range (mean blood pressure of 71 mm. of mercury), which amounts to a 28 per cent reduction, the glomerular filtration rate remains well within the range of normal and shows only a 14 per cent reduction from the control value. Of course, in terms of absolute decrease in mean blood pressure, it is more than twice as much in the hypertensive patients as it is in the normal ones. The mean control glomerular filtration rate for the hypertensive group is at the lower limit of normal because of the inclusion of a number of patients with secondary renal damage.

TABLE 5.—*Comparison of Results in Hypertensive and Normotensive Patients Showing the Effect of Reduction of Mean Blood Pressure on Glomerular Filtration Rate.*

	MBP_c	MBP_1	% Decrease	MBP_2	% Decrease	GFR_c	GFR_1	% Decrease	GFR_2	% Decrease
Average in 17 hypertensive patients after Pendiomide	153	100	35	95	38	91	61	33	67	26
Average in 8 hypertensive patients after Arfonad	143	103	28	91	36	88	63	28	66	25
Average in 9 normotensive patients after Pendiomide	97	77	21	71	28	134	111	17	115	14

MBP_c—Mean blood pressure in millimeters of mercury before Pendiomide or Arfonad (control values).
MBP_1—Value after maximum reduction in blood pressure.
MBP_2—Value after maximum reduction in mean blood pressure for one hour or more.
GFR_c—Glomerular filtration rate in cubic centimeters per minute before Pendiomide or Arfonad (control values).
GFR_1—Value after maximum reduction in blood pressure.
GFR_2—Value after maximum reduction in mean blood pressure for one hour or more.

Comment

Although a clearly defined critical blood pressure level for the maintenance of glomerular filtration rate was not found in patients with hypertension when the blood pressure was reduced by a ganglionic blocking drug, there was a significant decrease in glomerular filtration rate when blood pressure was lowered maximally. This reduction in glomerular filtration rate occurs within the normal blood pressure range. In normotensive persons, the changes in glomerular filtration rate are qualitatively similar and less marked and occur only after the blood pressure is reduced to hypotensive levels.

CONCLUSIONS

Vasopressor agents are effective in improving renal function in normovolemic shock and in some cases of hemorrhagic shock.

In contrast to the effect in shock, vasopressor agents compromise renal function when normotensive patients are rendered hypertensive.

In hypertensive patients, glomerular filtration rate is significantly depressed when the blood pressure is maximally reduced by a ganglionic blocking drug, and this reduction in glomerular filtration rate occurs within the normal blood pressure range.

A clearly defined critical blood pressure level for the maintenance of glomerular filtration rate in hypertensive patients was not found in this study.

LEPROSY CASE CITED

What appears to be the first reported case of leprosy acquired during World War II military duty is described by a California physician in the September 11 *Journal of the American Medical Association*. Although some cases had been expected in servicemen stationed in regions such as the Philippines and this is the first reported, Dr. Norman E. Levan, Bakersfield, said that some instances of the disease may be anticipated during the next thirty years or more in veterans of World War II and the Korean campaign who served in such regions.

A PROGRAM FOR ROENTGEN EXAMINATION OF HOSPITAL ADMISSIONS

CAROLINE W. ROWE, M. D., Galveston, Texas

PRIOR to 1949 the Texas Tuberculosis Association had wished to see a program established whereby routine hospital admissions could receive a chest roentgen-ray examination. Consequently, the group proposed to lend a 70 mm. photofluorographic unit to the University of Texas Medical Branch at Galveston so that such a program might be initiated. This offer was accepted and by December, 1949, the project was started.

This presentation includes the result of this program to date.

First, let us consider the trend of thought throughout the country concerning the use of the miniature film. The need for survey chest photofluorograms is well established. All doctors will agree that in the field of chest diseases many potentially serious conditions show no symptoms during a considerable part of their course and that these may be detected at a much earlier stage with the use of the photofluorogram than was hitherto possible. Also, there are many conditions which in themselves may not be important but which complicate the management of other diseases.

Furthermore, photofluorography may be the first step in evaluation of the cardiovascular system. Most physicians value the visualization of the heart and great vessels as an adjunct to the management of their cases and consider the miniature film a worth-while investment from this viewpoint.

Mass chest surveys are fully twenty years old and have been studied at length. They did not reach statistically significant size, however, until the use of the photofluorogram. There is no doubt that they have served their purpose in detecting unsuspected tuberculosis, and recent studies show a gratifying decline in the tuberculosis death rate. As a result of this decline a smaller percentage of active cases are currently being detected by this method. Therefore, in recent years more emphasis has been placed on the use of hospital surveys in place of mass surveys, since hospitals and clinics are thought to contain a higher percentage of cases of undiagnosed tuberculosis and a more fruitful yield of the disease is expected from a hospital survey.

Coincident with the decline in the tuberculosis death rate, there is an increase in the death rate from lung cancer. In males bronchogenic carcinoma is replacing gastric carcinoma as the most frequent cause of death from cancer. Thus chest surveys are now being studied in respect to their role in detecting early bronchogenic carcinoma. Much emphasis is placed on the treatment of bronchogenic carcinoma while it is in a presymptomatic stage as it is only in this stage that anything approaching curative treatment can be expected.

Overholt[3, 4] recently has reported that when prompt treatment has followed discovery by roentgen-ray survey of lung cancer in the silent phase, all lesions were resectable and 75 per cent of the patients are still living. In contrast, however, in the symptomatic group approximately 90 per cent of the lesions extended beyond the lungs, and there was a possibility of cure in less than 10 per cent. Since carcinoma of the lungs can be discovered in the asymptomatic phase by photofluorography, it is a challenge to the medical profession to utilize the simple expedient of routine photofluorographic examinations of the chest to accomplish this.

PRESENT PROCEDURE

At the John Sealy Hospital the photofluorographic unit is utilized as follows on (1) all new admissions except stretcher cases, children under 6 years, and a group of pay patients; (2) personnel; (3) students; (4) food handlers every six months; (5) all obstetric patients every six months; and (6) patients from a State Department of Health prenatal clinic.

When projects are begun at the hospital such as the workmen's compensation program, a 70 mm. film is taken of all new persons entering this program. This takes a tremendous load off the main Radiology Department.

To illustrate the method of obtaining the 70 mm. film on new patients, let us follow a patient whom we shall call Miss X through the procedure. Miss X appears at the registration office as a new patient. The necessary data are recorded on the initial registration sheet to which is attached the request for a 70 mm. film. Therefore, the vital statistics are recorded by means of carbon paper on the roentgen-ray request. After the patient has registered, the clinic worker tears off the request and directs the patient to the photofluorographic unit. This unit is not

From the Department of Radiology, University of Texas Medical Branch.

Presented before the Texas Tuberculosis Association, Dallas, April 9, 1954.

situated in the Radiology Department but is adjoining the out patient clinic.

The patient presents herself to the technician who gives her a gown to wear, the film is made in a short time, and the patient goes directly to the clinic. At 6 a. m. the following day the technician develops the film, which is dried and processed by 8 a. m. It is reported and typed up that morning, and by the end of the day the report should be in the record room. It is not brought directly to the attention of the doctor, and this is a deficiency in the system which will be discussed later.

EARLY DIFFICULTIES

When this program was started in 1949, there was not as widespread use of this unit as there is today. As is frequently the case with a new idea, it was not received with enthusiasm. The education of the staff to the use of the photofluorographic unit was not an easy or rapid procedure, and considerable initial resistance was met. It had not been a routine procedure to obtain chest films on all new cases, and when the use of the 70 mm. film was proposed, even though for routine examinations, the staff believed the patients were being cheated by having a small film made instead of the conventional size radiograph.

The general opinion was that one could not see sufficient detail on a 70 mm. film to make them worth while. However, with the idea that the 70 mm. film should be tried as a screening process on new patients to separate negative from positive cases, the Department of Radiology was able to increase the number of examinations during a twelve month period by eight times. For example, in December, 1949, only 74 films were made, but in the following December 561 examinations were made. The number of examinations each year is listed in table 1. After the

TABLE 1.—*The Number of Roentgen Examinations of Chests per Year at John Sealy Hospital.*

Year	No. Examinations
1949 to 1950	2,573
1950 to 1951	7,581
1951 to 1952	6,615
1952 to 1953	8,648
1953 to 1954	8,744
Total	34,161

first year the percentage of the 70 mm. films made on new clinic and hospital admissions remained about the same from year to year. It was 86.4 per cent in 1953. The remaining 13 per cent included stretcher cases, small children, and private patients.

There were also initial difficulties in film interpretation. The radiologists had to learn to read the miniature film. There was a tendency to interpret normal markings as possible infiltration and many cases were returned for follow-up examination which proved to be normal. The duty of interpreting these films is still rotated among the staff and residents, and each new reader commits the same error until he becomes aware of the difficulty. Inevitably a number of lesions were missed. The most frequent error was failure to see a soft lesion behind the first rib and clavicle. I cannot give accurate statistics on the number of errors of omissions made by the radiologists because cases which were called normal naturally were not returned for follow-up examination. The only way to obtain reliable statistics on errors of omission would be to run a series in which the same group of patients received a 70 mm. film and a 14 by 17 inch film so that the results could be compared. This has not been done at John Sealy Hospital.

In spite of the fact that miniature films have much less resolving power than full size radiographs and hence give less detail, small lesions usually could be seen in review of the 70 mm. film after being demonstrated on a 14 by 17 inch film. It is my impression that our known errors were based more on a personal factor than on inherent differences between the miniature and conventional size film.

RESULTS

The procedure of having the registration office fill out the request has increased the number to have photofluorograms by approximately 2,000 per year. This system has been used at the John Sealy Hospital

TABLE 2.—*Positive Results Found on 70 mm. Films During an Eighteen Month Period.*

Major Groups	No. Cases	%
Cardiovascular disease	251	33
Lung disease	337	45
Miscellaneous	74	10
Errors (follow-up normal)	85	12
Total	747	

for nearly two years. Therefore, I have taken the statistics for a late eighteen month period as an example of the results the survey is now obtaining.

All radiographs at John Sealy Hospital are coded and a card is punched for I.B.M. use by the statistical clerk. All positive 70 mm. cases were listed and submitted to me for this study. On surveying the positive reports, I find that the hospital has an average of 5.6 per cent positive cases, which is essentially the same average shown in the statistics from other institutions which are carrying on similar surveys. Table 2 indicates the number of positive cases divided into major groups. This 5 per cent positive group includes cardiovascular disease, which comprises about 33 per cent of the group; lung disease, which makes up about 45 per cent of the group; and a miscellaneous group, which comprises 10 per cent of the positive group. The miscellaneous group includes all other

conditions from a fractured rib to more serious conditions such as mediastinal tumor. It is necessary to include in the group of positive cases a number of errors, which comprise 12 per cent of it. These were errors in which a 14 by 17 inch film was requested without a reason given, and the follow-up film was proved to be normal.

I made no attempt to evaluate the cardiovascular group but studied the charts of every positive lung case. I found in this eighteen month period 337 positive lung cases as reported on the 70 mm. film; 141 of these were proved to have lung disease; 196 lung disease suspects were lost to follow-up study, a point on which I shall elaborate further.

There were 86 cases of proven tuberculosis in this group, 46 of which were found to be active cases and 40 considered inactive on subsequent study in the clinic. There were 10 cases of proven bronchogenic carcinoma in the group.

Because of lack of follow-up facilities and lack of interest of physicians in special clinics, 196 lung disease suspects were lost. Of these 196 cases, there were 37 that seemed so typical on the 70 mm. film that they were reported as probable tuberculosis so that it might stimulate the physician to obtain follow-up examination quickly, but the recommendation was not heeded. This is a distressing fact, and it was noted that this took place repeatedly in special clinics such as genitourinary; ear, nose, and throat; orthopedics; eye; and psychiatry. Also, there were a number of patients who made only one visit to the clinic, and a lack of follow-up facilities allowed them to slip through our fingers without being notified that they had positive chest films.

ANALYSIS OF STATISTICS

The customary figures have been presented for a project such as this. In reporting mass surveys, such figures would be significant without further analysis. However, on reporting a hospital survey, I believe a more critical analysis is needed for true evaluation of the project.

There is a definite difference between patients who have photofluorograms made in a mass survey and in a hospital survey in that, theoretically, those positive cases discovered in a mass chest survey would not have been discovered except by that method. On the other hand, a hospital survey is comprised of patients who have come to the hospital because they are ill or believe they are ill; therefore, many of them must have signs or symptoms of a chest disease or knowledge that they have a chest disease. For this reason I believe that the chart on each of the positive cases should be studied, and it should be determined whether the condition was actually discovered by means of the miniature chest film or whether the patient came to the hospital with symptoms or knowledge that would have warranted obtaining a regular chest film anyway.

The following facts were revealed: of the 141 proven lung cases, 69 had presented themselves with chest symptoms or a knowledge that they had disease and only 72 cases were asymptomatic and unsuspected. The results should read that out of 13,157 cases, 72 unsuspected lung disease cases were discovered. Out of 86 proven tuberculosis cases, 66 had presented themselves with symptoms of a chest condition or a knowledge that they had had tuberculosis; therefore, only 20 unsuspected tuberculosis cases were actually discovered. The same situation applied to the cases of bronchogenic carcinoma. Ten of the lung disease cases proved to have bronchogenic carcinoma, but only 1 was unsuspected.

COMPARATIVE COSTS

It is obvious that the previously mentioned figures should be used if one is to attempt to estimate the cost of a hospital survey.

It is not difficult to determine unit cost. Our unit cost is essentially the same as that from other institutions; that is 75 cents per person having a photofluorogram. Results show that each asymptomatic lung case or unsuspected lung disease case costs $137. The cost of detecting each unsuspected case of tuberculosis is $465.13. Although there is much current interest in detecting bronchogenic carcinoma by the survey method, if this survey had been conducted for this purpose alone, it would have cost $9,767 for each discovery of asymptomatic bronchogenic carcinoma.

These figures tally closely with those presented by Guiss[1] in reporting the value of the chest photofluorogram in the control of lung cancer from a study of 1,867,201 examinations at Los Angeles County Hospital. This is the largest survey of its kind in the nation. This study was made with the use of a medical board and adequate secretarial and social service help in order to obtain the necessary follow-up data. They found 1.9 per cent of these patients were tumor suspects, but only .08 per cent proved to have bronchogenic carcinoma. It cost $396 each to discover a chest tumor suspect, and each proven carcinoma cost $9,625.

DISCUSSION

In spite of the small percentage of proven cases from the suspects of the Los Angeles group, Guiss believed that there is no question that the mass chest survey was an effective method of discovering chest neoplasms, although it was expensive. However, he thought that only by this means could one detect lung cancer still in the asymptomatic phase. He em-

phasized that the mere screening is useless unless this lead is properly exploited and a prompt clinical investigation and surgical intervention accomplished. Also, there is a difference between the problems of tuberculosis and of cancer.

In discovering unsuspected cases of tuberculosis the population is definitely benefited, and there is a sustained effect on the extent of the problem if the patient is given proper treatment. But in attempting to control lung cancer, surveys must be repeated every six months since cancer may develop during an interval of a few months in cases which were negative at the time of the initial survey. This raises another problem, but it is believed that if, for example, all males over 40 years of age could be surveyed every six months, it might prove worth while in the control of lung cancer.

On the other hand, in a report by McNulty[2] from the *New England Journal of Medicine* early this year one finds a more depressing viewpoint. He reported on a survey centered on bronchogenic carcinoma. In this survey the incidence of bronchogenic carcinoma was 1 to 14,000 cases. He thought that this is a discouragingly low figure and that more than one-half of the lesions which were discovered were not resectable at operation. This again emphasizes the point made by the Los Angeles group that bronchogenic carcinoma must be detected early. The only way to approach this problem would be through surveys at a minimum of every six months, or much of the effort and money is wasted.

In spite of the low percentage of cases from which the patients and community benefit by the discovery of disease, it appears to be the only approach to these problems, and I believe that the physician and the interested layman desire the continuation of such a project. Most physicians today agree that the 70 mm. chest film discloses more important information than the much longer established routine of obtaining complete blood counts, urinalysis, and serologic tests for syphilis on new patients. It cannot be disputed that the detection and control of syphilis has resulted largely from obtaining compulsory routine serologic tests for syphilis on all patients seen. Therefore, I think that if we are to progress in the field of early detection of disease and in the control of disease, it is worth while to carry on these projects. They must be carried to completion in an efficient manner so that the value is not lost.

CONCLUSION

As a result of compiling this report, I see that this survey has not been carried on with maximum efficiency and economy, and it is hoped that the following suggestions will be helpful to other hospitals that might be interested in starting chest surveys:

Requests for the 70 mm. examination filled out by the registration clerk are found to expedite this matter and aid in obtaining a high percentage of examinations on new patients.

The photofluorographic unit should be adjacent to the clinic or registration office and not in the main Radiology Department.

The report must be in the hands of the doctor within twenty-four hours in order for this project to serve its purpose. This will aid in preventing unnecessary exposure to staff and other patients of unsuspected tuberculosis cases. It will also allow patients who make only one visit to the clinic to be informed of the need for further chest investigation. It will encourage the doctors in special clinics to obtain further study on the chest before they become absorbed in treating the original complaint.

A social service worker or clerk should be responsible for following up all positive 70 mm. reports and corresponding with those patients who do not return.

Education of the staff doctors to the objectives of the program should be accomplished before it is started, for without their cooperation the project becomes a costly and useless procedure.

Ratio of Doctors to Population

The graduation of the largest class of physicians in history has brought a record ratio of one doctor for every 730 persons in the United States. The ratio is expected to be lowered even more in the next few years as the number of medical graduates rises more rapidly than the general population.

The record graduation of 6,861 doctors during 1953-1954 brings the physician population in the United States to approximately 220,100.

AMA EXHIBIT EXPOSES QUACKS

The American Medical Association's newest exhibit, titled "The Modern Medicine Show," exposes quack healers and food faddists and presents the facts as to how "medicine men" have duped the public into spending thousands of dollars for "would-be cures."

After being shown at the annual meeting of the AMA in San Francisco, the exhibit is now available from the Bureau of Exhibits for use at medical meetings, fairs, and public gatherings.

CASE REPORTS

Dissecting Aneurysm of the Thoracic Aorta Due to Trauma

FREDERICK P. BORNSTEIN,* M. D., El Paso, Texas

WITH the advent of the automobile, stresses of a magnitude previously unknown have been imposed upon the human organism. Consequently traumas and associated diseases which had not been known in previous years have developed. The case to be reported here is so unusual that I have been able to find only 1 similar case in literature.[1]

Of all the various types of aneurysms formed by the aorta, the dissecting aneurysm is the rarest and most unusual. In dissecting aneurysm there is a break of the wall. Blood digs itself a new tract between the layers of the aorta either between the intima and the media or more commonly between the media and adventitia.

Such a condition frequently causes sudden and dramatic termination of the life of the afflicted person. It is no wonder, therefore, that the older literature[2] contains numerous references to so-called traumatic dissecting aneurysms. However, study of these reports always shows that the trauma referred to consists of a relatively small effort such as sudden lifting or a rash movement. In all these cases on autopsy a previously existing disease of the aortic wall has been demonstrated. Therefore, we should accept as traumatic dissecting aneurysm only cases in which there is a clear connection between a heavy injury and the aneurysm and in which gross and histopathologic examinations of the aorta reveal the absence of preexisting diseases.

CASE REPORT

A 21 year old white man was admitted to El Paso General Hospital after an automobile accident. He was sitting next to the driver when the car went out of control and hit an iron telephone pole with sufficient impact to bend the pole. He was found by the police lying on the seat, but apparently not seriously injured, and was able to walk into the hospital under his own power. Because of a broken rib, a chest roentgenogram was made three hours after the accident; it revealed a chest which was essentially normal. At this time the man appeared to be in good condition. One hour later he went into shock, became pale, and died within ten minutes.

On autopsy 3,000 cc. of partially clotted blood was found in the left pleural cavity. The organs of the chest and abdomen were removed en bloc, and upon inspection of the aorta posteriorly, a layer of blood was located between the adventitia and the media. This bloody infiltration extended to the level of the renal arteries. In following the aorta upward, there was found in the adventitia a tear from which the hemorrhage had broken into the left pleural cavity. When the aorta was opened, a transverse tear was seen in the intima of the aorta slightly above the level of the origin of the first intercostal artery (fig. 1a).

Important findings of microscopic examination were limited to the aorta. Sections taken a considerable distance from the intimal tear, namely, in the abdominal aorta, showed a hemorrhage existing between the adventitia and the media. This established the dissecting character of the lesion. In addition, histologic examination of the wall of the aorta with hematoxylin and eosin and with Verhoeff's elastic stain proved the absence of previously existing disease of the aorta. A section taken directly from the tear showed the splintering of the medial layer and the rolling up of the intima, evidently under the impact of the injury (fig. 1b).

DISCUSSION

From the autopsy and clinical findings, it can be established that this man suffered a tear in the intima and media at the time of accident and that a dissecting aneurysm developed in the following four hours. Upon rupture of this aneurysm death occurred.

This case is similar to the one described by Leonard.[1] The location of the tear was at approximately the same place in our case and in Leonard's case,[1] whereas in Stryker's saccular aneurysms[3] the tears were found in the first part of the ascending aorta. In Leonard's case the dissecting tract extended in an upward direction; in our case it extended downward. In Leonard's case there was a survival of four days. This is important; the interval between the original injury and death in some of these cases may give the physician an opportunity for treatment after more is learned about this condition.

It is unfortunate that in neither Leonard's case, nor our case, nor in the more common cases of complete traumatic rupture of the aorta any adequate data are available to explain the mechanism involved. In traffic accidents, one would like to know the rate of deceleration, the probable direction of the travel of the body, and similar items which would permit an estimation of the magnitude of the impact sustained by the body. Without quantitive data it always will be difficult to explain the sequence of events.

Presented at the annual meeting of the Academy of Forensic Sciences, Chicago, February 27, 1954.

*Pathologist, El Paso General Hospital.

SUMMARY

A case of a partial traumatic rupture of the aorta followed by a dissecting aneurysm is presented. This is the second case in literature so reported.

Radiological Physics Course

Beginning October 7 and continuing for twenty-four weeks each Thursday afternoon for an hour, a course in radiological physics is being offered in Houston by the University of Texas Postgraduate School of Medicine in cooperation with the Texas Medical Association, the Texas State Department of Health, and the Texas Academy of General Practice. W. K. Sinclair, Ph. D., is the instructor in charge, and A. Cole, Dr. G. H. Fletcher, Dr. J. E. Richardson, and Dr. R. J. Shalek assist. Twenty-four hours' credit is given for the course, the tuition for which is $10.

Some of the lectures to be presented include physical principles of the diagnostic use of roentgen rays, the measurement of radioactive isotopes, dosimetry, physical aspects of radiobiology, applications of electronics in radiology, and radiological protection. A complete schedule of weekly lectures may be obtained from the postgraduate school, Texas Medical Center, Houston.

INDUSTRIAL POLICYHOLDERS MORTALITY

Mortality among industrial policyholders of the Metropolitan Life Insurance Company set a new low record during the first half of 1954. According to the company's statisticians, 650 per 100,000 policyholders compares with 667 per 100,000 for the first six months of 1950, which was previously the lowest registered mortality rate.

Among the males the death rate for all ages under 75 years combined was about the same as in 1953, when the rate was 670 per 100,000. Female policyholders recorded a lower death rate this year than last in every age group.

Cancer and allied conditions were the only major causes of death to show a rise in mortality over last year. The rate rose from 124.8 to 129.5 per 100,000 for the first half of 1954. The cardiovascular-renal diseases, diabetes, and tuberculosis death rate was lower than that for the same period last year.

Texas Surgical Society. Dr. Dudley Jackson, Sr., San Antonio, Pres.; Dr. Albert W. Hartman, 414 Navarro St., San Antonio 5, Secy.

Texas Tuberculosis Association, Galveston, April 15-16, 1955. Mrs. Joella Terrill Butler, Wichita Falls, Pres.; Miss Pansy Nichols, 2406 Manor Rd., Austin, Executive Secy.

Texas Urological Society, Corpus Christi, 1954. Dr. S. J. R. Murchison, Fort Worth, Pres.; Dr. A. J. Ashmore, 255 Medical Dental Bldg., Corpus Christi, Secy.

West Texas Surgical Society, Dec. 8, 1954. Dr. J. A. Shapira, Midland, Pres.; Dr. Milton J. Loring, 304 North N St., Midland, Secy.

DISTRICT

First District Society, Pecos, 1955. Dr. John W. O'Donnell, Alpine, Pres.; Dr. H. D. Garrett, First National Bldg., El Paso, Secy.

Second District Society. Dr. John R. Mast, Midland, Pres.; Dr. M. J. Loring, 304 North N St., Midland, Secy.

Third District Society, Borger, April, 1955. Dr. M. C. Overton, Jr., Pampa, Pres.; Dr. William Klingensmith, 215 Fisk Bldg., Amarillo, Secy.

Fourth District Society, San Angelo, Oct. 21, 1954. Dr. P. M. Wheelis, Brownwood, Pres.; Dr. James N. White, San Angelo, Secy.

Fifth and Sixth Districts Society, Corpus Christi. Dr. John J. Sloan, Corpus Christi, Pres.; Dr. E. Jackson Giles, 705 Medical-Professional Bldg., Corpus Christi, Secy.

Seventh District Society. Dr. William McLean, Austin, Pres.; Dr. John Rainey, 1709 San Antonio, Austin, Secy.

Eighth District Society, Galveston, 1955. Dr. George E. Glover, Jr., Victoria, Pres.; Dr. York Lancaster, Port Lavaca, Secy.

Ninth District Society, Houston, March 17, 1955. Dr. Thomas H. Giddings, Brenham, Pres.; Dr. Lyman C. Blair, 1212 Rothwell, Houston, Secy.

Tenth District Medical Society. Dr. John M. White, Port Arthur, Pres.; Dr. Rider Stockdale, Jasper, Secy.

Eleventh District Society, Jacksonville, Oct. 27, 1954. Dr. John Dean, Crockett, Pres.; Dr. Marlin T. Braswell, Henderson, Secy.

Twelfth District Society. Dr. Neil Buie, Marlin, Pres.; Dr. Paul H. Mitchell, Corsicana, Secy.

Thirteenth District Society, Abilene, March 2, 1955. Dr. Mal Rumph, Fort Worth, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteenth District Society. Dr. J. David Thomas, Denton, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Mount Pleasant, 1955. Dr. R. L. Johnson, Mount Pleasant, Pres.; Dr. R. L. Hardman, Mount Pleasant, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 14-17, 1955. Dr. Lawrence B. Sheldon, Dallas, Pres.; Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco. Dr. Ross Shipp, Waco, Pres.; Dr. Milton Spark, 3805 Herwal, Waco, Secy.

International Medical Assembly of Southwest Texas, San Antonio, Jan. 24-26, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 7-10, 1955. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference. Dr. L. N. Simmons, 1518 Tenth St., Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin, Oct. 22-23, 1954. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

Southwestern Begins Postgraduate Series With Obstetrics and Gynecology Course

The Southwestern Medical School of the University of Texas, in association with the Dallas Southern Clinical Society and under the auspices of the Postgraduate School of Medicine of the University of Texas, the Texas Medical Association, and the Texas Academy of General Practice, is offering a three-day course in obstetrics and gynecology, November 15-17, at the new Parkland Hospital, 5201 Harry Hines Boulevard, Dallas.

The course, to be taught by members of the full-time and clinical faculty of Southwestern Medical School, will give twenty hours' credit to members of the Academy of General Practice.

Those teaching will be Drs. William F. Guerriero, Mary A. Jennings, Douglas M. Haynes, J. R. Jordan, William F. Mengert, Jules W. Vieaux, Stewart A. Fish, G. C. Nabors, A. R. Shapiro, William P. Devereux, Oran V. Prejean, V. A. Davidson, and William G. Langston.

In addition to individual papers, four panels will be offered. They are "Caesarian Section," "Obstetrical Analgesia and Anesthesia," "Newer Drugs in Relation to Obstetrics and Gynecology," and "Genital Cancer."

The course, which is limited to fifty, will cost $5 for registration and $25 for tuition.

The tentative schedule for postgraduate courses to be presented during the school year 1954-1955, in addition to the course on obstetrics and gynecology for general practitioners, includes recent advances in special surgery for general prac-

titioners, December 2-4; pediatrics for general practitioners, January 7-9; surgical cardiac disease for internists and thoracic surgeons, February 7-9; seminar for dietitians, February 18-19; seminar for medical technologists, March 4-5; fluids and electrolytes, April 4-6; and seminar in tuberculosis for physicians sponsored jointly with the Dallas Tuberculosis Association, late May.

The annual spring conference of the Dallas Southern Clinical Society, to be held March 14-17, is jointly sponsored by the medical school, and a number of courses will be scheduled one night a week for six to ten weeks.

Further information and application forms may be obtained from Dr. John S. Chapman, assistant dean for graduate and postgraduate education of the school, 2211 Oak Lawn Avenue, Dallas 19.

Courses already presented this year were a seminar in current development in medicine for medical social workers September 9-11 and a discussion of recent advances in internal medicine October 4-6.

TRI-STATE SOCIETY CONVENES

Seven guests presented the major portion of the scientific program when the Tri-State Medical Society met September 29 and 30 in Longview. Dr. Joe Nichols, Atlanta, presided over the organization as its president.

Featured as the speakers were Dr. C. T. Ashworth, chief of pathology at Harris Memorial Hospital, Fort Worth; Dr. Arthur Grollman, professor of internal medicine at Southwestern Medical School of the University of Texas, Dallas; Dr. Ellery C. Gay, professor of plastic surgery at the University of Arkansas, Little Rock; Dr. Curtice Rosser, professor of proctology at Southwestern Medical School, Dallas; Dr. Joe Shuffield, chairman of the Division of Traumatic Surgery, American College of Surgeons, Little Rock; Dr. Jack B. Trunnell, chief of the Department of Endocrinology and Cancer Research, M. D. Anderson Hospital, Houston; and Dr. Robert Watson, professor of neurosurgery at the University of Arkansas, Little Rock.

The program was as follows:

SEPTEMBER 28

Whitehead Operation—Dr. J. R. Stamper, Shreveport.
Pathologic Physiology of Hemorrhoids—Dr. Ashworth.
Office Management of Minor Anal Condition, Including Early Hemorrhoids—Dr. Rosser.
Physiology of Hypertension—Dr. Grollman.
Nature of Cancer—Dr. Trunnell.
Proctoscopic Examination with Differential Diagnosis—Dr. Rosser.
Newer Drugs in Treatment of Hypertension—Dr. Grollman.
Pathologic Physiology of Cancer of Prostate—Dr. Ashworth.
Treatment of Cancer of Prostate—Dr. Trunnell.

SEPTEMBER 29

Burns—Dr. Gay.
Compound Fractures—Dr. Shuffield.
Terminal Phase of Hypertension—Dr. Grollman.
Present Management of Diverticulitis—Dr. Rosser.
Pathologic Physiology of Cancer of Thyroid—Dr. Ashworth.
Treatment of Cancer of Thyroid—Dr. Trunnell.
Head Injuries—Dr. Watson.
Fluid Balance—Dr. Grollman.
Pruritus Ani—Dr. Rosser.
Pathologic Physiology of Cancer of Breast—Dr. Ashworth.
Treatment of Cancer of Breast—Dr. Trunnell.

Drs. Winston C. Holman, Shreveport; W. S. Terry, Jefferson; and Frank G. Thibault, El Dorado, Ark., vice-presidents, presided over parts of the scientific sessions. Dr. V. R. Hurst, Longview, was general chairman for the convention.

Luncheons, one of them jointly with visiting wives, a dinner, and a golf tournament rounded out the two day meeting.

Dr. William B. Harrell, Texarkana, was elected president; Dr. Karlton Kemp, Texarkana, secretary-treasurer. The 1955 meeting will be in September in Texarkana.

Southwestern Medical School

Dr. George N. Aagaard has resigned as dean of Southwestern Medical School of the University of Texas, Dallas, to assume the same position at the University of Washington School of Medicine, Seattle. He will also have charge of all other medical activities centering around the university. Dr. A. J. Gill, assistant dean of buildings and development, has been appointed acting dean.

Other resignations include that of Dr. J. J. Quilligan, associate professor of pediatrics, who joins the faculty of the College of Medical Evangelists at Los Angeles, and Dr. Louis Tobian, assistant professor of medicine, who is to be associate professor of medicine at the University of Minnesota Medical School, Minneapolis.

New staff members include Dr. Harlow Ades, professor of anatomy; Dr. Edward Pratt, professor and chairman of the Department of Pediatrics; Dr. James Hamilton, assistant professor of experimental medicine; and Drs. Marvin Siperstein and James P. Lillehei, on the Department of Medicine faculty.

Dr. J. Harold Cheek, Dallas, recently has been elected by circular vote vice-president and consequently president-elect of the alumni group; Dr. James Holman, Dallas, is the new secretary-treasurer. Dr. Ern C. Mooney, Victoria, was elected president at the group's May meeting in San Antonio.

Southern Medical Association

The forty-eighth annual meeting of the Southern Medical Association will be November 8-11 in St. Louis with the St. Louis Medical Society as host.

The meeting, which opens with a general public session on Monday afternoon, will be held at Keil Municipal Auditorium. Included in the program are scientific and technical exhibits, section meetings, Woman's Auxiliary meetings, and entertainment. The scientific sections will have half-day sessions beginning Monday afternoon and extending through Thursday. The Doctor's Day luncheon planned by the Woman's Auxiliary is scheduled for Tuesday, and the Association dinner will be held Wednesday evening.

The Southern Medical Association has provided for twenty-one sections to meet, enabling each physician present to find something in his field. The sections are general practice, medicine, gastroenterology, neurology and psychiatry, pediatrics, pathology, radiology, dermatology and syphilology, allergy, physical medicine and rehabilitation, industrial medicine and surgery, surgery, and orthopedic and traumatic surgery. Other sections are gynecology, obstetrics, urology, proctology, ophthalmology and otolaryngology, anesthesiology, public health, and medical education and hospital training.

Dr. Alphonse McMahon, St. Louis, is president of the Association, and Dr. Robert L. Sanders, Memphis, Tenn., will be installed as president during the four-day session. Dr. R. O. Muether is president of the St. Louis Medical Society, and Dr. Daniel L. Sexton is serving as general chairman of the Committee on Arrangements.

Meeting with the Association are the American College of Chest Physicians, Southern Chapter; Southern Gynecological and Obstetrical Society; Southern Society of Cancer Cytology; Southern Electroencephalographic Society; Association for Research in Ophthalmology, Southern Section; and American Therapeutic Society.

Requests for hotel accommodations should be sent to the Housing Bureau, Southern Medical Association, 911 Locust Street, Room 406, St. Louis 1.

JESSE JONES LIBRARY DEDICATED

The $1,250,000 Jesse H. Jones Library Building, Houston, was dedicated on September 9 in a program in which Dr. M. D. Levy, president of the Houston Academy of Medicine, gave the address of welcome. John T. Jones, Jr., gave an address which was followed by a speech on "The Medical Library in a Medical Center and Community" by Chauncey D. Leake, Ph. D., Galveston, dean of the University of Texas School of Medicine. Dr. C. C. Cody, Jr., Houston, gave the dedication address, and Dr. C. A. Dwyer, Houston, presented a plaque to Jesse H. Jones.

The four-story building was paid for entirely through contributions. Mr. and Mrs. Jesse H. Jones gave $600,000 to the building through the Houston Endowment, Inc.; The M. D. Anderson Foundation, $300,000; the oil companies of the Houston area, $75,000; and doctors and laymen, the other $275,000. The Texas Medical Center provided the land on which the building stands.

The library is housed on the first two floors with stacks for 140,000 volumes. In addition to a Fellows Room, which is furnished as an informal reading room where doctors may discuss their professional interests and problems, are a reading room and thirty carrells. Also on the second floor are a Rare Books Room, a small auditorium, a microfilm room, two seminar rooms, and ten individual study rooms.

JESSE H. JONES LIBRARY BUILDING

On the third floor is an auditorium with a seating capacity of 516; with its high ceiling it also occupies one section of the fourth floor. A doctors' club also is included on the third floor.

The fourth floor houses the executive offices of the Harris County Medical Society, the Texas Medical Center, University of Texas Postgraduate School of Medicine, Postgraduate Medical Assembly of South Texas, Houston Heart Association, Texas Heart Association, and the Woman's Auxiliary to the Harris County Medical Society; administrative office of the Houston Committee on Alcoholism; and a branch of the Medical and Dental Service Bureau.

The color scheme throughout the building is of cocoa and various tones of green, the interior being planned to complement the exterior. The auditorium is so constructed that no amplification system is needed.

A portrait of Mr. Jones hangs in the front lobby, as do portraits of Dr. C. C. Cody, Jr., chairman of the Library Committee, and Dr. M. D. Levy in the Fellows Room.

ANDERSON HOSPITAL OPENS OFFICIALLY

Clinical conferences and symposiums on basic problems in cancer research for Texas physicians will precede the formal opening of the University of Texas M. D. Anderson Hospital and Tumor Institute to be held October 23.

One unit of credit for each hour of attendance at the scientific sessions October 21 and 22 will be certified by the University of Texas Postgraduate School of Medicine to the Academy of General Practice for physicians who wish it.

Following registration and a welcome at 9 a. m. from Dr. R. E. Clark, Jr., director and surgeon in chief, four successive panel discussions lasting an hour and a half each will be held October 21. Dr. David A. Karnofsky of the Sloan-Kettering Institute in New York will lead the panel on "The Chemotherapy of Cancer"; Dr. F. A. D. Alexander of the Veterans Administration Hospital at McKinney will lead that on "The Control of Pain"; Dr. Alexander and Dr. William Brewster of Massachusetts General Hospital at Boston will be panelists in a discussion of "The Anesthesiology of Cancer Surgery"; and Dr. Herbert C. Allen of the Veterans Administration Hospital in Houston will be a member of the panel on "Studies of Thyroid Tumors."

A fifth panel, "The Team Approach to Gynecologic Cancer" with Dr. A. N. Arneson of Washington University at St. Louis as chairman, will be presented the morning of October 22 after a review of "Admission Policies of the M. D. Anderson Hospital" by Dr. Clifton D. Howe, chief of clinics. A series of four clinical conferences with presentation of patients will be held the same day with the first beginning at 11 a. m. Conducted by members of the medical staff of the hospital, these conferences will be on "The Recognition and Treatment of Cancer," "Medical Malignancies," "Head and Neck Malignancies," and "General Surgery Malignancies." Simultaneously during the afternoon will be three symposiums on basic problems of cancer research: "Biologic Effects of Radiation," "Cancer Diagnostic Tests," and "Proteins and Cancer." The first of these will be participated in by Edgar Altenberg, Ph. D., of Rice Institute, Houston, and Wilson S. Stone, Ph. D., Orville Wyss, Ph. D., and A. B. Schrank, Ph. D., of the University of Texas, Austin.

M. D. ANDERSON HOSPITAL AND TUMOR INSTITUTE

Formal dedication ceremonies for the $10,000,000 building in the Texas Medical Center will be held at 10:30 a. m. October 23. The public will be invited to a program the afternoon before.

The new hospital, occupied last March, has 310 beds and facilities to serve 300 out patients per day. Research in biochemistry, biology, pathology, radiology, physics, surgery, experimental medicine, and epidemiology has been allotted about 80,000 square feet of space. One operating room has been equipped with color television equipment so that operations can be televised to an auditorium and staff rooms elsewhere in the building. A library on the first floor is supplemented by departmental collections. A cafeteria and a coffee shop serve staff and visitors.

LIBRARY OF THE
COLLEGE OF PHYSICIANS

With exterior finish in pink marble, the hospital was financed by private philanthropy (notably from the M. D. Anderson Foundation), state funds, and a federal grant.

PERSONALS

Dr. Curtice Rosser, Dallas, was named president-elect of the International College of Surgeons at the group's September meeting in Chicago. Dr. Rosser will serve as president-elect for two years prior to taking the office of president in 1956.

Dr. Odon F. von Werssowetz, Gonzales, was awarded a gold medal and first prize for the scientific exhibit, "Supportive Assists in the Rehabilitation of Paralytic Hand," which he and his staff presented at the annual session of the American Congress of Physical Medicine and Rehabilitation September 6-11 in Washington, D. C. Dr. von Werssowetz also participated in the scientific program.

Dr. Weldon O. Murphy, Amarillo, presented a paper at the Pan-American Association of Ophthalmology, which met during the summer in Sao Paulo, Brazil.

Dr. K. J. Kemp, Corpus Christi, is quoted in the Congressional Record of July 27. His comments on the Children's Hospital Medical Center of Corpus Christi, a physical medicine center with emphasis on cerebral palsy, were included as an extension of remarks by Representative John E. Lyle, Jr., of Texas.

Dr. Morris D. Mann, Coleman, was presented a special award of appreciation by Boy Scout Troop 31 of Coleman at its August 10 meeting. Dr. Mann received an honorary membership in the troop and a statuette for his contribution to the troop in its health program.

Dr. Ralph Homan has been named to fill a vacancy on the El Paso school board.

Mrs. W. L. Brown of El Paso, widow of the late bone surgeon and past president of the Woman's Auxiliary to the El Paso County Medical Society, died the latter part of September at the age of 70 years. An active Catholic layman, Mrs. Brown also was interested especially in the Pan-American Round Table program locally, statewide and nationally.

Dr. Juanita Thacker Hart, Bellaire, and Mr. Cecil Robertson were married in Houston on August 1.

The *Bulletin* of the Alumni Association of the University of Texas Medical Branch lists *Dr. and Mrs. V. A. Stembridge,* Galveston, as parents of a girl, born on June 20. The *Bulletin* reports that boys were born to *Dr. and Mrs. Charles B. Sadler,* Amarillo, on July 12; *Dr. Worth Walton and Dr. Ida K. Walton,* Galveston, July 1; and *Dr. and Mrs. Robert J. Ulmer,* Galveston.

University of Texas Medical Branch

C. M. Pomerat, Ph. D., director of the Tissue Culture Laboratory at the University of Texas Medical Branch, Galveston, acted as moderator of a symposium at the eighth International Congress for Cell Biology in Leiden during the first week in September and later that month attended the fifth International Congress of Hematology in Paris, where he displayed the exhibit, "Cultures of Human Vascular Tissue." *John Finnerty, Ph. D.,* Department of Anatomy, also attended this congress.

Dr. C. R. Allen and Dr. Truman G. Blocker, Jr., participated in a week's lectures and demonstrations of anesthesiology and plastic surgery at the ninth annual summer program of the Medical School, University of Nuevo Leon, Monterrey, Mexico.

C. D. Leake, Ph. D., director of the Medical Branch; *Dr. Titus Harris;* and *Dr. E. I. Bruce, Jr.,* recently attended a meeting in Atlanta on mental health training and research sponsored by the Southern Regional Educational Board.

The Medical Branch has been given $45,000 by the Josiah Macy, Jr., Foundation of New York for a five year study and survey of personality factors among medical students. The money is to be used by the Student Health Service, the Department of Neuropsychiatry, and the Dean of Students.

William Verwey, Ph. D., director of Bacteriological Research of Sharp and Dohme, spoke on tools of modern research on September 21 at the Medical Branch.

Heart Disease Conference

The third annual Western Cardiac Conference will be held in Denver, November 8-13, with seven out-of-state speakers and Colorado teachers participating in the combined conference on "Clinical Electrocardiography and Recent Advances in Cardiovascular Diseases." This is sponsored by the Colorado Heart Association, Colorado State Department of Public Health, Fitzsimons Army Hospital, Denver Veterans Administration Hospital, and the University of Colorado School of Medicine. Those serving on the guest faculty are Dr. M. M. Best, Louisville, Ky.; Dr. William H. Bunn, Youngstown, Ohio; Dr. George C. Griffith, Pasadena, Calif.; Dr. Gordon B. Myers, Detroit; Dr. Myron Prinzmetal, Beverly Hills, Calif.; Dr. Henry A. Schroeder, St. Louis; and Dr. Paul Dudley White, Boston.

A three-day clinical electrocardiography course is being conducted by Colonel Edwin M. Goyette, Medical Corps, on November 8-10 at the Veterans Administration Hospital Auditorium. Lectures, panel discussions, a clinical-pathological conference, and scientific exhibits will be at the Cosmopolitan Hotel November 11-13. Additional information may be obtained from the Colorado Heart Association, 901 East Seventeenth Avenue, Denver.

Greater Longevity Achieved in Spinal Surgery

A study of 58 patients with verified intrinsic tumors of the spinal cord shows that when immediate postoperative radiation therapy is applied, patients with intrinsic tumors of the spinal cord achieve greater average longevity than those patients with surgery alone, three New York radiologists reported in the July issue of *Radiology.* The physicians, from the Department of Radiology, Columbia University College of Physicians and Surgeons, are Dr. Ernest H. Wood, Dr. Alfred S. Berne, and Dr. Juan M. Taveras.

They report that 36 of the 58 patients can be evaluated on the basis of survival beyond the average of six years assumed for the effect of surgery alone. Twenty-five of the 36 survived beyond six years, and 22 others are alive but as yet have not been followed for the full six years. Seven of these 22 patients have been followed five years.

CIVIL SERVICE EXAMINATIONS

The United States Civil Service Commission has announced new examinations for filling medical officer positions in the following Federal agencies: medical officer, paying $5,940 and $7,040 a year, and medical officer (specialist), paying $8,360 to $10,800 a year. These positions will be filled in agencies in Washington, D. C., and vicinity, and in the Public Health Service and the Children's Bureau, located throughout the United States. Positions of medical officer paying $7,425 to $10,450 a year will be filled in the Panama Canal Company-Canal Zone Government Organization. No written test is required. A physician must be a graduate of a medical school, and for most positions as medical officer must have completed an internship. For specialists, applicants must have completed appropriate study or residency training; professional medical experience is required for the higher-paying positions.

Institute on Epilepsy

The sixth Western Institute on Epilepsy will be held October 22-23 at the Jack Tar Hotel in Galveston. The sixth Institute, which is being sponsored jointly by the Hogg Foundation of the University of Texas, the Baylor University College of Medicine, and the University of Texas School of Medicine, will have Dr. Howard D. Fabing, Cincinnati, president of the American Academy of Neurology, as its honored guest. The theme of the meeting is the psychosomatic aspects of epilepsy with a portion of the program devoted to research in the disease.

Chauncey D. Leake, Ph. D., Galveston, will give the welcoming address; speakers from New York, California, Arizona, and Colorado as well as many Texas physicians will be on the program. President of the organization and chairman of the sixth Institute is Dr. John L. Otto, Galveston; vice-president, Dr. John R. Green, Phoenix; and secretary-treasurer, Dr. Madison H. Thomas, Salt Lake City, Utah.

The Institute was organized six years ago in Denver by Dr. Jerry Price of New York, Dr. Harriot Hunter of Denver, Dr. Otto, and others to create interest in epilepsy in the western part of the United States. It is aimed to appeal to both lay persons and physicians as a means of coordinating their efforts toward the eventual betterment of the epileptic. The program is open to any doctor of medicine, social worker, psychologist, or properly qualified person officially connected with an accredited agency, association, or society interested in the problem of epilepsy. The registration fee is $3, except for medical students and teachers, for whom there is no fee. The Western Institute on Epilepsy has offices at 112 North Boulevard, Galveston.

Fellowships Offered

A limited number of clinical fellowships in the fields of physical medicine and rehabilitation are being offered by the National Foundation for Infantile Paralysis to physicians who wish to become eligible for certification by the American Board of Physical Medicine and Rehabilitation.

Each recipient of a fellowship must agree to practice as a specialist in physical medicine and rehabilitation for at least two years following the completion of his fellowship and must practice in the United States or its territories. Applicants, who must be licensed to practice medicine in one or more states and be graduates of an approved school of medicine with a year of internship in an approved hospital, must be citizens of the United States (or applicants for citizenship) and must be in sound health. Fellows receive $300 to $400 per month, depending on marital status and number of dependents.

RADIATION THERAPY

A North Carolina radiologist, Dr. Robert J. Reeves, discusses the value of roentgen therapy and its nearly universal selection as the treatment of choice in lymphoid hyperplasia of the nasopharynx in the August issue of the *American Journal of Roentgenology*. Dr. Reeves, from the Department of Radiology, Duke University Hospital, Durham, outlines the value of roentgen therapy in preference to radium in treating this condition and reviews histories of more than 1,200 patients.

His survey shows that roentgen therapy produced marked improvement in 70 per cent of the more than 700 patients who suffered persistent and recurrent colds; that postnasal drip due to the infection was improved in 72 per cent of more than 300 cases and 28 per cent of the patients were relieved completely; and that impaired hearing was relieved in approximately 30 of nearly 40 patients, with the other 10 persons improved.

AMERICAN COLLEGE OF SURGEONS

The fortieth annual Clinical Congress of the American College of Surgeons, November 15-19, is expected to bring more than 10,000 fellows of the College and their guests to Atlantic City, N. J. The postgraduate education meeting will present recent surgical developments through programs including panel discussions, symposia, surgical forums, motion pictures, cine clinics, color television, and exhibits.

Dr. Charles deT. Shivers, Atlantic City, is chairman of the Atlantic City Advisory Committee on Arrangements. Dr. Alfred Blalock, Baltimore, will be installed as president for the coming year.

PHYSICIAN AND MINISTER LECTURE-CLINIC

The director's committee on religious activity of the Methodist Hospital, Lubbock, presented a lecture-clinic for physicians and ministers, "Serving the Suffering," on October 7 and 8. Speakers were Dr. Gilbert H. Marquardt, associate professor of medicine, Northwestern University Medical School, Chicago, and Russell L. Dicks, D. D. The first day they discussed the role of the physician and the minister, respectively, in helping persons suffering from the feelings of anxiety, hostility, and guilt. They spoke on how ministers or physicians hurt the other dealing with the sick, giving suggestions for closer cooperation. They also discussed work with alcoholics and each one's role in caring for the dying.

ALIEN PHYSICIANS

A survey in the September 4 issue of *The Journal of the American Medical Association* showed that a large increase in alien physicians taking postgraduate work in the United States had helped fill gaps left by young doctors now on active military duty.

During the 1953-1954 school year, 5,589 foreign physicians held appointments as interns, residents, or fellows on house staffs of the 800 civilian hospitals approved for such training by the Department of State. The states of Mississippi, North Dakota, and Arkansas had no alien physicians in training.

This program began in 1949 under the United States Information and Educational Exchange Act of 1948.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

The next scheduled Part I examination for the American Board of Obstetrics and Gynecology will be held on February 4, 1955. The written examination and review of case histories for all candidates will be held in various cities in the United States and Canada and in military centers outside the United States. Twenty case abstracts are to be sent by the candidate to the secretary as soon as possible after receiving notification of eligibility to the Part I written examination.

TV Postgraduate Education

A closed circuit television program broadcast by the American College of Physicians on September 23 was the first nationwide closed circuit hookup for postgraduate medical education. The program, "A Symposium on the Management of Hypertension," was received at two Texas stations, Dallas and Houston, out of the twenty-three receiving stations.

New Tuberculosis Association Headquarters

The Texas Tuberculosis Association has moved into a new headquarters building at 2406 Manor Road, Austin. Built especially for the organization, the new structure replaces a converted residence into which the tuberculosis offices were moved in 1948.

Muscular Dystrophy Research

The National Muscular Dystrophy Research Foundation, the only national charitable health organization chartered by Texas, has as its new president F. R. C. Brown, Houston. Mr. Brown has appointed several new directors with whom he will plan a fund raising and educational campaign, including Coffee Day and the annual national Prayer Crusade, which are among those successful drives conducted previously by the foundation.

An additional grant of $1,500 from the research fund was given to the Southwest Foundation for Research and Education at San Antonio for a project conducted by Roy B. Mefferd, Jr., associate research biochemist, under the supervision of N. T. Werthessen, director of the Biological Division. The study is on "Individual Metabolic Patterns for Members of Families Having a History of Muscular Dystrophy."

The organization was founded in 1950 by two Liberty sisters, Sallie and Nadine Woods, who are victims of the disease.

New March of Medicine Show

The March of Medicine television show will have a program on schizophrenia on the National Broadcasting Company network October 31, 6:30 p. m. The show, sponsored by Smith, Kline, and French Laboratories in cooperation with the American Medical Association, will be broadcast over sixty-three television stations.

LIBRARY SECTION

RECENT PUBLICATIONS BY TEXAS PHYSICIANS

Following is a list of recent articles published by Texas physicians and available at the Memorial Library of the Texas Medical Association. Articles appearing in the TEXAS STATE JOURNAL OF MEDICINE are not included. If a physician who has had a paper printed in the past six months is not named below, the Library would appreciate being notified. Also, the Library would like to have two reprints of each article.

Alexander, J. C.: Suprapubic Prostatectomy, J. Internat. Coll. Surgeons, *21:*532-534 (May) 1954.

BOOK NOTICES

[1]Motion of the Heart

BLAKE CABOT, *New York. 173 pages. $2. New York, Harper and Brothers, 1954.*

Sponsored by the American Heart Association, this book was written by a layman primarily for laymen. It is an absorbing and enlightening survey of the main fields of cardiovascular research from Harvey to the present, with projections into the future. Such a project is admittedly difficult—especially for its intended audience, yet the book can be recommended to patients and lay friends without reservation.

[2]Pelvic Relaxations and Herniations

JAMES M. WILSON, M. D., *Assistant Professor of Gynecology and Obstetrics, Medical College of South Carolina, Charleston. Illustrations by* ELON HENRY CLARK, *Artist and Professor of Medical Art and Illustration, Duke University School of Medicine, Durham, N. C. Edited by* E. C. HAMBLEN, M. D., F.A. C.S., *Professor of Endocrinology and Associate Professor of Obstetrics and Gynecology, Duke University School of Medicine. 64 pages. $2.75. Springfield, Ill., Charles C Thomas, 1954.*

This monograph in the American Lectures in Gynecology and Obstetrics Series continues to present an interesting subject in easily readable form. It is well illustrated, on good paper, and nicely bound. The subject matter is well organized.

The normal pelvic anatomy from the clinical rather than from the academic aspect is presented, and the changes from normal that occur with pelvic relaxations are pointed out. The monograph gives the indication for surgical interference and principles of repair without giving a lengthy detailed operative technique. It not only presents the common varieties of pelvic relaxation such as prolapse, rectocele, cystocele, and urethrocele with and without incontinence but also the frequent (but frequently misunderstood) posterior vaginal hernia and the rare obturator hernia, sciatic hernia, and herniation into the broad ligament. The description of the normal pelvic fascia and supportive structures is easily readable and understood with excellent illustrations. The various changes that occur with pelvic relaxation are likewise well presented. In discussing the frequently overlooked or misunderstood problem of posterior vaginal hernia or enterocele, the author presents the anatomic variations from normal and principles of repair so that anyone doing pelvic surgery should be able to recognize and correct this condition.

His presentation of the episiotomy should be read by every physician who does obstetrics. He includes in this monograph descriptions of all, even the rarest, pelvic herniations with adequate bibliography for further study.

This volume should be required reading by every medical student during his obstetrics and gynecology courses and available to every physician doing obstetrics and/or gynecology.

[3]Coal Tar and Cutaneous Carcinogenesis in Industry

FRANK C. COMBES, M. D., *Professor of Dermatology and Syphilology, New York University Post-Graduate Medical School; Director of Dermatology and Syphilology, Bellevue Hospital, New York. 76 pages. $2.75. Springfield, Ill., Charles C Thomas, 1954.*

In this short volume Dr. Combes presents a readable, concise, and good survey of the basic considerations of coal tar and the various factors related in its carcinogenesity. For the most part he uses common sense in presenting suggestions as to protective procedures to be used in industrial processes to protect workers from carcinogenic or possibly carcinogenic materials.

His discussion of the consideration of carcinogenic agents in the petroleum industry I believe should be construed as a consideration of possibilities in large degree until epidemiologic and animal research programs now in progress have been completed and confirm such considerations.

[4]Amebiasis

ERNEST CARROLL FAUST, A. B., M. A., Ph. D., *The William Vincent Professor of Tropical Diseases and Hygiene, Head of the Division of Parasitology, Department of Tropical Medicine and Public Health, Tulane University of Louisiana School of Medicine, New Orleans, La. 154 pages. $4.75. Springfield, Ill., Charles C Thomas, 1954.*

Amebiasis is an important disease not only because of soldiers returning from heavily infested areas but because of the proximity of Texas to Mexico. In that country actual statistics are difficult to compile, but most authorities feel that the incidence is somewhere between 25 and 50 per cent. Americans are traveling more in foreign lands, and short vacations in Mexico are becoming popular with people in Texas. A knowledge and awareness, therefore, of amebiasis seems to be imperative.

The author has stated well in his preface the purpose of this book, "to provide a concise, comprehensive picture of amebiasis as a present day clinical and public health problem. In no sense is it an exhaustive treatise of the subject." Dr. Faust is a renowned authority on this subject and accomplishes his purpose with ease. He has stripped the subject of nonessentials and gives a clear picture of the disease and the problems essential to its control.

Because an exhaustive treatise was not planned, the subject matter is presented factually with no attempt made to cover controversial points. This does not in the least detract from the book.

The monograph can be recommended to all physicians and surgeons, particularly those who see amebiasis rarely. For those physicians in intimate contact with the disease, the book may be elementary. It is, however, thought provoking and presents well a subject which should be recognized as a major public health problem.

[5]An Atlas of Congenital Anomalies of the Heart and Great Vessels

JESSE E. EDWARDS, M. D., *Consulting Physician in Section of Pathologic Anatomy, Mayo Clinic;* THOMAS J. DRY, M. D., Ch. B., M. S. in Med., F.A.C.P., *Consulting Physician in Division of Medicine, Mayo Clinic;* ROBERT L. PARKER, M. D., M. S. in Med., F.A.C.P., *Consulting Physician in Division of Medicine, Mayo Clinic;* HOWARD B. BURCHELL, M. D., Ph. D. in Med., *Consulting Physician in Division of Medicine, Mayo Clinic;* EARL H. WOOD, M. D., Ph. D. in Physiol., *Consulting Physician in Section of Physiology, Mayo Clinic;* ARTHUR H. BULBULIAN, D.D.S., F.A.C.D., *Director, Museum of Hygiene and Medicine, Mayo Foundation for Medical Education and Research, Rochester, Minn. 202 pages. $13.50. Springfield, Ill., Charles C Thomas, 1954.*

This atlas contains 30 anomalies of the heart and great vessels. There is a brief description of the principal clinical features of each anomaly accompanied by a case history. In most instances a photograph and drawings of the anomalous heart are shown. Models of the heart are illustrated in the form of color plates. A chest roentgenogram and an electrocardiogram are usually shown with each case. Catheterization data, oximetry, dye-dilution methods, and intra-arterial pressure studies are given in some cases. The surgical techniques for correction of the anomalies amenable to surgery are not included.

This atlas is brief and easily read. It is recommended for students or physicians interested in becoming familiar with the various types of anomalies of the heart and great vessels.

[6]Children for the Childless

Edited by MORRIS FISHBEIN, M. D., *with chapters by Sidonie Matsner Gruenberg; Edward Weiss, M. D.; I. C. Rubin, M. D.; Nicholson J. Eastman, M. D.; J. P. Greenhill, M. D.; Fred B. Kyger, M. D.; Richard L. Jenkins, M. D.; Benjamin C. Gruenberg, Ph. D., and Dr. Fishbein. 223 pages. $2.95. New York, Doubleday and Company, Inc., 1954.*

This book is an interesting and readable presentation covering a considerable range of material. From a layman's viewpoint this should be an enjoyable and informative source of medically accepted facts. The subject matter is not covered in detail, but the high points are reviewed from the angle of both children and parents.

[7]Arthritis and Rheumatism

CHARLES LEROY STEINBERG, M. D., *Director of Arthritis Clinic and Senior Attending Physician in Medicine, Rochester General Hospital, N. Y. 326 pages. $10. New York, Springer Publishing Company, Inc., 1954.*

This book will be intensely interesting to any physician who sees arthritic patients. The beginning of the book with the physiology of the joints is one filled with an absorbing amount of information, and it offers a more complete understanding of what goes on in the joints and of the structures that make them up. The illustrations in this treatise are well done, with the color ones well balanced and presented.

The photography and the quality of editing in the book are excellent.

The chapter on pathology of rheumatoid and collagen diseases ties together the many conditions that are somewhat interwoven and related. The chapters on rheumatic fever and rheumatoid conditions are dealt with as to history, incidence and mortality, geographic and climatic factors, etiology, clinical manifestations, and laboratory with treatment. The author takes up bed rest, salicylates, digitalis, corticotropin, and cortisone with the comment that it will take a number of years to evaluate properly the latter two drugs mentioned. Finally, prevention and prophylaxis are discussed. The use of gold, phenylbutazone, vaccines, and other drugs is extensively discussed in connection with rheumatoid arthritis. The color and radiograph reproductions in this section are exceedingly good.

Gout and the malignant collagen diseases are also well discussed. The orthopedic and physical medical handling of these rheumatic and arthritic conditions and the place of hydrotherapy is brought out. The section with illustrations for self help by the arthritic patients themselves is a real contribution.

Although this book has only 326 pages, it contains a wealth of information and helps in the evaluation of these conditions.

[8]Music Therapy

Edited by EDWARD PODOLSKY, M. D., *Department of Psychiatry, Kings County Hospital, Brooklyn, N. Y. 335 pages. $6. New York, Philosophical Library, 1954.*

A compilation of present day information regarding music therapy, this book is done in thirty-two parts by thirty-nine contributors. History, physiological and psychological effects, uses, and future of music in medicine are discussed. It is probably the only such symposium to date. It particularly delves into the value of music therapy in specific psychological entities. For anyone applying total push therapy, this book will be of aid; for study and research in music therapy, the book is a must.

[9]The Thyroid

T. LEVITT, F.R.C.S. (Eng.), F.R.C.S. (Edin.), F.R.C.S.I., *Hunterian Professor of the Royal College of Surgeons of England, London; First Surgical Assistant, Thyroid Clinic, New End Hospital, London; and Demonstrator in Anatomy, Middlesex Hospital, University of London. 606 pages. $20. Baltimore, Williams and Wilkins Co., 1954.*

This rather large volume on a limited subject is well organized, concisely written, and replete with illustrations, charts, and references. It represents twenty-five years' experience in all phases of thyroid disease and attempts not only to present the latest advances in the field but also to correlate in a strictly original manner the natural history of thyroid disease. A new classification and nomenclature are presented to fit with the author's concept of unity and evolution among previously accepted separate entities of the toxic gland. An exhausting clinical and histologic study of more than 2,000 consecutive thyroidectomies is presented as the foundation of this idea. The volume also includes an excellent section on exophthalmos and localized myxedema and critical reviews of Hashimoto's and Reidel's original work. It will be of particular interest to those pathologists, surgeons, and internists who encounter more than an occasional thyroid problem.

[10]Copying and Duplicating Medical Subjects and Radiographs

H. LOU GIBSON, *Technical Editor, Eastman Kodak Company, Rochester, N. Y. 75 pages. $5. Springfield, Ill., Charles C Thomas, 1953.*

This book is well suited for those persons who have a reflex camera and will enable the owners of such equipment to obtain the best lighting procedures for copying of their

[5]*Roy L. Smith, M. D., Lubbock.*
[6]*R. W. Loveless, M. D., Bastrop.*
[7]*Joe C. Rude, M. D., Austin.*
[8]*Lee F. Scarborough, M. D., Austin.*
[9]*E. Ross Kyger, Jr., M. D., Fort Worth.*
[10]*J. C. Rude, M. D., and Gary Henry, R. T., Austin.*

subjects, whether they be patients, photographs, books, or radiographs. It gives a simple equation for figuring exposures at a new distance when the exposure at a known distance has already been established. All other factors such as film, lens opening, and lighting must remain the same.

It has a good section on the use of filters as well as the selection of the proper type of film for the purpose at hand. The duplicating of color transparencies in black and white is well handled and described, including both negatives and slides. The process of the duplicating of roentgen-ray film is taken up separately and is valuable reading for those who have much of this type of work to do. It also gives good tips on getting the most out of radiographs that are overexposed and underexposed but explains that in the final analysis there is no real substitute for well balanced film to copy.

The book is small, written in an attractive style, and easy to read. It can be recommended for those who have reflex cameras at their disposal. The book was not written or designed for those who use miniature cameras such as the Leica, but there are some good tips on lighting, background, composition, and the proper selection of both film and the type of paper to be used for printing and enlarging to make it a useful reference.

[11]Endocrinology in Clinical Practice

Edited by GILBERT S. GORDAN, M. D., Ph. D., *Assistant Professor of Medicine, University of California School of Medicine; and* H. LISSER, M. D., *Clinical Professor of Medicine and Endocrinology and Chief, The Endocrine Clinic, University of California School of Medicine, Berkeley-San Francisco. 407 pages. $10.50. Chicago, The Year Book Publishers, Inc., 1953.*

The rapid progress and numerous discoveries in this field in recent years make the need for this work evident. Subject matter is presented in a lucid style making easy, pleasant reading. The entire field of endocrinology is touched on, and this probably lends toward making the book particularly appealing to the general practitioner. However, most specialties are involved; internists, pediatricians, and gynecologists particularly should be attracted.

It would be unfair to single out certain sections for special comment in that it is difficult to compare a presentation on a subject that holds fresh appeal, like the section on the adrenal, for example, to the section on carbohydrate metabolism. In every instance the authors have apparently weighed and digested the most recent literature as well as depended on personal experiences. An additional attraction is an appendix that presents a large number of endocrine pharmaceutical preparations with trade names and dosages clarified. The purpose of this book is to furnish practical material for the practicing physician, and it succeeds in accomplishing this end.

Primer of Allergy

WARREN T. VAUGHAN, M. S., M. D., *Richmond, Va. Illustrations by* JOHN P. TILLERY. *Fourth edition, revised by* J. HARVEY BLACK, M. D., *Dallas. 191 pages. $4.25. St. Louis, C. V. Mosby Company, 1954.*

"Primer of Allergy," a guidebook for those physicians who must find their way through the mazes of this strange and tantalizing state, has been revised by Dr. Black. The changes in the fourth edition are more extensive than in the last, the new material being necessary because of new knowledge. The aim of the book is to inform better the patient as to his condition so as to get better results from his treatment. Foods are not stressed.

[11]*Jerome O. Ravel, M. D., Austin.*

Acute Renal Failure

ARTHUR GROLLMAN, Ph. D., M. D., F.A.C.P., *Professor and Chairman, Department of Experimental Medicine, Lecturer in Pharmacology and Toxicology, Southwestern Medical School of the University of Texas; Attending Physician, Parkland Hospital; Consultant in Internal Medicine, Baylor University Hospital; Consultant in Biochemistry and Physiology, Veterans Administration Hospital, Dallas. 92 pages. $4. Springfield, Ill., Charles C Thomas, 1954.*

This short monograph attempts to bring together the material available from many sources on acute renal failure. The etiology, pathology, physiology, clinical course, and treatment are presented in a practical manner.

The book is highly recommended for the general practitioner's library because it is a compact summary of the subject. The bibliography contains more than 100 references arranged in alphabetical order; the book is well indexed, making it easy to use.

Thoracic Surgery

RICHARD H. SWEET, M. D., *Associate Clinical Professor of Surgery, Harvard Medical School, Boston. Illustrations by* JORGE RODRIGUEZ ARROYO, M. D., *formerly Assistant in Surgical Therapeutics, University of Mexico Medical School. Second edition. 381 pages. $10. Philadelphia, W. B. Saunders Company, 1954.*

The first edition of this work was well received by surgeons in 1950. A complete revision was required to include the new techniques which have been accepted and alterations in others since they were first described. Only the operations that were found useful in everyday practice are given thorough consideration; many methods which are still in the trial period are mentioned. Any surgeon interested in thoracic surgery will find this up-to-the-minute text a valuable addition to his library. The illustrations are excellent.

A list of the subject headings will show the coverage of this book. Surgical anatomy of the thorax, general technical considerations, thoracic incisions, operations on the thoracic wall, operations concerning the pleural cavity, operations on the lungs, operations within the mediastinum, operations on the esophagus, abdominal operations performed through thoracic incisions, and surgery of the diaphragm are included.

The Book of Health

Compiled and edited by RANDOLPH LEE CLARK, JR., M. D., M. Sc. (Surg.), F.A.C.S., *Director and Surgeon-in-Chief, The University of Texas M. D. Anderson Hospital for Cancer Research; Professor of Surgery, The University of Texas Postgraduate School of Medicine, Houston; and National Consultant in Surgery, United States Air Force; and* RUSSELL W. CUMLEY, M. A., Ph. D., *Director of Publications, The University of Texas M. D. Anderson Hospital for Cancer Research; Professor of Medical Journalism, The University of Texas Postgraduate School of Medicine, Houston. 768 pages. $10. Houston-New York, Elsevier Press Inc., 1953.*

This one volume is a compilation by 242 doctors of what they think the average lay person should know about the body, how to keep it healthy, and what to do in case of illness. The work has been well done, and the subjects have been handled by experts who can speak with authority in their fields. There are 1,400 illustrations which add to the value of the book in beauty and delineation.

An answer to the increasing interest in medicine by the average man, this book is recommended to the layman as well as to medical students and medical personnel. It is also a valuable reference for students taking related courses in college and high school. Particularly interesting are the chapters on medicine and the law, medical history, and the medical profession.

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

AMA Begins Law Department

Beginning August 1 all requests for legal opinions and advice were directed to the newly established Law Department of the American Medical Association. The Bureau of Legal Medicine and Legislation and the headquarters staff of the Committee on Legislation have been transferred to the new department. The director is C. Joseph Stetler, secretary of the Council on National Emergency Medicine Service since 1951, and J. W. Holloway, Jr., who has headed the Bureau of Legal Medicine for many years, is serving as consultant for the new office.

MENTAL HEALTH COMMITTEE

A meeting of mental health representatives of state medical associations was held in Chicago September 17-18 under the sponsorship of the American Medical Association Committee on Mental Health. Special speakers for the meeting were Dr. Elmer Hess, Erie, Pa., President-Elect of the AMA, and Dr. Leo H. Bartemeier, Detroit, Chairman of the AMA Committee on Mental Health. Descriptions of the mental health programs of the state medical associations of Virginia, Texas, and Connecticut were presented by their respective committee chairman. Dr. Hamilton F. Ford, Galveston, represented the Texas committee. Mrs. George Turner, El Paso, President of the Woman's Auxiliary to the American Medical Association, spoke to the group at the September 18 morning meeting.

RADIO SHOWS AVAILABLE

Five more fifteen-minute radio shows of the Help Yourself to Health series are ready for shipment to county societies by the American Medical Association Bureau of Health Education. These shows, produced by the Rocky Mountain Radio Council are entitled "Rural Community Receives a New Doctor," "A New Doctor in a Rural Community," "Success of a Health Council Survey," "How to Build a Hospital," and "Nursing." Also available through the Bureau are five new fifteen-minute panel discussion programs for radio. They include "Medical Pre-Payment Plans," "New Fields of Medical Research," "Hope for Your Heart," "Advancement Against Polio," and "Superstition and Chicanery."

TEXAS MEDICAL ASSOCIATION

ASSOCIATION COMMITTEE CHANGES

Several appointments were made recently to councils and committees of the Texas Medical Association by Dr. F. J. L. Blasingame, Wharton, President.

Dr. John S. Chapman, Dallas, was appointed September 7 to fill the vacancy on the Council on Medical Education and Hospitals created by the resignation of Dr. George N. Aagaard, who has moved from Dallas to become dean of the University of Washington School of Medicine, Seattle.

Dr. Charles P. Hawkins, Fort Worth, became a member on October 1 of the Committee on Maternal Mortality; and Dr. J. W. Birdwell, Tyler, has been serving on the State Committee for American Medical Education Foundation as of August 31.

PAPERS FOR ANNUAL SESSION STILL NEEDED

Officers of some of the scientific sections of the Texas Medical Association have indicated that openings still exist on their tentative programs for the annual session next spring and that papers from members of the Association will be welcomed for review. Any physician interested in submitting a presentation in Fort Worth who has not been in touch with the appropriate section officers will find a list of the officers with their mailing addresses on page 458 of the July JOURNAL. If a completed paper is not now ready, the topic and some indication of how the author proposes to develop the subject should be forwarded to the section officers as promptly as possible.

NOVEMBER VISITATIONS

Visits to eight county societies and one district society are scheduled by officers and members of the central office staff of the Texas Medical Association during November. The county societies which will be visited are Lubbock-Crosby Counties, November 2; Lamar County (Delta County physicians will attend), November 4; Kerr-Kendall-Gillespie-Bandera Counties, November 8; Wichita County, November 9; Hill County, November 9; Jefferson County, November 16; Pecos-Jeff Davis-Presidio-Brewster, November 17; and Reeves-Ward-Winkler-Loving-Culberson-Hudspeth, November 18.

COUNTY SOCIETIES

Angelina County Society

September 16, 1954

(Reported by Forrest C. Orman, Secretary)

The Angelina County Medical Society met on September 16 in Lufkin for a social hour and a program given by two officers and a member of the central office staff of the Texas Medical Association. Denton Kerr, Houston, member of the Board of Trustees, told the group about the facilities available through the Texas Medical Association and about the function of the Board of Trustees. Milford O. Rouse, Dallas, delegate to the American Medical Association, spoke on the recent AMA meeting and discussed recent legislation affecting the medical profession. Mr. C. Lincoln Williston, Austin, assistant executive secretary, explained the aims for the coming year to better coordinate the work of the county society with that of the state organization.

Bell County Society

August 4, 1954

(Reported by F. M. Hammond, Secretary)

At the August 4 meeting of the Bell County Medical Society in Temple, R. A. Murray, Temple, and H. H. Brindley, Temple, presented a film on "Replacement of Proximal Humerus and Distal Radius with Fibular Graft." Raleigh R. Curtis, Temple, gave a report on the function and purpose of the American Medical Education Foundation and urged members to support it. He also emphasized the importance of the county medical society and announced that Mr. Philip R. Overton, Austin, legal counsel of the Texas Medical Association, and Mr. C. Lincoln Williston, Austin, assistant executive secretary, would be present at the October meeting of the group.

Bosque County Society

July 7, 1954

The Bosque County Medical Society and its woman's auxiliary met on July 7 at the home of Dr. and Mrs. Van D. Goodall, Clifton. Tom Lyles, Clifton, presented a case report of a surgical patient, using colored slides. Special guests for the program were M. O. Rouse, Dallas, who spoke on medical jurisprudence; Mr. N. C. Forrester, Austin, executive secretary of the Texas Medical Association, who spoke on topics pertaining to his work with the Association; and Mr. R. V. Voyer, Dallas, general director of the David Graham Hall Foundation for the betterment of Texas health, who spoke on pending legislation concerning Texas hospital districts.

Mrs. S. L. Witcher, Clifton, president of the local woman's auxiliary, told of the group's proposed projects.

Eastlond-Collohon-Stephens-Shockelford-Throckmorton Counties Society

September 21, 1954

(Reported by M. A. Treadwell, Secretary)

Roentgen-Ray Diagnosis of Cervical Spine—V. H. Shoultz, Abilene.

The Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Medical Society met in Cisco on September 21 for a dinner and scientific program. Dr. Shoultz presented the above paper with films, after which a business meeting was held.

El Poso County Society

The El Paso County Medical Society and the auxiliary cosponsored the observance of September as Child Safety Month in El Paso with the police department, El Paso Safety Council, parent-teacher organizations, Boy Scouts, business firms, and other groups cooperating. Designation of the special month was proclaimed by the mayor; and radio, television, and newspaper publicity called attention to the need for safety in relation to children. The society and auxiliary are cooperating in the preparation of a booklet on first aid for distribution to public school children as a gift of the medical society.

Hale-Floyd-Briscoe-Swisher Counties Society

September 14, 1954

(Reported by John C. Long, Jr., Secretary)

The Hale-Floyd-Briscoe-Swisher Counties Medical Society met in Plainview on September 14 and heard Randall Heye, Plainview, director of the West Texas Poliomyelitis Center, discuss the western equine encephalitis epidemic. Plans were made for Diabetes Detection Week by the drive chairman.

Lomor County Society

September 2, 1954

(Reported by Harold E. Hunt, Secretary)

Discussion of Three Current Clinical Diagnostic Problems—O. W. Robinson, J. A. Stephens, and D. R. Lewis, Paris.

The Lamar County Medical Society had three guests present when it met in Paris on September 2. After dinner, a short business meeting was held and the above scientific program presented. It was announced that the October program was to be on tuberculosis.

Lubbock-Crosby Counties Society

July 6, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Collagen Diseases—William Ishmael and Richard Payne, Oklahoma City.

Members of Lubbock-Crosby Counties Medical Society heard the above discussion presented at the July 6 meeting in Lubbock. It was followed with a discussion by Sam C. Arnett, William H. Gordon, Frank C. Goodwin, R. K. O'Loughlin, all of Lubbock, and Jay McSween, Slaton.

At the business meeting a student who plans to enter medical school this fall was given a loan of $400.

August 3, 1954

(Reported by Richard K. O'Loughlin, Secretary)

The Lubbock-Crosby Counties Medical Society met at Lubbock on August 3 and approved a request that Garza County be included in the schedule of the mobile unit x-ray for tuberculosis. O. W. English, Lubbock, spoke on his recent visit to Europe, giving his impressions of the socialistic trends in the practice of medicine there. A discussion by Sam C. Arnett, O. B. Hull, J. T. Krueger, Howard Hancock, William H. Gordon, Frank Goodwin, L. B. Smith, Roy Riddel, and Roy Sheffield, all of Lubbock, followed.

Nueces County Society

August 10, 1954

(Reported by Gerald S. Ahern, Secretary)

Management of Uterine Fibroids—G. Cooley Nabors, Dallas.

The Nueces County Medical Society met on August 10 in Corpus Christi for a short business meeting and to hear the above paper by Dr. Nabors. Elected to membership in the society were Stephen Ware, Jr., John Kohlhaas, and Mary McCaskey, all of Corpus Christi. A resolution expressing the sympathy of the society to the family of Harry Heaney was read.

September 14, 1954

(Reported by Gerald S. Ahern, Secretary)

Treatment of Cancer of Prostate with Radioactive Gold—Cecil M. Crigler, Houston.

The Nueces County Medical Society met at Corpus Christi on September 14 and elected seven physicians to membership. Those elected were Vance J. Maloney, Harold Ross Garza, John D. Reeve, John P. Moran, Ernesto Sierra, John J. DeLaney, and Robert C. Wood.

The president of the local chamber of commerce addressed the group, encouraging them to join the chamber of commerce. George Schuster, Corpus Christi, was elected to the Tumor Clinic Committee, and an amendment to the by-laws requiring a probationary period of two years for new members was approved.

Pecos-Jeff Dovis-Presidio-Brewster Counties Society

July 6, 1954

Professional Public Relations—D. J. Sibley, Fort Stockton.

The Pecos-Jeff Davis-Presidio-Brewster Counties Medical Society met in Fort Stockton on July 6 to hear the above program. Prior to the meeting the society members and members of the auxiliary had dinner together.

Torront County Society

July 6, 1954

(Reported by S. W. Wilson, Secretary)

Symposium on Impotence—Grant F. Begley, Nealie E. Ross, W. W. Moorman, and F. C. Rehfeldt, Fort Worth.

The Tarrant County Medical Society met on July 6 in Fort Worth and heard the above scientific program. Ralph E. Campbell, Fort Worth; and William J. Nelson, Jr., Fort Worth, were elected to membership.

August 3, 1954

(Reported by S. W. Wilson, Secretary)

A film on "Glaucoma—What General Practitioners Should Know" was shown at the August 3 meeting of the Tarrant

County Medical Society by C. Harold Beasley, Fort Worth. Prior to showing the film, Dr. Beasley told members that it was prepared by the National Society for the Prevention of Blindness, and he gave some statistical information about blindness.

John J. Boluch, Fort Worth, and William B. McLeroy, Azle, were elected to membership in the society.

September 7, 1954

(Reported by S. W. Wilson, Secretary)

Tarrant County Medical Society was host to the Dallas County Medical Society at the Godfrey Ranch, east of Grapevine, on September 7. F. E. Wilson, Washington, D. C., director of the Washington office of the American Medical Association, was guest speaker.

Tom Green-Eight County Society

September 13, 1954

(Reported by Joe L. Cornelison, Secretary)

The Tom Green-Eight County Medical Society met in San Angelo on September 13 and heard a speech by the guest, William MacComb, Houston.

At the business meeting prior to the program, a Crippled Children's Committee composed of R. M. Arledge, E. C. Winkelmann, Perry J. C. Byars, Charles F. Engleking, and Henry N. Ricci, all of San Angelo, was appointed.

The society decided to provide district prizes of $100, $50, and $25 for winners of this year's essay contest, sponsored nationally by the Association of American Physicians and Surgeons.

Wilbarger County Society

July 6, 1954

Symposium on Surgery

Development and Management of Shock—J. A. Stirman, Dallas.
Emergencies During Anesthesia—M. T. Jenkins, Dallas.
Minor Incompatible Blood Transfusions—E. E. Muirhead, Dallas.

The Wilbarger County Medical Society met on July 6 in Vernon to hear the above outlined program presented by members of the faculty of Southwestern Medical School of the University of Texas. There were fifteen guests present for the dinner and scientific meeting.

DISTRICT SOCIETIES

Eighth District Society

September 23, 1954

(Reported by George E. Glover, President)

Most Frequently Encountered Malignancies in Children—Mary Ellen Haggard, Galveston.
Diagnosis and Treatment of Tumors of Cecum and Ascending Colon—Edgar J. Poth, Galveston.
Pathological Diagnosis of Pleural and Peritoneal Fluids—John H. Childers, Galveston.
Diagnosis and Treatment of Peripheral Circumscribed Lesions of Lung—A. W. Harrison, Galveston.

The Eighth District Medical Society met jointly with the American Cancer Society in Victoria on September 23. After the above outlined program was given by members of the faculty of the University of Texas School of Medicine, several cancer cases were presented by members of the society. Newly elected officers are George E. Glover, Victoria, president, and York Lancaster, Port Lavaca, secretary.

AUXILIARY SECTION

AN AWARD OF MERIT

The Woman's Auxiliary to the Texas Medical Association has another brag—it has received one of the fifty-five awards given in the United States for its work and contributions on behalf of the American Medical Education Foundation. Even though the Auxiliary has been recognized for its work in the past, members must remember that the need for additional funds is great.

Since the organization in 1951 of AMEF, 260 Texans have contributed $10,959.28 to the fund. In 1951, 31 contributed $991; in 1952, 27 contributed $1,065; and in 1953, 202 gave $8,903.28. Through 1953, the three medical schools in Texas had received a total of $185,342. Therefore, Texans have received much more than they have given. In 1952, only .32 per cent of the medical profession of the state contributed financially to the AMEF, and in 1953, 2.4 per cent of the profession donated funds.

Gifts to AMEF are combined with funds of the National Fund for Medical Education, and then the money is allotted to the various medical schools. The National Fund for Medical Education raises its money from big industry. The American Medical Association is the sole sponsor of the AMEF and co-sponsor of the National Fund.

The need for the AMEF is great. The medical schools need $10,000,000 more annually to meet operating expenses. The seventy-nine medical schools in the United States must provide doctors to take care of the needs of 158,000,000 people. These schools graduate more than 6,000 doctors each year, 1,000 more than a decade ago.

Cost of training a doctor has doubled in the past twenty years, and though tuition fees have been raised 165 per cent since 1940, tuition pays only one-fifth of the cost. Gifts, income from endowments, general university funds, and appropriations no longer meet current operating costs, let alone future demands, so funds must come from other sources. Unless new funds are made available, most medical schools are faced with three dangerous choices: (1) lowering their high teaching standards, (2) reducing the number of doctors they graduate, or (3) becoming subsidized by the government.

Mrs. J. L. Jinkins, Galveston, State Auxiliary and Southern Regional chairman of the American Medical Education Foundation, has suggested the following ways for the Auxiliary members to help obtain additional funds for the foundation:

1. Contributions from county auxiliaries.
2. Gifts from individual members.
3. Birthday gifts from members (10 cents to $1 per year of age).
4. Benefit parties (game parties, fashion shows, and teas).
5. Honorary gifts (in lieu of flowers or other gifts on birthdays or anniversaries or to pay tribute to another physician who has rendered some medical service to the Auxiliary member or a member of her family).
6. Memorial gifts (in lieu of flowers at funerals).

The Auxiliary is again called upon to help Texas carry its share of the load on medical education.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. Mark H. Latimer, Houston; President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas; First Vice-President, Mrs. Mal Rumph, Fort Worth; Second Vice-President, Mrs. Harold Lindley, Pecos; Third Vice-President, Mrs. Howard R. Dudgeon, Jr., Waco; Fourth Vice-President, Mrs. Troy A. Shafer, Harlingen; Fifth Vice-President, Mrs. August J. Streit, Amarillo; Recording Secretary, Mrs. P. M. Kuykendall, Ranger; Corresponding Secretary, Mrs. William M. Palm, Houston; Treasurer, Mrs. J. C. Terrell, Stephenville; Publicity Secretary, Mrs. A. H. Neighbors, Jr., Austin; Parliamentarian, Mrs. John E. Hill, Marshall.

COUNTY AUXILIARIES

Galveston County Auxiliary honored the wives of interns and resident physicians in Galveston hospitals on August 11 with a coke party at the home of Mrs. Edgar F. Jones, Galveston. Mrs. Paul Brindley, Galveston, spoke on projects of the auxiliary.

Mrs. Haskell Hatfield, El Paso, president of the *El Paso County Auxiliary,* was requested by the Woman's Department of the El Paso Chamber of Commerce to write a play for presentation in public schools and to civic groups as a part of its clean up campaign. The play, "Don't You Be a Litterbug," expresses the relationship of health, sanitation, safety, fire prevention, and civil defense to cleaning up.

Mrs. George C. Farish, Houston, a member of the *Harris County Auxiliary,* is Republican candidate for the State Legislature, Place 3.

DEATHS

S. I. MILLER

Dr. Samuel Irving Miller, Jr., Houston, Texas, died on July 11, 1954, in a local hospital.

Dr. Miller was born in Galveston on December 14, 1912, the son of Mr. and Mrs. Samuel Irving Miller, Sr. He was graduated from Rice Institute, Houston, and from the University of Texas School of Medicine, Galveston, in 1938. He interned at Michael Reese Hospital, Chicago, until 1940, when he became an assistant resident in medicine at Billings Hospital, University of Chicago Clinics. In 1941 he took a residency in medicine at J. H. Pratt Diagnostic Hospital, Boston. He then served in the United States Army from 1942 until 1946, beginning the practice of internal medicine in Houston in 1947.

A member of the Texas and American Medical Associations through Harris County Medical Society continuously since 1947, Dr. Miller was certified by the American Board of Internal Medicine. He was a fellow of the American College of Physicians. He was a member of Alpha Omega Alpha honorary medical fraternity and was a member of the Jewish synagogue.

Survivors include his wife, Mrs. Betty (Russ) Miller, and two sons, Samuel Irving Miller, III and Ralph Henry Miller. Also surviving are his mother and a brother, Louis A. Miller.

W. H. BARNETT

Dr. William Harve Barnett, Abilene, Texas, died in a local hospital of pneumonia on July 18, 1954.

Dr. Barnett was born in Guntown, Miss., in 1866 and as an infant moved with his family to Kaufman County. After studying medicine in Louisville, Ky., Dr. Barnett was graduated in 1893 from Memphis Hospital Medical College, Memphis, Tenn., which later merged with the University of Tennessee College of Medicine. He practiced in Glen Cove for eight years and Runnells County for four years before moving to Abilene.

A charter member of the Taylor-Jones Counties Medical Society, Dr. Barnett had been a member of the Texas and American Medical Associations almost continuously since 1904. In 1947 he was elected an honorary member of the state organization. Dr. Barnett recently received a plaque from the University of Tennessee honoring him for having served his community for fifty years. He was a member of the Christian Church.

The former Miss Edna McDavid and Dr. Barnett were married on May 6, 1891, in Abilene. Mrs. Barnett died February 17 of this year. Dr. Barnett is survived by two grandsons, Robert E. Barnett, Austin, and Dr. W. L. Barnett, Cleveland; a brother, Richard Barnett, Eden; and five great-grandchildren.

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

J. W. SHARP

Dr. Jack Weston Sharp, Dallas, Texas, died on July 27, 1954, in that city of gunshot wounds.

Born on January 8, 1916, in Newkirk, Okla., Dr. Sharp attended Newkirk schools and was graduated from the North Texas Agricultural and Mechanical College, Arlington, in 1935. After being graduated from Baylor University College of Medicine, then in Dallas, in 1939, he interned at St. Paul's Hospital, Dallas, in 1940. He was director of the Dallas Venereal Diseases Clinic from 1940 to 1944, except for a two-month residency in venereal diseases at Vanderbilt University in 1941. He was field consultant to the Venereal Diseases Division of the Texas State Health Department until 1946 and was medical director of the Riverside Hospital in Waco from 1946 until 1947, when he entered private practice in Dallas.

DR. JACK W. SHARP

Dr. Sharp was a member of the Texas and American Medical Associations through Dallas County Medical Society in 1953.

He is survived by his wife; a son, Douglas Andrew Sharp, Dallas; and his grandmother, Mrs. Aldis Sharp, Newkirk.

W. A. MAUPIN

Dr. William Austin Maupin, Rowlett, Texas, died in a Santa Monica, Calif., hospital of coronary thrombosis and myocardial infarction on August 10, 1954, while visiting his daughters in Los Angeles.

Dr. Maupin was born October 20, 1869, in Kingston, Texas, the son of John A. and Martha (Hudspeth) Maupin. He was graduated from Calhoun College, Hunt County, Texas, and the Medical Department of the University of Tennessee, Nashville, in 1892, and did postgraduate work at Vanderbilt University in 1900. He practiced in Bailey for three months and had practiced in Rowlett since 1892.

A member of the American and Texas Medical Associations through Dallas County Medical Society almost continuously since 1922, he was elected an honorary member of the state organization in 1946. Dr. Maupin was a member of the Masonic Lodge and of the Knights of Pythias, was president of the Citizens Bank of Rowlett, and had

DR. W. A. MAUPIN

served numerous terms on the school board. He was local surgeon for the Missouri-Kansas-Texas Railway and a member of the Christian Church.

Surviving are Dr. Maupin's wife; two daughters, Mrs. Philip J. M. Doyle and Mrs. Corydon J. Glazier, Los Angeles; two sisters, Mrs. Geneva Largent, McKinney, and Mrs. Ann Yates, Los Angeles; two brothers, S. B. Maupin, Los Angeles, and J. R. Maupin, Dallas; and two granddaughters, Patricia Doyle and Peggy Doyle, Los Angeles.

W. E. JONES

Dr. William Edgar Jones, Texarkana, Texas, died there on July 3, 1954.

The son of Mr. and Mrs. S. C. Jones, Sr., of Dallas, Dr. Jones was born September 26, 1914, in Dallas. He attended Southern Methodist University, Dallas, and was graduated from the University of Texas School of Medicine, Galveston, in 1938. He interned and took a residency in internal medicine at Henry Ford Hospital, Detroit. From 1941 to 1946, Dr. Jones was on active duty with the United States Army Medical Corps, having served in the China-Burma-India theater. He was discharged as a major and was a lieutenant colonel in the Air Corps Reserve at the time of his death. After beginning his practice in Dallas in 1946, Dr. Jones moved in 1947 to Texarkana, where he practiced his specialty of internal medicine.

A member of the Texas and American Medical Associations continuously since 1946, Dr. Jones was first a member through Dallas County and then through Bowie County Medical Society. Dr. Jones was certified by the American Board of Internal Medicine; was a member of the Southern Medical Association, the Texas Heart Association, and the American Heart Association; was a fellow of the National Gastroenterological Association and the International Academy of Medicine; and was an associate fellow of the American College of Physicians. He was on the staff of St. Michael and Texarkana Hospitals.

Dr. Jones was a member of Alpha Omega Alpha honorary medical fraternity, Phi Chi medical fraternity, and Sigma Alpha Epsilon fraternity. He was a member of the Board of Stewards of the First Methodist Church in Texarkana. Having attended the School of Tropical Medicine in Calcutta, India, Dr. Jones lectured on that subject as an associate professor of medicine at the University of Arkansas School of Medicine, Little Rock, for the last few years.

He and the former Miss Gudrun M. Johnson were married on May 2, 1940, at Green Field Village, Dearborn, Mich. Survivors include his wife; two daughters, Sheila Jones and Victoria Jones; and two sons, William Edgar Jones, Jr. and Samuel Jones, Texarkana. Also surviving are his mother, Dallas; three brothers, James W. Jones, Spur; and S. C. Jones, Jr. and George F. Jones, Dallas; and a sister, Mrs. J. A. Cooper, Hillsboro.

R. DAWES

Dr. Raymond Dawes, Houston, Texas, died in a local hospital on August 3, 1954, of a cerebral hemorrhage.

Born in Ripon, Wis., on March 20, 1870, Dr. Dawes was the son of Hector and Jane (Ruggles) Dawes. He was a graduate of Ripon College, and of Dearborn Medical College, Chicago, in 1907. Dr. Dawes practiced in Chicago until 1913, when he moved to Houston.

Through Harris County Medical Society Dr. Dawes had been a member of the Texas and American Medical Associations continuously since moving to Texas, and he was elected an honorary member in 1950.

Dr. Dawes was a captain in the Army Medical Corps during World War I. He was a Scottish Rite Mason, a Shriner, and a member of the Presbyterian Church. Dr. Dawes was a descendant of William Dawes, who rode with Paul Revere on the night of April 18, 1775, taking the route from Boston to Concord. He was a second cousin to the late Charles G. Dawes, who was vice-president of the United States from 1925 until 1929.

Dr. Dawes and the former Miss Margaret Lahan were married on February 12, 1901, in Chicago. She died on October 6, 1939. He is survived by a son, Edward Lahan Dawes, Chicago; two granddaughters, Misses Patricia Ann Dawes and Marylahan Dawes; a grandson, Raymond Hector Dawes; and a nephew, Neil B. Dawes, all of Chicago.

G. BARTLETT, JR.

Dr. Glenn Bartlett, Jr., of Falfurrias, Texas, died in a local hospital on June 25, 1954, of coronary occlusion.

The son of Dr. Glenn Bartlett, Sr., and Mary (Haynes) Bartlett, Dr. Bartlett was born May 9, 1904, in Shafter. He attended Southwestern University, Georgetown, and the University of Texas, Austin, prior to entering the University of Texas School of Medicine, Galveston. After being graduated in 1931, Dr. Bartlett interned at Jefferson Davis Hospital, Houston, and did postgraduate work at Central Park Clinic, Buffalo, N. Y. He practiced in Buffalo and Sherman, N. Y., until 1938 when he moved to Texas. He practiced in Harlingen, San Diego, and Laredo before moving to Falfurrias. He specialized in surgery.

Dr. Bartlett had been a member of the Texas and American Medical Associations almost continuously since 1938, when he moved to Texas, being a member primarily through Brooks-Duval-Jim Wells Counties Medical Society. In New

York he had belonged to Erie County Medical Society. In 1940 he and his father began the Bartlett Hospital in Falfurrias, and Dr. Bartlett continued its operation alone after the death of his father in 1945. He was a member of the Catholic Church.

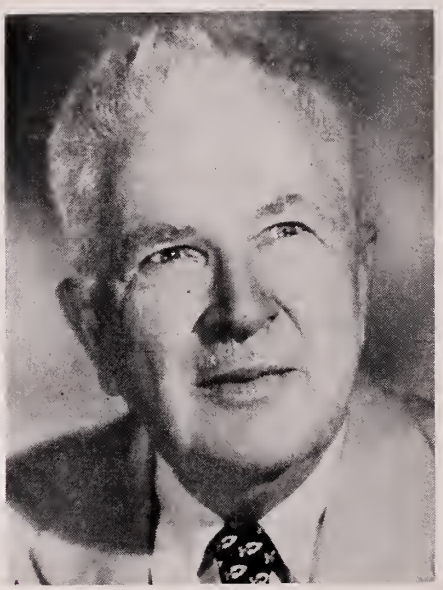
Dr. Bartlett and the former Miss Barbara Margaret Reimann, Buffalo, N. Y., were married January 6, 1938, in Tyler. He is survived by his wife; a son, Glenn Bartlett, III, Falfurrias; and two sisters, Mrs. G. Fry, San Antonio, and Mrs. Lee Daniels, Aransas Pass.

H. G. HEANEY

Dr. Harry Gilbert Heaney died on July 3, 1954, at his home in Corpus Christi, Texas, from hypostatic bronchial pneumonia and pulmonary edema.

The son of Dr. and Mrs. Alfred George Heaney, Dr. Heaney was born on April 11, 1878, in Thomaston, Conn. In 1882 his family moved to Corpus Christi. He was graduated from Texas Military Institute, San Antonio, and as valedictorian from the University of the South Medical Department, Sewanee, Tenn., in 1900. After an internship as clinical assistant at the Hospital for Diseases of the Chest, London, Dr. Heaney did postgraduate work in London, Edinburgh, and Paris from 1902 until 1905, when he began practicing in Corpus Christi. He retired in 1947 after a coronary occlusion.

A charter member of the Nueces County Medical Society and a member of the Texas and American Medical Associations almost continuously since 1905, Dr. Heaney was elected an honorary member of the state organization in 1948. He was a fellow of the American College of Surgeons and an early member of the Texas Surgical Society. He also belonged to the Fifth and Sixth Districts Medical Society. A member of Phi Gamma Delta fraternity, Dr. Heaney had served as city commissioner; president of the Rotary Club, of which he was a charter member; president



DR. HARRY G. HEANEY

of the Elks Lodge; senior warden of the Episcopal Church of the Good Shepherd; and a member of the Board of Regents of the University of the South. He was a thirty-second degree Mason and a Shriner.

Known for his interest in young people, Dr. Heaney entertained as many Navy men from the Naval Air Station and from ships visiting the port in Corpus Christi as his home would accommodate during World War II. Recently, Dr. Heaney arranged for Ringling Brothers, Barnum and Bailey Circus to entertain the children in Memorial Hospital while the circus was in town.

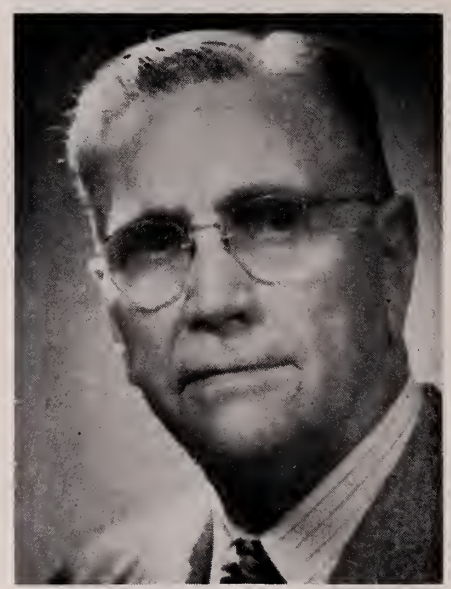
Dr. Heaney and the former Miss Mabel Winifred Pilter were married in Paris, France, in 1905. She survives, as do two sons, Dr. H. Gordon Heaney, Corpus Christi, and Dr. John P. Heaney, San Antonio; two daughters, Dr. Katheryn Heaney Heymann and Mrs. William F. White, Jr., Corpus Christi; two sisters, Mrs. Roy Miller and Mrs. Richard King, Corpus Christi; and twelve grandchildren.

F. E. SADLER

Dr. Finis Ewing Sadler, Abilene, Texas, died on June 1, 1954, in Abilene of cancer of the tongue.

The son of John W. and Belle (McGee) Sadler, Dr. Sadler was born on February 10, 1879, in Bonham. In 1904 he was graduated from the Memphis Hospital Medical College, Memphis, Tenn. Except for a short time, he practiced in Oklahoma until 1948, when he moved to Midland.

Dr. Sadler was on the staff of the Oklahoma State Department of Health for several years, working in the fields of maternal and child health and tuberculosis control. He was superintendent of the State Veterans Hospital in Sulphur, Okla., for fourteen years, except for a brief period when he served as director of the Corsicana-Navarro County



DR. F. E. SADLER

Health Unit. Dr. Sadler took over the Midland-Ector-Howard Counties Health Unit in 1947, and he became director of the Abilene-Taylor County Health Unit in 1952.

He had been a member of the Texas and American Medical Associations since 1948, first through Andrews-Ector-Midland Counties and then through Taylor-Jones Counties Medical Society since 1952. Dr. Sadler served as a first lieutenant in the Medical Corps Reserve during World War I. He was a member of the Presbyterian Church.

He is survived by his wife, the former Miss Mary Louise McMillan, whom he married February 10, 1945. She is now living in Midland. Also surviving are one son, Ewing C. Sadler, McAlester, Okla.; two daughters, Mrs. Hugh Hall and Mrs. Ed Rector, both of Oklahoma City; and three brothers, H. E. Sadler, Marlow, Okla.; J. R. Sadler, Port Arthur; and L. R. Sadler, Corpus Christi.

President's Page

EFFECTIVE ACTION THROUGH COMMITTEES

Early in my term as President, I expressed my intention to encourage an improvement in the functioning of the various councils and committees of our Association. I regret to report my success in this effort so far has not been altogether satisfactory. Therefore, I feel it is timely that I write you about this organizational problem; and I earnestly solicit your cooperation and assistance.

The committee mechanism offers an established and time-tested method in carrying out the program of an organization. In the long life of our Association, experience has proved that there are certain problems which arise and need attention year after year and certain areas of activity which require continuous observation and study. To have an effective organizational mechanism to cope with such conditions, our House of Delegates established certain councils and standing committees and has named them and outlined their functions in the Constitution and By-Laws. In addition, special committees are named by the President on an annual basis to deal with problems considered to be of a special nature or shorter duration. These committees may be perpetuated from year to year as necessity dictates if the incoming President sees fit to rename them. He has the responsibility to create new special committees if new needs arise.

The councils and committees receive material referred to them by the House of Delegates and the officers for evaluation and study. Such working units often are charged with the responsibility to take the initiative and leadership for the Association in a certain aspect of its program, making progress reports to the Executive Council or the House of Delegates periodically.

Selection of members for committee assignments is a difficult task. Many members who have special knowledge or aptitude for a particular responsibility may be unable to accept because of other commitments of their time. Too, consideration has to be given to proper geographical distribution of membership of official bodies. In spite of deliberate effort to make wise choices, and after much corresponding,

telephoning, and conferring, I have felt that perhaps I have not been able to take full advantage of the available talent in our Association. Nevertheless, I am confident that much good new timber has been added to our councils and committees this year.

In the hope of tapping new talent and interest among the membership for next year, I suggest that any physician who has time and means and willingness to contribute to the work of a council or a committee notify the central office, indicating the part of the Association program preferred. Although there are not enough vacancies to utilize all of those who might be interested in serving, such information as might be furnished the central office should prove very helpful to the President-Elect in selecting members for assignments next year.

Some of our committees have made deliberate and energetic efforts to carry out their responsibilities and, in some instances, have expressed disappointment in their failure to get responses from other members of the Association to inquiries. If a council or committee requests information or help, each physician should respect the request and reply promptly. Further, the members at large should feel an obligation to inquire of the councils and committees for information or assistance that may be desired and to try to improve the Association by making constructive suggestions. Using our established organizational setup in this manner will improve the effectiveness of individual programs.

I should like to ask each member of a council or committee to reexamine his assignment and see if as much is being done as can be done. More particularly, the chairman has the responsibility to take the initiative and guide the work of his group. I am sure that the staff at the central office stands ready and willing to assist, as do the other officers of our Association.

A sustained effort should be made to implement the functions of the various councils and committees. Let us use the entire organizational framework that exists and develop a more effective program.

T. J. L. Blasingame, M.D.

Volunteer Now—The Association Needs You

TPR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: Meeting in a shirt-sleeve, idea session in Austin on October 31, a working Committee on Public Relations came up with a thoroughly strong campaign to publicize adequately the excellent program planned for annual session in Fort Worth next April. This session's bigger budget provides one of the most outstanding programs ever, both in scientific and entertainment aspects. Refresher courses, highlighting the meeting, will be both informative and engrossing.

In an effort to provide all members with a factual digest of the Association, the Committee considered preparation of a Guide to Services handbook, which will be filled concisely with Association information. Distribution is tentatively scheduled for early next year. The book should be an important addition to every doctor's library.

Concerned with strengthening county societies to tighten the grass roots level of organized medicine, the Committee discussed county society attendance—believes all societies should elect both a president-elect and a secretary-elect; also feels that going a step further with long-term delegates will insure well informed officers, resulting in stronger societies with more interest and better attendance.

For the Presidents' and Secretaries' Meeting held in Austin every January to indoctrinate new society officers, committee members planned a strong, informative program of interest to all Association members. The 1955 meeting will include presidents-elect and secretaries-elect, as well as delegates, PR chairmen, and legislative chairmen.

FROM OVER THE STATE: A top-notch special medical section in the Austin American-Statesman October 17 heralded the four-day birthday celebration of the Travis County Medical Society. Observing 101 years of service in Travis County, the society's open house at the Texas Medical Association building gave laymen a chance to meet their doctor-hosts socially, see exhibits of widespread interest, and hear an outstanding public forum, so popular that would-be listeners lacked seating space. Public interest demanded the program be extended past the original closing hour.

Bexar County Medical Society, recognizing the value of drop-in ads it has sponsored in local San Antonio papers, is continuing the project for another series. Ads feature 'round-the-clock medical service—advise readers to secure the services of a personal physician before problems arise.

"Serving the Suffering," lecture-clinic for physicians and ministers in Lubbock, showed cooperation of the two groups for mutual aid and betterment of patients. Program presented October 7 and 8 by director's committee on religious activity of the Methodist Hospital, Lubbock, was reported a great success.

ON THE NATIONAL FRONT: Completing the series of ten kits scheduled for release in 1954 by the AMA, six kits covering PR projects and how to organize them were added to the four published early this spring. Since the supply of this material is limited, copies will be available, on request to state societies, for use on loan to county societies planning PR projects. The first four kits in the series supplied information on emergency calls, mediation or grievance committees, health forums, and TV programing. New titles are "Indoctrination of Members," "Medical Care for All," "Public Service Projects," "Speakers' Bureaus," "Citizenship Projects," and "Press Relations." Societies interested should write Texas Medical Association central office.

TIP OF THE MONTH

This column was designed as an idea-exchange for county societies. The Committee on Public Relations will sincerely appreciate each county society making monthly reports on its activities. The program you are enjoying may be one some other society has been looking for. Please address reports to PR Diagnotes, Texas Medical Association, 1801 North Lamar Boulevard, Austin.

Volume 50 | Austin, Texas, November, 1954 | No. 11

ANNUAL OFFICERS' MEETING BROADENED

New officers will be elected by the majority of the county medical societies in Texas next month, and the Texas Medical Association is wasting no time before giving these local leaders an opportunity to air their problems and to learn about their state and national medical organizations. The fourth annual County Medical Society Presidents' and Secretaries' Meeting, to be held Saturday, January 22, at the headquarters building in Austin, has been broadened to include delegates and public relations and legislative committee chairmen. Invitations also are being extended to members of all councils and committees of the Texas Medical Association.

The program will consist of a general session with special sessions on legislation and on medical economics and public relations. Although the plans are not definite, tentative arrangements include a number of brief talks by physicians and laymen, bringing in the nonscientific phases of medical practice, from combating public criticism to what happens to the dues dollar. Of particular interest to delegates will be an account of the issues pending before the House of Delegates. County society secretaries may have many of their questions answered in a discussion on dues, records, and other business matters. A buffet luncheon also is on the agenda.

It is expected that at least two noted out-of-state speakers will take part in the day-long program, which will precede the Executive Council meeting on Sunday, January 23, and probably three guests will come to Texas for the activities. Others on the program will be officials of the Texas Medical Association, including Dr. F. J. L. Blasingame, Dr. Milford O. Rouse, Dr. Hobart O. Deaton, Dr. Robert W. Kimbro, Dr. R. G. Baker, Dr. May Owen, and Dr. William M. Crawford, together with C. Lincoln Williston of the central office staff.

In the field of legislation on the county society level, two panel discussions will be held simultaneously for smaller and larger societies, with Dr. J. W. Rainer and Dr. J. R. Donald-

son as moderators. Dr. C. S. E. Touzel, president of the Tarrant County Medical Society for 1955, will extend a welcome to the 1955 annual session in Fort Worth, mentioning some of the special events being planned.

A successful meeting depends on the cooperation of each county medical society, both large and small, in reporting new officers and committee chairmen immediately upon their election and/or appointment and in urging them to attend. The Presidents' and Secretaries' Meetings in the past have been considered by county and state officers alike as one of the most effective programs ever attempted.

The 1955 session has been planned to help more society leaders—the presidents, secretaries, delegates, public relations chairmen, and the legislative chairmen—meet the problems and answer the questions that are likely to arise during their year in office. If these men take advantage of the January 22 program, a stronger medical organization on all levels could result.

REFRESHER COURSES IN FORT WORTH

A brand new feature has been added to the 1955 Texas Medical Association annual session, which will be held in Fort Worth, April 24-27. Approximately twenty-four refresher courses on subjects important in everyday practice are being arranged with eight scheduled to run simultaneously each morning Monday through Wednesday from 8:15 until 9:45 o'clock. This time has been set aside especially for refresher courses so that each physician will be free to take part in three courses without missing other programs.

Registration for the courses, which will be limited to about fifty physicians each, will be completed prior to the meeting; details will be announced later. There will be no charge.

Given by a guest faculty of outstanding speakers from all over the United States, the courses will be divided into an hour of instruction followed by a thirty minute question and answer period. Informal credit hours, which must be reported beginning January 1 for maintenance of good standing in the Texas Academy of General Practice, will be granted by the Academy for attendance at the scientific sessions including the refresher courses.

Eminent representatives from all medical fields will come to Fort Worth in April to give the refresher courses, talk before general meetings, or participate in section or related specialty organization programs. Most will speak several times. The following is a list of speakers who have accepted invitations:

Dr. Frank N. Allan, Boston, Executive Director of Medical Department, Lahey Clinic.

Dr. John A. Anderson, San Francisco, Professor and Head of Department of Pediatrics, Stanford University School of Medicine.

Dr. William H. Bickel, Rochester, Minn., Associate Professor of Orthopedic Surgery, Mayo Foundation.

Dr. Francis J. Braceland, Hartford, Conn., Clinical Professor of Psychiatry, Yale University.

Dr. Walter A. Fansler, Minneapolis, Clinical Professor of Surgery and Head of Division of Proctology, University of Minnesota.

Dr. Russell S. Fisher, Baltimore, Chief Medical Examiner of the State of Maryland.

Dr. Norman E. Freeman, San Francisco, Associate Clinical Professor of Surgery, University of California.

Dr. Douglas M. Kelley, Berkeley, Professor of Criminology, University of California.

Dr. William J. Kerr, San Francisco, former Professor of Medicine and Chairman of Division of Medicine, University of California.

Dr. Clair M. Kos, Iowa City, Professor of Otolaryngology and Maxillofacial Surgery, State University of Iowa.

Dr. Hugh R. Leavell, Boston, Professor of Public Health Practice, Harvard University School of Public Health.

Dr. C. Ferd Lehmann, San Antonio, Practicing Dermatologist and Consultant, Brooke Army Hospital.

Dr. Nicholas C. Leone, Bethesda, Md., Staff Member of the National Institute of Dental Research, National Institute of Health.

Dr. Frank R. Lock, Winston-Salem, N. C., Professor of Obstetrics and Gynecology, Bowman Gray School of Medicine, Wake Forest College.

Dr. John S. Lundy, Rochester, Minn., Professor of Anesthesiology, Mayo Foundation.

Dr. Walter B. Martin, Norfolk, Va., President of the American Medical Association.

Dr. Alton Ochsner, New Orleans, Chairman of Department of Surgery, Tulane University of Louisiana School of Medicine.

Dr. Lester W. Paul, Madison, Professor of Radiology, University of Wisconsin.

Dr. Robert L. Sanders, Memphis, Tenn., Senior Surgeon, Baptist Memorial Hospital.

Dr. Lucian A. Smith, Rochester, Minn., Member of Division of Internal Medicine, Mayo Clinic.

Dr. Phillips Thygeson, San Jose, Clinical Professor of Ophthalmology, University of California.

In addition to the refresher courses to be conducted by the guests, a course on "Athletic Injuries" will be given by Dr. Edward T. Smith, Houston, team physician for the Rice Institute Owls; Jess Neely, athletic director and head football coach at Rice; and Eddie Wojecki, trainer for the Owls.

Every physician who is absent from the 1955 annual session will miss a scientific program which has been redesigned this year with him in mind. Whether a doctor is a general practitioner or a specialist, there will be refresher course and general meeting subjects, as well as topics of more restricted appeal, to interest him. Furthermore, the special guests have been invited to be in Fort Worth during the entire session so that more Texas doctors will have an opportunity to meet and talk with them about individual problems.

Now is the time to mark the calendar so that the meeting in Fort Worth will not be missed.

NEW OFFICIAL NAMED

A new helmsman has taken the wheel at the central office of the Texas Medical Association, and members of the Association can do much to assure him steady winds and a willing crew to keep the organization on its course. C. Lincoln Williston, who came from Illinois last April as assistant executive secretary, was elevated to the executive secretaryship November 1 following the resignation of N. C. Forrester. Mr. Forrester left the Association after serving on the staff since June, 1950.

Because of the county medical society visitation program which Mr. Williston has activated in recent months, many Texas doctors and their wives already know him. It is the hope of the Board of Trustees, which named him to his new post, that every member of the Association soon will know Mr. Williston and will cooperate with him in achieving the organization's goals.

CURRENT EDITORIAL COMMENT

HELPING PATIENTS TO BUY ACCIDENT AND HEALTH INSURANCE

Doctors often are called upon to advise on problems which are not strictly medical, including this or that health insurance plan. Doctors are not inclined to praise or condemn any specific insurance company or plan. Yet, in some situations a plea for advice may be strong enough to offset a doctor's natural hesitancy. What then can a doctor say to his friends or patients in terms that will be most helpful? Here are some pointers:

Study present insurance coverage. If the person has insurance where he works or through another organization, he should find out how much and for what. Group insurance is usually the broadest and cheapest protection available. However, it is often not enough or the patient may not be a member of such an insurance-providing group.

Figure out what is needed. A family head needs insurance as replacement for at least half of his take-home income to meet current living expenses while he is laid up. A doctor can be helpful by explaining the general level of local hospital room rates, the charge for professional calls, and some of the more common surgical procedures. He should caution the person to budget about 3 per cent of his annual net income for other health costs which insurance does not or cannot cover.

Look at the types of policies available. Protection can be bought for either accident or sickness separately, but it is a good idea to get both either in a combination policy or in two separate policies.

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and others closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions preferably should be between 300 and 500 words in length.*

Loss of income policies pay weekly or monthly benefits when a person cannot work at his job, or any job, or both—whichever benefits are desired and for which the individual is willing to pay. The loss of income policy also pays lump sum death or loss of limb benefits. Noncancellable policies cost substantially more than those that can be cancelled by the insurance company. However, a 1952 survey shows that nationally only .4 per cent of the cancellable policies then in force were cancelled by companies.

Hospital insurance pays a certain daily amount for room and board and another amount for extras. The extras are important, for they can often account for a major portion of the hospital bill. Pregnancy is often covered under hospitalization policies, but usually there is a nine month waiting period before eligibility for benefits. A deductible feature in some hospital policies—as in automobile collision insurance—will save money on premiums.

Surgical insurance pays a maximum amount for operations listed in a "schedule." Provision is usually made for operations not listed to be paid according to their comparative difficulty up to a maximum of the schedule.

Medical insurance pays for doctor calls at home or in the hospital, usually when no surgery is involved or when a patient comes to the doctor's office.

Major medical expense insurance helps pay the catastrophic accident or sickness costs. Top limits usually run from $2,500 to $10,000. Often there is a deductible clause on the first $500, but expenses within that amount may be met substantially by the regular hospital-medical-surgical coverages. On the remainder of the bill, most policies pay 75 per cent. The patient pays the rest.

Decide from whom to buy. An insurance company representative who is well regarded in the community should be consulted. If a person wishes to do so, he may get the views of policyholders who have recently received insurance benefits.

Know the policy. An insurance buyer should understand completely what a given policy provides before deciding to buy it. The questions he should ask about a policy will be pointed out in the fourth and last article in this series.

HEALTH INSURANCE COUNCIL,
Chicago, Illinois.

208 South LaSalle Street.

This is the third in a series of articles prepared at the request of the Hospital-Insurance-Physicians Joint Advisory Committee of Texas. The first two, explaining income insurance for doctors and some ABC's of health insurance, appear in the September and October issues of the JOURNAL, *respectively.*

OPEN-CHANNEL TV USED FOR CLINIC

A successful experiment in the use of open-channel television for postgraduate medical education conducted by the Division of Graduate and Postgraduate Medical Education of the University of Utah has been reported by Dr. Robert S. Warner and Dr. John Z. Bowers in the October issue of the *Journal of Medical Education.*

Choosing 7 to 8 a. m. as an hour convenient for most doctors and one free from commercial television interference, the university telecast four clinics which reached an audience area including 75 per cent of the practicing physicians in Utah.

The clinics were televised weekly for four weeks and covered roentgen-ray diagnosis of calcifications in the abdomen, gastrointestinal hemorrhage in the elderly patient, the approach to congenital heart disease, and a diagnostic clinic. Physicians in the reception area were given the number of an unlisted telephone installed at the site of the telecast and were urged to place questions by collect calls.

The authors report that a survey indicated 48.9 per cent of the potential doctor audience viewed the telecasts, with 74 per cent of the viewers stating they learned new facts. Sixty-one per cent felt that their "previous knowledge had been revitalized," and 53 per cent indicated renewed interest in a specific field.

A questionnaire revealed that 46.7 per cent of all physicians interviewed thought that televised clinics were the best means of gaining new information. Drs. Warner and Bowers emphasized that rural practitioners, in particular, could benefit from this type of presentation.

ACCIDENTAL DEATHS

Heart disease and cancer are the only diseases causing more deaths than accidents among American men in the ages of 15 through 64 years, according to statisticians of the Metropolitan Life Insurance Company.

The three leading causes of accidental death—motor vehicles, falls, and drownings in that order—were responsible for about seven out of every ten accidental deaths in this insured group, and a large part of the remaining mortality was due to burns, firearms, and poisoning.

The reduction in mortality among men between 15 and 64 has amounted to about one third over the past twenty years.

CLINICAL EVALUATION OF RADIOACTIVE IODINE(I^{131}) AS A DIAGNOSTIC AND THERAPEUTIC AGENT

RALPH S. CLAYTON, SR., M. D., Dallas, Texas

RADIOACTIVE iodine (I^{131}), the eight day half-life radioactive isotope of iodine, has been in large-scale use in research and in clinical medicine only since 1946. Prior to that time, small-scale studies with this and other short-lived isotopes had been reported.[9, 10]

This paper is concerned with the current status of I^{131} in clinical medicine only.

It is important to recognize that procedures employing this isotope are still in the process of development and differ in many details among various laboratories; therefore only broad concepts can be described. Generally, I shall outline the principles involved in and the indications and contraindications for the use of I^{131} at present. Furthermore, since by far the widest use of this isotope is in the diagnosis and treatment of thyroid disease, this paper is concerned mostly with its use in this field.

PROPERTIES OF I^{131}

These properties of I^{131} are responsible for its usefulness in clinical medicine: (1) its metabolism is identical to that of stable iodine and therefore is well known; (2) the quantities of I^{131} which provide sufficient radioactivity for diagnosis and therapy are nontoxic to the patient; (3) the physical half-life of eight days is relatively short, and on the basis of no excretion of the isotope, 87.5 per cent of its radiation is delivered in twenty-four days; (4) the half-life is long enough to permit deliberate preparation, assay, shipment, storage, and administration without excessive losses; (5) radiation from I^{131} is biologically highly effective, yet it is easily shielded for safe handling; (6) the gamma ray emission permits in vivo measurements by instruments outside the patient; (7) the cost of the I^{131} and equipment for its measurement are reasonable; and (8) the eight day half-life makes laboratory contamination much less of a problem than with substances of longer half-lives such as radioactive cobalt (Co^{60}).

DIAGNOSIS OF THYROID DISEASE

Tracer studies should be considered only as supplementary to older, more established tests of thyroid function. They should not replace any of these tests nor any part of an adequate clinical study. Thorough clinical study and follow-up are just as essential to the successful management of thyroid conditions with I^{131} as they were before its discovery. I^{131} studies are not indicated in the vast majority of cases of thyrotoxicosis where there is no doubt of the diagnosis. Their greatest value is in diagnostic problems, especially in suspected hyperthyroidism or hypothyroidism, suspected carcinoma of the thyroid, and vague clinical syndromes. Uptake studies always should be done before therapy with I^{131} for any reason.

When other evidence of thyroid function is equivocal, I^{131} data are usually definitive; rarely are both equivocal in the same patient. Tracer studies on patients with nonspecific signs and symptoms have revealed positive evidence of hyperthyroidism and hypothyroidism.[15] The full potentialities of I^{131} in this regard have not been determined fully.

I^{131} diagnostic tracer techniques involve the determination of one or more of several aspects of thyroid metabolism:

1. I^{131} uptake by the thyroid—total uptake, with or without the rate of accumulation by the gland, at twenty-four to thirty-six hours, as percentage of a tracer dose.

2. I^{131} renal excretion—total excretion, with or without the rate of excretion, at forty-eight to seventy-two hours, as percentage of a tracer dose.

3. Distribution of I^{131} within the thyroid and in other organs and tissues, with or without the rates of uptake and loss from each area.

4. Rate of plasma clearance of I^{131} related to the thyroid accumulation rate.

From the Department of Radiology of Parkland Memorial Hospital and of Southwestern Medical School of the University of Texas.

Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

5. Plasma I^{131} levels as an indication of the rate of conversion of iodine to thyroxine.

Figure 1 is a schematic representation of thyroid uptake curves in hyperthyroid, euthyroid, and hypothyroid states and in functioning thyroid carcinoma. The thyroid function curves overlap in a small percentage of cases. Total thyroid uptake values at twenty-four hours are about 75 per cent plus or minus 15 per cent in hyperthyroidism, 25 per cent plus or minus 15 per cent in euthyroidism, and 5 per cent plus or minus 5 per cent in hypothyroidism. The hyperfunctioning gland takes up more iodine more rapidly and loses it faster than the normal. Hypofunctioning

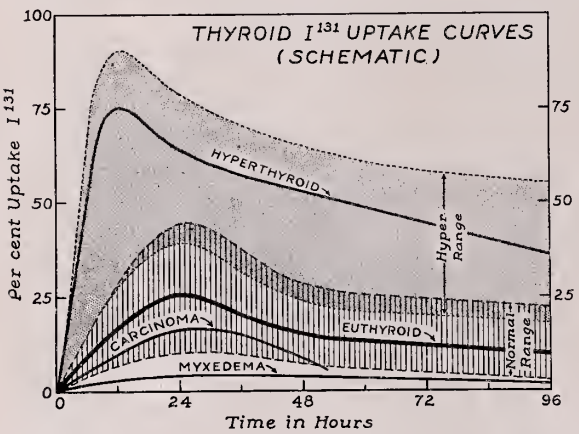

FIG. 1. Graph shows a schematic representation of thyroid I^{131} uptake curves in hyperthyroid, euthyroid, and myxedema states and in functioning thyroid carcinoma.

glands take up less iodine more slowly and lose it slower than normal. Thyroid carcinoma of functioning type always takes up less than normal thyroid tissue and loses it at the most rapid rate of all.

Figure 2 is a schematic representation of renal excretion curves in hyperthyroid, euthyroid, and hypothyroid states and in functioning thyroid carcinoma. Except for a 10 to 15 per cent insensible loss through perspiration and the intestinal tract and in tissue reservoirs, all iodine not taken up by the thyroid is promptly excreted by the kidneys. Measurement of excretion is an accurate indirect method of determining thyroid intake.

Discussion of the relative accuracy and difficulty of these tests is not within the scope of this paper. The tests commonly used today in declining order of frequency are total thyroid uptake, total urinary excretion and rate of excretion, thyroid uptake rate, and others.

Mapping the distribution of the radioiodine and observing the rates of accumulation and loss in each area may be highly informative. Reynolds, Corrigan, and Hayden[14, 15] have reported an amazing success with the skin contact scanning technique in detecting unsuspected thyroid carcinoma and in the differential diagnosis of cervical and mediastinal masses. Toxic and nontoxic nodules, extensions of thyroid tissue into the retrotracheal region and anterior and posterior mediastinum, and residual masses of thyroid tissue after thyroidectomy have been shown beautifully by this method. Furthermore, accurate estimates of the volume of functioning thyroid tissue are possible by the distance scintillation counter, linear scanning technique of Goodwin and others.[2, 8] However, the equipment for this procedure is expensive at present.

The technique now used at Parkland Memorial Hospital, Dallas, is to measure total thyroid uptake at twenty-four hours, with determination of the effective half-life when I^{131} therapy is contemplated. Corrections are made for effective depth of the thyroid, background radiation, and Geiger tube resolving time counting losses.[16] We have begun to employ the skin-contact mapping technique and thyroid uptake rate determination but have had too little experience at this time to warrant comment.

The uptake of I^{131} by the thyroid may be seriously altered by many factors. Iodine in therapeutic doses

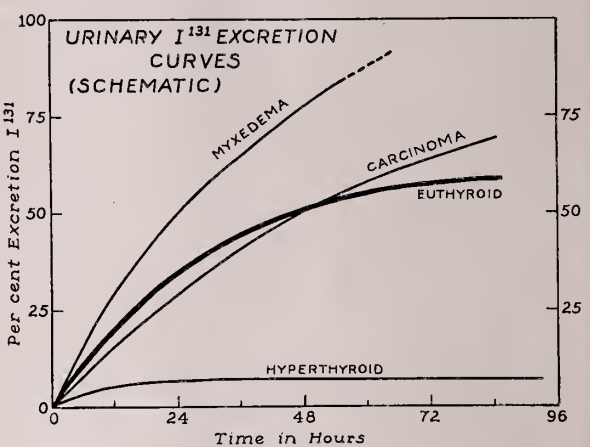

FIG. 2. A schematic representation of renal I^{131} excretion curves in hyperthyroid, euthyroid, and myxedema states and in functioning thyroid carcinoma is given in the graph.

saturates the thyroid so that uptake is deceptively low. Thiouracil and its derivatives block the conversion of diiodotyrosine to thyroglobulin, thus reducing uptake. Desiccated thyroid, by inhibiting the production of thyrotropic hormone from the pituitary gland, results in the most severe depression of I^{131} uptake of all these factors. Some of the influences which tend to decrease uptake and the approximate periods during which their effects on uptake may persist are listed in table 1.

Any unexpectedly low uptake should suggest the possibility of thyroid block. Antithyroid drugs or

iodine should be discontinued at least one to two weeks, longer if possible, before diagnostic or therapeutic doses of I^{131} are given. Desiccated thyroid should be stopped three months before tracer studies if at all possible. Careful history should be taken to exclude other influencing agents.

Thyroid uptake tends to be deceptively high in the presence of impaired renal function, cardiac edema, or thyroid hypertrophy following prolonged antithyroid therapy. In cardiac edema, occult or detectable, and in renal diseases, the increased extracellular fluid acts as a reservoir which can hold considerable iodide.

TABLE 1.—*Influences Which Tend to Decrease Thyroid Uptake and Approximate Duration of Each.*

	Duration
Stable iodine (therapeutic, dietary, vitamin preparations, and the like)	1 to 4 weeks
Radiographic contrast media	
Diodrast	2 to 7 days
Gallbladder dyes	1 to 3 months
Lipiodol and Pantopaque	months to years
Antithyroid drugs	1 to 2 weeks
Desiccated thyroid	2 to 4 months
Thyroiditis	weeks to months or no effect
Previous irradiation with I^{131}	months to years or no effect

This results in a longer exposure of the thyroid to higher values of circulating iodine, thereby increasing the total amount taken up.

TREATMENT OF THYROTOXICOSIS

Radioisotope therapy is attended by mild morbidity. Except for one or two isolated reports of death from a thyroid crisis a few days after a therapeutic dose, there is no mortality. The one significant complication is permanent hypofunction of the thyroid requiring replacement therapy. From 6 to 12 per cent of patients show evidence of hypothyroidism one to three years after treatment. The proportion of cases showing permanent hypofunction probably will be less than this figure. This incidence possibly may be reduced by divided dose treatment regimens now under evaluation in many centers.

My experience with cases seen in three radioisotope laboratories in and near Dallas has paralleled that contained in the current literature. Though I was unable to make a detailed study of results of all cases treated in the time available, the response to treatment has been satisfactory, with few cases requiring any replacement therapy for hypothyroidism.

Practically all patients with hyperthyroidism can be rendered clinically euthyroid if careful follow-up is done and supplemental doses of I^{131} are given as indicated.

The objective in treating thyrotoxicosis is to render the patient euthyroid. It appeared logical at first to calculate therapeutic dosage on the basis of gland size, percentage uptake, effective half-life, severity and duration of symptoms, and the age of the patient.[11] Experience to date, however, reveals poor correlation between the response to treatment and calculated dosage.[12, 17] There is a growing tendency to give a standard initial dose of 3 or 4 millicuries and to give small supplementary doses as required. Data concerning any improvement in results by this method of management are not yet available.

Until they are proved to be unnecessary, I shall continue to take certain factors into account in making decisions on dosage to assist in evaluating results and as a matter of principle in teaching. These factors are (1) percentage uptake of I^{131} by the thyroid at twenty-four hours; (2) effective half-life of I^{131} in the thyroid; (3) estimated weight of the thyroid gland; (4) duration and severity of symptoms; (5) age of the patient; and (6) response to previous I^{131} treatment.

Treatment with either Lugol's solution or antithyroid drugs may be initiated three to seven days after the therapeutic dose, if indicated, to control symptoms until effects of the radiation are manifest two to four weeks later. This is particularly important in patients showing evidence of rapidly increasing severity of symptoms and if there is any possibility of thyroid crisis.

Diffuse Toxic or Exophthalmic Goiter.—I^{131} is rapidly replacing surgery in the treatment of diffuse toxic or exophthalmic goiter where the isotope is available. Most investigators at present prefer to avoid treatment of patients under 25 years of age because the question of carcinogenesis[4] or genetic[13] effects of I^{131} irradiation has not been resolved, but young patients are treated when surgery is contraindicated or is refused. Unless evidence of carcinogenesis or adverse genetic effects is demonstrated soon, I^{131} is likely to replace surgery as the treatment of choice for toxic diffuse goiter at all ages.

Nodular Toxic Goiter.—Surgery is the treatment of choice for nodular toxic goiter. The short range (2.2 mm.) of the beta particles makes them relatively ineffective in reducing the size of nonfunctioning nodules. Larger doses are required, and the risk of hypothyroidism is perhaps greater than in diffuse goiter. However, if surgery is contraindicated because of coexisting disease, conservative I^{131} treatment certainly may be considered.

Recurrent Hyperthyroidism.—I^{131} is the treatment of choice for recurrent hyperthyroidism after either thyroidectomy or failure of antithyroid drug therapy. Since the volume of functioning tissue after surgery is usually small and palpation is impossible, calculation of dosage on the basis of tissue volume cannot be done. Dosage, therefore, is somewhat empirical.

Slightly larger doses of I^{131} are required than in the initial treatment of diffuse toxic goiter.

Thyrotoxicosis During Pregnancy.—Iodine therapy for thyrotoxicosis should not be considered during pregnancy. In the first trimester there is a small possibility of the radiation producing malformation of the fetus. The fetal thyroid gland is functioning during the second and third trimester and may be damaged. Even tracer studies should not be done if avoidable.

Solitary Thyroid Nodule.—Because of the high probability of malignancy,[5, 6] the solitary nodule in the thyroid gland should be treated by surgery only. Since up to 20 per cent of these nodules prove to be malignant, they should be removed as soon as detected. Except as a last resort, and only if surgery is absolutely contraindicated, is there any reason to consider I^{131}, and then only if the nodule takes up significant amounts of the iodine.

Simple (Colloid) Goiter.—Simple (colloid) goiter should not be treated with I^{131}.

Nodular Nontoxic Goiter.—Multinodular goiter should receive I^{131} only if surgery is positively contraindicated and then only in carefully selected cases.

Intrathoracic Goiters.—Diffuse toxic goiters with demonstrated mediastinal extensions but not showing large masses near the trachea may be treated with I^{131}. Large masses may swell from the irradiation and could produce respiratory obstruction. Intrathoracic multinodular goiters should be removed surgically.

TABLE 2.—*Indications and Contraindications for Tracer Studies and Therapy with I^{131}.*

Indications for tracer studies with I^{131}—	Indications for therapy with I^{131}—
Determination of thyroid function in diagnostic problems.	Diffuse toxic or exophthalmic goiter.
Suspected residual or aberrant thyroid tissue.	Thyrotoxicosis after thyroidectomy or antithyroid drugs.
Suspected thyroid carcinoma.	Toxic nodular goiter when surgery is contraindicated.
Suspected metastases of thyroid carcinoma.	Thyrotoxicosis at any age when the patient absolutely refuses surgery or antithyroid drugs.
Undiagnosed intrathyroid, cervical, and mediastinal masses.	Intractable congestive heart failure or severe angina pectoris.
Suspected brain tumors or liver masses.	
Contraindications to tracer studies—	Contraindications to I^{131} therapy—
Pregnancy, especially second and third trimester.	Relative:
Current therapy with iodine or antithyroid drugs.	Toxic nodular goiter at any age with high uptake (more than 15 per cent).
Vomiting or diarrhea.	Young patient (under 25 years).
	Exophthalmic goiter with large gland.
	Absolute:
	Pregnancy.
	Nontoxic nodular goiter.
	Nontoxic diffuse (colloid) goiter.
	Solitary nodule of thyroid gland.
	Toxic nodular goiter at any age with low uptake (under 15 per cent).
	Intrathoracic multinodular goiter.
	Goiters producing mechanical obstruction.
	Hard glands likely to be malignant.

MALIGNANCY OF THYROID

I^{131} uptake and excretion curves have been used successfully in the diagnosis of thyroid cancer. Thyroid carcinoma tends to take up less iodine and lose it faster than normal thyroid tissue. The urinary excretion and liver uptake and retention curves are altered.[14, 15] I have not had the opportunity to study a case by this uptake and retention curve technique. Patients suspected of having thyroid carcinoma should receive a large tracer dose of I^{131} the day before operation to permit radioautographic studies and measurements of the uptake by the malignant tissue. The patient also should be scanned for unsuspected metastases.

Surgery is the only method of treatment of thyroid carcinoma which has any significant chance of cure. Radiation is indicated in persistent disease or for the detection and treatment of metastases in certain types of tumor. Effective treatment of thyroid malignancy with radioactive iodine is possible only when significant amounts of the I^{131} are taken up and retained by the malignant tissue. Only the well differentiated adenocarcinomas, particularly those which form colloid, may be expected to do so. The cancerous tissue must take up from 50 to 100 times as much activity per gram as the rest of the body if any damage to the cancer is to result.

Early optimism that I^{131} might cure carcinoma of the thyroid gland has not been justified by experience to date. Few real cures have been obtained, but a good proportion of patients whose tumors take up iodine do receive significant palliative benefit.

Less than 10 per cent of thyroid tumors will take up enough I^{131} to justify treatment. A large dose of from 25 to 50 millicuries of activity should be given initially, and repeated if necessary, to destroy all normal thyroid tissue. In some cases, this may result in an increased uptake by the carcinoma. Thyrotropic hormone has been shown to increase tumor uptake in some cases. The behavior of metastases is entirely unpredictable, some showing no uptake with one dose but taking up considerable iodine a few months later.

Treatment of carcinoma requires large doses of

I^{131}, but there is a limit to total dosage. Severe depression of hematopoiesis has resulted in a few cases. Myxedema is prevented by replacement therapy.

However, in view of the poor prognosis of metastatic thyroid carcinoma by any other method of treatment, I^{131} should be tried if the histology and uptake studies suggest any possibility of help by this method. At present a therapeutic trial is the only valid way to determine whether the radioactive isotope will affect the tumor.

INTRACTABLE CARDIAC DISEASE

Patients having intractable congestive cardiac failure or severe angina pectoris may receive significant benefit from reduction of thyroid function with I^{131}, thus reducing the work required of the heart. From one-half to two-thirds of these patients may be expected to show improvement for from nine months to three years; the remainder will not be improved.[3] From two to three times the therapeutic dose for hyperthyroidism is required since the normally functioning gland takes up less iodine and is less radiosensitive than the hyperfunctioning gland.

The purpose of treatment is to reduce thyroid function to low levels without the shock of an operation, and then to maintain the patient just above myxedema level with desiccated thyroid. No complications of any significance have been reported, and the cost of the treatment is low. In selected cases, I^{131} therapy appears to be indicated on the basis of experience to date.

OTHER CONDITIONS

Diiodofluorescein and iodinated human serum albumin, made with I^{131}, have been used successfully in the diagnosis of brain tumors and certain other conditions which alter the blood brain barrier so as to increase the deposition of the radioactive material in the extravascular spaces. The resulting irregular distribution is detected by measuring the gamma-ray emission from symmetrical areas of the brain. Ashkenazy[1] has reported an accuracy of 95 per cent in the diagnosis of brain tumors. Other reports describe varying degrees of success with this technique.[7]

Total blood volume may be measured accurately with radioiodinated human serum albumin by employing the principle of simple dilution. Circulation times can be determined by this method. Detection of intrahepatic masses by studying the distribution of the isotope in the liver has been reported.[18]

SUMMARY

The current status of radioactive iodine (I^{131}) in clinical medicine has been reviewed. Tracer studies utilizing this isotope provide valuable additions to older diagnostic regimens. Treatment with this isotope is indicated in selected cases of thyroid and cardiac disease.

BALLISTOCARDIOGRAPH PERFECTED

After more than two decades of medical research, the first successful bloodless method of accurately measuring the strength of a human heart beat has been achieved. Perfection of the ballistocardiograph apparatus was announced recently by the Air Research and Development Command in Baltimore.

The new device at present is employed by the Air Research and Development Command to evaluate the effect of partial pressure suits on the output of blood from the heart. However, it has been used clinically with promising results.

The apparatus consists of a light-weight bed suspended in so sensitive a manner that it moves with each minute rebound of the body caused by the ejection of blood from the heart. Coupled with a highly-sensitive accelerometer, the ballistocardiograph apparatus records on a graph the force and time course of the heart beat.

BENIGN BREAST TUMORS

FRANK A. SELECMAN, M.D., and ROBERT A. McCALL, M.D., Dallas, Texas

EXPERIENCE in private practice with more than 400 cases of breast lesions has stimulated our interest in this subject. Approximately 72 per cent of the patients with breast lesions have been found to have benign breast tumors of some sort. This paper was written to correlate our information so that we might gain a better understanding of these conditions. No attempt is made to mention every variety of benign breast tumors but rather to consider those that are most frequently observed.

A high percentage of benign breast tumors fall into a group in which much confusing terminology has been used. For example, there are the terms cystipherous desquamative epithelial hyperplasia, Brodie's disease, Reclus' disease, Bloodgood's blue dome cyst, mazoplasia, adenofibromatosis, Schimmelbusch's disease, nodular hyperplasia, fibrocystic disease, mastodynia, and chronic cystic mastitis, to name a few.

The impact of Geschickter's book[8] on the classification of breast tumors has been noted in recent years, and our discussion is confined chiefly to the following classifications: (1) mammary dysplasia, under which we note mastodynia, adenosis, and cystic disease; (2) fibroadenomas; (3) papillomas; and (4) hypertrophies, namely, prepuberal, virginal, and gynecomastia. In addition, the relation of benign breast tumors to carcinoma is discussed.

MAMMARY DYSPLASIA

Clinical observations and experimental studies have indicated the factors of hormonal imbalance in relation to the development of benign breast tumors. It has been stated that these tumors are "an expression of endocrine dysfunction." It is recognized that mammary development is secondary to the stimulation by estrogen, causing the development of lobular buds. It is known also that the stimulation by progestin causes differentiation of the epithelial cells in ducts in the breast tissue and that stimulation by the anterior pituitary gland activates the secretory mechanism. Experimentally, it has been shown in monkeys and rodents that testosterone has an action like that of progestin, and one would infer that this same function might be true in human beings. There are certain tumors of the adrenal cortex and there have been lesions in the third ventricle which also were shown to stimulate mammary growth and activity. Studies by Ewing indicated hereditary tendencies toward unusual mammary development.

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

Cyclic changes in the breast have been noted over a long period of time and are considered physiologic and normal. Hormones may be used experimentally in rabbits and rodents to cause the development of almost every known breast tumor or neoplasm. Clinical studies, particularly using assays on urinary excretions, have indicated that patients with benign breast lesions have a relative hyperestrinism. To explain why only a certain portion of one breast or certain parts of both breasts are involved, Nathanson[13] has stated, "Localized areas of the specific tissue are unusually sensitive to a stimulus."

Mastodynia

Following Geschickter's classification, let us first consider mastodynia, which occurs most commonly in persons between 20 and 40 years of age. It constitutes the largest group of benign breast lesions. The diagnosis is made on the basis of the presence of pain, tenderness, and a thickened area which is usually located in the upper outer quadrant of one or both breasts. When a biopsy is performed, the pathologic picture is that of imperfect lobules with an increased connective tissue component. The treatment is usually nonsurgical in that as a rule the condition is self-limited (if it persists, it indicates the development of adenosis) and will terminate with a pregnancy or the menopause. These patients need reassurance. Some physicians prefer to treat them with mild, stimulating doses of endocrines, including both estrogen and testosterone, and luteal factors as well. Mild, stimulating doses of estrogen are believed by some physicians to stimulate activity of corpus luteum. Testosterone is thought by some doctors to counteract the effects of excess estrogen and progestin. There is no standardized hormone treatment.

It has been interesting to us over a period of years to know about the work of three brothers named Biskind, one a gynecologist, one an internist, and one a pathologist. In their studies, they noted the frequent association of cystic disease of the ovary, hyperestrinism, and benign breast lesions. They developed the thought that hyperestrinism was associated with poor liver function so that the liver did not conjugate the excess estrogens in the blood stream. Good results were reported in these cases following the administration of vitamin B complex to improve liver function.[3] This simple form of treatment we frequently have utilized along with heat and support. Clinically, it has been satisfactory since most patients

generally feel better following its administration anyway.

Adenosis

Adenosis occurs most commonly in persons between the ages of 35 and 45 years. Whereas mastodynia is usually self-limited, adenosis is more persistent. The diagnosis is made by the finding of definite nodularity; about one-third of the patients present themselves because of pain and two-thirds because of being conscious of the presence of a nodule. Adenosis may mimic carcinoma, and most cases require biopsy. Following the excision of a wedge of breast tissue containing this nodular area, the pathologic picture is that of a limited or a diffuse lesion in which there is a marked fibrous component, frequently small cysts, adenomas, papillomas, and epithelial hyperplasia. This condition is frequently difficult clinically to differentiate from carcinoma, and the microscopic picture also may be difficult to interpret, particularly on frozen section. It is well to be considerate of the pathologist when he requests that the diagnosis be deferred for permanent section.

Treatment for adenosis usually begins with the establishment of the diagnosis by biopsy. Occasional cases that do not cause concern from the clinical picture may be treated with progestin or B complex while being carefully observed at frequent intervals. It has been stated that adenosis will clear up if the patient becomes pregnant; this fact we have not personally witnessed nor have we been able to verify from several obstetricians.

Cystic Disease

Cystic disease of the breast occurs chiefly in the fourth decade of life. This condition is diagnosed by finding one or more cysts, more than 1 cm. in diameter, particularly during or near the menopause. Forty per cent of these patients have mild pain. The lesions, as a rule, will transilluminate and also may be diagnosed by aspiration; however, obtaining these signs is a problem if the cyst lies deeply in the breast or is thick walled. Treatment in the past was excision alone. These lesions do not respond to endocrines; however, 7 per cent are said to regress spontaneously. Geschickter[7] stated that 85 per cent do not recur following excision and that 35 per cent do not recur following aspiration. Many agree with Nathanson,[13] who stated that a physician may aspirate a solitary cyst with considerable safety.

If aspirations are done for diagnosis and treatment, certain precautions should be advised. Each case should be individualized with the following points in mind: (1) Patients who develop cysts after the menopause should have them excised as there is much greater hazard of neoplastic change and less likelihood of relative hyperestrinism. (2) If on aspiration the contents are found to be bloody or microscopic examination of suspicious looking contents shows marked epithelial elements, the cyst should be excised. (3) In many cases excision of the first simple cyst may be advisable, and then recurrent cysts may be aspirated with a feeling of safety. (4) If a nodularity is noted in the region of the aspirated cyst at the time of aspiration or when the patient is checked in three or four weeks, excision of this area should be performed. (5) Those patients who have recurrence of a cyst following a second aspiration should have the cyst excised. (6) A patient who cannot return conveniently for careful follow-up studies at frequent intervals should have a biopsy performed.

Many patients come to us with multiple cysts in both breasts and few are willing to have bilateral, simple mastectomies unless their lesions are exquisitely painful and sensitive. It is our opinion that simple mastectomy is performed too often for these benign lesions and should be avoided. In our experience, 25 per cent of the patients with cystic disease required only one aspiration. After seeing nearly 400 benign breast tumors in the office, we have witnessed the development of carcinoma in only 1 patient who had been followed over a period of thirty-two months with multiple cysts in both breasts.

FIBROADENOMAS

Not much time need be spent on discussing fibroadenomas. These occur most commonly in younger women. They are characteristically firm and do not transilluminate or aspirate. Recurrences are common, with as many as five or six recurrences in a single patient. Several Dallas physicians have noticed the frequency of necrosis in preexisting fibroadenomas with the beginning of lactation or in any part of pregnancy.

PAPILLOMAS

Papillomas are, of course, intraductal lesions, and the first symptom is commonly bleeding from the nipple. The discharge from the nipple may also be serous. It is recognized that nipple discharges may accompany inflammatory conditions within the ducts. Many have stated that it is safe to watch such cases until a palpable tumor presents itself, but the study of smears made of breast secretions has somewhat altered this conception. It also has been stated that more than 50 per cent of intraductal papillomas can be cured by a simple operative procedure which involves excision under general or local anesthesia and frozen section. When one can press on a single spot and see that a discharge of a drop of blood comes from a single duct, it has been possible to insert the

eye end of a milliner's needle into the duct and cut down on this to disclose the underlying papilloma, which may be small in size. This technique was used by one of us (F. A. S.) and found satisfactory before it was published by Babcock.[2] The value of smears can be shown best by the findings in 2 cases.

CASE 1.—Mrs. J., a 33 year old woman, had noted a bleeding from the left nipple for two days. She had seen her obstetrician and surgeon. Pressure on the lower inner quadrant of the breast caused a few drops of blood to appear from a single duct at the nipple. The laboratory report on a smear gave the following microscopic description: Sections of this tissue show many clumps of cells which are of large size and have the appearance and arrangement of malignant cells. The diagnosis was carcinoma of the breast. At operation, the milliner's needle was inserted into the duct from which a bloody appearing fluid could be expressed. This duct and all of its ramifications were followed to the periphery of the breast and a wedge excised. Upon excision of this wedge of breast tissue, multiple intraductal papillomas were noted near the periphery of the breast. Frozen section was reported as not malignant, but a permanent section was thought to be necessary; this was reported two days later as papillary adenocarcinoma. Following radical mastectomy there was no evidence of metastasis to axillary nodes.

CASE 2.—Mrs. S. T. D., a 62 year old woman, had a history of discharge and discomfort of the right breast for two months, with recent bleeding. Past history revealed that the patient had had a benign tumor removed from her right breast ten years previously. She had a scar above the areola of the right breast and a thickened narrow area exactly lateral to the areola of the right breast; several drops of blood were expressed from a single duct by pressure on this area. Microscopic examination of this smear showed clumps of cells having an appearance and arrangement suggestive of malignant cells. The pathologist gave the diagnosis: appearance very suggestive of malignancy. The patient had an operation similar to that of the patient in case 1. However, frozen section revealed adenocarcinoma and, following radical resection, the pathologic diagnosis was mucinous adenocarcinoma with six negative lymph nodes.

These cases do not belong in a paper on benign breast tumors but are included to show the value of smears and the fallacy of watching and waiting for a palpable tumor mass.

HYPERTROPHIES

Hypertrophy may be included in a discussion of benign breast tumors. There may be prepuberal hypertrophy in either male or female breasts. Teen-age boys frequently will have a doughnut-like hypertrophy which often is rather sensitive and occasionally embarrassing in size. As a rule these are self-limited and respond to hot applications and observation for a short period of time. Several girls 10, 11, and 12 years of age have been seen to have unilateral hypertrophy usually with a ring of breast tissue with a central depression, and conservatism is warranted in these cases also. Virginal hypertrophies are occasionally massive. Our experience has been limited to 1 case in which plastic surgery was necessary for both physical and psychologic reasons.

Hypertrophy of the male breast is well known as gynecomastia; many of these lesions deserve observation and will regress spontaneously. If there is a question of irregular induration or persistent pain, a simple mastectomy is warranted and can be performed, as a rule, through an incision halfway around the circumference of the areola.

RELATION TO CARCINOMA

The relationship of benign tumors to carcinoma of the breast has been widely considered. Many physicians have seen more than one patient with a breast tumor which had been present for ten to twenty years before a sudden increase in size, accompanied usually by some pain, was noted and the patient was found to have a malignant condition. Most of these malignancies, we believe, have formed in persisting cysts into which papillary projections have grown and malignant changes developed over a period of many years, mostly in the postmenopausal patient. All doctors agree that mastodynia is not related to the development of carcinoma. Geschickter[7] has stated that adenosis was related to the development of carcinoma in approximately 4 per cent of his patients. Again, Geschickter stated that 5 of 445 patients with cystic disease followed for a period of ten years developed carcinoma. In his study at Boston, Warren[17] found that patients with cystic disease had four and a half times the likelihood of developing carcinoma as the average in the state of Massachusetts. Clagett,[4] at Mayo Clinic, reported five times the likelihood in similar cases in the state of Minnesota. Lewison[10] stated that evaluation was a sort of game to consider the transition from normal breast through the intermediate stage to carcinoma and believed the practical approach to be careful clinical follow-up. His studies indicated that 2.6 to 3.6 times the likelihood of developing carcinoma was found in patients with previous benign breast tumors.

The term "premalignant" is one that should be used carefully, and it is believed that simple mastectomy for this so-called condition is performed too often. It is known that 7.5 to 10 per cent of patients with a carcinoma in one breast will develop carcinoma in the opposite breast, and a simple mastectomy of the opposite breast is frequently indicated and should be performed if the breast is massive or questionable nodules are present.

Aberrant breast tissue is almost altogether limited to the axilla; malignant tumors which develop within it are usually highly malignant, and it is a good general practice to advise excision of axillary breast tissue. Massive virginal hypertrophy may be followed by malignant changes, and plastic surgery may be

indicated in these patients. An occasional painful nodular breast which defies other diagnostic procedures may warrant unilateral or bilateral simple mastectomy.

Following the previously mentioned considerations, further evaluation is indicated. It is interesting to note that, after years of intense estrogen administration, the rhesus monkey failed to produce tumors. Another interesting point is that massive and prolonged estrogen therapy in patients with advanced or metastatic breast carcinoma has not been found to develop benign tumors or secondary carcinoma when it is applied in the postmenopausal state. It has been noted that gynecomastia follows estrogen administration for carcinoma of the prostate. Stout[16] reported the finding of chronic cystic mastitis in 74.4 per cent of 1,038 surgically treated breasts and reported the finding of chronic cystic mastitis in 78.5 per cent of 410 patients with carcinoma of the breast. Frantz and her co-workers,[6] in routine autopsies, found chronic mastitis in 53 per cent of the breasts in patients who had not previously had breast problems. Therefore, it is evident that we do not have complete knowledge in regard to the effect of hormones or the relationship of benign breast tumors to carcinoma.

SUMMARY AND CONCLUSIONS

A simple classification of benign breast tumors has been presented. Etiology, diagnosis, and treatment have been discussed, and the relationship of benign tumors to malignancies has been evaluated.

In conclusion, the following recommendations are suggested for practical use:

1. Patients with breast lesions should have regular follow-up checks and also should be instructed in the technique of self examination.

2. Aspiration of cysts of the breast for diagnosis and treatment may be done safely with certain limitations mentioned previously.

3. Microscopic study of smears made from discharges from the nipple is a valuable aid in diagnosis.

4. Aberrant, or accessory, breast tissue should always be excised because of the high incidence of malignant changes.

5. Patients past the menopause with cysts or lumps in their breasts should have biopsies performed.

Medical Arts Building.

Physicians Earn Less Than $4 Per Hour

A survey made by the Bureau of Medical Economic Research of the American Medical Association of data supplied by 30,000 physicians for a study of 1949 incomes made jointly by the bureau and the United States Department of Commerce indicates that physicians averaged more than 56 hours of work a week, general practitioners more than 60 hours, and some specialists 50 to 56 hours. Distribution of net annual earnings over the number of hours worked, with the number of hours computed according to prevailing practices of large employers in the United States regarding overtime pay, would give an average "hourly wage" for physicians of $3.13 in 1949 and, on the basis of small sample studies of the U. S. Department of Commerce, $3.26 in 1950 and $3.54 in 1951.

Similar computations based partly on a survey by the Bureau of Economic Research and Statistics of the American Dental Association show the average work week of dentists to be 45 hours with the average "hourly wage" for dentists $3.01 in 1949, $3.12 in 1950, and $3.31 in 1951.

These figures are announced in an editorial in the October 2 issue of *The Journal of the American Medical Association.*

Nursing Activities Manual

A publication to aid hospitals in making better use of personnel, entitled "How to Study Nursing Activities in a Patient Unit," has been put out by the United States Public Health Service. A manual offering a method by which hospitals of all sizes may determine how nursing personnel time is distributed between duties requiring nursing skills and those which could be performed by other hospital personnel, the purpose of its publication is to teach administrators how to give nurses more time to be with patients and effectively use their nursing skills.

McWHIRTER TECHNIQUE FOR TREATMENT OF BREAST CANCER

An Appraisal

VINCENT P. COLLINS, M. D., Houston, Texas

THE treatment of breast cancer falls to the surgeon and the radiotherapist, but the problem of breast cancer is shared by every physician. Every physician is a counselor who must answer for his patients and for himself the contradictory views that arise as to diagnosis, prognosis, method of treatment, and effectiveness of treatment.

The role of radiotherapy in the treatment of breast cancer is one point of sharp disagreement. Taylor[8] stated that he was unable to establish that prophylactic irradiation improved the results of operation or decreased or deferred the appearance of operative field recurrences. In reporting on the results at the Massachusetts General Hospital, he stated that when there was no axillary involvement, about 75 per cent of the patients were cured at five years, but when there was axillary involvement, the cures were about 33 per cent. McWhirter,[5, 6] observing the same disease, challenged the usefulness of radical mastectomy. He argued that if disease was localized to the breast, radical mastectomy was unnecessary. If axillary metastases were present, then the axillary dissection of radical mastectomy was not conspicuously successful because the cure rate dropped from approximately 70 per cent to 30 per cent despite the dissection of axillary lymph nodes. He reasoned that simple mastectomy and radiation of the lymphatic drainage areas would do as well.

In 1941 in southeast Scotland a program was undertaken in which a treatment policy for breast cancer would be simple mastectomy plus a rigidly prescribed and executed course of postoperative radiotherapy.[5] The five and ten year results of this program are now available and compare favorably with the results of radical mastectomy (table 1).

TABLE 1.—*Five and Ten Year Results of Treatment of Breast Cancer by Radical Mastectomy and by Simple Mastectomy and Radiation.*

	Absolute Survival Rate			
	5 Years		10 Years	
Treatment	No. Patients	%	No. Patients	%
Radical mastectomy (Haagensen[1])	668	47.2	None available	
Simple mastectomy and radiation (McWhirter[6]) .	1,882	42.0	480	25.0

The absolute survival rate is preferred for comparing the effects of treatment in different institutions. It is based upon all the primary cases of breast cancer that are seen, early or late, operable or too advanced for any form of treatment. All survivors are counted whether they are treated or not. Although each institution is apt to have a dominant treatment policy, it is obvious that not all patients will be eligible for a single form of treatment. The absolute survival rate, therefore, compares the course of the disease in different centers as it is influenced by the treatment policy of the institution. If one were to deal only with patients selected for a given form of treatment, the criteria for selection could not be uniform from one center to another and the effect of treatment could not be compared directly.

In studying the survival figures as a measure of the effectiveness of treatment, it should be remembered that no author intentionally implies that all survivors are living solely as the result of treatment or that all living patients would be dead had they not been treated. The natural duration of breast cancer is subject to extreme variation. We are all aware of reported instances of patients living for twenty years or more without treatment, and many physicians have personal knowledge of treated but uncured patients who lived ten years or more. It must be concluded, therefore, that some patients in any group of survivors would have survived even without treatment.

Any unselected series of consecutive patients could be divided into three groups. Group A would be those with disease confined to the breast. For these patients, cure should be possible either by simple or radical mastectomy. Group B would be those patients with metastatic disease limited to the accessible axillary lymph nodes. Group C would be those patients with more distant spread of disease in whom cure by any method of treatment would not be a reasonable goal.

If there is any difference in the adequacy of surgical dissection and radiation in the treatment of axillary metastases, it is the survival of patients in group B that could be influenced by the choice of treatment.

Since survival rates under the two treatment policies do not show a significant difference, one might conclude that either the methods are equally effective

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

From the Department of Radiology, Baylor University College of Medicine, and Jefferson Davis Hospital.

or group B is so small that any difference in effectiveness is not evident in over-all survival.

Recent work by Handley,[2, 3] by Wangensteen,[9] and by McDonald, Haagensen, and Stout[4] has shown a previously unsuspected incidence of metastases in the supraclavicular and internal mammary regions. Many patients, formerly believed to have localized disease, must be placed in the inoperable group due to distant spread. Handley's results,[3] shown in table 2, were based on an investigation of operable patients. Approximately one-half the patients with axillary metastases also had metastases in internal mammary lymph nodes.

TABLE 2.—*Incidence of Metastases to Internal Mammary Lymph Nodes as Reported by Handley.*[3]

	Incidence (%)
No axillary metastases found	9
Axillary metastases found	48
All operable cases	34
Primary in inner half of breast	74
Primary in outer half of breast	27

On the basis of clinical findings, group B is represented by those patients in whom axillary lymph nodes are palpable. For this group, McDonald, Haagensen, and Stout[4] recommended in a 1953 report the "triple biopsy" prior to radical mastectomy. In their procedure the diagnosis is confirmed from the primary lesion, and if metastases are found in either the supraclavicular or internal mammary region, the patient is not eligible for radical mastectomy. Of the first 13 patients so investigated, 8 had metastases in both sites. This suggests that group B (those patients with metastases limited to the axilla) may be small. The group will be even smaller than indicated because the recognized metastases must, of course, be large enough for the pathologist to find. The incidence of metastases increases with painstaking dissection and with serial sections of lymph nodes,[7] but there must always remain the earliest metastasis which is too small to find. We come to the conclusion, then, that whenever axillary lymph nodes are positive for metastatic cancer, there is a high likelihood of more distant spread of disease.

BASIS OF COMPARISON

In weighing the merits of radical mastectomy versus simple mastectomy with radiation, these features must be considered:

1. Both are forms of treatment limited to the chest wall and the regional lymphatics.

2. Outcome, in terms of survival, depends on the extent of the disease at the time of treatment rather than upon treatment itself.

3. Treatment methods should be evaluated and compared on a basis of control of the disease in the treated area.

Treatment methods are compounded of knowledge of the natural course of the disease, development of technical skills, and analysis of the effects of treatment.

There are always two approaches to treatment of disease. One is to act upon the conclusions from past experience and attempt to equal accepted standards; the other is to test the validity of these conclusions by modifying techniques in an attempt to improve on accepted standards.

Radical mastectomy is an example of the first approach to treatment of carcinoma of the breast and remains the accepted form of treatment for operable breast cancer. However, the work of Handley,[2, 3] Wangensteen,[9] and McDonald, Haagensen, and Stout[4] represents new knowledge of the natural course of the disease and McWhirter's work is the development of an alternate technique of treatment which is apparently equally effective. The application of the McWhirter technique for the treatment of breast cancer is an example of the second approach to treatment.

McWhirter's evidence may be tested justifiably in the following circumstances:

1. When patients are poor operative risks because of age or competing disease.

2. When breast cancer is inoperable by the strictest application of the criteria of operability. Haagensen's criteria of operability[4] have been revised recently to exclude those patients who are discovered by the triple biopsy to have occult metastases in the supraclavicular region or internal mammary chain. There will be an appreciable number of patients in this category who were formerly eligible for radical mastectomy and may now properly be offered treatment by the McWhirter technique.

3. When the control of the primary lesion is important to the management of a patient, even in the presence of limited distant metastases.

If the McWhirter technique is applied in the circumstances outlined, experience will be gained in the technical aspects of the method. An appraisal of the usefulness of this approach cannot be made on a basis of survival rate because the favorable cases have been selected for radical mastectomy. Even in the unfavorable circumstances which have been recommended for testing the technique of simple mastectomy and radiation, there is a practical basis for testing its merit. This would include control of the disease on the chest wall and in the axillary and supraclavicular drainage areas; mortality and morbidity; anatomic defect; late sequelae, for example, lymphedema or radiation injury; and functional impairment.

These are the direct and observable effects of any treatment for breast cancer. They are equally applicable for the evaluation of the McWhirter technique

of simple mastectomy and radiation, the conventional radical mastectomy, or the so-called super-radical mastectomy now being carried out in some centers. These aspects have not been critically analyzed for any series of breast cancer treated by any method.

Available information indicates that because of the nature of the disease, no marked difference may be expected in the survival rates associated with any form of treatment. The direct and observable effects of treatment that have been outlined represent data yet to be collected before the relative merit for different methods of treating breast cancer can be determined.

SUMMARY

Survival statistics for patients treated by simple mastectomy and radiotherapy compare favorably with those treated by conventional radical mastectomy. The basis for establishing the relative place of these two methods of treating breast cancer requires a critical analysis of the direct and observable effects and complications of the two methods. This information is not yet available.

At present, radical mastectomy is the accepted form of treatment for favorable cases of breast cancer. Its proper application requires strict observance of criteria of operability which were designed to offer reasonable assurance that disease is still localized to breast and surgically accessible lymph nodes. When radical mastectomy was the only form of treatment, compassion sometimes influenced judgment and patients unsuitable for radical surgery were subjected to futile operation. Simple mastectomy and radiation are now sufficiently well established to merit serious consideration. The method might justifiably be tested in a group of patients who are shown to be ineligible for radical mastectomy. Experience with the local effects of the method will provide a basis for determining the ultimate role of the McWhirter approach to the treatment of breast cancer.

MORTALITY AT SCHOOL AGES DECLINES

Extraordinary gains have been made over the past twenty years in reducing mortality at the school ages, statisticians of the Metropolitan Life Insurance Company report. In the experience of the insurance company's industrial policyholders at ages 5 to 14 years, the death rate for boys dropped nearly two-thirds, from 158 to 57 per 100,000 between 1933 and 1953, and the rate for girls has declined even more sharply, from 126 to 37 per 100,000.

In each sex decreases of 85 per cent or more were recorded over the twenty year period in the death rates for a number of diseases, including the principal communicable diseases of childhood, appendicitis, pneumonia and influenza, and tuberculosis.

Despite this progress, there are still about 15,000 deaths among children at school ages in the general population of the United States, and a considerable part of the loss of life is amenable to control, according to the statisticians.

Accidents are the greatest single menace to child life, accounting for more than two-fifths of the total mortality among boys, and for more than one quarter of the mortality among girls. Second in rank as a cause of death are the cancers, which twenty years ago were a minor cause of death at the school ages. The leukemias account for nearly a half of all the deaths attributed to malignancy among school-age children.

Although spectacular progress has been made in the control of the infectious diseases, they are still responsible for an appreciable loss of life among children. Pneumonia and influenza, and acute poliomyelitis continue to be among the leading killers at ages 5 to 14, but the death toll from these diseases varies from year to year with their prevalence and virulence.

NEW PORTABLE RESUSCITATOR

A resuscitator that can be used anywhere from a dentist's office to a battlefield has been developed while researchers at Western Reserve University and the University Hospitals of Cleveland were working on a small oxygen inhalator for use in hangover treatment of acute alcoholism, Dr. Robert A. Hingson, Cleveland, said in the October 9 *Journal of the American Medical Association.*

The device, without tanks attached, weighs about 17 ounces and can be held in the palm of one hand; it has a rubber face mask, a rebreathing bag, and two aluminum arms to contain gas or oxygen cylinders.

Dr. Hingson said that the pocket-size resuscitator could be used by patients with heart trouble, by passengers of planes at high altitudes, and by police and firemen in drowning accidents, mine explosions, fires, and other suffocation emergencies. He said that the device could be dropped undamaged from a plane without a parachute to forward positions on the battlefield and in disaster areas.

The smallest such unit now in use weighs 40 pounds; the new device weighs only 2 pounds, including gas or oxygen cylinders, and could be used even as a gas mask for twenty minutes to an hour during evacuation from dangerous areas of smoke, poison gas, or incendiary explosives, he stated.

RADIATION THERAPY IN MANAGEMENT OF THE LYMPHOMAS

SIMEON T. CANTRIL, M. D., Seattle, Washington

A DISCUSSION of the lymphomas (exclusive of leukemias) is necessarily a broad subject. To be more meaningful to the practitioner it would seem that problems relating to diagnosis are of equal importance with those of treatment. Rather than describing technicalities in the management of lymphomas by irradiation, this presentation emphasizes a discussion of problems referable to diagnosis and to treatment as they relate to certain of the pathologic and clinical forms of the disease.

In a group with as widespread manifestations as exist with the lymphomas, one finds varying opinions and practices regarding methods of irradiation or the use of chemotherapy. The views expressed herein are those which result from fifteen years' experience in the management of the lymphomas in the Tumor Institute of the Swedish Hospital. They are experiences which we as a group have accumulated and from which we have evolved our present methods of management.

Finally, to bring so large a subject into sharper focus, it may be more instructive to discuss a limited number of problems than to attempt a general survey lacking in direct clinical application.

Pathologically, we are speaking of the lymphomas as a group comprised of Hodgkin's disease, lymphosarcoma, and giant follicle lymphoma. For purposes of discussion here it is not important to differentiate further between the separate pathologic varieties of Hodgkin's disease or lymphosarcoma, as there seems to be little correlation between the pathologic subdivisions in either and their radioresponsiveness or prognosis. It is important, however, to differentiate by microscopic confirmation whenever possible whether one is dealing with Hodgkin's disease, lymphosarcoma, or giant follicle lymphoma because the treatment, radiosensitivity, and more particularly, the natural history have important dissimilarities. The diseases are similar, however, in that they mask or simulate so many other pathologic states and may be so bizarre in signs and symptomatology that in many instances the problems of diagnosis are in themselves extremely puzzling. Whereas one or more decades ago syphilis found its way into the list of those diseases to be excluded in not too obvious diagnostic problems, its place may now be taken by the lymphomas. In our experience they affect all ages and may be manifest to varying degrees in all important organ systems to produce at times an Oslerian problem in differential diagnosis. Fortunately the pathologist often can resolve the problem if only the physician thinks of the lymphomas as possibly the underlying disease state and can furnish him the material for pathologic study.

From the Tumor Institute of the Swedish Hospital.
Read before Section A (Medical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

HODGKIN'S DISEASE

Patients with Hodgkin's disease in whom the initial manifestation is lymphadenopathy limited to a single regional group of lymph nodes seem to be in the minority. When such a finding results and careful clinical and roentgenologic examination gives no evidence of other demonstrable involvement, the patient receives roentgen therapy directed to the regional lymphadenopathy.

It is our aim to give sufficient irradiation to produce permanent arrest of the local process. In our experience one cannot be certain of this short of a dose of 3,500 r minimum delivered to the tumor-bearing area in three to four weeks. There are also those in whom larger doses are required for local arrest of growth. The majority of such patients eventually will have progression of the disease in other superficial or deep lymphatics, or later will succumb by invasion of the important organ systems. Yet the time factor for this progression of events cannot be predicted at the outset with any certainty. We have seen rapidly lethal Hodgkin's disease, and also have seen patients who have been in a relatively good and efficient state of health over several years before impairment becomes serious. There are those few and unpredictable patients in any large group who survive (perhaps with their Hodgkin's disease) for long periods and seemingly have no symptomatic reappearance. In our material there are 3 patients, all with cervical and mediastinal disease, who have survived for ten or more years.

It is for reasons of unpredictability that we heavily irradiate the more localized Hodgkin's disease, and particularly that appearing as cervical, axillary, or mediastinal lymphadenopathy. When the disease as first seen involves the abdomen, bone, retroperitoneal, or pelvic lymphatics, the prognosis is less favorable for long survival. If, however, the general condition of the patient is reasonably good and without evidence of severe bone marrow replacement, then if

one hopes to obtain any kind of worth-while palliation, irradiation still must be carried to a dose within the diseased tissues which is sufficiently great to produce freedom from major complaints from the irradiated region. Otherwise maximum benefits of irradiation are not obtained. Resorting to reirradiation at a later time is usually not helpful, although we have done so successfully to accomplish local arrest in a few cases when initial irradiation had been inadequate, either in dose or in volume of tissue irradiated.

With certain exceptions to be mentioned later, we have continued the use of external roentgen-ray therapy as the primary therapeutic agent when the disease clinically advances to involve other lymphatic areas and is producing symptoms which are important to the patient's welfare. We do not always attempt to irradiate all scattered lymphadenopathies if certain of these are asymptomatic. Realizing that the patient will require more irradiation as time goes on, we prefer to spare him the injury to hemopoietic tissues and use roentgen therapy when one or another focus becomes symptomatic. We do so with the realization that in other than Hodgkin's disease which is seen in a stage involving a single or at the most contiguous lymphatic areas, the process eventually and inevitably will become more generalized. So-called "prophylactic irradiation" to regions as yet uninvolved or to asymptomatic or to nonprogressing adenopathies wastes both the patient's recuperative reserves and the roentgen therapy which may be needed later for more important infiltration. We see no detriment to the patient in regularly observing quiescent lymph nodes and treating them when enlargement becomes important. Following this course we have used roentgen therapy to cause sufficient local regression of fossae as they have become clinically important to

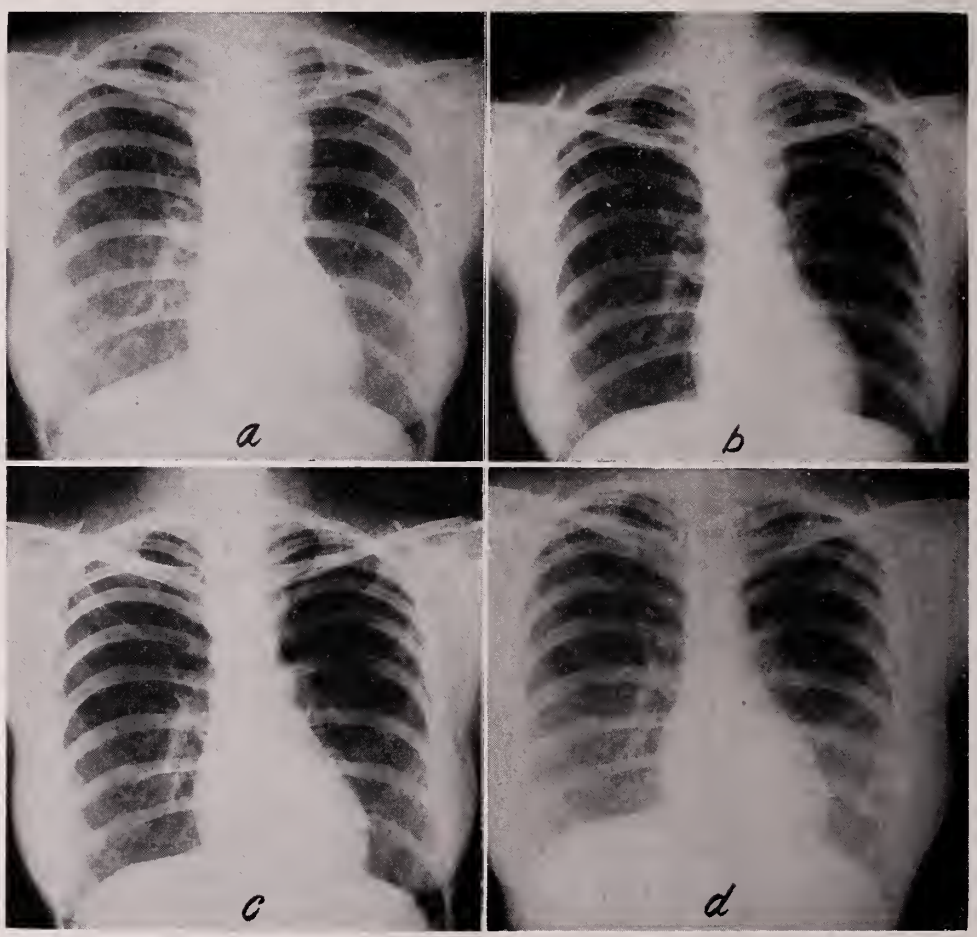

FIG. 1a. Mediastinal lymph node enlargement associated with bilateral supraclavicular lymphadenopathy was discovered on preemployment examination of a 33 year old woman. The original lesion as of March 7, 1945, is pictured. Biopsy revealed Hodgkin's disease. Roentgen therapy, 2,500 r to the mediastinum, was given in twenty-seven days.

b. A roentgenogram made August 8, 1945, showed the hilar mass to be regressing.

c. One year after irradiation, February 2, 1946, gradual regression was apparent. No irradiation to the neck was administered until 1950, when 3,500 r to the left cervical region in fifteen days was given because of an enlarging cervical lymph node.

d. A roentgenogram made March 24, 1951, indicated that the patient was well. She remained so to 1954.

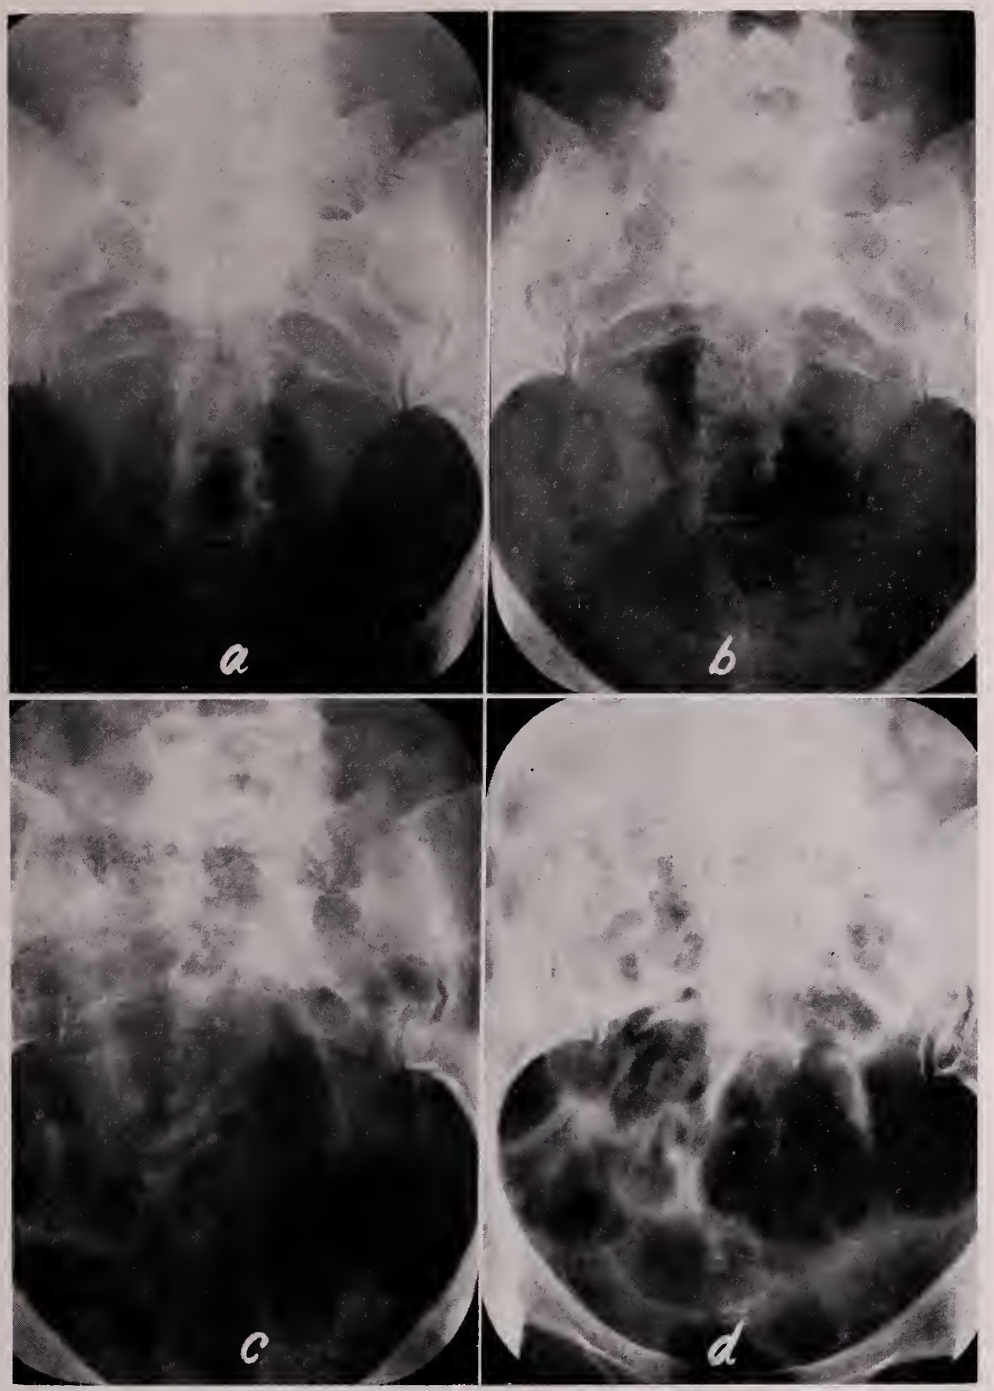

FIG. 2a. A woman aged 42 was seen originally in 1944 with massive bilateral cervical and axillary lymph nodes. The condition was diagnosed as Hodgkin's disease. Radiation therapy was given to the cervical disease in 1944 and to a mass in the left part of the pelvis in January, 1945. The pelvis was asymptomatic in 1944 when this roentgenogram was made.

b. Swelling and pain in the right sacroiliac region was evident when a roentgenogram was made June 29, 1948, and destruction of bone in the right upper sacrum had begun.

c. Spinal fusion was done by a surgeon unaware of the presence of Hodgkin's disease, and he found bone destruction, as evidenced in the roentgenogram made September 15, 1948.

d. This roentgenogram was made December 8, 1948, following spinal fusion and roentgen irradiation to the right sacral focus with bone regeneration. The patient died in 1949 of uremia of Hodgkin's disease.

carry a number of patients for a period of years before irradiation is no longer useful.

In the irradiation of every patient with Hodgkin's disease due attention is given to maintaining the general condition of the patient. Nutrition, weight, status of the blood, fever, sweating, and pain are all to be queried, observed, and treated as they bear directly on the ability to sustain adequate irradiation locally as well as being signs of possible further spread of disease which one is not at the time treating.

The only agents other than roentgen rays which currently have any place in the treatment of Hodgkin's disease are systemic irradiation by radioactive substances, primarily radioactive phosphorus, and the use of chemotherapy in the form of the nitrogen mustards. We have had little experience with radioactive phosphorus, but in those more advanced states wherein it has been used, its effects have not been as satisfactory as the nitrogen mustards. Radioactive colloidal gold or chromic phosphate can be useful, how-

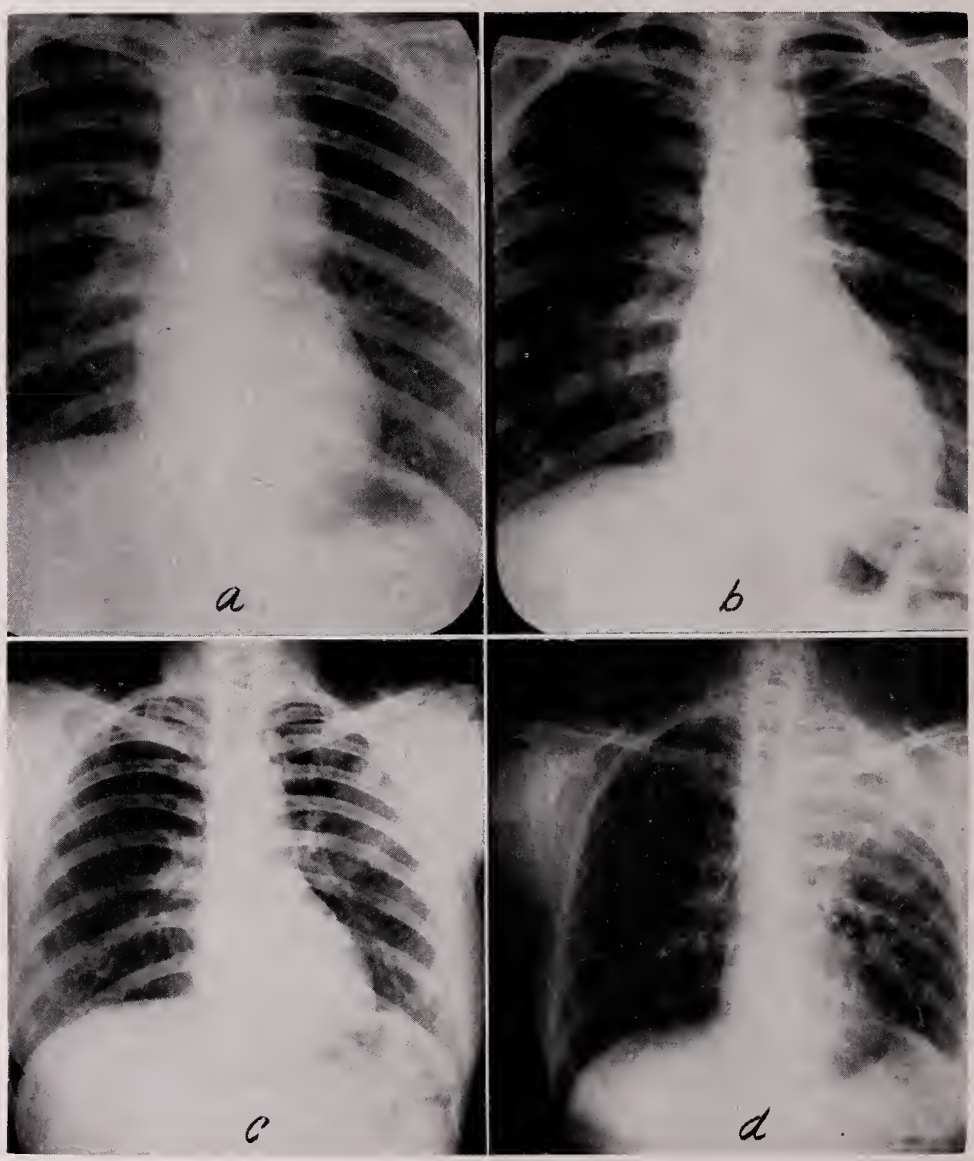

FIG. 3a. A woman aged 22 was seen in February, 1949 (roentgenogram made February 9), with bilateral cervical and mediastinal lymph node enlargement. Hodgkin's disease was diagnosed. Roentgen therapy was administered, 2,800 r to the midmediastinum in thirty-seven days.

b. A roentgenogram of the chest made April 28, 1949. Irradiation, 3,900 r, was directed to an enlarging right cervical lymph node in 1951.

c. The patient became asymptomatic and lymph node enlargement disappeared. A follow-up chest roentgenogram made October 22, 1953, showed soft infiltration of the left upper lung parenchyma. Tuberculosis was excluded.

d. A roentgenogram made April 16, 1954, showed progressive infiltration with probable atelectasis. Bronchial fixation encountered in bronchoscopy and failure of filling of the left upper bronchus was believed to be due to probable obstruction from hilar lymph nodes. The patient in 1954 was still asymptomatic except for generalized pruritus.

ever, in significantly reducing the pleural effusions due to pleural infiltration by Hodgkin's disease.

Although our primary resource is external roentgen therapy, we have used nitrogen mustard in selected cases and found it helpful. In this work we have been assisted by Dr. James Crosbie. In general, preference has been given to nitrogen mustard administered intravenously rather than to triethylene melamine given orally. The intravenous route is for certainty of dosage and prompter effect.

Chemotherapy has been used under the following conditions: (1) When roentgen therapy is no longer useful because of a disease too widespread for irradiation, or in previously heavily irradiated regions with infiltration and fibrosis, nitrogen mustard may help. The general condition of the patient, and particularly his blood, must be able reasonably to support the toxic effects of nitrogen mustard, or by transfusions the blood must be brought to levels which support the drug's use. (2) In patients who either initially or later present the clinical picture of anemia secondary to bone marrow replacement by Hodgkin's disease or associated hemolytic anemia, provided they have sufficient blood and supportive agents, nitrogen mustard may cause a temporary improvement in the anemia with resulting benefit to well being. (3) The intractable itching of Hodgkin's disease may be relieved for varying periods by nitrogen mustard. Some

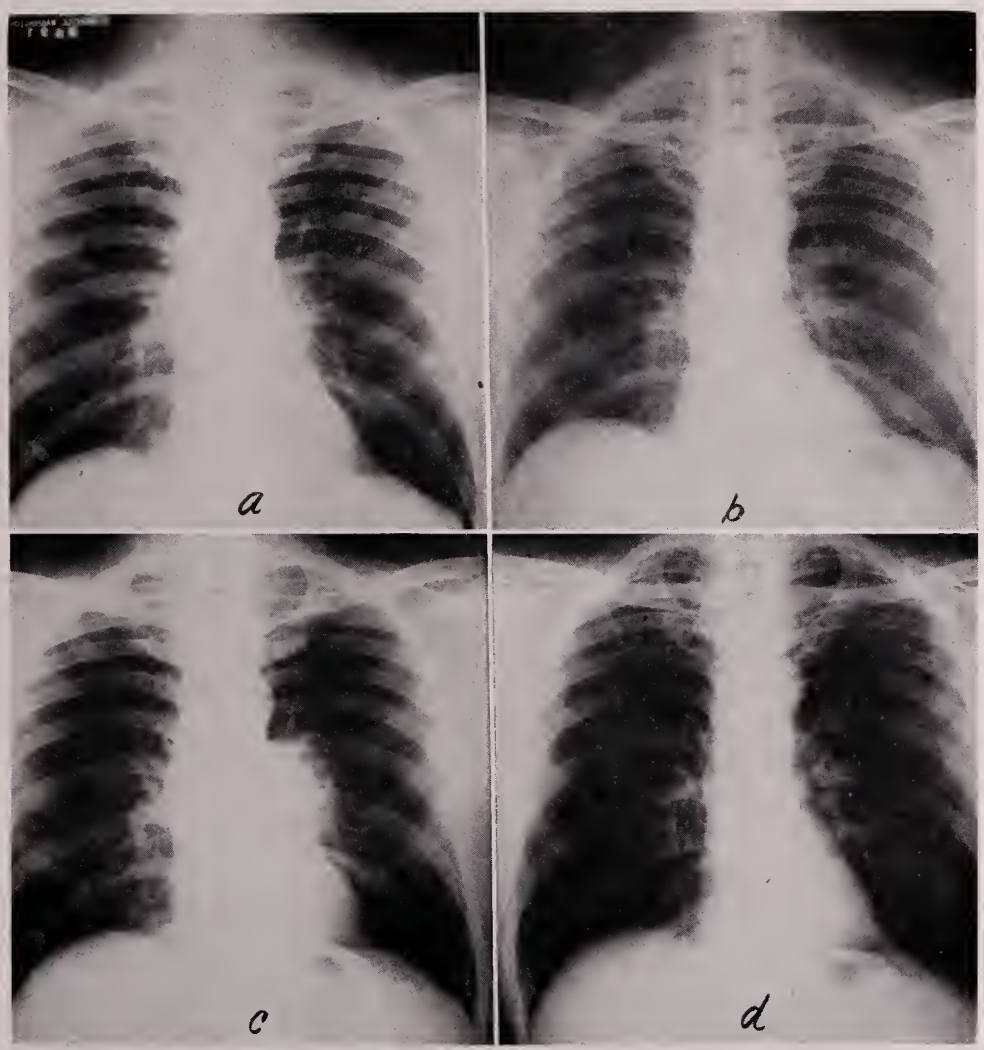

FIG. 4a. A 49 year old man had had bilateral supraclavicular swelling with enlarged lymph nodes for two months prior to November 6, 1950, when this roentgenogram was made. His general condition was good; no anemia was evident. Bilateral hilar lymph node enlargement was diagnosed as Hodgkin's disease upon biopsy of one of the nodes which was removed. Radiation was administered bilaterally to the cervical regions, 3,750 r to each, and to the midmediastinum, 3,250 r, over a period of thirty-eight days.

b. Roentgenogram of the patient's chest December 27, 1950. His general condition was excellent; there was no clinical evidence of disease.

c. By August 7, 1951, the patient still was asymptomatic, but a chest roentgenogram showed a large area of disease in the previously irradiated left hilar area. An additional 4,300 r was directed to the midmediastinum.

d. Roentgenogram made April 27, 1954, at which time the patient's general condition remained excellent and no clinical evidence of disease had appeared.

patients' relief is only temporary but may be sufficiently long to warrant use of the agent, particularly when the pruritus is generalized. Roentgen therapy in minimal dosage to the nodular cutaneous infiltrations of Hodgkin's disease also can relieve the localized itching. Generalized pruritus also at times may be relieved by irradiation of deep infiltrations. Chemotherapy offers a more prompt relief, and we have used it before irradiation of localized and symptomatic infiltrations to give the patient respite from sleeplessness and continued irritation of the pruritus. (4) We have used chemotherapy in parenchymal pulmonary infiltrations, but usually with no more than temporary regression of pulmonary fossae. (5) The fever associated with generalized Hodgkin's disease often can be promptly reduced by nitrogen mustard. In such patients we have used it as a preirradiation measure with considerable improvement of the general condition and ability to support roentgen therapy.

It has been our observation that the responsiveness of Hodgkin's disease to nitrogen mustard is shorter lived than to adequate irradiation.

Pain is often a symptom in Hodgkin's disease, and its cause is not readily found by clinical examination alone. Involvement of bone is common and at times may be seen by roentgen examination. As in the common cancer metastasis to bone from breast the pain may long precede roentgenologic evidence of bone disease, and radiation has been given for pain presumed to be in bone when clinical signs point to this. The appearance of bone invaded by Hodgkin's disease is usually that of destruction. However, it may simulate other forms of bone malignancy, both osteolytic and osteoblastic. We have seen spinal fusions done for "back pain" which in reality represented Hodgkin's disease of the vertebrae and could have been diagnosed as such by more careful clinical appraisal. Flank or abdominal pain associated with paravertebral and retroperitoneal pressure from Hodgkin's disease cannot always be demonstrated by palpation or by roentgenologic examination. Gastrointestinal and renal roentgen-ray studies may be helpful in demonstrating displacement of stomach, bowel, or ureter. Pain is at times the first manifestation of Hodgkin's disease, and the diagnosis is made only at laparotomy. In a patient with known Hodgkin's disease such pain usually can be relieved by adequate irradiation to paravertebral and retroperitoneal structures.

Thoracic involvement is most commonly mediastinal lymph node enlargement. Its progression may be slow and even at times asymptomatic. Respiratory embarrassment, however, may become rapidly progressive and call for prompt but cautious irradiation of the mediastinum. The complications are those due to pressure, producing pain and obstruction to the great vessels. Edema of the supraclavicular fossae and later neck, producing the Stokes color associated with severe dyspnea and venous dilatation, is not uncommonly seen. Deviation and compression of the trachea simulating cancer of the thyroid or lung may be noted. Esophageal obstruction by external pressure is likewise seen. Bronchial obstruction with atelectasis may result in a problem simulating cancer of the lung, chronic bronchiectasis with abscess, or tuberculosis. Of interest is the absence of vocal cord paralysis from recurrent laryngeal involvement, as is commonly seen in cancer of the lung and thyroid. Pleural effusion may result either from pressure or pleural infiltration.

In the absence of peripheral lymphadenopathy from which to secure a lymph node for microscopic study, and if the patient is not acutely dyspneic, we prefer to know the pathologic nature of the mediastinal lymph nodes whenever possible. In such a patient a lymph node usually can be secured by the simple surgical procedure of entering the superior anterior mediastinal space through the supraclavicular fossae. Even small lymph nodes of not more than 1 cm. in size so obtained have proved diagnostic. When the patient is acutely dyspneic and no peripheral lymph nodes are removed, we proceed with roentgen-ray therapy and attempt to judge the nature of the adenopathy by the degree of response to irradiation. In general the most responsive are the lymphatic leukemias (in an aleukemic phase diagnosis cannot always be made from blood or bone marrow); the giant follicle lymphomas are the most responsive of the lymphoma group other than the leukemias. Usually lymphosarcoma requires more irradiation than giant follicle lymphoma, but less than Hodgkin's disease. It is rare that later in the disease's course the opportunity does not present to secure tissue for pathologic examination from an accessible lymph node if this has not been possible prior to irradiation of the mediastinum.

Mediastinal involvement by the nature of its visibility by roentgen-ray examination affords a good opportunity to judge both the degree of response and the dose of irradiation required to reduce regression. In treating abdominal and retroperitoneal infiltration one cannot see and follow the results so readily, and the response must be judged by clinical evidence unaided by visualization. This has caused us to re-treat reappearing mediastinal enlargement as long as one year after an initial dose in the mediastinal tumor in excess of 3,000 r, and by addition of 3,000 r to 4,000 r in the mediastinum by the second series. Supervoltage roentgen therapy (800 kilovolts) has per-

mitted us to do this without injury to skin or lung. It can be done with 200 to 400 kilovolts through the selection of appropriate fields of irradiation. These experiences have caused us to use greater doses initially than are more commonly advocated in the irradiation of Hodgkin's disease. We likewise have learned that, unless the whole of the mediastinum is irradiated, there is a likelihood of reappearance of lymph nodes peripheral to the irradiated volume.

We have not successfully irradiated parenchymal pulmonary infiltration of Hodgkin's disease and its associated atelectasis. In 2 patients in whom this was attempted after the failure of nitrogen mustard, both had rapid generalization of the disease, of which the pulmonary involvement was clinically prominent. In neither did it significantly alter the course.

Gastrointestinal manifestations of Hodgkin's disease are important entities. The sites of predilection are gastric and ileocecal. Although the diagnosis of Hodgkin's disease of the stomach at times may be made by roentgenologic methods and aided by gastroscopy, the findings are usually those of exploratory laparotomy. A thick-walled, edematous stomach, with or without associated regional lymph nodes, should cause suspicion of a lymphoma and lead to visualization of the lumen of the stomach at surgery. Exten-

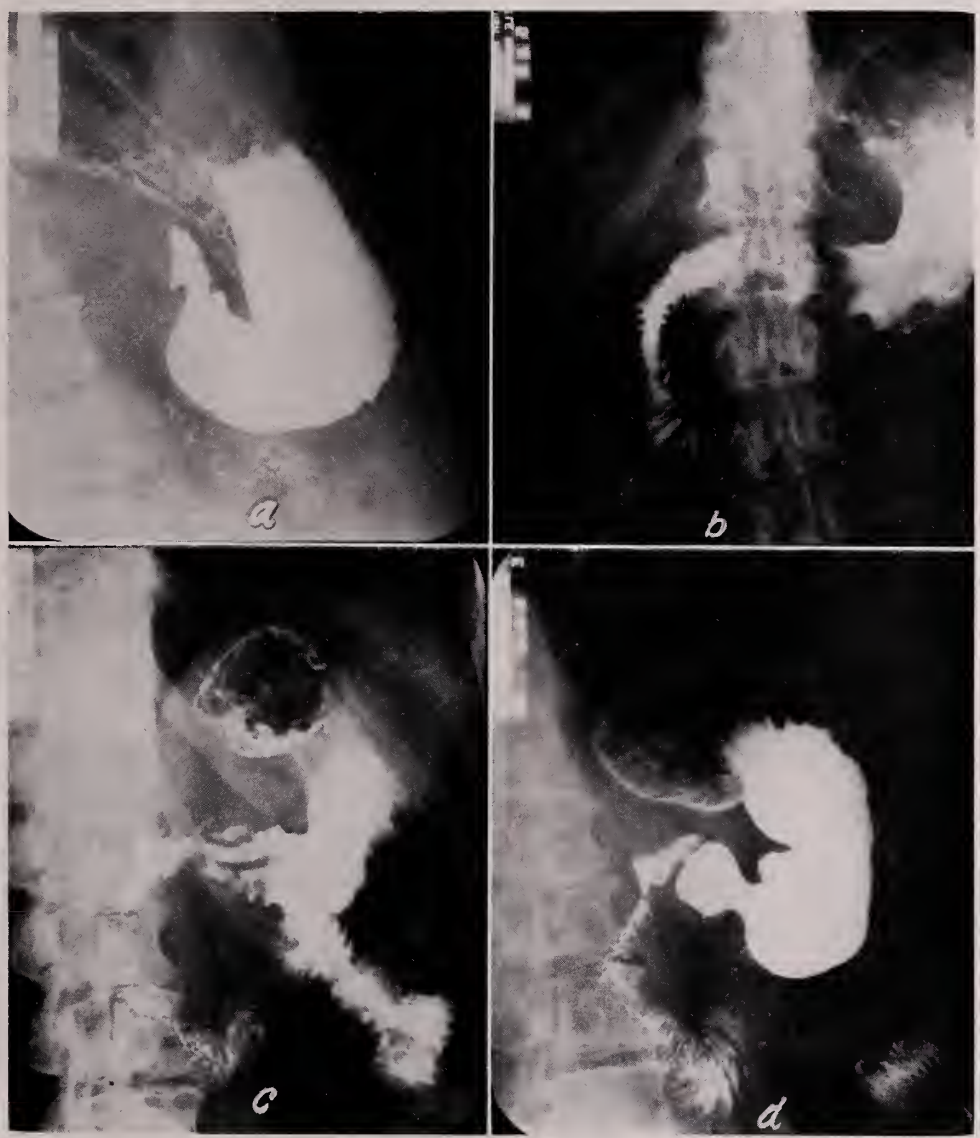

FIG. 5a. Prelaparotomy roentgenogram (May 11, 1948) of a patient thought to have gallstones.

b. Roentgenogram made June 9, 1948, after the laparotomy and after Hodgkin's disease of the stomach had been established by biopsy of tissue removed at operation.

c. A postirradiation film made December 21, 1948.

d. Another postirradiation roentgenogram made October 9, 1951. The patient continued in 1954 to be well after 4,500 r of supervoltage irradiation to the stomach.

sive submucosal infiltration with minimal ulceration may be noted. Tissue from the stomach and regional lymph nodes should be secured for examination. The pathologist may be able to confirm the diagnosis by frozen section. Patients with both Hodgkin's disease and lymphosarcoma of the stomach have lived for long periods following gastrectomy when other regional involvement was not present. Depending upon the degree of extragastric disease and the general condition of the patient, one may elect to do a gastrectomy alone or to follow gastrectomy by regional irradiation.

In 1 such patient examined surgically for gallstones (fig. 5) diagnosis of Hodgkin's disease of the stomach was made by tissue removed for study. At surgery no other lymphatic or hepatic lesion was noted. The patient refused gastrectomy and now is asymptomatic after six years following roentgen therapy alone. A dose of 4,500 r to the stomach was given without complication other than transitory leukopenia. This was done with supervoltage irradiation. Nitrogen mustard in 1 case of Hodgkin's disease of the stomach associated with disease in the liver gave only transitory palliation.

We have not accomplished complete arrest of disease in ileocecal Hodgkin's disease discovered at surgery. The few cases we have seen were associated with abdominal lymphatic spread. Surgical resection (usually for intussusception or obstruction) followed by irradiation has given limited palliation.

In summary, Hodgkin's disease is ubiquitous and should be regarded as such. In its treatment by irradiation our aim is to produce arrest of local regional infiltration whenever indicated by the symptomatology and in the absence of demonstrable generaliza-

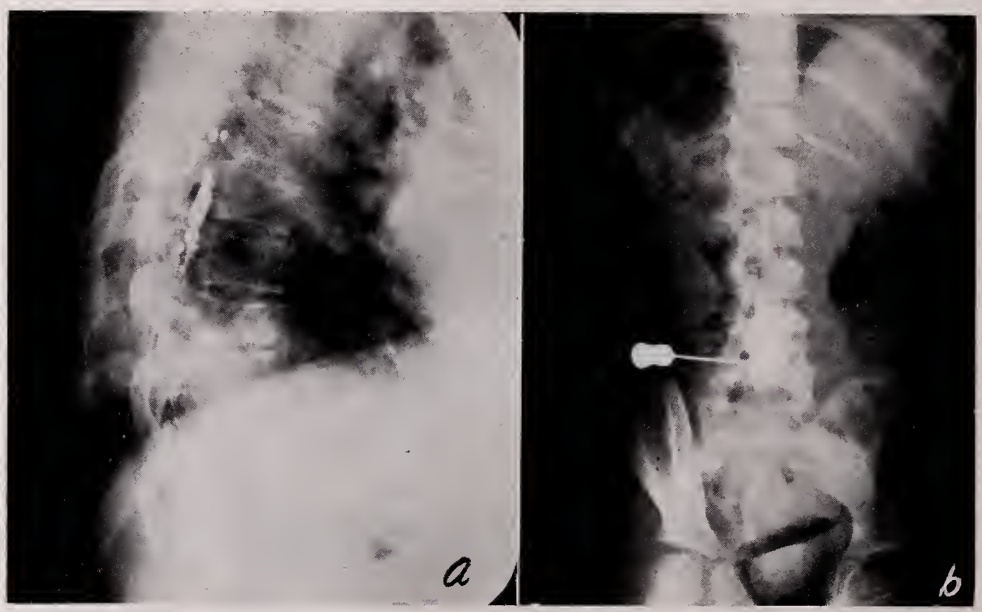

FIG. 6a. Myelogram showing complete blockage in a 59 year old man who had suffered pain in the lower dorsal spine for three months and then sudden loss of motor activity in the lower extremities. Laminectomy was performed; destruction of the involved vertebral segments with extramedullary lymphosarcoma was evident. The patient died suddenly from pulmonary embolism.

b. A child 4 years of age had a tumor of the soft parts in the lower lumbar region which was diagnosed as lymphosarcoma. Two weeks postoperatively the patient developed paralysis of the lower extremities. A myelogram showed complete block. Cord compression was not relieved by roentgen therapy (2,900 r in two weeks). Laminectomy was performed and intraspinal lymphosarcoma observed contiguous with the originally noted lumbar mass. The patient died from pulmonary metastasis five months after onset of the disease.

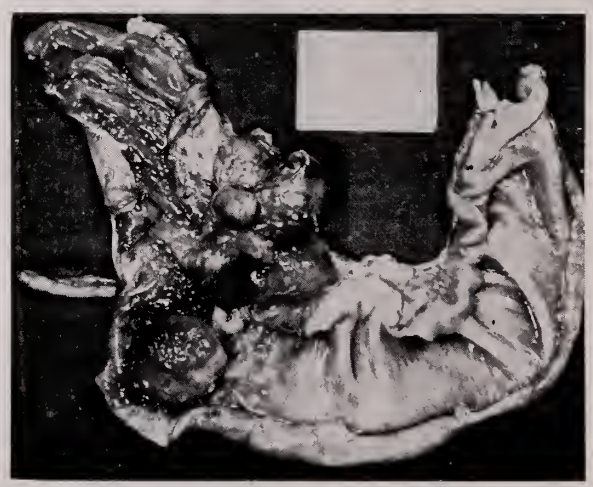

FIG. 7. Acute intussusception of the terminal ileum was observed in a 7 year old child in 1947. Resection of the tumor in the ileum and where it was invading the cecum and of the regional mesentery containing lymph nodes was done. Complete resection of all the gross regional lymphadenopathy was not attempted. Lypmphosarcoma of the ileocecal region with lymphosarcoma in some of the resected lymph nodes was diagnosed. No irradiation therapy was given. The patient was well and asymptomatic in 1954.

tion. When the disease has advanced to involve more than one or contiguous regions, irradiation judiciously used may keep the patient in a reasonably efficient state for periods of several years. There are those who may survive for long periods seemingly controlled. In our experience chemotherapy is a useful adjunct to irradiation, and particularly in cases presenting fever, itching, or anemia or when irradiation is no longer applicable.

LYMPHOSARCOMA

Lymphosarcoma is perhaps more capable than Hodgkin's disease of involving any or all tissues and thus producing clinical manifestations of all degrees of complexity. Although Hodgkin's disease may be seen in childhood, lymphosarcoma is more common than Hodgkin's disease in the early ages. It lacks the phenomenon of pruritis associated with Hodgkin's disease, yet in all other respects it may be clinically indistinguishable. Unlike Hodgkin's disease, it is seen in the accessory nasal sinuses, nasal pharynx, tonsil, and base of tongue—all sites rich in lymphoid tissue. Like Hodgkin's disease, it is found in the stomach and ileocecal region as an apparent primary focus. We have encountered lymphosarcoma infiltrating the rectum and clinically simulating cancer of the rectum. It responds readily to external irradiation with relief from bleeding, pain, and debilitation. That these are not all simple rectal lymphoid hyperplasia is evidenced by 2 cases with other organal involvement by lymphosarcoma. In 1 the initial diagnosis was made at laparotomy for splenectomy, and the other patient later succumbed to gastric lymphosarcoma. In these cases the rectal involvement is no doubt a magnified picture of lesser (or perhaps only hidden) disease throughout the gastrointestinal tract.

Certain forms of lymphosarcoma are relatively benign, as for example the lymphosarcoma of the parotid and lacrimal glands. Lymphosarcoma of the skin (lymphoma cutis) may be relatively benign for long periods. The entity of mycosis fungoides, responsive as a cutaneous manifestation to roentgen-

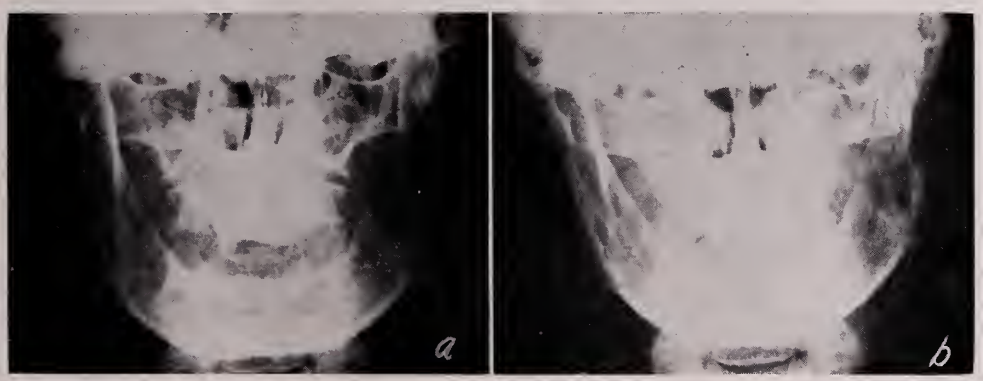

FIG. 8a. Lymphosarcoma of the mandible, evident in the roentgenogram made August 14, 1942, was the presenting disease.
b. This roentgenogram made February 2, 1943, showed bone healing after irradiation. The patient developed lymphosarcoma of the ileum six months later, however, and although this lesion was resected, he died April 4, 1943.

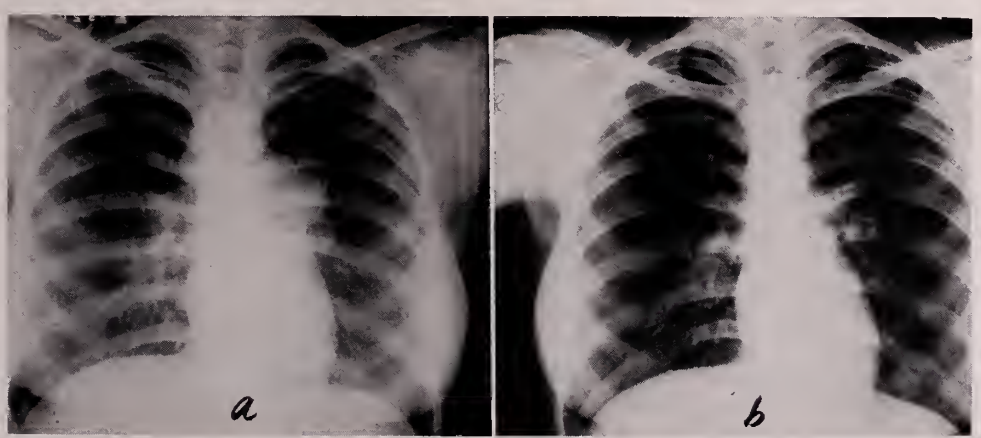

FIG. 9a. Roentgenogram made of a 16 year old girl July 21, 1952, and revealing an entirely asymptomatic mediastinal lymph node enlargement. No peripheral adenopathy, anemia, or other signs were observed. Biopsy of a lymph node obtained from the anterior superior mediastinum was diagnostic of lymphosarcoma. Roentgen therapy, 3,150 r to the midmediastinum, was administered during forty days.
b. The patient was well and without clinical evidence of lymphosarcoma when this roentgenogram was made April 8, 1954.

irradiation, invariably ends by generalized involvement of visceral organs. In other respects lymphosarcoma may be rapidly malignant by widespread infiltration of important visceral organs. In the more slowly developing forms it ends in lymphatic organal and skeletal infiltration. With so many possibilities of clinical forms it is beyond the purview of this discussion to do other than present examples of the disease which are within the scope of irradiation, and in which worth-while and, at times, long palliation may be accomplished.

In children the disease is usually a fulminating one, although we have seen children with lymphosarcoma limited to one peripheral regional group of lymph nodes who, following irradiation, have remained well. Our more common experience is the massive mediastinal or abdominal involvement temporarily regionally controlled by irradiation, but with progression to lung and other organs. Intraspinal lymphosarcoma with cord paralysis (fig. 6 b) has been encountered but with later pulmonary spread. In all of these more massive forms in children, irradiation used cautiously will afford some relief of pressure and add to an all too brief span of life. In our experience it has not controlled the total disease.

We call attention to one particularly interesting form of lymphosarcoma observed in childhood (fig. 7). This is the ileocecal lymphosarcoma in which both grossly and microscopically the disease is indistinguishable from the more clinically highly malignant forms, and yet, following resection, may permit an unexpectedly long survival. In the case cited we did not follow resection with irradiation despite the presence of removed regional lymph nodes, pathologically indistinguishable from lymphosarcoma. Dr. Paul Lund, pathologist of the Swedish Hospital, has called attention to this unusual lesion from other similar cases which he has observed.

In the adult, lymphosarcomas of the stomach or ileocecum may be at times a primary and solitary form. They represent the bona fide reported cases of long survival following resection. We have seen these forms only in association with regional or more advanced disease and treated them both by irradiation alone and by surgery and irradiation. In 1 patient with ileocecal involvement found at laparotomy for obstructive intussusception and with regional lymphatic spread, resection and irradiation gave symptomatic relief from the abdominal disease until the patient died five years later from pulmonary infiltration. Also of interest in this respect is the patient (fig. 8) with the presenting disease as a destructive lesion of the mandible which was responsive to irradiation. Six months later he developed intestinal obstruction from a lesion in the ileum, which on resection was found to be lymphosarcoma and similar histologically to the tissue removed from the mandible. The patient died of other abdominal spread.

As in Hodgkin's disease the initial complaint may be due to the destruction of bone (fig. 8). In later and more generalized disease bone rarely escapes some degree of infiltration that does not add to the clinical problem.

Massive peripheral lymphadenopathies of lymphosarcoma are not uncommon but in our experience are only prodromal to a rather fulminating general-

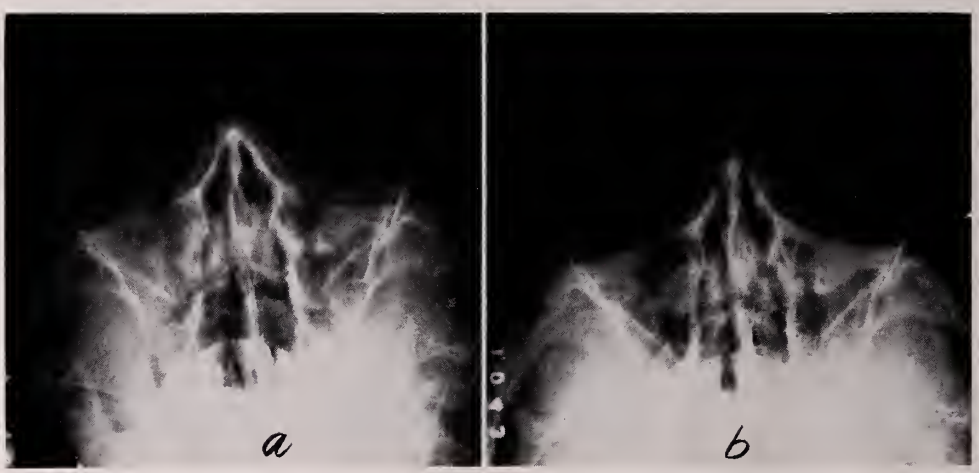

FIG. 10a. A 42 year old man suffered rapid swelling of the right side of the face for three months. Tissue obtained by incision through the tumor of the facial soft parts on the right was diagnosed as lymphosarcoma. A roentgenogram made October 23, 1950, showed a defect in the lateral inferior wall of the left antrum secondary to a shrapnel wound. Opacity of the right antrum with partial destruction of the medial, lateral, and anterior walls was evident. Tumefaction of the soft parts was palpable through the upper right gingival buccal sulcus. Roentgen therapy was applied, 800 kilovolts, 4,800 r minimal throughout the right maxillary region in forty-nine days.

b. A roentgenogram March 29, 1952, showed bone regeneration of the medial and lateral walls with aeration. The status of the patient was unchanged by 1954.

ized disease. As in Hodgkin's disease, mediastinal lymph node enlargement is common, and here also we have resorted to exploratory surgery of the superior anterior mediastinum to secure lymph nodes for diagnosis when peripheral lymph nodes were not available (fig. 9).

Lymphosarcoma of the tonsil, unilateral or bilateral, may be encountered as a primary complaint. In our experience it is more often seen in the elderly, producing a painless obstruction to swallowing, and may or may not be associated with cervical lymph node involvement. Although we have irradiated these patients sufficiently to produce complete regression of the tonsillar and lymph node masses, none have survived later visceral lymphosarcoma. The same sequence of events has followed the lymphosarcomas of the nasopharynx which we have irradiated. One patient with massive involvement of a maxillary sinus with bone destruction (fig. 10) has had apparently complete arrest of this seemingly primary focus for a period of four years. Despite a pathologic fracture in one rib two years after the original therapy, which was likewise irradiated, the patient's general condition still remains excellent. Later complications are anticipated.

In the irradiation of lymphosarcoma the volume of tissue irradiated in general is as large as can be tolerated and consistent with a dose within the involved structures of a minimum of 2,400 r to 3,000 r in three to four weeks. This is somewhat less than we attempt in Hodgkin's disease, but must be varied according to the individual status of each patient. As in Hodgkin's disease, as the patient advances in more generalized lymphosarcomatosis, it is important to give supportive treatment for anemia, fever, and infection and to use irradiation only for those complaints in which it can add to the patient's welfare without detracting from his energies and general condition.

As a striking example of supportive chemotherapy in lymphosarcoma, we may cite 1 case of a man, aged 46, who, three years after irradiation to multiple regional lymphosarcoma, entered a stage of severe anemia associated with massive enlargement of the liver. The patient has been kept going for an additional two years by cortisone; three episodes of severe bone marrow depression have been converted by transfusions and ACTH. During this period he has been able to work and live comfortably. Such a response as Dr. Crosbie has obtained in this patient is not usual, but the individual patient is not interested in statistics.

In relation to the hematologic picture in lymphosarcoma, one always must bear in mind that certain of these patients eventually develop leukemia, which in general has a rather rapidly fatal course.

GIANT FOLLICLE LYMPHOMA

I shall discuss only briefly giant follicle lymphoma, yet it is a syndrome of great interest and importance among the lymphomas. Its importance lies in its relatively benign natural course and the prognosis for many years of life which it may have. The pathologist can readily distinguish the microscopic form and thus initially alert the radiologist to the course which he may anticipate. The disease is also of interest in that it may be found in many and unexpected tissues and be highly susceptible to local control by external irradiation in minimal dosage. One not infrequently sees the patient with a history of painless, peripheral lymph node swelling for years which either may gradually enlarge to produce pressure and pain or later undergo rapid enlargement, finally bringing the patient to the physician. One also learns that the swellings may spontaneously diminish in size as we have observed by following certain cases objectively. Associated with peripheral lymphadenopathy one may find asymptomatic abdominal or hilar masses.

We have seen the disease on the cervix associated with cervical, inguinal, and hilar lymph node enlargement, but in a patient who initially sought help for pain in the mandible which was due to infiltration of bone by giant follicle lymphoma. She has since received irradiation to multiple fossae of skeletal, abdominal, thoracic, and cutaneous involvement, and yet six years after the onset of the disease remains in a relatively efficient condition. A patient, aged 72, treated in 1939 for a massive unilateral, cervical lymphadenopathy of giant follicle lymphoma, returned thirteen years later with the disease involving the nasopharynx and palate, and these were likewise controlled by irradiation. At age 87, he may still die of senility rather than lymphoma. A patient treated in 1938 for a large cervical mass died in 1952 under our care with extensive skeletal involvement by giant follicle lymphoma. For the majority of the intervening years she had lived comfortably.

As in the other lymphomas we do not attempt to irradiate all manifestations of involvement by giant follicle lymphoma unless they produce symptoms of pressure or pain. Irradiation is for symptomatic relief. The dose required to any one focus may not be more than 1,000 r to 1,500 r, and in many instances considerably less.

Giant follicle lymphoma is a disease par excellence for the beginning radiotherapist to establish his reputation among his colleagues, but he must be willing to accept the clinical care and repeated irradiation over periods of years which certain of these patients will require. He also must be willing, if he outlives

the patient, to carry him through a long and difficult end, which may be that of intestinal obstruction, uremia, or bone marrow failure. To a greater degree than lymphosarcoma certain of these patients end with leukemia.

Lastly (and it pertains to the management of the lymphomas in general and by whatever therapeutic agent), the physician responsible for the care of the patient must at the outset establish confidence. This he can best do if he discusses with the patient something of the general nature of the disease and assures him that though there may be reappearance of problems later, his condition is one which may receive help for long and unpredictable periods. It is only right to lend this encouragement, and by so doing the physician treats the patient as well as his disease.

ROENTGEN EXAMINATION OF THE UPPER GASTROINTESTINAL TRACT

J. E. MILLER, M.D., Dallas, Texas

THE diagnostic value of the roentgenologic examination of the upper gastrointestinal tract is recognized by the internist, the surgeon, and the radiologist. The general practitioner must be included in this group if this examination is to give maximum benefit to the largest number of people. There is no doubt this examination is the easiest to perform, discommodes the patient the least, costs less, and gives more information concerning the upper gastrointestinal tract than any other modality at our disposal. For this reason the four categories of physicians mentioned should know as much about the technical and interpretive phases of the examination as time will permit them to learn in one lifetime.

There is no more fascinating story in the annals of human endeavor than the discovery of x-ray. The development of this, the most important single method of physical diagnosis, to its present status is a subject for lifetime study to the radiologist. Roentgen's strange phenomenon announced on December 28, 1895, was destined to revolutionize the world. It is one of the ten most important scientific discoveries of all times.

Haschek and Lindenthal[3] in January of 1896, only one month after the publication of Roentgen's article, injected radiopaque material into the brachial artery of a dead body. They made the following observation: "Should it be possible through technical improvement to radiograph other portions of the body, this would open up a new field in diagnosis for the healing of the sick." It was apparent even then that diagnosis is of paramount importance if one is to heal the sick.

Hemmeter[4] in 1896, less than one year after Roentgen's original article, said: "I do not consider the use of the Röntgen method on account of its complexity and long duration of exposure as practical for determining the size and location of the stomach." Many men deserve credit for the remarkable advances in the examination of the gastrointestinal tract. Dr. Cannon[2] as a first year student at Harvard Medical School began his work on the upper gastrointestinal tract within a year of Roentgen's announcement of his discovery.

Physicists and engineers are responsible for the technical improvements which permit the diagnostic accuracy this examination now enjoys. One does not need to know all of the details regarding the structure of the roentgen apparatus. The details of the conduct of the examination, however, should be known to those who propose to perform it. Such information is usually given as generalizations and specific details are difficult to find. The real purpose for this paper is to discuss step by step one method of performing the "G I series."

There are three phases of the upper gastrointestinal tract examination which must be considered, namely, (1) technical performance of the examination, (2) recognition of abnormality, and (3) interpretation of abnormal findings.

The technical performance of the examination is the most important, since if it is inadequate, the last two will not be adequate. The acquisition of visual dexterity to observe the abnormality requires several years' experience and many mistakes. The ability to ascertain the exact nature of the lesion together with its histologic pattern is never adequately achieved, nor indeed is it always necessary. Since the technical aspects of this examination are inadequately performed by most physicians including many radiologists, I will dwell on this aspect of the problem.

Read as part of a symposium on lesions of the upper gastrointestinal tract before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

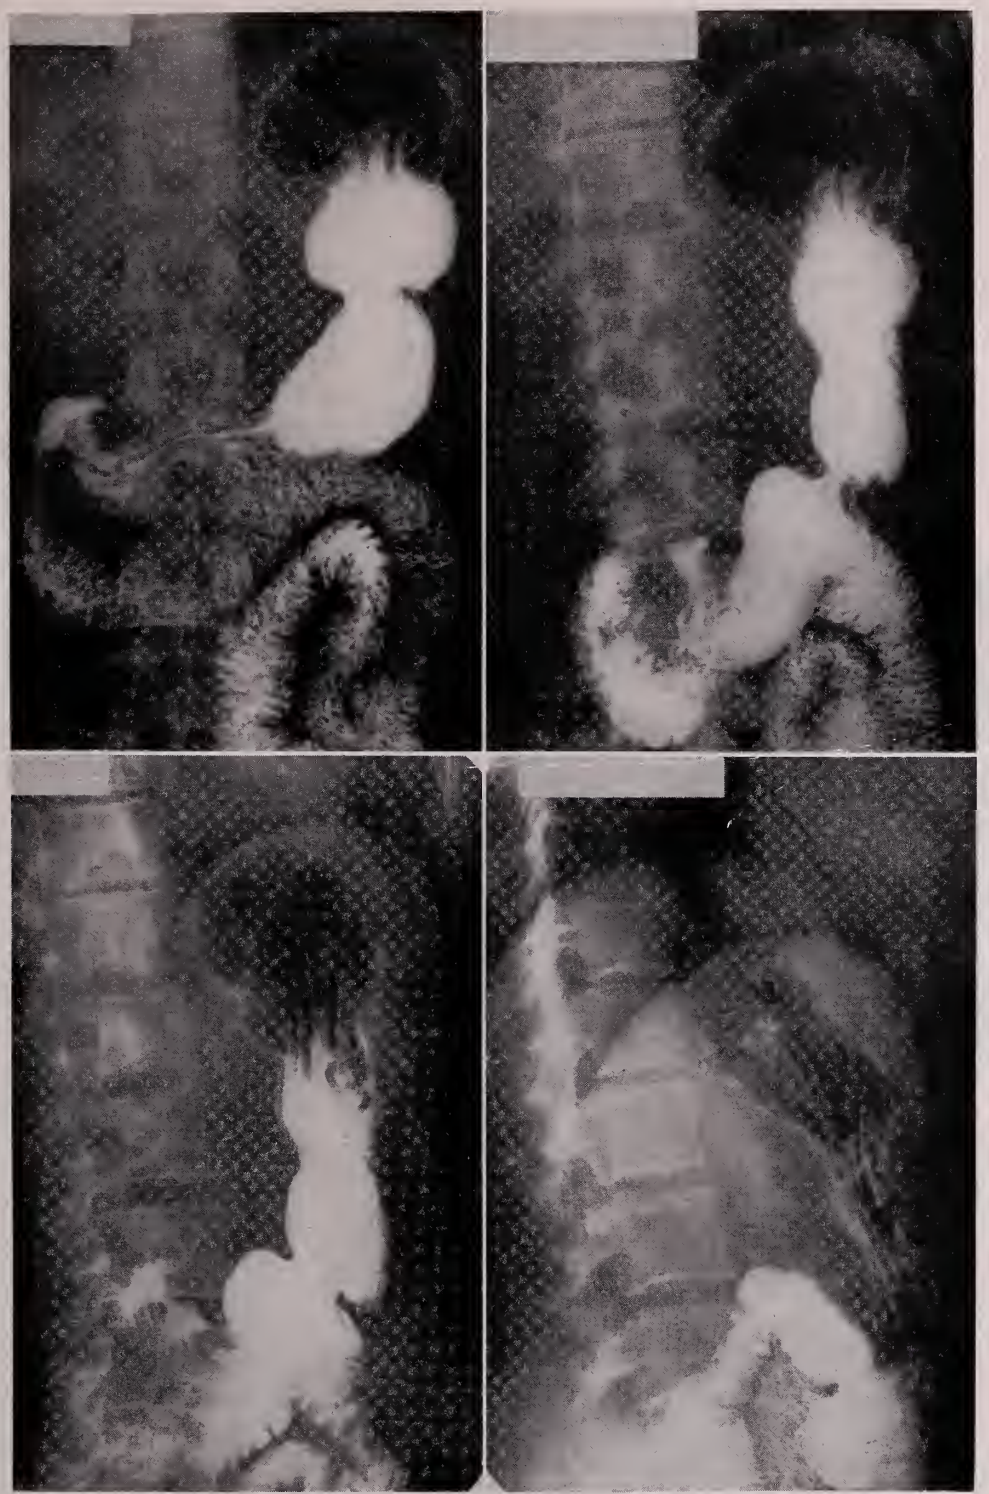

FIG. 1. Four roentgenograms made at the beginning of an examination of the upper gastrointestinal tract: a postero-anterior film *(upper left)*, two films of different obliquity *(upper right* and *lower left)*, and a right lateral film *(lower right)*.

TECHNIQUE

At 8 o'clock in the morning the patient who has had nothing by mouth since midnight is given 4 ounces of a mixture containing one part barium and two parts water. Within two minutes after the ingestion of the barium a series of four 10 by 12 inch films is started. After a straight postero-anterior film of the stomach, two films of different obliquity are made with the right side of the patient down, and then a true right lateral film of the stomach is obtained. After these four films are made, the patient is placed supine for a moment. The right side is then elevated about 15 to 30 degrees and the anteroposterior film of the stomach is made. All of these five films should be obtained in less than ten minutes from the time the patient ingests the barium. If the duodenal bulb does not fill during the course of this series of films, one may presume that pylorospasm

FIG. 2. An anteroposterior roentgenogram showing double contrast of the stomach and duodenal bulb.

or some other abnormality of the pyloric canal or the duodenal bulb exists.

Figure 1 shows the four films which are obtained initially. One notes that the mucosal folds throughout the stomach and duodenal bulb are well visualized since the proper amount of barium has been used. If one completely fills a hollow viscus with radiopaque material, one is likely to miss even a large lesion in this viscus. Too much barium in the stomach, therefore, will cause one to overlook many lesions. No more than 4 ounces of barium mixture should be placed in the stomach at any time. A measuring cup should be available and the technician instructed to have 4 ounces of barium in the cup. Figure 2 shows the anteroposterior film with double contrast of the stomach and the duodenal bulb. The barium gravitates to the fundus of the stomach and outlines the fundus well.

Immediately following these films, eight views of the distal end of the stomach and duodenal bulb are obtained on two 10 by 12 inch films. This is done by means of a polygraph board. This easily made simple device is of great importance in the performance of the examination. This board is a piece of lead which may be encased in plywood if desired, in the center of which a 5 by 6 inch aperture is cut. This piece of lead should be as wide as the table top and should be about 24 inches long. The patient is placed in the prone position on the polygraph board or "polyboard" as the technicians frequently call it. The technician should attempt to place the duodenal bulb over the 5 by 6 inch rectangular aperture as nearly as he possibly can. Then with the aid of the fluoroscope the duodenal bulb is placed directly in the middle of the polygraph aperture. The patient is turned to the desired obliquity and then turned flat in order to ascertain that the duodenal bulb and the distal end of the stomach will remain within the aperture during these maneuvers. The patient is then placed in the oblique projection and asked to remain in this position until four exposures of the duodenal bulb are made on one 10 by 12 inch film. This is accomplished by moving the cassette in the cassette tray beneath the table in such a manner that the four quadrants of the 10 by 12 inch film are placed beneath the aperture of the polygraph board. This is a simple technical procedure and is quickly mastered by the technician. The patient then rolls to the prone position and a second polygraph is obtained. If this procedure has been done correctly, the duodenal bulb and distal end of the stomach still will be within the aperture, since this has been tested with fluoroscopic control. Here on two 10 by 12 inch films the most vital area of the gastrointestinal tract is obtained with eight exposures in two different projections.

The total elapsed time thus far should be no longer than twenty minutes. If it is necessary to add more barium for the polygraphs, the person doing fluoroscopy will see this need immediately and ask the patient to take 2 ounces.

Moving the cassette for the polygraphs in the bucky tray may require a little experimentation by the technician. Since most trays are not quite long enough it may be necessary to move the entire tray a slight amount after two exposures have been made at one end of the film. Accurately to place one quadrant under the aperture in the polygraph board a block of wood cut to the proper width may be placed next to the cassette in the tray and the lock engaged. On the second exposure if the block of wood is placed

on the other side of the cassette, the second quadrant will be in proper position.

Figure 3 shows one polygraph of the duodenal bulb and distal end of the stomach obtained by this technique.

These seven 10 by 12 inch films are processed and are available for inspection within an hour of the time the last film is made. Fluoroscopic examinations are started at 10 o'clock about two hours after the ingestion of the barium. Much of the disease that is found in the upper gastrointestinal tract thus will be already apparent to the person who is to do the fluoroscopy. There may be some criticism that one who sees the roentgenograms before the fluoroscopy will be prejudiced. This challenge implies that the fluoroscopist does not examine all areas with equal care. There should be a reasonable routine for the fluoroscopic examination of the upper gastrointestinal tract. After this routine has been accomplished the fluoroscopist should concentrate on the area which may be in question from an objective inspection of the films. I am glad to be criticized for examining certain areas more in detail since this has saved many repeat examinations which have to be done when the fluoroscopic examination precedes the radiographic examination. The screen examina-

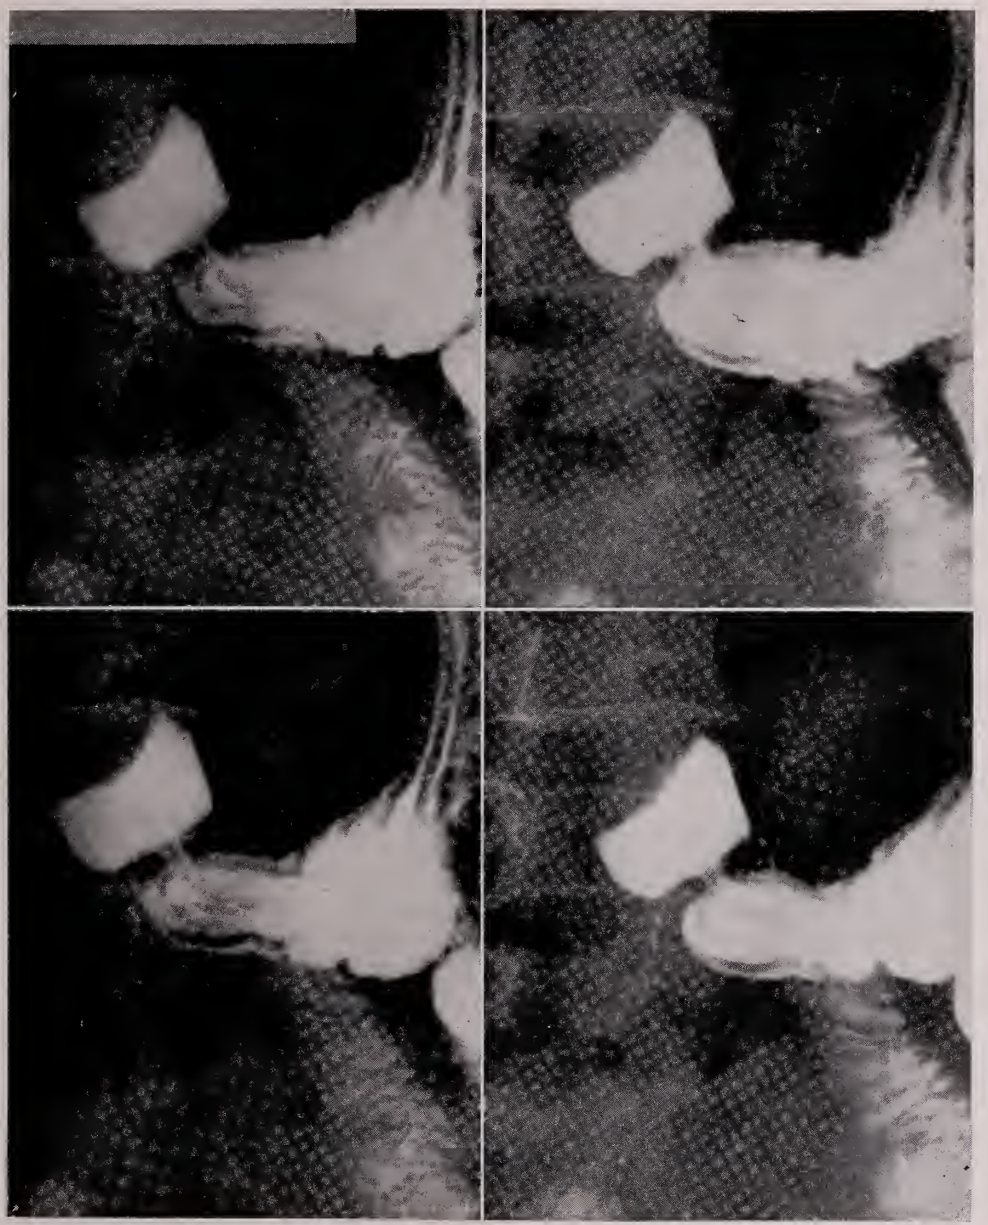

FIG. 3. One of two polygraphs of the duodenal bulb and distal end of the stomach. This series was made with the patient in an oblique position. A second series of four pictures on a single 10 by 12 inch film is made with the patient prone.

tion immediately gives more information concerning the physiology of the upper gastrointestinal tract than is obtained with antecedent fluoroscopy. Most of the small bowel will be visualized at this time some two hours after the administration of the barium. If any retention is present in the stomach, this can be noted and its significance evaluated. At the time of fluoroscopy again only 4 ounces of barium is permitted in the cup.

During the screen examination one should be able to obtain spot films of what is seen. It is also desirable to have pressure spot films. Many physicians who do the gastrointestinal tract examination do not have a spot film device, and most of those who do, have inadequate devices. This spot film device should be used to confirm what one sees or what one thinks one sees during the screen examination. I do not believe that one should talk about a lesion he has seen fluoroscopically unless he can demonstrate it on film. It seems impractical to obtain spot films of the entire gastrointestinal tract. If there is any suggestion of abnormality in an area, one should not hesitate to obtain as many spot films as seems reasonable.

The stomach is usually empty at the beginning of fluoroscopy. The patient is asked to take a small swallow of barium and this is watched from the time it enters the mouth until it enters the stomach. This swallow is usually taken with the patient facing the

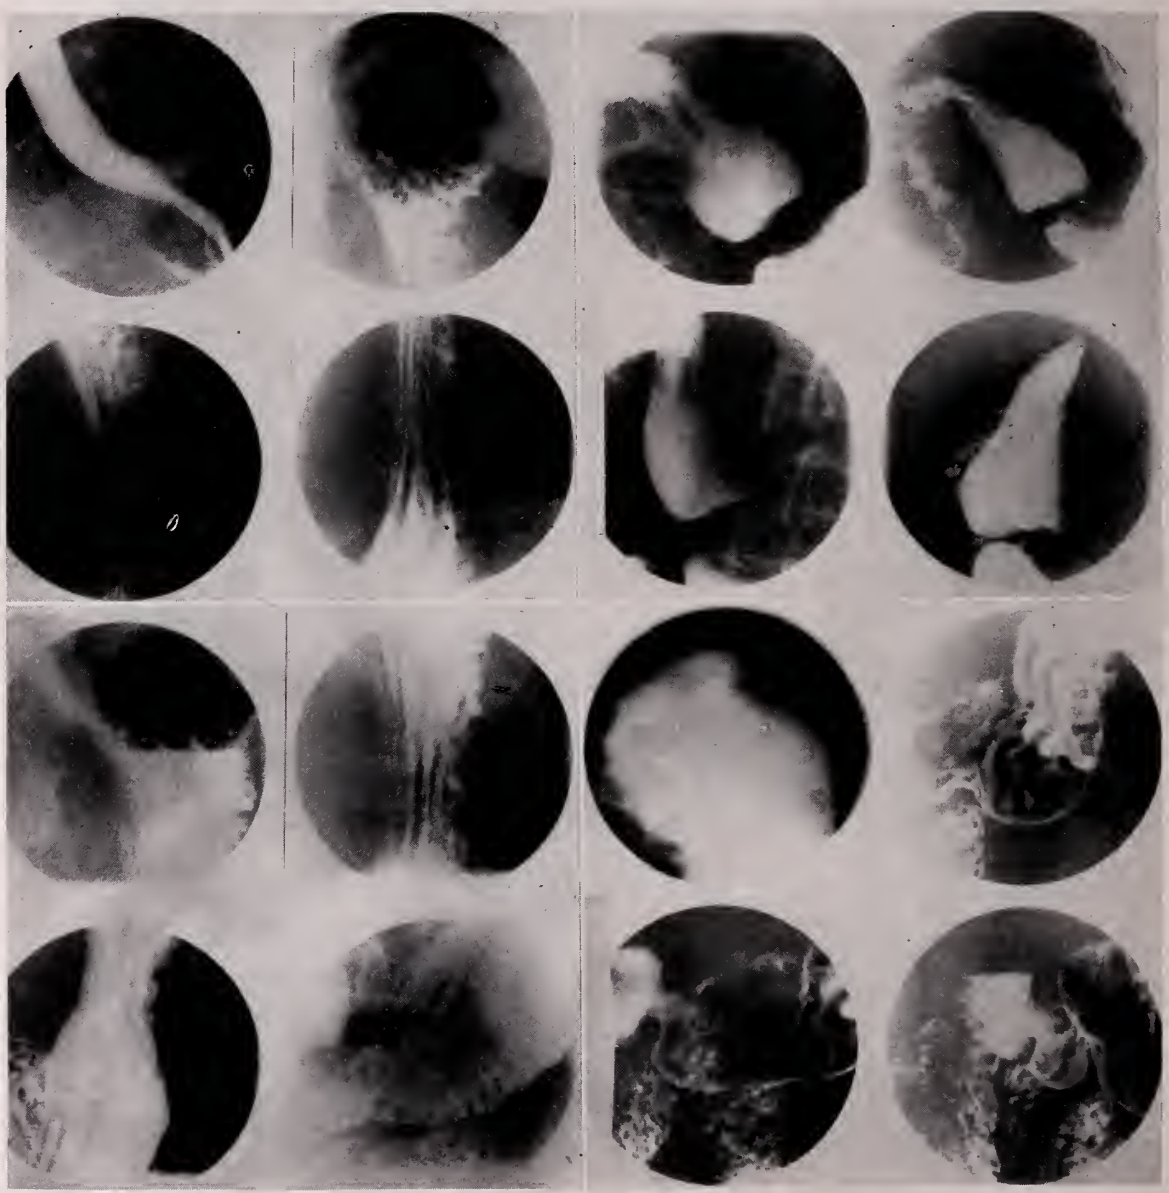

FIG. 4. Spot films of the esophagogastric junction, the stomach, and the duodenal bulb made during the fluoroscopic examination.

fluoroscopist. The patient is then turned into a right anterior oblique projection and a second swallow is observed as it passes through the mouth, the pharynx, and the esophagus. The detail of esophageal visualization is so good that films are not obtained unless there is an indication from the clinical story or from the fluoroscopic visualization. The patient is examined by fluoroscopy in the upright and horizontal positions. In fact it is routine to place the head down slightly and observe whether or not a hiatus hernia can be seen. Various maneuvers are used to try to visualize a hiatus hernia. If such a hernia is suspected clinically, polygraphs of the esophagogastric junction are obtained in the same manner as those which are obtained of the duodenal bulb. The only difference is that a thick barium paste is used so that it will stick in the esophagus. Figure 4 shows a series of spot films of the esophagogastric junction, the stomach, and the duodenal bulb that are usually obtained as a routine.

FIG. 5. Final roentgenogram of the examination showing a postero-anterior view of most of the small bowel.

After the fluoroscopic examination a 14 by 17 inch film of the abdomen made postero-anteriorly is obtained. This can be made immediately after the fluoroscopic examination, but it is desirable to wait about thirty minutes. The patient is given an additional 2 ounces of barium before this film is made. By this technique the barium given originally in the morning is usually in the terminal ileum, the cecum, and ascending colon. That given during the screen examination is filling the jejunum. Since information concerning the retention of barium already has been obtained during the screen examination another 2 ounces is given in order to obtain an additional film of the stomach. This film is made slightly high to show the diaphragm. On this film have been seen many hiatus hernias which were missed during the entire series of films and during the screen examination. Hence, it is advisable to take the film high enough to show the fundus of the stomach and the esophagogastric junction.

The entire course of this examination usually consumes about three hours of the patient's time and hardly ever more than four hours. For survey purposes the small bowel examination obtained on the 14 by 17 inch film is usually adequate. If there is a clinical indication, however, a 14 by 17 inch film should be obtained every hour until the cecum is visualized. I see no purpose in returning the patient for further films, and certainly the twenty-four hour film so frequently made does not have enough value to warrant the patient's return.

Figure 5 shows the 14 by 17 inch film made at the end of the examination with a fairly good visualization of most of the small bowel.

SUMMARY

A brief history of the development of the upper gastrointestinal tract examination is given. Its paramount importance in diagnosis of lesions of the upper gastrointestinal tract is stressed. Technical details for performing an adequate upper gastrointestinal tract examination are given. A technician following instructions given in this presentation can produce a set of roentgenograms adequate for interpretation by anyone competent to do so.

PEPTIC ULCER IN CHILDREN

LESLIE L. LEMAK, M. D.; PALMER E. WIGBY, M. D.;
and JOHN E. MARTIN, M. D., Houston, Texas

THERE is ample evidence of peptic ulcer in children, as is well indicated by numerous articles in the literature on the subject. The purpose of this paper is to present 6 cases of peptic ulcer in children. Etiology and pathology are not considered in detail. These 6 cases demonstrated roentgen evidence of the disease on initial examination. A follow-up of 2 of these cases is presented. One case showed complete clearing of the disease, both clinically and on roentgen examination. The other case showed roentgen evidence of persistence of the disease despite intensive medical therapy.

CASE 1 (fig. 1).—A. G., a 10 year old girl, offered the chief complaint of vague pain in the abdomen. The history showed that she had been somewhat nervous and irritable the past few months and was finicky about her food. Initial examination on November 6, 1953, showed duodenal ulcer; a second examination November 23 showed no evidence of ulcer.

CASE 2 (fig. 2).—P. B. was a 10 year old girl whose chief complaint was pain in the stomach for three weeks. Past history showed she had had a dietary problem for two years. She would vomit on occasions when upset. Initial roentgen examination on October 29, 1953, showed a deformity of the duodenal cap with a duodenal ulcer. The condition was still in evidence November 28.

The following four cases show roentgen evidence of duodenal disease. Follow-up studies have not been made as yet.

CASE 3 (fig. 3).—C. A. G., 7 years old, presented a history of pain in the stomach for two years, and vomiting the week prior to examination.

CASE 4 (fig. 3).—P. I., 10 years old, offered the chief complaint of pain in the lower part of the abdomen. The patient would have attacks about once a day, lasting from two to four hours. The first examination was February 12, 1954.

CASE 5 (fig. 4).—D. S., 10 years old, presented as the chief complaint pain in the upper part of the abdomen. The patient was a very nervous child and had morning nausea with occasional vomiting. The initial examination was February 2, 1954.

CASE 6 (fig. 4).—D. C., 12 years old, had pain in the epigastrium. Nausea and vomiting occurred every day for a week prior to examination.

An interesting parallel of the first 2 cases is the psychosomatic background. Both girls were nervous and irritable on initial examination, whereas only the second patient showed no change in her personality on the follow-up examination. The longstanding history of the second patient as to dietary habits and maladjustments to her family problems indicate the psychosomatic element. This girl probably would benefit more from psychiatric care. The first girl's symptoms and roentgen evidence of disease were relieved by medical management and possibly may have had a dietary cause.

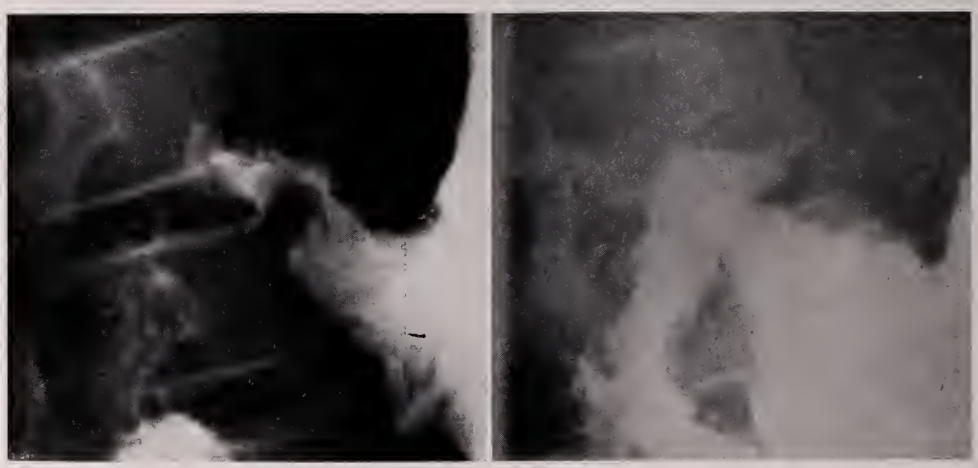

FIG. 1. Case 1. Evidence of duodenal ulcer in a 10 year old girl in a roentgenogram made November 6, 1953 *(left)*, has disappeared by November 23 *(right)*.

DISCUSSION

Peptic ulcer in infancy (newborn to 2 years of age) may have an acute onset with minimal premonitory signs. The majority of the lesions in this age group either bleed profusely or perforate. The literature we covered showed that there was no consistency in the symptoms of children with this dis-

Read before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

ease. Bird and his co-workers have shown that in early infancy the ratio of gastric to duodenal ulcers is approximately 2 to 1. We found this even higher in a review of 18 cases of peptic ulcer in 6,500 admissions in Children's Hospital of Michigan in Detroit in 1950. In children older than 2 years duodenal lesions occur from three to five times more often than gastric ulcers. Bird also found that bleeding, perforation, stenosis, and pain, in that order of frequency, may be expected in patients younger than 2 years. After the age of 2 years the evidence of bleeding and perforation diminishes and symptoms are more in line with those of chronic duodenal ulcer in the adult. The symptomatology in peptic ulcer in children, in general, follows a less distinct pattern than in the adult.

The most frequent complaint as reported by Jenkins was vague upper abdominal pain in the great majority of 80 cases. This also was the predominating complaint in the cases we are presenting.

In Alexander's series, 3 of the patients previously had been operated upon for appendicitis (as reported by Dr. R. H. Morgan). In these 3 patients the episodes of nausea and vomiting were frequently severe and the anorexia was sufficiently prolonged to produce weight loss.

The differences in the symptom complex between ulcer in childhood and in the adult might be due to the fact that the erosion of the ulcer in childhood is usually shallow and superficial, whereas in the adult it is undoubtedly deeper and frequently penetrates or perforates. This is obvious when one considers the comparative anatomy of adults and children. In children and infants the stomach wall is thinner and the ulcer naturally more shallow. In adults the greater thickness of the stomach would allow for a deeper ulcer crater and therefore more chronicity of symptoms before perforation.

FIG. 2. Case 2. Deformity of the duodenal cap with a duodenal ulcer in a 10 year old girl, evident upon initial examination October 29, 1953 *(left)*, continues to show on roentgenograms made November 28 *(right)*.

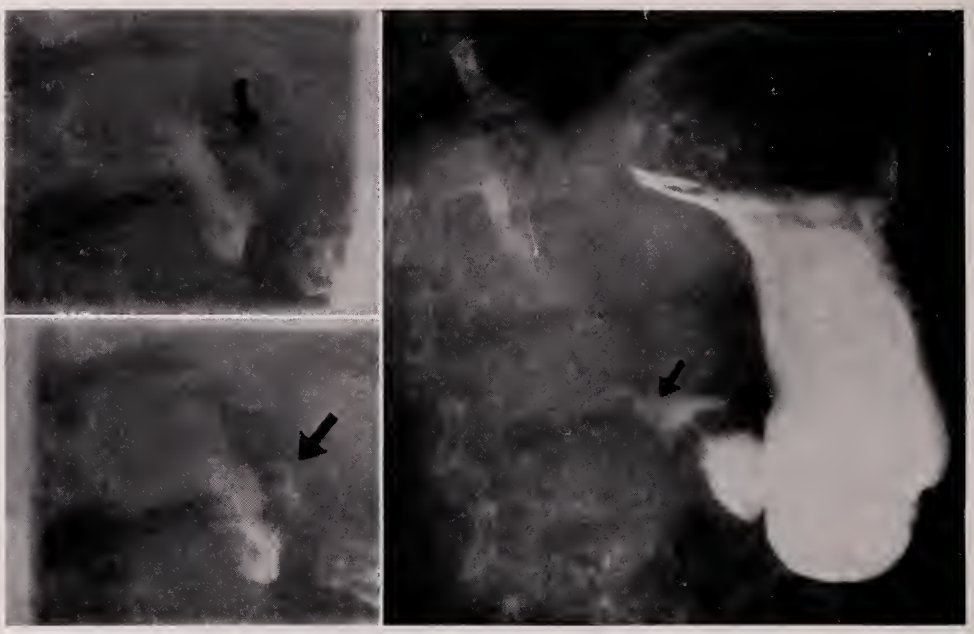

FIG. 3. Cases 3 and 4. Evidence of ulceration in a 7 year old patient in films made March 23, 1954 *(left)*, and in a 10 year old patient in a film made February 12, 1954 *(right)*.

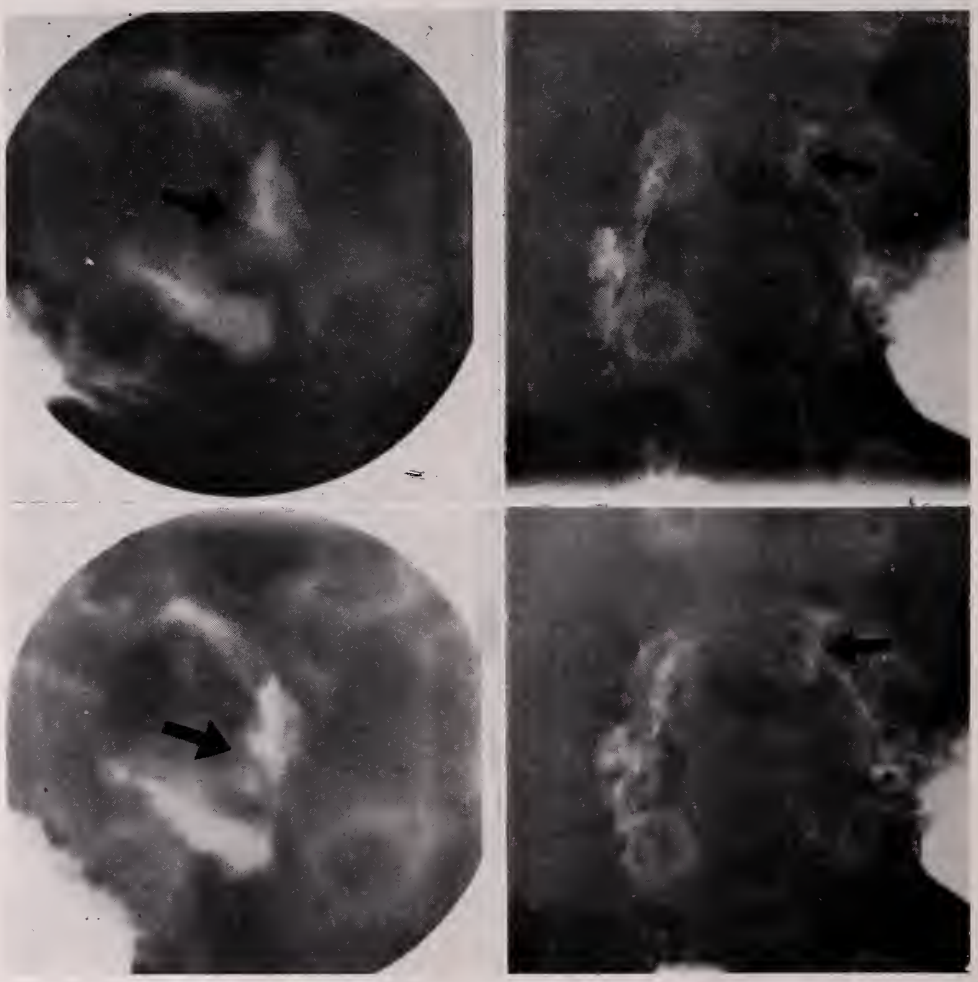

FIG. 4. Cases 5 and 6. Evidence of ulceration in a 10 year old child in roentgenograms made February 2, 1954 *(left)*, and in a 12 year old child in films made January 11, 1954 *(right)*.

The diagnosis of peptic ulcer in children is primarily a roentgenologic procedure with the technique similar to that used in adults. Difficulties in the examination, however, will be frequently encountered from the standpoint of patient cooperation. We believe that spot films are necessary, but they sometimes are difficult to obtain. It is probable that a good many duodenal ulcers in children have been missed in the past because the examiner failed to obtain spot films. Another reason why the usual care in examination is not exercised is that some examiners do not realize that there is a relatively high occurrence of peptic ulcer in children and so do not go to the trouble of making a careful examination, including spot films. All of the illustrations in this paper are based on spot film demonstrations of the ulcer crater.

ABSTRACT OF DISCUSSION

DR. A. G. BARSH, Lubbock: In discussing duodenal ulcers in children, I will give primarily my experience, which has been in examining a relatively large number of children from the ages of 4 to 12 years for possible duodenal ulcer since the pediatricians referring work to me have been rather conscious of that possibility. In a report in 1952, Dr. Arthur Jenkins[3] referred to 85 positive cases of duodenal ulcers. It was my privilege to do most of these examinations.

I find that the differential points for the diagnosis of duodenal ulcers in children vary some from adults in that the deep ulcer niche is not observed as it is in adults in most cases. There is an occasional perforating type of ulcer, but most of the cases are superficial ulcers. The proof of the presence is primarily in finding the ulcer and, after a course of treatment, in a reexamination being negative. Obviously, autopsy reports are not available for proof of the diagnosis. I find too that the mobility of the small child's intestine is such that the retention of barium in superficial craters is relatively more difficult than in adults. The matter of cooperation on the part of the patient also makes the examination more difficult. It has been my experience that few of these cases have recurrences; I make that comment because of the relatively few reexaminations I do after the patient has once recovered.

I would like to call attention to one youngster who happened to be a pediatrician's only son on whom I made a diagnosis of a duodenal ulcer. This pediatrician was not completely convinced, and the child was reexamined in St. Louis Children's Hospital with confirmation of the diagnosis. Under therapy this youngster recovered; however, the primary part of this therapy was getting the home situation corrected. The father was in military service and the family was moving about with the father; the home situation was very unstable. When the patient was brought back to the permanent family home and kept there under proper care, the duodenal ulcer responded satisfactorily. I make that point because I think we must recognize that the emotional factor in children is probably much more important than any "acid factor" which we consider so important in adults. We do not think of stress and strain in a child in the same terms of that produced in an adult, but we do have it created by psychologic circumstances.

I would like to mention another case of duodenal ulcer in a 7 year old child who had a mother with marked impairment of her hearing. This child had to do the listening for the mother, who could read his lips although she was not able to read the lips of other people. Consequently he was the interpreter for this woman in all her daily affairs in running a home. This put undue strain on the child, as one could readily see, and produced a duodenal ulcer. The correction of this situation has not been so simple.

I am much aware of the possible family conflicts being a causative factor in duodenal ulcers, and I always like to report these to the referring physician if I may sense anything irregular in the conduct of the child in relation to the family or in the misconduct of either parent. I am convinced that the psychosomatic approach in this problem outweighs the organic element as we think of it in the adult case.

I have had one child go on from the original diagnosis of ulcer at the age of 12 years in 1941 to perforation into the pancreas in 1949. He had a partial resection of the stomach and has done well since that date.

NEW USE FOR CORTISONE

Cortisone has been found useful in treating two serious infectious diseases, three articles in the October 2 *Journal of the American Medical Association* reported.

Physicians in Bombay, India, working with an American visiting professor, Dr. Roger A. Lewis, Baltimore, found that cortisone helped reduce spasms, breathing difficulty, muscle rigidity, fever, and deaths from tetanus. The American doctor, a member of the World Health Organization, working with Drs. Rajaninath S. Satoskar, Gopalkrishna G. Joag, Bhalchandra T. Dave, and Jamnauas C. Patel, all of Bombay, treated 20 cases of severe, quick-acting tetanus with cortisone and hydrocortisone. Eight patients survived, and only 3 of 20 similar patients not given these hormones survived, they reported.

Three Philadelphia physicians said that cortisone helped reduce such symptoms as fever, mumps-like swelling, and eye inflammation accompanying sarcoidosis. They reported the most dramatic response to cortisone in patients with swelling and fever, and the response of those with eye infections "was almost equally prompt and striking." They noted that their study may help in finding clues to the cause of the disease. This study was made by Drs. Harold L. Israel, Maurice Sones, and Dick Harrell.

Three Cleveland physicians, Drs. Paul H. Curtiss, Jr., William S. Clark, and Charles H. Herndon, sounded a warning note about prolonged treatment with cortisone and corticotropin. They said they believed bone fractures suffered by 4 patients studied were the result of overlong treatment with the hormones, which tended to remove minerals from the skeleton.

MANAGEMENT OF RECTAL POLYPS

JOHN P. HEANEY, M. D., F.A.C.S., and ASA BEACH, M. D., F.A.C.S., San Antonio, Texas

THERE has been a widespread tendency in the past to rely on the use of roentgen-ray study to determine the presence or absence of polyps in the large bowel and rectum. This tendency has been carried to the point that even simple digital rectal examination is too often omitted. The use of the sigmoidoscope in some institutions has been confined to cases in which the patient had compelling signs and symptoms which pointed to a rectal disorder. These are a sense of incomplete evacuation, tenesmus on defecation, and passage of bright red blood in large quantity either with the stool or immediately after evacuation. Failure to perform an adequate rectal examination either by digital means or by use of the sigmoidoscope has been due in part to lack of appreciation of the limitations of roentgen-ray diagnosis and in part to frank haste and/or laziness on the part of the examiner.

There are accumulating data to make one realize that careful sigmoidoscopic examination should be performed with greater frequency both in the infant[5, 6] and in the adult.[4, 9] Welch[10] has stated that one should not treat a patient with chronic anemia, hemorrhoids, or chronic diarrhea without a careful, complete examination of the entire gastrointestinal tract. This of necessity requires examination of the rectum by means of the index finger and the sigmoidoscope. Still another group of patients should be included in this category, that is, the group of patients with vague, ill defined abdominal symptoms which point to no special anatomic system.

There is further ample evidence to indicate that the yield from careful examination of this type is gratifying in terms of disease detection and cancer prevention. Swinton[9] has noted that in a consecutive series of 150 patients, exactly 15 were found to have benign polyps within reach of the sigmoidoscope. Fifty-two per cent of all polyps of the large bowel are within reach of the standard instrument, according to the autopsy figures presented. These polyps occur in both sexes and at all ages, being slightly more common in adult males. They are true tumors and constitute the source of origin of a high percentage of malignant lesions of the colon and rectum.[9]

If the lesions are dealt with in the precancerous stage, ablation of polyps is simple, whereas if they are left until cancer has developed, necessitating loss of the rectum, the morbidity and mortality are magnified many times.

Boehme[3] in 1950 described a new "suction-cautery" technique for eradication of polyps within reach of the sigmoidoscope. His method is simple but effective and deserves wide adoption. By this method, the dual purpose, metallic suction tip is used to grasp the polyp. Thus held, the tissue is fulgurated with the suction tip which also serves as the electrode. Even when the adenoma is small and sessile, the presence of a well developed, loose submucosal stratum permits the lesion to be pulled away from the wall in such a fashion that a pedicle or fold of normal mucous membrane is created. Instead of applying pressure with the cautery, the lesion is gently drawn into the scope away from the underlying stratum of the bowel wall and fulgurated while in that position. The advancing margin of the zone of electronecrosis can be readily seen as it ascends the pedicle and radiates circumferentially at its base. Smoke is evacuated simultaneously through the suction apparatus. The extent of fulguration can be controlled with great accuracy (fig. 1).

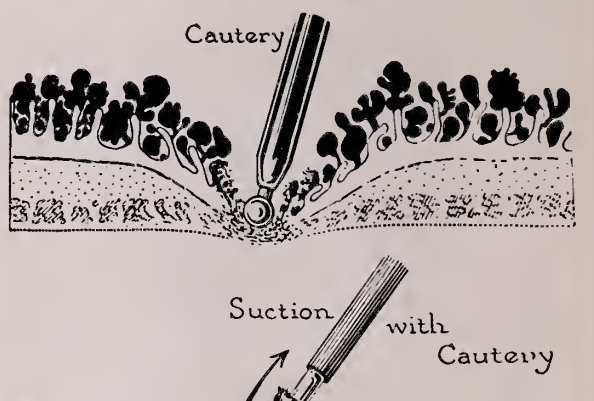

FIG. 1. The upper sketch illustrates conventional ball-point fulguration. Destruction may include adjacent mucosa and bowel wall as the polyp is pushed about by the electrode. The lower sketch shows destruction of a polyp while it is held away from the bowel wall by the "suction-cautery" technique. The apparatus used is an ordinary bronchoscopic suction instrument insulated except at each end by a sheath of plastic or rubber tubing. (After Boehme, E. J.: Surgical Treatment of Familial Polyposis of Colon, Report of Seven Cases, Six in One Family, Ann. Surg. *131*:519-533 [April] 1950.)

Whereas the monopolar current has been used with satisfaction by Boehme and by others,[3, 8] we have used, after work in the animal laboratory, a

bipolar, mixed fulguration and high frequency cutting current. This type of current is stronger in terms of tissue destruction and therefore must be used cautiously. We believe that it is better to destroy a small peripheral zone of normal tissue than to destroy the adenoma incompletely. There is scarcely any danger of bowel perforation when Boehme's technique is employed.

Most polyps of the rectum can be treated by fulguration without biopsy.[9] To us it has seemed simple, with use of appropriate forceps, to obtain a biopsy specimen in order to be certain that the lesion is an adenomatous mucosal polyp. It is then obliterated by means of the technique described. If there are multiple polyps, only one or more of the largest are subjected to biopsy. There is a tendency, however, if one relies solely on the microscopic picture of these lesions, to overgrade them in the malignant direction and recommend unnecessarily radical operative procedures. The gross appearance of the lesion usually will serve to distinguish the adenomatous polyp from the more dangerous villous, papillary type of polyp.[1, 9] This appearance combined with the microscopic picture usually will settle the issue wisely in favor of the more conservative treatment plan.

Electrical ablation of polyps of the rectum in the precancerous stage has been found to be so satisfactory that it is now agreed by most authorities that even patients with familial polyposis of the colon, which is acknowledged to be a 100 per cent precancerous disease, should have a total excision of the part of the large bowel above reach of the sigmoidoscope, followed by an end-to-end ileoproctostomy.[2,3,8] Later, polyps within the rectum are controlled by means of periodic sigmoidoscopic examination and electrofulguration.

SUMMARY

A plea is made for more frequent use of the sigmoidoscope in examination and treatment. The conditions in which this is desirable are listed. An improved technique for the destructon of rectal polyps is presented.

Texas Dermatological Society, Fort Worth, April 24, 1955. Dr. Paul H. Power, Waco, Pres.; Dr. Thomas L. Shields, 1216 Pennsylvania Ave., Fort Worth, Secy.

Texas Diabetes Association, Fort Worth, April 24, 1955. Dr. George M. Jones, Dallas, Pres.; Dr. Hugo Engelhardt, P. O. Box 2180, Houston, Secy.

Texas Division, American Cancer Society. Mr. Travis Wallace, Dallas Pres.; Mr. J. Louis Neff, 1609 Colorado, Austin, Executive Director.

Texas Geriatric Society. Dr. Henry H. Niehuss, Longview, Pres.; Dr. Frank V. Mondrik, 214 Bramlette Bldg., Longview, Secy.

Texas Heart Association, Fort Worth, April 25, 1955. Dr. George R. Herrmann, Galveston, Pres.; Mr. Edgar M. Brown, Jesse H. Jones Library Bldg., 1133 M. D. Anderson Blvd., Houston, Executive Director.

Texas Hospital Association, Houston, April 12-14, 1955. Mr. W. U. Paul, El Paso, Pres.; Mrs. Ruth Barnhart, 2210 Main St., Dallas, Secy.

Texas Neuropsychiatric Association. Dr. Edgar S. Ezell, Fort Worth, Pres.; Dr. Bruce H. Beard, 1519 Pennsylvania, Fort Worth, Secy.

Texas Orthopedic Association, Fort Worth, April 25, 1955. Dr. Brandon Carrell, Dallas, Pres.; Dr. Margaret Watkins, 3629 Fairmount St., Dallas, Secy.

Texas Pediatric Society, Galveston, October, 1955. Dr. M. C. Carlisle, Waco, Pres.; Dr. James N. Walker, 3616 Tulsa Way, Fort Worth, Secy.

Texas Proctologic Society. Dr. Jack Kerr, Dallas, Pres.; Dr. John McGivney, 2202 Avenue L, Galveston, Secy.

Texas Public Health Association, Galveston, Feb. 13-16, 1955. Mr. Ed Riedel, Austin, Pres.; Mr. H. E. Drumwright, City Health Department, Dallas, Executive Secy.

Texas Radiological Society, Houston, Jan. 21-22, 1955. Dr. E. F. Lyon, Jr., San Antonio, Pres.; Dr. R. P. O'Bannon, 650 Fifth Ave., Fort Worth, Secy.

Texas Railway and Traumatic Surgical Association, Fort Worth, April 25, 1955. Dr. Raleigh White, Temple, Pres.; Dr. W. D. Marrs, 306 Broadway, Fort Worth, Secy.

Texas Rheumatism Association. Dr. Alfred W. Harris, Dallas, Pres.; Dr. Charles H. Cornwell, Marlin, Secy.

Texas Society for Mental Health, Mineral Wells, 1955. Dr. Charles N. Burrows, San Antonio, Pres.; Mrs. Elizabeth F. Gardner, 2504 Jarratt Ave., Austin 3, Executive Secy.

Texas Society of Anesthesiologists, Fort Worth, April 24, 1955. Dr. Frank O. Barrett, El Paso, Pres.; Dr. Milton M. Rosenzweig, 200 Wildwood Dr. E., San Antonio, Secy.

Texas Society of Gastroenterologists and Proctologists, Fort Worth, April 25, 1955. Dr. Charles Hardwicke, Austin, Pres.; Dr. W. T. Arnold, 1402 Hermann Prof. Bldg., Houston, Secy.

Texas Society of Ophthalmology and Otolaryngology, San Antonio, Dec. 3-4, 1954. Dr. John L. Matthews, San Antonio, Pres.; Dr. Gatlin Mitchell, 1604 Medical Arts Bldg., Fort Worth, Secy.

Texas Society of Pathologists, Dallas, Jan. 30, 1955. Dr. John J. Andujar, Fort Worth, Pres.; Dr. Lloyd R. Hershberger, Shannon Memorial Hospital, San Angelo, Secy.

Texas Surgical Society. Dr. Dudley Jackson, Sr., San Antonio, Pres.; Dr. Albert W. Hartman, 414 Navarro St., San Antonio 5, Secy.

Texas Tuberculosis Association, Galveston, April 15-16, 1955. Mrs. Joella Terrill Butler, Wichita Falls, Pres.; Miss Pansy Nichols, 2406 Manor Rd., Austin, Executive Secy.

Texas Urological Society, Corpus Christi, Feb. 27-28, 1955. Dr. S. J. R. Murchison, Fort Worth, Pres.; Dr. A. J. Ashmore, 255 Medical Dental Bldg., Corpus Christi, Secy.

West Texas Surgical Society, Dec. 8, 1954. Dr. J. A. Shapira, Midland, Pres.; Dr. Milton J. Loring, 304 North N St., Midland, Secy.

DISTRICT

First District Society, Pecos, 1955. Dr. John W. O'Donnell, Alpine, Pres.; Dr. H. D. Garrett, First National Bldg., El Paso, Secy.

Second District Society. Dr. John R. Mast, Midland, Pres.; Dr. M. J. Loring, 304 North N St., Midland, Secy.

Third District Society, Borger, April, 1955. Dr. M. C. Overton, Jr., Pampa, Pres.; Dr. William Klingensmith, 215 Fisk Bldg., Amarillo, Secy.

Fourth District Society, Brownwood, October, 1955. Dr. James N. White, San Angelo, Pres.; Dr. Joe B. Stephens, Bangs, Secy.

Fifth and Sixth Districts Society, Corpus Christi, July 7-9, 1955. Dr. John J. Sloan, Corpus Christi, Pres.; Dr. E. Jackson Giles, Medical Center, Suite 42, Corpus Christi, Secy.

Seventh District Society, Austin, Feb. 17, 1955. Dr. William McLean, Austin, Pres.; Dr. John Rainey, 1709 San Antonio, Austin, Secy.

Eighth District Society, Galveston, 1955. Dr. George E. Glover, Jr., Victoria, Pres.; Dr. York Lancaster, Port Lavaca, Secy.

Ninth District Society, Houston, March 17, 1955. Dr. Thomas H. Giddings, Brenham, Pres.; Dr. Lyman C. Blair, 1212 Rothwell, Houston, Secy.

Tenth District Medical Society, Port Arthur, Nov. 16, 1954. Dr. John M. White, Port Arthur, Pres.; Dr. Rider Stockdale, Jasper, Secy.

Eleventh District Society, Dr. Porter Bailes, Tyler, Pres.; Dr. Hugh F. Rives, Jacksonville, Secy.

Twelfth District Society. Dr. Neil Buie, Marlin, Pres.; Dr. Paul H. Mitchell, Corsicana, Secy.

Thirteenth District Society, Abilene, March 2, 1955. Dr. Mal Rumph, Fort Worth, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteeoth District Society. Dr. J. David Thomas, Denton, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Mount Pleasant, 1955. Dr. R. L. Johnson, Mount Pleasant, Pres.; Dr. R. L. Hardman, Mount Pleasant, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 14-17, 1955. Dr. Lawrence B. Sheldon, Dallas, Pres.; Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco. Dr. Ross Shipp, Waco, Pres.; Dr. Milton Spark, 3805 Herwal, Waco, Secy.

International Medical Assembly of Southwest Texas, San Antonio, Jan. 24-26, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 7-10, 1955. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference. Dr. L. N. Simmons, 1518 Tenth St., Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas. Dr. Edward T. Smith, 906 Hermaon Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

TEXAS RHEUMATISM ASSOCIATION TO MEET

A day-long scientific session featuring Dr. Joseph J. Bunim, director of the National Institute of Arthritis and Metabolic Diseases, Bethesda, Md., will be held by the Texas Rheumatism Association, December 10 in Galveston. Dr. Alfred W. Harris, Dallas, president of the organization, will preside.

Interested physicians may write the secretary of the Texas Rheumatism Association, Dr. Charles H. Cornwell, Marlin, for additional information.

Medical Expedition Through Africa

The first medical expedition through Africa is being organized by Sabena Belgian Airlines and will last from January 4, 1955, to March 17. The group will be guided by Dr. Neville H. Romain and Dr. Ronald H. Abbott, both of Riverside, Calif. Both physicians have spent many years in Africa, Dr. Romain having been born and reared there. He became a naturalized citizen of the United States in 1945. Dr. Abbott, a member of the American Medical Association, is a fellow of the American and International College of Surgeons and is thought to be the only medical doctor in the United States who is a foundation member of the Association of Surgeons of East Africa. He is the author of "Dark Continent," and has spent fifteen years there as a medical missionary.

The expedition, consisting of a limited number of the medical profession, will visit places of interest in Ethiopia, the Belgian Congo, Kenya, Tanganyika, Rhodesia, and the Union of South Africa, with complete cooperation of the governments and medical associations of each country. They will be shown research centers throughout the continent and will visit field-jungle units of the various areas of Central Africa. Two highlights of the expedition will be an invitational visit to the annual meeting of the East Africa Medical Association at Kampala, Uganda, in January, and at the end of the trip, a specially-arranged seminar at the Institute of Tropical Medicine, Antwerp, Belgium. Information can be obtained through the Sabena Airlines, African Safaris and Research Expeditions, Dallas.

Personals

Dr. George R. Herrmann, Galveston, was a presiding officer of the Second World Congress of Cardiology held in Washington, D. C., September 12-17. He and his associates also presented a paper, "Clinical Studies of Newer Diuretics: Desidron (SU 1775), Dicurin, and Diamox."

Dr. Austin E. Hill, Houston, spoke on the nutritional needs of school children for the American School Health Association, which met as a related organization during the eighty-second annual meeting of the American Public Health Association, October 11-15, in Buffalo, N. Y.

Dr. G. V. Brindley, Sr., Temple, was elected vice-president and president-elect of the American Cancer Society at its October meeting. Dr. Brindley, who will take office as president a year from now, will be the first Texan to serve in that position.

Dr. James N. Walker, Fort Worth, on October 5 was elected governor of the Texas-Oklahoma District of Kiwanis International for 1955. Dr. Walker was lieutenant governor of Division I of the district this year and will be succeeded in that position by *Dr. Joseph L. Guffy,* Hillsboro.

Dr. Marjorie J. Williams, Temple, and Miss Mary P. Clapp, Temple bacteriologist, showed the exhibit "Nocardiosis" at the International Congress of Clinical Pathology in Washington, D. C., in September.

Currently serving as members of the nineteen examining boards in the medical specialties, as reported in the October 2 *Journal of the American Medical Association,* are the following Texans: *Dr. Harvey C. Slocum,* Galveston, American Board of Anesthesiology; *Dr. Bedford Shelmire,* Dallas, advisory member of the American Board of Dermatology and Syphilology; *Dr. Willard R. Cooke,* Galveston, American Board of Obstetrics and Gynecology; *Dr. James T. Mills,* Dallas, chairman of the American Board of Plastic Surgery; *Dr. Truman G. Blocker, Jr.,* Galveston, American Board of Plastic Surgery; *Dr. Robert J. Rowe,* Dallas, American Board of Proctology; *Dr. Jack Kerr,* Dallas, associate member of the American Board of Proctology; and *Dr. Curtice Rosser,* Dallas, member of the advisory council of

the American Board of Proctology; and *Dr. Michael E. DeBakey,* Houston, Board of Thoracic Surgery (an affiliate of the American Board of Surgery).

Dr. Wendell H. Nickell was named president of the newly organized Goodfellow Flying Club at Goodfellow Air Force Base near San Angelo.

Dr. E. L. Clark, Cleburne, spoke to the Cleburne Optimist Club on poliomyelitis at its August 24 meeting.

Dr. E. P. Powell, Centerville, celebrated his seventy-fifth birthday in August at a dinner party for family and a few friends.

Dr. E. D. McKay's mother died at his home in Amarillo September 23. She resided in Oklahoma City.

Dr. Frank P. Sainburg and Mrs. Constance Smith Nance were married August 5 at the home of the bride's parents in Longview, where the couple will live.

Four Fort Worth couples have announced the birth of sons recently: *Dr. and Mrs. J. W. Collier,* September 5; *Dr. and Mrs. Will Horn, Jr.,* July 11; *Dr. and Mrs. William W. McKinney,* August 20; and *Dr. and Mrs. H. W. Thomas, Jr.,* August 12.

Dr. and Mrs. Leo Duflot, Galveston, are parents of a girl born August 17, and *Dr. and Mrs. John L. Jackson,* Wichita Falls, of a girl born in September.

A boy was born August 31 to *Dr. and Mrs. Thomas O. Shindler,* Houston.

Dr. and Mrs. John Witt, Amarillo, are parents of a daughter born September 20.

Pathologists Campaign for Medical Examiners

The Texas Society of Pathologists has begun a campaign to have a system of medical examiners take over the coroner duties now held by the justices of the peace in Texas. The present state coroner law empowers justices of the peace to rule how a person dies and to sign death certificates in cases in which they conduct inquests.

At a meeting in San Antonio the society voted to sponsor a scholarship at the Institute for Forensic Medicine, University of Texas, Austin, with the intention of studying ways to overhaul the state's coroner law. At the society's January meeting in Dallas, a symposium on the campaign will be given.

The society has listed six ways in which murder can fool a layman coroner. These are death by poisoning, murder by suffocation, murder by a hard blow on the back of the head which may leave no external marking if death is not instantaneous and the skin is not broken, murder by drowning, murder by inserting air into the veins, and murder by injecting excessive amounts of insulin into the veins. The pathologists believe that many of the deaths in Texas which are listed as being from "natural causes" have behind them foul play which could be detected by medical examiners but is not discovered by laymen.

Internists Meet in Atlanta

The Texas Club of Internists met November 1-5 in Atlanta, Ga., with the Emory University School of Medicine as host. Approximately fifty members attended the five day meeting. Members of the auxiliary of the group were invited to a buffet on October 31 in honor of the charter members Dr. David W. Carter, Jr., Dallas; Dr. Alvis E. Greer, Houston; Dr. Robert B. McBride, Dallas; and Dr. Charles T. Stone, Galveston. This was the thirtieth anniversary of the Club.

Speakers included Drs. R. Hugh Wood, Dean of the School of Medicine, Arthur J. Merrill, Albert A. Brust, Walter Lyon Bloom, Eugene B. Ferris, J. Gordon Barrow, H. S. Weens, Spalding Schroder, R. Bruce Logue, Osler A. Abbott, Charles M. Huguley, Carl C. Pfeiffer, Walter H. Sheldon, Luther G. Fortson, Morris Tager, Charles A. LeMaistre, and Walter Lynch Bloom.

Also, Drs. Thomas C. Hill, Jr., John H. Peters, Walter H. Thiele, Israel R. Berger, Walter H. Cargill, James C. Crutcher, E. Napier Burson, Ralph B. Hogan, Donald S. Martin, Sidney Olansky, Joseph S. Wilson, Gerald R. Cooper, Edward W. Hook, Milton J. Krainin, James A. Hagans, and Marion M. Brooke, Sc. D., and Libero Ajello, Ph. D., Alfred E. Wilhelmi, Ph. D.

A buffet supper honoring the hosts was given on November 4. Auxiliary entertainment included a one day trip to Ida Cason Callaway Gardens and return trip by way of Warm Springs and a visit to the Little White House, and a tour of points of interest and beauty in Atlanta.

UNIVERSITY OF TEXAS MEDICAL BRANCH

Visitors from foreign countries recently speaking at the Medical Branch were *Dr. A. Francescetti,* Geneva, Switzerland. Director of the Ophthalmology Clinic of the University of Geneva, he gave the annual John McReynolds Lecture in Ophthalmology for 1954, speaking on "Cataract in Relation to Hereditary Skin Disorders," on October 15. *Dr. Francis E. Camps,* professor of forensic medicine at the University of London, conducted conferences and seminars relating to the coordination of medical, legal, and scientific personnel in connection with medical legal problems. *Dr. Neville F. Stanley,* director of epidemiology in the Public Health Service of New South Wales, Australia, spoke on October 18 on "Newer Trends in Poliomyelitis Research." He also gave a series of conferences and seminars on technical aspects of handling poliomyelitis virus in relation to epidemics.

A special seminar on "Advances in Neuro-Pathology" was given on November 9 by *Dr. Webb Haymaker,* neurologist of the Armed Forces Institute of Pathology.

Another out-of-state speaker during October was Dr. Walter J. Meek, emeritus professor of physiology at the University of Wisconsin, who gave a series of lectures and seminars at the Medical Branch. A special seminar on "The Role of Potassium in Cardiac Irregularities" was included in the lectures, as was a discussion for members of the staff on "The Gentle Art of Poisoning."

Dr. R. Anliker, Department of Organic Chemistry, Federal Institute of Technology, Zurich, Switzerland, spoke at the Medical Branch on November 2 on "Synthesis in Vitro and Vivo of Cortisone."

General Elbert DeCoursey, director of the Armed Forces Institute of Pathology, Washington, D. C., spoke on Radiation Injuries on November 3.

EXAMINATION FOR MEDICAL OFFICERS

A competitive examination for appointment of medical officers to the regular corps of the United States Public Health Service will be held throughout the country February 15-17, 1955. Requirements for both assistant and senior assistant surgeon are United States citizenship, the age of at least 21, and graduation from a recognized school of medicine. To be an assistant surgeon, at least seven years of collegiate and professional training and appropriate experience are needed, and for senior assistant surgeon, at least ten years of collegiate and professional training and appropriate experience are needed.

Application forms, which must be completed and returned by January 12, may be obtained from the Chief, Division of Personnel, Public Health Service, Department of Health, Education, and Welfare, Washington 25, D. C.

National Meetings

The sixth *American Congress on Obstetrics and Gynecology* will be held in the Palmer House, Chicago, December 13-17. The meeting is sponsored by the American Committee on Maternal Welfare, Inc., and the American Academy of Obstetrics and Gynecology. Dr. William F. Mengert, Dallas, will be installed as president of the Academy on December 16. The program is designed for physicians, nurses, public health officials, and hospital administrators concerned with mother and baby care; it will consist of approximately thirty papers, twenty-two panels and symposiums, luncheon discussion groups, round-table discussions, and scientific and technical exhibits.

The thirteenth annual meeting of the *American Academy of Dermatology and Syphilology* will be held December 4-9 in the Palmer House. In addition to two new round-table panels added this year, seven special courses will be held the first two days at Northwestern University, the University of Illinois College of Medicine, and at Billings Hospital of the University of Chicago. The courses will include histopathology, mycology, roentgen-ray and radium therapy, bacteriology and virology of the skin, anatomy and embryology, and special problems in dermatohistopathology. Special lectures, symposiums, and scientific and technical exhibits will round out the program.

Practical Electrocardiology Course

A course in Practical Electrocardiology will be given December 6-10 in Houston. Lecturers will be Dr. Demetrio Sodi-Pallares, chief of the Department of Electrocardiology, National Institute of Cardiology, Mexico, D. F., and members of the faculty of the University of Texas Postgraduate School of Medicine and Baylor University College of Medicine. These schools are sponsoring the course in association with the Houston Heart Association, Texas Medical Association, Texas State Department of Health, Houston Society of Internal Medicine, and the Houston Academy of General Practice. All lectures, except on the evening of December 7, will be given in the Auditorium of the M. D. Anderson Hospital, the Tuesday evening one to be given in the Auditorium of the Jesse H. Jones Library.

In addition to Dr. Sodi-Pallares, local faculty will include Drs. Hugh D. Bennett, Edward W. Dennis, E. Ghent Graves, Clifton D. Howe, Abbe A. Ledbetter, Robert G. McConn, Dan G. McNamara, and B. F. Smith, all of Houston. Coordinator is Dr. Sidney Schnur, Houston.

The registration fee of $45 entitles the registrant to attend all or any part of the course. Medical students, interns, residents, and military personnel will be admitted without charge. Formal credit of thirty hours will be given by the American Academy of General Practice.

Doctor Draft

To make certain that enough doctors who have residency training in certain fields are in the armed forces after the expiration of the "Doctor Draft" act next July 1, a new program has been worked out by Dr. Frank Berry, assistant secretary of defense for medical affairs, and the officers assisting him.

A plan called the Armed Forces Reserve Medical Officer Commissioning and Residency Consideration Program has been put in effect; it applies only to interns who have had no prior military service and who therefore have a two year obligation for service under the regular draft.

By October 10, the plan's first deadline, the young physicians were to have sent to the Defense Department a form stating their first, second, and third choices among the services; whether they want additional deferment for residencies, and, if so, choice of hospitals; and their preferred specialties. Any in this group not applying for reserve commissions will be subject to the regular draft, will not be considered for residency deferments, and will not have a choice of services.

Because it is estimated that about half of the interns will want residency deferments and only a quarter can be deferred if the Army, Navy, and Air Force are to get their quotas of physicians, a lottery is being used. Those winning deferments will stay in the reserves and be called up for duty as their specialties are needed after the completion of their residencies. Those losing will be called as needed at the end of their internships. The half not asking for deferments will be allowed a choice of the month to be called up, a privilege not accorded the others.

American College of Surgeons

The American College of Surgeons will have a sectional meeting January 17-19, 1955, at Galveston. The program will consist of early morning hospital clinics and hotel sessions which will include scientific reports, panel discussions, and surgical motion pictures.

Texas doctors on the program other than local physicians will be Drs. Albert W. Hartman, San Antonio; William D. Seybold, John M. Howard, and Luke W. Able, Houston; John R. Cochran, Fort Worth; and Ben J. Wilson, Ernest E. Muirhead, and J. Warner Duckett, Dallas.

Out-of-state speakers include Drs. Frederick A. Coller, Ann Arbor, Mich.; Harry H. McCarthy and Leon S. McGoogan, Omaha, Neb.; Kenneth W. Warren, Boston; Justin J. Stein, and Ian MacDonald, Los Angeles; Robert L. Sanders, Memphis, Tenn.; Jesus Lozoya Solis, Mexico, D. F.; Frank McDowell, St. Louis; William H. Frackelton, Milwaukee; Richard H. Mellen, Colorado Springs; Harry Wilkins, Oklahoma City; William L. Valk, Kansas City; Willis E. Brown, Little Rock; and Conrad G. Collins, New Orleans.

Dr. Robert M. Moore, Galveston, is chairman of the Committee on General Arrangements.

MEDICAL WRITING AND JOURNALISM COURSES

Four year courses in medical journalism and medical writing, which have been approved by the American Medical Writers' Association, have been inaugurated at the Schools of Journalism, University of Oklahoma, University of Illinois, and University of Missouri. The Writers' Association is seeking funds to establish a Visiting Lectureship on Medical Literature for American medical colleges and teaching hospitals and also to augment its Medical Journalism Scholarship Fund for needy students studying in the new four year courses. After students have graduated from one of these courses, medicine and its allied sciences and fields will have people especially trained in medical journalism and writing just as it now has laboratory technicians, health educators, hospital administrators, and other nonmedical graduates.

GP REVIEW

A six day postgraduate course, General Practice Review, will be given at the University of Colorado Medical Center during the week of January 17-22, 1955. Each day a separate area of practice will be presented. Monday, medicine will be reviewed; Tuesday, pediatrics; Wednesday, surgery; Thursday, anesthesiology; Friday, obstetrics and gynecology; and Saturday, trauma.

Hotel reservations will be made through the Office of Graduate and Postgraduate Medical Education, University of Colorado Medical Center, 4200 East Ninth Avenue, Denver 20, prior to December 20. Those wishing reserva-

tions for evening performances of the Western National Stock Show, which will be held concurrently, may make them through this office also.

ESSAY CONTEST OPENS

The fifteenth annual essay contest of the Mississippi Valley Medical Society, offering a cash prize of $100, a gold medal, and a certificate of award, has been announced. Contestants, who must be residents and citizens of the United States and be members of the American Medical Association, are asked to submit an unpublished essay on any subject of general medical interest and practical value to the general practitioner of medicine (medical economics and education included) by May 1, 1955. The winner will be invited to present his contribution before the twentieth annual meeting of the Society, September 28-30, 1955, at St. Louis.

Dr. Harold Swanberg, secretary, announced that the paper must be submitted in five copies and must not exceed 5,000 words. Additional information can be obtained from Dr. Swanberg, 209-224 W. C. U. Building, Quincy, Ill.

Postgraduate Course in Anatomy

A course in surgical and applied anatomy, which began November 2 and will last through June, 1955, is being given in Houston by the University of Texas Postgraduate School of Medicine and Baylor University College of Medicine.

LIBRARY SECTION

BRONCHOSCOPY

Bronchoscopy has been defined by Jackson and Jackson as "the endoscopic examination and treatment of the tracheobronchial tree and lungs, by means of the bronchoscope used as a speculum." Bronchoscopy is distinctly in the category of an art. The dramatic nature of the operative procedure has been exploited in the daily newspapers to a wide extent; hence the public at large is aware of this procedure.

Gustav Killian, professor of laryngology and rhinology at the University of Frieburg, was the first to show the possibilities of the use of the bronchoscope. In March, 1897, he removed a bone from the trachea of a patient. This led to the exploration of the bronchi, and on July 24, he showed the local medical society that he was able to introduce tubes freely into the air passages.

By his experiments he learned that the bronchi were freely movable, and by turning the patient's head he could explore the right or left ramifications of the bronchi. The lack of knowledge on the part of the medical profession that this was an examination which could be carried out with safety and with minimal discomfort to the patient prevented the use of the bronchoscope for several years.

There are many indications for bronchoscopy other than its special field of usefulness in removing foreign bodies. Bronchoscopy is indicated in any case of pulmonary disease of unexplained origin, the location of tumors, the collection of bronchial secretions for cytologic and bacteriologic study, chronic or persistent cough, carcinoma of the lung, and many other conditions.

The Memorial Library of the Texas Medical Association has purchased a copy of the motion picture film "A Bronchoscopic Clinic" from the Jacques Holinger Memorial Fund and is now making it available to the membership.

BOOKS RECEIVED IN OCTOBER

Alvarez, Walter C.: *Nervousness, Indigestion and Pain,* New York, Harper and Brothers, 1954.

Andrews, George Clinton: *Diseases of the Skin,* ed. 4, Philadelphia, W. B. Saunders, 1954.

Bower, Albert G.: *Diagnosis and Treatment of Acute Phase of Poliomyelitis and Its Complications,* Baltimore, Williams and Wilkins, 1954.

Brown, James Barrett, and McDowell, Frank: *Neck Dissections,* Springfield, Ill., Charles C Thomas, 1954.

Clark, Randolph Lee: *Book of Health—A Medical Encyclopedia,* Houston, Elsevier Press, 1953.

Flitter, Hessel Howard: *An Introduction to Physics in Nursing,* ed. 2, St. Louis, C. V. Mosby, 1954.

Freud, Anna: *The Ego and Mechanisms of Defense,* New York, International Universities Press, 1946.

Gillilan, L. A.: *Clinical Aspects of the Autonomic Nervous System,* Boston, Little, Brown and Company, 1954.

Hopkins, Edward Scott, and Schulze, Wilmer Henry: *The Practice of Sanitation,* ed. 2, Baltimore, Williams and Wilkins, 1954.

Jonas, Karl C.: *Babcock's Principles and Practice of Surgery,* ed. 2, Philadelphia, Lea and Febiger, 1954.

Kauvar, A. J., and Goldner, Martin G.: *Hypoglycemia and the Hypoglycemic Syndrome,* Springfield, Ill., Charles C Thomas, 1954.

McAuley, W. F.: *Concept of Schizophrenia,* New York, Philosophical Library, 1954.

Reddish, George F.: *Antiseptics, Disinfectants, Fungicides, and Chemical and Physical Sterilization,* Philadelphia, Lea and Febiger, 1954.

Russell, Lord: *The Scourge of the Swastika, A Short History of the Nazi War Crimes,* New York, Philosophical Library, 1954.

Sarton, George: *Galen of Pergamon,* Lawrence, Kan., University of Kansas Press, 1954.

Schiff, Leon: *Clinical Approach to Jaundice,* Springfield, Ill., Charles C Thomas, 1954.

Steinberg, Charles LeRoy: *Arthritis and Rheumatism,* New York, Springer, 1954.

Yater, Wallace Mason: *Fundamentals of Internal Medicine,* ed. 4, New York, Appleton Century-Crofts, 1954.

CONTRIBUTIONS TO THE LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Dr. D. W. Brown, Jr., Fredericksburg, 312 journals.

Dr. Dan B. Hamill, Corsicana, Davis' "Gynecology and Obstetrics."

Dr. D. B. Harmon, Austin, 26 journals.

Dr. J. O. S. Holt, Jr., Dallas, 7 journals.

Dr. J. Edward Johnson, Austin, 3 books, 22 journals, 422 reprints and pamphlets.

Dr. Georgia Legett, Austin, 75 journals.

Mr. Philip R. Overton, Austin, 1 book, 111 journals, 45 reprints and pamphlets.

Dr. N. L. Schiller, Austin, 35 journals, 22 reprints and pamphlets.

Dr. Joseph Selman, Tyler, 1 book.

Dr. C. H. Standifer, Austin, 70 journals.

Terrell's Laboratories, Fort Worth, 2 journals.

MOTION PICTURES FOR LOAN

A Bronchoscopic Clinic

16 mm., silent, color, 33 minutes. Prepared by Drs. Paul H. Holinger, Kenneth C. Johnston, and Frank J. Navak, Ill.

This film portrays the value of and the indications for bronchoscopy in the study of diseases involving the tracheobronchial tree. It clearly and beautifully demonstrates the bronchoscopic appearance of a variety of lesions. A short abstract of the clinical history of each patient, presented in association with roentgenograms of the thorax and the pathologic findings, adds greatly to the teaching value of the film. The technique employed for the performance of intratracheal and intrabronchial photography is demonstrated. The film clearly shows that skill and infinite and painstaking care must have been extended to obtain such excellent photography.

This is a motion picture that should be studied by all physicians interested in diseases of the chest and in bronchoscopy; it should be available to all medical schools for student teaching. It demonstrates visually factors that otherwise are hard to grasp. It is certainly suitable for any type of medical meeting and should be of interest to all physicians. The photography is outstanding.

When You Choose Nursing

16 mm., sound, 20 minutes. Prepared by the Committee on Careers in Nursing; available through courtesy of the Woman's Auxiliary to the Texas Medical Association.

Designed primarily for student nurse recruitment, the film presents four major fields in nursing: pediatrics, education, industry, and public health. Students and graduates are shown at work and play, with several scenes in the nurses' residence.

The film ends with a montage which presents nursing opportunities other than the four portrayed. The narrator says, "No matter which branch you choose, you can be assured of a full, interesting life; the opportunity to alleviate pain and suffering; and to help others when they need you most. A career in nursing is a career with a future. Sometime, somewhere, everyone of us needs a nurse. The nursing profession, now more than ever before, wants qualified young men and women to prepare for a nursing career."

BOOK NOTICES

[1]First Aid and Resuscitation

LT. CARL B. YOUNG, JR., M.P.H., *Instructor, Emergency First Aid, Former Assistant Director, Harris County Emergency Corps, Inc., Houston; Member, International Rescue and First Aid Association, First Lieutenant, Medical Service Corps, U.S.A.R. 338 pages. $8.50. Springfield, Ill., Charles C Thomas, 1954.*

The thoughtfulness of the author in the dedication of this book to fire rescue squads and volunteer life saving organizations is commendable and deserves comment. It is also worthy of note we should be aware of the fine work that is being carried on in Harris County and the Houston area.

In this book the fundamentals of first aid such as control of bleeding, resuscitation measures for those who are not breathing, treatment for those who have taken poison, prevention and treatment of shock, proper care of burns and other wounds, immobilization of fractures and dislocations, care in handling, and proper transportation are all taken up and given their proper discussion.

Other things such as acute heart emergencies, acute indigestion, cerebral vascular accidents, injuries to the air passages and chest wall, acute alcoholism, and acute drug intoxication are treated with practical suggestions for their emergency handling.

In the discussion of the transportation of the seriously ill and injured and emergency ambulance service, the author discusses the advantages of municipally operated ambulance services. He omitted one part which he might have related ---some of the sordid conduct of funeral homes who engage in body chasing runs and their reckless handling of patients, which results in fatalities.

The sections on oxygen therapy and the importance of records and statistics being accurate are well done. The chapter urging cooperation of the first aid crews with physicians, police officials, and utility companies is well evaluated and places the medical profession in the proper perspective, but at the same time physicians must reciprocate in the management of the sick and injured.

A well illustrated book, it deals realistically with the subject matter.

[1]*Joe C. Rude, M. D., Austin.*

[2]The Jealous Child

EDWARD PODOLSKY, M. D., *Department of Psychiatry, Kings County Hospital, Brooklyn, N. Y. 147 pages. $3.75. New York, Philosophical Library, 1954.*

This book takes up not only the problem of jealous children but also problems of the lefthanded child, the diabetic child, the obese child, the deaf child, the unwanted child, and the child from divorced parents. It is full of philosophical comments with little practical advice concerning the management of the jealous child.

Menorrhalgia—Menstrual Distress

WILLIAM BICKERS, M. D., *Diplomate, American Board of Obstetrics and Gynecology; Attending Gynecologist to Retreat for Sick, Sheltering Arms, Richmond Community, and Evangeline Booth Hospitals, Richmond, Va. Edited by* E. C. HAMBLEN, B. S., M. D., F.A.C.S., *Professor of Endocrinology and Associate Professor of Obstetrics and Gynecology, Duke University School of Medicine, Durham, N. C. 97 pages. $2.75. Springfield, Ill., Charles C Thomas, 1954.*

This book is an excellent exposition of its subject. The author speaks with authority since he has been interested in menorrhalgia for many years. Each chapter is followed by a list of references. The various forms of treatment are discussed with special emphasis on Dr. Bickers' own.

Oestrogens and Neoplasia

HAROLD BURROWS *and* ERIC S. HORNING *with contributions by* W. C. J. ROSS *and* C. W. SHOPPEE. *189 pages. $6.75. Springfield, Ill., Charles C Thomas, 1952.*

The authors are distinguished pioneers in the field of cancer research. This authoritative review of the scientific literature on the effects of estrogens as a cause of cancer is clearly presented. There are discussions on the effect of estrogens on tumors of the ovary, pituitary glands, testes, adrenal glands, and urogenital organs. The hereditary factors in mammary cancer are discussed, and many charts are presented on the subject. It was not the intention of the authors to have this monograph used as a guide to therapy but as an aid to the interested physician and the research worker. The complex data are skillfully presented. The references are in alphabetical order by author, but the titles have been omitted; there is an excellent index.

[2]*A. L. Exline, Jr., M. D., Austin.*

[3]**Doctor at Sea**

RICHARD GORDON. *191 pages. $3. First American edition. New York, Harcourt, Brace and Company, 1954.*

This is an amusing book about the adventures of a company physician on a British merchant ship. The young doctor leaves his socialized medical practice in England on the advice of a psychiatrist to avoid an unfortunate marriage. Aboard the Lotus he finds that the crew is suspicious of him because of a long line of alcoholic predecessors. He manages to work around the inadequate medical chest and finds his place among the crew by becoming a relaxed alcoholic. "Doctor at Sea" presents many humorous incidents and makes good light reading.

[4]**Practical Electrocardiography**

HENRY J. L. MARRIOTT, M. D., *Associate Professor of Medicine, University of Maryland; Assistant Cardiologist, Mercy Hospital, Baltimore. Illustrated by Marcie Ethridge Perry. 171 pages. $5. Baltimore, Williams and Wilkins Company, 1954.*

All of the intricate, uninteresting, and detailed electrophysiology that is usually written in books on electrocardiology have been omitted from this book. It is to be used primarily as a manual and for quick reference for the beginner in electrocardiology.

The summary at the end of each subject matter, given in a clear cut and concise manner, is excellent. These summaries are especially good in the section on cardiac arrhythmias.

Many types of precordial leads are advocated; this may cause the beginner some concern. Using the Wilson V lead for all precordial leads reduces variations in potentials common with these other precordial leads. These variations can become confusing even to the well trained observer.

It is true that the augmented unipolar leads are not essential for the reading of an electrocardiogram. The use of all frontal plane leads, however, makes a better interpretation of the electrocardiogram possible.

The terms "left axis deviation," "right axis deviation," and "ventricular strain" used by the author have lost their meaning in present day electrocardiography.

This is a short, clear cut, and concise manual. It has been presented well and has a place in the library of the beginner in electrocardiography.

[5]**The Uncommon Heart Diseases**

NATHANIEL E. REICH, M. D., F.A.C.P., F.C.C.P., *Clinical Assistant Professor of Medicine, State University of New York College of Medicine; Associate Attending Physician, Kings County Hospital; Attending Physician in Cardiology, Veterans Administration; Attending Cardiologist, Jewish Sanatorium and Hospital for Chronic Diseases. 516 pages. $10.50. Springfield, Ill., Charles C Thomas, 1954.*

This book constitutes a new and novel approach to this subject. Rich in pathologic physiology of the heart, it has many valuable points. It has a few but well chosen references at the end of each chapter.

Subjects such as the fungus diseases of the heart, barely mentioned in standard texts, are clarified in this book. The collagen disorders are made as clear as they may be made; the study of enzymes and their importance is emphasized. This is a good source of information on the subject of myocarditis.

Being the product of one man makes the book's contents more valuable than if many men had contributed a chapter each. It is a "must" for the library of the cardiologist, internist, or general practitioner.

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

AMA Clinical Meeting in Miami

The American Medical Association Clinical Meeting will be held in Miami, Fla., November 29-December 2. The House of Delegates will convene Monday, November 29, in the McAllister Hotel; and the scientific meetings and scientific and technical exhibits will be held in the Dinner Key Auditorium.

Scientific programs will be given Monday afternoon, Tuesday and Wednesday mornings and afternoons, and Thursday morning. More than one hundred physicians will present scientific papers or participate in panel discussions. The meeting is directed toward alleviating the everyday medical problems of the physician. Even though specialties of surgery, medicine, obstetrics and gynecology, pediatrics, and neuropsychiatry are represented at the meeting, the program is directed toward the general practitioner who has to face these problems. The opening general assembly will be on Monday morning, at 10:25 o'clock.

Motion pictures will be shown from Monday morning through Thursday noon, as will color television. Programs originating from Miami's Jackson Memorial Hospital will be brought directly into the lecture hall. Leading surgeons and obstetricians will be available at the scientific exhibit for conferences with individual doctors on problems in fracture cases and deliveries. The technical exhibit will have more than one hundred thirty organizations participating.

Registration Bureau will be at the Dinner Key Auditorium, and an information booth will be there also. All those registering early on Monday will have their names and Miami addresses included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered. Presenting the 1954 American Medical Association membership pocket card will enable members to register without delay. General officers and members of the House of Delegates may register for the Scientific Assembly near the entrance to the Flagler Ballroom in the McAllister Hotel on Monday. They can also register on Saturday, November 27, or Sunday, November 28, in the office of the secretary of the Association, which will be located near the Flagler Ballroom.

Preceding the clinical meeting, Dr. Elmer Hess, President-Elect, will conduct the Association's Seventh National Medical Public Relations Conference. This will begin at 10 a. m. Sunday in the Flagler Ballroom of the McAllister Hotel. The meeting will feature panel discussions on implementation of the AMA's policy on veterans' medical care, on professional management consultants, and of public relations tools and aids available from the Association's Public Relations Department. A special screening of the new television film, "A Life to Save," has been scheduled.

The Woman's Auxiliary to the Dade County Medical Society will maintain a Courtesy Corner in the Columbus Hotel. The auxiliary will give visiting ladies information about places to visit in Miami and has planned one special tour, a cruise to Villa Vizcaya, the palatial estate of the late James Deering, now maintained as a county-operated museum. The auxiliary will arrange other tours if desired.

Invitations from the Jamaica Branch of the British Medical Association and the Medical Association of Haiti have come to encourage members of the AMA attending the conference to visit them after the Miami meeting. The Jamaica association will meet in Kingston, on Saturday, December 4, and will hold a reception in the evening. A meeting of the Haiti association will be held at Port-au-Prince on Saturday, December 4. A special series of social and entertainment events will be planned for those who come to the medical session. Travel information about these can be obtained from the American Express Company in Miami.

Texas physicians appearing on the scientific program include Dr. Alvis E. Greer, Dr. Denton A. Cooley, and Dr. Michael E. DeBakey, Houston; Dr. Charles L. Martin, Dallas; and Dr. Hamilton Ford, Galveston. Four groups of Texans will present scientific exhibits as follows: Drs. Edward W. Dennis, Robert L. Herschberger, John H. Moyer, and Ralph V. Ford, Houston, "The Medical Management of Hypertension"; Drs. DeBakey, Cooley, and Oscar Creech, Jr., Houston, "Aneurysms and Thrombo-Obliterative Disease of the Aorta—Surgical Considerations"; Drs. B. F. Boylston and Roland Carroll, Houston, "Normal and Abnormal Roentgenograms of the Cervical Spine"; and Drs. Gilbert H. Fletcher, Jacob W. Old, and George S. Loquvam, Houston, "A Topographic Approach to the Roentgenologic and Pathologic Examination of Laryngopharyngeal Tumors."

The following five physicians from the Surgical Research Unit of Brooke Army Medical Center, Fort Sam Houston, will also present a scientific exhibit: Drs. Curtis P. Artz, Harry S. Soroff, Alvin W. Bronwell, Eric Reiss, and John H. Davis, on "Treatment of Burns."

Standard Nomenclature Institute

Sponsored for the first time by the American Medical Association will be a three day Standard Nomenclature Institute February 7-9, 1955, at AMA headquarters, Chicago. The short course will offer expert instruction and helpful suggestions on the correct way of utilizing "Standard Nomenclature of Diseases and Operations" in the hospital, doctor's office, or clinic.

The course will be divided into three parts: (1) lectures covering basic principles, construction, and installation plus discussion on the tumor and operation sections and handling of specific problems; (2) anatomy as it pertains to the topographic section; and (3) practice in coding, to be offered at two evening sessions.

With registration limited to 150, application blanks will be distributed after December 1.

DEADLINES FOR JUNE AMA MEETING

The deadline for those planning to participate in the Atlantic City meeting of the American Medical Association, June 6-10, 1955, has been announced by the Council on Scientific Assembly. Deadline for section papers is December 15, 1954, and deadline for scientific exhibits is January 10.

Applicants should communicate with the secretary or the representative to the scientific exhibit of the section in which they are interested. Additional information can be obtained from the secretary, Council on Scientific Assembly, A.M.A., 535 North Dearborn St., Chicago 10.

TEXAS MEDICAL ASSOCIATION

Williston New Executive Secretary

C. Lincoln Williston became executive secretary of the Texas Medical Association on November 1.

Coming to the Association on April 2 as assistant executive secretary, Mr. Williston had been manager of public relations for the University of Illinois Medical Center in Chicago since 1947. He was also chairman of the Medical Schools Section, American College Public Relations Association; lecturer in public relations, Northwestern University; and chairman, Section on Public Relations, Tri-State Hospital Assembly.

C. LINCOLN WILLISTON

He was graduated from the University of Illinois in 1942 with a bachelor of science degree and served as a captain in the United States Air Force on Guam during World War II.

Mr. Williston is married and has two daughters, Christine, 5, and Jayne Ann, 4, and a son, C. Lincoln, who was born last July.

VISITATIONS FOR DECEMBER

Officers and members of the central office staff of the Texas Medical Association will visit the following county medical societies in December: Kimble-Mason-Menard-McCulloch Counties, December 8; Angelina County, December 9; Bexar County, December 14; Hardin-Tyler Counties, December 21; and Comal County, date not determined.

COUNTY SOCIETIES

Cameron-Willacy Counties Society

October 18, 1954

(Reported by Harry A. Miller, Secretary)

Subarachnoid Hemorrhage—Robert C. L. Robertson, Houston.

The Cameron-Willacy Counties Medical Society met on October 18 at Harlingen with eighty-four doctors and guests present. Evan B. Hume, Brownsville, chairman of the tumor clinic committee, reported that attendance is good at the Tumor Clinic, which is held bimonthly. After Howard E. Tewell, Jr., Harlingen, called the x-ray survey of South

Texas counties to the attention of the membership, it was voted to ask the mobile unit to include Willacy County in the tuberculosis survey.

Elected to membership in the society were Hendrik Evart J. Kruisheer, Harlingen, and David W. Flory, Brownsville.

After a discussion about the advisability of having all members of the Cameron-Willacy society listed as such in a specified section of the telephone directory, the problem was referred to the committee on public relations. This committee was to discuss the matter with the telephone company and report its findings at the next meeting.

Lamar County Society

October 7, 1954

(Reported by Harold E. Hunt, Secretary)

Present Medical Treatment of Tuberculosis—H. Frank Carman, Dallas.

The Lamar County Medical Society met in Paris on October 7 with sixteen members and six guests present. After dinner, the above scientific program was held. It was announced that the program for the November 4 meeting would be provided by an officer and a member of the central office staff of the Texas Medical Association.

Lubbock-Crosby Counties Society

September 7, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Problems of Obstetrics and Gynecology in General Practice—Allen T. Stewart, Lubbock.

Discussion—Ewell Hunt, Frank Hudgins, John Selby, and Marie Shaw, Lubbock.

Hemorrhage now exceeds infection and toxemia as the most formidable complication of obstetrics, Allen T. Stewart told members of the Lubbock-Crosby Counties Medical Society when they met September 7 in Lubbock. Dr. Stewart amplified on the physiology of bleeding from the reproductive tract and stressed the importance of early detection of malignancy of the uterus by the general practitioner.

Members of the society were encouraged to donate books for the medical reading room of the new library. They approved classified headings for medical specialists for use in the telephone directory. Dr. Roy Sheffield was appointed representative to attend a meeting of the Welfare Board later in the month.

Potter County Society

September 13, 1954

Injuries Around the Elbow in Children—E. M. Cowart, Houston.

After a three months vacation the Potter County Medical Society met September 13 in Amarillo for a dinner, program, and business session.

A visiting orthopedic surgeon, E. M. Cowart of Houston, presented a scientific paper, after which the society unanimously voted to invite the Negro doctors of Amarillo to attend its regular meetings and dinner; accepted a report from the Citizens Committee on Health, Recreation and Welfare Service of Amarillo; heard four proposed amendments to the constitution and by-laws; and acted on several membership matters.

Visitors from the staff of the Amarillo Air Force Base hospital and from Panhandle were present.

Tarrant County Society

September 21, 1954

(Reported by S. W. Wilson, Secretary)

Clinical-Pathological Conference—Robert Mitchell, Fort Worth, Moderator.

Discussion of the Case—DeWitt Neighbors, T. H. Thomason, and Robert Moreton, Fort Worth.

Pathological Findings—John Wallace, Fort Worth.

Organization of a softball team to play the Fort Worth Amputee Club during National Employ the Physically Handicapped Week, October 3-9, was begun at the September 21 meeting of the Tarrant County Medical Society. In answer to a letter from the Amputee Club's president challenging the physicians to a game, Robert Stow and Louis Levy were named to organize a team.

Four physicians were elected to membership upon application; four on transfer.

Seventy-four members and three visitors heard the program outlined.

October 5, 1954

(Reported by S. W. Wilson, Secretary)

Venous Diseases—Leroy J. Kleinsasser, Dallas.

The Tarrant County Medical Society met in Fort Worth on October 5 and heard the above scientific program. Ernest E. Anthony, Jr., Fort Worth, reported for the legislative committee on social security, and a resolution requesting repeal of Section 106 of Public Law 761 was adopted.

Elected to membership in the society were M. W. Brous, Harold R. High, Joanne Kenner, James R. McKinney, and Charles A. Rush, Jr.

Tom Green-Eight County Society

October 4, 1954

(Reported by Joe L. Cornelison, Secretary)

Chest Pain—Julian H. Acker, Wichita Falls.

The Tom Green-Eight County Medical Society met October 4 in San Angelo. After a short business meeting, the above scientific paper was heard.

DISTRICT SOCIETIES

Fourth District Society

October 21, 1954

(Reported by James N. White, Secretary)

Abdominal Tumors in Childhood—Luke W. Able, Houston.

Surgical Emergencies of Newborn—Dr. Able.

Roentgen-Ray Diagnosis of Urologic Conditions—Palmer E. Wigby, Houston.

Roentgen-Ray Diagnosis of Nonmalignant Diseases of Chest—Dr. Wigby.

Management of Rh Patient—Warren M. Jacobs, Houston.

Indications for Hysterectomy, Vaginal and Abdominal—Dr. Jacobs.

Sexual Precocity and Retardation—Mavis P. Kelsey, Houston.

Management of Thyroid Tumors—Dr. Kelsey.

The Fourth District Medical Society met October 21 in San Angelo and heard the program as outlined above. The group also heard a speech by F. J. L. Blasingame, Wharton, President of the Texas Medical Association, at a luncheon attended by one hundred. Mr. C. Lincoln Williston, assistant executive secretary of the state organization, gave a resumé of the activities and plans of the central office in regard to district and county meetings. Other visitors present for the luncheon were Mrs. Joseph H. McCracken, Jr., Dallas, President-Elect of the Woman's Auxiliary to the Texas Medical Association; Mrs. A. B. Pumphrey, Fort Worth, chairman of the Auxiliary Committee on Mental Health; Mrs. Oscar N. Mayo, Brownwood, council woman for the Fourth District; Mrs. Arleen Draker, Austin, Auxiliary executive secretary; Mrs. Cecil M. French, San Angelo, president of Tom Green-Eight County Auxiliary; and Mrs. Perry J. C. Byars, San Angelo, chairman of the State Auxiliary's Essay Contest Committee.

Newly elected officers are James N. White, San Angelo, president; Oscar N. Mayo, Brownwood, vice-president; and Joe B. Stephens, Bangs, secretary. Oran H. Chandler, Ballinger, was nominated for councilor for 1955.

The program was put on by the University of Texas Postgraduate School of Medicine.

AUXILIARY SECTION

EXECUTIVE BOARD MEETING

The Executive Board of the Woman's Auxiliary to the Texas Medical Association met in the Sam Thompson Room of the Texas Medical Association headquarters building, Austin, at 1 p. m., Wednesday, September 22, 1954, with the President, Mrs. Mark H. Latimer, Houston, presiding.

Mrs. P. R. Denman, Houston, Chaplain, gave the invocation and a short devotional on prayer. The group repeated the Auxiliary pledge in unison.

Mrs. Latimer greeted those present and introduced Mrs. S. W. Bohls, Austin, president of the Woman's Auxiliary to the Travis County Medical Society, who welcomed members and guests to Austin. She introduced Mrs. G. G. Zedler, Austin, president-elect of the Travis County Auxiliary and local arrangements chairman for the meeting. Mrs. O. M. Marchman, Dallas, responded.

Mrs. G. V. Brindley, Temple, introduced the past state presidents attending the meeting. These included Mesdames Brindley; E. W. Coyle, San Antonio; P. R. Denman, Houston; Joseph B. Foster, Houston; S. M. Hill, Dallas; F. F. Kirby, Waco; O. M. Marchman, Dallas; A. B. Pumphrey, Fort Worth; and O. W. Robinson, Paris. Mrs. Brindley then presented the state committee members, county presidents and presidents-elect, and other visitors.

Mrs. John H. Wootters, Houston, moved that notes be sent to those past state presidents unable to be present. The motion was carried.

In the absence of Mrs. William M. Palm, Houston, Corresponding Secretary, Mrs. Arleen Draker, Austin, Executive Secretary, announced that letters or telegrams had been received from several members who could not be present. A letter from Mrs. George Turner, El Paso, expressed her thanks for the $101 gift to the American Medical Education Foundation given in her honor by the Texas Auxiliary when she was installed as President of the Woman's Auxiliary to the American Medical Association and for the courtesies extended her.

Mrs. J. Guy Jones, Dallas, moved that a telegram regretting Mrs. Turner's absence be sent to her, and the motion was carried.

Mrs. Latimer expressed regret that Dr. F. J. L. Blasingame, Wharton, President of the Texas Medical Association, could not be present. Mrs. F. Paul Burow, Killeen, moved that a cablegram of greetings be sent Dr. Blasingame, who was in Rome, Italy, attending a meeting of the World Medical Association. The motion passed.

The President then called for reports and recommendations from the state officers, committee chairmen, and council women. In place of a formal report, Mrs. Latimer referred members to her column which appears in each issue of the *News Letter* and reiterated her intention of trying to meet personally with as many county auxiliaries as possible during the year. She asked that these meetings be kept simple and said she hoped the smaller groups would adopt at least one project in which to engage and thereby become a vital force in the community for the betterment of health.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. Mark H. Latimer, Houston; President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas; First Vice-President, Mrs. Mal Rumph, Fort Worth; Second Vice-President, Mrs. Harold Lindley, Pecos; Third Vice-President, Mrs. Howard R. Dudgeon, Jr., Waco; Fourth Vice-President, Mrs. Troy A. Shafer, Harlingen; Fifth Vice-President, Mrs. August J. Streit, Amarillo; Recording Secretary, Mrs. P. M. Kuykendall, Ranger; Corresponding Secretary, Mrs. William M. Palm, Houston; Treasurer, Mrs. J. C. Terrell, Stephenville; Publicity Secretary, Mrs. A. H. Neighbors, Jr., Austin; Parliamentarian, Mrs. John E. Hill, Marshall.

Mrs. Joseph H. McCracken, Jr., Dallas, President-Elect, expressed her appreciation for having been sent to the national convention in San Francisco. She gave a brief resumé of the meeting and announced that Mrs. Mason G. Lawson, Little Rock, who was endorsed by the Texas Auxiliary at its Executive Board meeting in San Antonio on May 5 for the nomination as President-Elect of the National Auxiliary, had been elected to that office.

Reports were given by Mrs. Mal Rumph, Fort Worth, First Vice-President, and chairman of the Organization and Membership Committee; Mrs. Harold Lindley, Pecos, Second Vice-President; Mrs. Howard R. Dudgeon, Jr., Waco, Third Vice-President; and Mrs. Troy A. Shafer, Harlingen, Fourth Vice-President.

Mrs. J. C. Terrell, Stephenville, Treasurer, reported a State Auxiliary membership of 4,761 and a balance on hand of $18,563.94. She requested that all contributions to the Auxiliary's philanthropic funds—American Medical Education Foundation, Library, Memorial, and Student Loan —be sent directly to the chairmen of these funds. January 15 to March 1, 1955, were the dates announced for payment of annual state dues.

Other officers reporting were Mrs. P. M. Kuykendall, Ranger, Recording Secretary; Mrs. A. H. Neighbors, Jr., Austin, Publicity Secretary; and Mrs. John E. Hill, Marshall, Parliamentarian.

Mrs. Joseph B. Foster, Houston, chairman of the Advisory Committee, announced her committee had been asked to review the custom of annually awarding blue ribbons to county auxiliaries for work done in certain fields. She stated the committee agreed that some adjustment should be made —either by doing away entirely with awards or by making only ones which could be decided on the basis of statistics. If awards are to be continued, the committee felt that a more effective plan for their distribution could be worked out. Mrs. Foster moved that the Board consider the problem of awards and that the Historical Committee and President be empowered to study the problem further and act accordingly. The motion was carried.

Mrs. J. V. Blair, Corpus Christi, Civil Defense chairman, announced Mrs. Grace M. Martin, College Station, State Coordinator of Women's Activities in Defense and Disaster Relief, was attending the Board meeting as her guest.

Upon motion by Mrs. John H. Wootters, Houston, chairman of the Historical Committee, the Board authorized the purchase of uniform filing binders and directed this committee to place the materials presently in the past presidents' books in the archives in these binders because the binders used heretofore have been too large to permit satisfactory filing. The Board also passed Mrs. Wootters' motion to have the Historical Committee select and purchase a binder and present it to the president each year.

In the absence of Mrs. Jacob F. Schultz, Houston, Mental Health chairman, the committee report was read by Mrs. A. B. Pumphrey of Fort Worth, co-chairman. Following the reading of this report, Mrs. Pumphrey called the Board's attention to some projects suggested for Auxiliary members and incorporated in the material being sent out by the mental health chairman of the National Auxiliary. A discussion of these suggestions followed. Mrs. Guy E. Knolle, Houston, moved that the Board leave it up to the discretion of the local groups as to which material is used. The motion was carried.

Mrs. William D. Nicholson, Freeport, Nurse Recruitment chairman, presented a draft of a proposed manual for members of Future Nurses Clubs in Texas. She recommended

that the Auxiliary publish and distribute the proposed manual, which was written with the help of the State Committee on Careers in Nursing. The recommendation was approved. It was voted also to print and distribute to Texas high schools a brochure on nursing schools in Texas which previously had been compiled and distributed by the State Committee on Careers in Nursing.

Mrs. Guy E. Knolle, Houston, Program Chairman, introduced Miss Pauline Duffield, Austin, librarian for the Memorial Library of the Texas Medical Association, who stated that the use of films available from the Library has increased because of requests by Auxiliary members.

Mrs. Knolle moved that the Auxiliary purchase two or three films, after they have been previewed and passed on by the Program Committee, total cost not to exceed $250. The motion was carried. Also upon a motion by Mrs. Knolle, the Board voted to adopt a resolution favoring "A Family Doctor for Every Doctor's Family" and to send copies of the resolution to the Woman's Auxiliary to the American Medical Association and the American Academy of General Practice.

Mrs. Milton Spark, Waco, *Today's Health* chairman, recommended that the Auxiliary send subscriptions of *Today's Health* to the two United States Senators and the Governor and Lieutenant Governor of Texas. This was approved. Mrs. Spark announced that any organized county auxiliary in Texas which is able to get renewals from unorganized areas will receive credit for these renewals. She suggested the Finance Committee follow the recommendations of the past year's chairman when allocating funds for this committee's work.

Mrs. Ridings E. Lee, Dallas, Public Relations chairman, displayed a foldertype mailing piece being distributed by the National Auxiliary and giving county auxiliary objectives, the Auxiliary pledge, and a brief history of the Auxiliary and its program and projects. The Board approved Mrs. Lee's motion that enough money be voted to have orientation folders similar to the one shown printed for the State Auxiliary membership.

Mrs. Ramsay H. Moore, Dallas, reporting for the Revisions Committee in the absence of Mrs. T. H. Thomason, Fort Worth, chairman, recommended that the Board vote to have the newly revised By-Laws put into printed booklet form. This recommendation was approved.

Other committee chairmen reporting were Mrs. V. M. Longmire, Temple, Finance; Mrs. F. Paul Burow, Killeen, Legislation; Mrs. E. W. Coyle, San Antonio, Nominating; Mrs. J. L. Jinkins, Galveston, American Medical Education Foundation; Mrs. Allan Shields, Victoria, Library Fund; Mrs. J. Guy Jones, Dallas, Memorial Fund; Mrs. Charles V. Bintliff, Texarkana, *Bulletin;* Mrs. Haskell Hatfield, El Paso, *News Letter;* Mrs. Lynn Hilbun, Henderson, Reference; and Mrs. R. C. Bellamy, Liberty, Workshop. Mrs. Edward T. Smith, Houston, read the report of the Student Loan Fund Committee in the absence of Mrs. J. Charles Dickson, Houston, chairman. The report of the Essay Contest Committee as filed by Mrs. Perry J. C. Byars of San Angelo, chairman, was read in her absence by Mrs. Draker.

The following council women gave reports: Mrs. William C. Barksdale, Borger, District 3; Mrs. Andrew J. Magliolo, Dickinson, District 8; Mrs. C. M. Hansen, Navasota, District 9; Mrs. C. H. Stripling, Jacksonville, District 11; Mrs. W. Frank Armstrong, Fort Worth, District 13; Mrs. Emmett Essin, Sherman, District 14; and Mrs. Charles J. Wise, Naples, District 15.

Mrs. Latimer asked the Board to act upon the letter of resignation which had been received from Mrs. Scott C. Applewhite, San Antonio, member of the Revisions Committee. The Board voted to accept with regret Mrs. Applewhite's resignation.

Mrs. Longmire, reporting on recommendations of the Finance Committee, moved that funds be set aside for revising the State Auxiliary handbook and for the purchase of two wrought iron flower stands to be presented as a gift to the Texas Medical Association for the Sam Thompson Room. The motion was carried.

Mrs. Rumph read the report of the Courtesy Resolutions Committee in the absence of Mrs. Cecil O. Patterson, Dallas, chairman. The report expressed appreciation and thanks to Mrs. Mark H. Latimer, President; Mrs. S. W. Bohls, president of the Travis County Auxiliary; Mrs. G. G. Zedler, president-elect of the Travis County Auxiliary and chairman of the local arrangements committee; Mrs. R. C. Bellamy, Workshop chairman; N. C. Forrester, Executive Secretary of the Texas Medical Association and other members of the central office staff, particularly Mrs. Arleen Draker, Executive Secretary of the Auxiliary; and to the firm of Syers-Pickle & Winn, public relations counsel for the Association.

Mrs. Rumph moved the adoption of the committee's report, and the motion was carried.

Mrs. Latimer announced that the Southern Medical Auxiliary's annual convention will be November 8-11 in St. Louis. The Texas Auxiliary will be represented at the meeting by Mrs. McCracken.

After hearing other announcements, the President declared the meeting adjourned.

On Wednesday evening, September 22, Executive Board members boarded the Riverboat Commodore for a 10 mile ride up Lake Austin to the Greenshores Picnic Grounds, where a barbecued chicken supper was served.

On Thursday, September 23, Mrs. R. C. Bellamy, Liberty, conducted the Workshop for County Presidents and Presidents-Elect. Following the opening invocation, panel discussions on organization, program, public relations, philanthropic funds, and publications were held, with approximately thirty-five members taking part. N. C. Forrester, Executive Secretary of the Texas Medical Association, was introduced and in turn presented the central office staff members, describing the job of each. At noon a buffet luncheon was served in the Association building. Staff members were the guests of Mrs. Latimer at this luncheon.

Following the luncheon, motion picture films were shown. Guest speaker for the afternoon session was John H. Lane, Jr., field representative for the Texas Society for Mental Health, who spoke on "The Epidemic Nobody Talks About."

Approximately ninety-five attended the two day meeting in Austin.

MRS. P. M. KUYKENDALL, Ranger,
Recording Secretary.

WOMAN'S AUXILIARY CONFERENCE IN CHICAGO

The eleventh annual Conference of State Presidents, Presidents-Elect, and National Committee Chairmen of the Woman's Auxiliary to the American Medical Association is being held November 16-18 in Chicago. Mrs. Mark H. Latimer, Houston, President of the Woman's Auxiliary to the Texas Medical Association, and Mrs. Joseph H. McCracken, Jr., Dallas, President-Elect, are official delegates from Texas. Theme of the conference, which expected to draw about 200 state representatives and national leaders, is leadership in community health.

The program consists of panels on organization, legislation, program, publications, *Today's Health,* public relations, mental health, nurse recruitment, and Auxiliary finances, and a talk on the World Medical Association.

MRS. TURNER GOES TO EUROPE FOR CONFERENCE

Mrs. George Turner, El Paso, President of the Woman's Auxiliary to the American Medical Association, was one of

the seventy-six persons chosen to be a guest of the American Heritage Foundation to join an inspection tour of Radio Free Europe. In the interest of its Crusade for Freedom project, the foundation selected presidents or representatives of leading national organizations to be its guests on the tour and for conferences in Munich, Berlin, and Paris. The party flew from New York on October 20 and returned October 29.

COUNTY AUXILIARIES

The *Dallas County Auxiliary* sponsored a Nurse Recruitment Week the first week in September. To call attention to the importance and advantages of the nursing profession, television programs, posters, and store window displays were used during the week. Almost every high school in the county will have an auxiliary-sponsored future nurses club this year.

An art show with works done by members and their families featured the first meeting of the season held by *Tarrant County Auxiliary*. The show was in connection with a luncheon October 8 in Fort Worth at which a local artist, Mrs. Thelma Park, demonstrated several art media.

The *Navarro County Auxiliary* heard a review of the history of the Woman's Auxiliary to the American Medical Association by Mrs. Dan B. Hamill when it met September 3 in the home of Mrs. A. L. Grizzaffi, Corsicana. "The Patient's Watchdog," an article from *Today's Health*, was reviewed for the group by Mrs. Paul H. Mitchell October 1 at the home of Mrs. G. H. Sanders, Kerens. Committee reports were heard at both meetings, and attention was called to radio and television shows of special interest to auxiliary members.

DEATHS

W. J. McCREIGHT

Dr. William Joseph McCreight died in Anson, Texas, on August 17, 1954, from cancer of the lung.

Dr. McCreight, born November 29, 1888, in Stephens County, was the son of Joseph Samuel McCreight and Jane Elizabeth (Sharman) McCreight. Receiving his medical degree from the old Southern Methodist University Medical Department, Dallas, in 1914, Dr. McCreight interned at Parkland Hospital, Dallas. He practiced in Anson from

DR. W. J. McCREIGHT

that time until his death with the exception of his military service. Dr. McCreight served during World War I from January, 1918, to May, 1919, as a first lieutenant in the Army Medical Corps in France and with the Army of Occupation in Germany.

A member of the American and Texas Medical Associations almost continuously since 1916 through Taylor-Jones Counties Medical Society, Dr. McCreight served as president of his county society in 1930-1931. He was a member of the Southern Medical Association and was elected an honorary member of the Texas Medical Association in 1953. Dr. McCreight had served several times as city and county health officer and was county health officer at the time of his death. He was a member of the Masonic Lodge and the Baptist Church. Examining physician for Jones County local selective service board during World War II, Dr. McCreight was recognized with a certificate from the President of the United States for his work in that capacity.

Dr. McCreight and Mrs. Annie Hale King were married on June 21, 1915, in Anson. Surviving are his wife; three sons, W. J. McCreight, Jr., Abilene; Dr. Henry H. McCreight, Winters; and Charles T. McCreight, Lubbock; a step-daughter, Mrs. John L. McQuigg, Birmingham, Mich.; three brothers, Lloyd McCreight, Comanche, Okla.; Sherman McCreight, Oklahoma City; and Sidney McCreight, Duncan, Okla.; two sisters, Mrs. Mintie Clayton, San Francisco, and Mrs. Nell Holden, San Antonio; and eight grandchildren.

L. F. TAYLOR

Dr. Lafayette F. Taylor, Haskell, Texas, died July 7, 1954, at his home after an illness of more than two years.

Born May 12, 1873, in Denton County, Texas, Dr. Taylor was one of eight sons of a Baptist minister, the Rev. John J. Taylor, and Mrs. Taylor, three of whom became ministers and four doctors. He was graduated in 1894 from Memphis Hospital Medical College, now the University of Tennessee College of Medicine. After practicing in Pendletonville for three years, Troy for three years, and Eldorado for five years and also in Ozona and Hereford, Dr. Taylor moved in 1909 to Haskell, where he practiced until 1951, when he had a stroke and was confined to his bed. In 1952 the doctor was honored with the presentation of a Golden T Award from his medical school for more than fifty years of active practice.

A member of the Texas and American Medical Associations first in 1908 through the Randall-Deaf Smith-Parmer-Castro-Oldham Counties Medical Society and more recently through the Baylor-Knox-Haskell Counties Medical Society, Dr. Taylor had served as city-county health officer of Deaf Smith and Hereford Counties. He had helped organize the Haskell County Hospital and served on its staff for many years. He was on the school board at Haskell and on the board of directors of the Haskell National Bank. He be-

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

longed to Woodmen of the World Lodge and was a deacon of the First Baptist Church, Haskell.

Dr. Taylor and his wife, the former Miss Edna Pearl Bernero of Cedar View, Miss., whom he married on June 5, 1899, were among the first settlers of Bailey County, living on a ranch, and one of their sons was the first child born in the county. Mrs. Taylor preceded her husband in death in 1950. Dr. Taylor's survivors include two sons, Dr. Floyd Taylor and Bailey F. Taylor, both of Abilene; six daughters, Mrs. Richard E. Sherrill, Pittsburgh, Pa.; Mrs. T. M. French, Austin; Miss May Bell Taylor, a Baptist Missionary to Brazil but in Haskell on leave since 1951; Mrs. Edwin Fisher, Longview; and Mrs. G. H. Henshaw and Mrs. W. H. Carrothers, both of Abilene; twelve grandchildren; and five great-grandchildren. He is also survived by one sister, Mrs. Sam Williams, Scottsdale, Ariz., and three brothers, the Rev. Sam D. Taylor, San Saba; the Rev. W. W. Taylor, Phoenix, Ariz.; and the Rev. Gordon Taylor, Burnet.

J. D. WILLIAMSON

Dr. James Dorsey Williamson died on September 2, 1954, at his home in Castroville, Texas, of coronary occlusion.

Born in Learned, Miss., on March 13, 1912, Dr. Williamson was the son of Dr. and Mrs. R. D. Williamson. Dr. Williamson attended public schools in Castroville; Texas Military Institute, San Antonio; and the University of Texas, Austin, before entering the University of Arkansas School of Medicine, Little Rock, from which he was graduated in

DR. J. D. WILLIAMSON

1938. He interned at Santa Rosa Hospital, San Antonio, until 1939, when he organized the Castroville Clinic and Hospital. Dr. Williamson ran the clinic until the time of his death.

A member of the Texas and American Medical Associations continuously since 1942 through Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Medical Society, Dr. Williamson was secretary of his county society in 1949 and president in 1950 and had served as delegate. He was past president of the Bexar County chapter of the Heart Association; was a member of the Texas Academy of General Practice, Private Clinics and Hospitals Association of Texas, and Texas Hospital Association; and was health officer for Castroville. He had served on the staff of the Santa Rosa Hospital for sixteen years. Dr. Williamson was a member of the Travis Park Methodist Church, San Antonio. His main hobbies were fishing and swimming.

The former Miss Dorothy Mae Yerger and Dr. Williamson were married in Little Rock on June 6, 1939. She survives, as do two daughters, Dorothy Anne and Mary Louise Williamson; and one son, James Robert Williamson, all of Castroville, and one brother, Robert Edward Williamson, Little Rock.

S. A. KING

Dr. Stephen Allen King, Karnes City, Texas, died on July 13, 1954, in a San Marcos hospital of apoplexy after an illness of a year.

Dr. King, the son of H. P. and Emma (Bryan) King, was born in Shelby County on February 2, 1868. He attended the old Coronal Institute, San Marcos, and was

S. A. KING

graduated from the Hospital College of Medicine, Louisville, Ky., in 1890. He began practicing in Centerville, and in 1895 he moved to Karnes City, where he was a general practitioner until his retirement in 1953.

An early member of the Texas Medical Association, Dr. King held membership in that organization for approximately fifty years. He was also a member of the American Medical Association and the Karnes-Wilson Counties Medical Society, having served as president of the county society in 1940. County health officer for twelve years, he was active in civic and church work, being a member of the Baptist Church. In November, 1948, the citizens of Karnes City honored him and his wife with a "Dr. and Mrs. King Day" in recognition of their service to the community and of his more than fifty years of practice in Karnes City.

In 1897 Dr. King married the former Miss Bennie Makamson of Leona. She died in 1949. He is survived by a son, Dr. Allen D. King, Wilmington, Del.; two grandchildren, Miss Ernestine Loeffler King and Allen D. King, II, also of Wilmington; a brother, Henry P. King, San Marcos; and five sisters, Mrs. Annie Kennard, Miss Ola King, and Miss Sara King, all of San Marcos; Mrs. W. B. Taylor, Shawnee, Okla.; and Mrs. G. R. Cox, Bryan.

President's Page

YOUR DUES DOLLARS

The year 1954 is drawing to a close; and we look forward to 1955.

It is the season to pay our annual Association dues of $50. I think it is timely to discuss the manner in which this money is used and to point out the benefits and returns which members receive.

As you perhaps know, the dues are allocated as follows: General Fund, $30; Building Fund, $15; TEXAS STATE JOURNAL OF MEDICINE, $3; Woman's Auxiliary, $1; Medical Defense, $1.

This year the General Fund amounted to approximately $185,000, which provided about $76,000 for salaries to 23 employees. Other major expenditures from the General Fund were public relations ($12,000), legal services ($12,000), purchase of books, journals, and bindings for library ($10,000), operation and maintenance of building ($9,200), insurance and taxes ($9,000), public education (legislation) ($6,000), office supplies ($6,000), annual session ($3,600), and a few other minor expenditures.

The allotment of $15 to the Building Fund needs repeated explanation so that more members be kept informed. The central office building originally cost $732,000. This money was obtained by borrowing $120,000 from assets which had accumulated in the General Fund (none of which has yet been repaid), borrowing $61,000 ($30,000 of which has been repaid) from the Medical Defense Fund, and by securing a supplemental loan of $415,000 from the Equitable Life Assurance Society. This mortgage loan has been reduced to approximately $250,000 in a little over three years. The amounts originally borrowed from the General Fund and the Defense Fund, an as yet unpaid total $150,000, will require additional time from dues to repay.

Even though the dues were raised from $35 to $50 to cover the necessary allotment to the Building Fund, it is my considered opinion that the dues should continue at the present figure indefinitely and after retiring our outstanding indebtedness should accumulate a reasonable reserve fund for the future. Such a fund, in my judgment,

should be developed to at least $1,000,000 and perhaps more as our membership increases and as our state grows. After the present debt retirement, this present rate of income from dues, when later channeled into services by our Association, can produce a more effective program for our profession and the public. I believe our members will want this arrangement.

It is apparent that the returns are excellent on the $3 allocated to the TEXAS STATE JOURNAL OF MEDICINE, the $1 to the Woman's Auxiliary, and the $1 to the Medical Defense Fund.

To come to the current year, I should like to mention two things which directly effected financial savings to our members.

Last February the National Bureau of Casualty Underwriters filed an application for an increase of rates in Texas amounting to approximately 183 per cent on malpractice insurance premiums. The Texas Medical Association, through its officers and staff, appeared and testified and supplied facts to the Board of Insurance Commissioners which subsequently held the increase to 50 per cent. The rate of $25 per year for $5,000-$15,000 coverage was raised to only $38 instead of $72.

Collective action with other medical associations earlier this year resulted in the exclusion of the medical profession from social security and amounted to a saving of $126 per year for each physician at present tax rates.

It is impossible to estimate the value to the individual physician and to the public to be gained in having the Texas Medical Association strong and asserting its position and policies effectively. Such dividends may be intangible but are real and important.

Let us pay our Association dues gladly and realize that we obtain a wealth of benefits in return.

Best wishes for a blessed Yuletide and a happy and productive New Year.

J. J. L. Blassingame, M.D.

PR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: The second annual Medical Students' Days at Houston and Galveston, December 10 and 11, were enthusiastically received by almost 300 medical students from Baylor University College of Medicine and the University of Texas School of Medicine. Meetings were held in cooperation with Harris and Galveston Counties Medical Societies, respectively. Program's success underscores appreciation of students for information on the socio-economic side of medical practice.

The forthcoming Presidents' and Secretaries' Meeting, Austin, January 22 (see Organization Section of this Journal for complete program) has been enlarged to include society officers-elect, legislative chairmen, public relations chairmen, and delegates. Designed to ease the way for incoming officers with a strong indoctrination program, the 1955 session will feature talks by three out-of-state speakers, Frank G. Dickinson, Ph.D., Chicago, director, Bureau of Medical Economics Research, American Medical Association; Dr. George F. Lull, Chicago, secretary and general manager, AMA; and Edwin J. Faulkner, Lincoln, Neb., one of the nation's leading authorities on health and accident insurance and a strong critic of federal reinsurance legislation. It is vital that the central office be in receipt of names of newly elected officers at the earliest possible moment.

The central office recently has released results in its latest doctor distribution survey. Querying secretaries of the chambers of commerce and mayors of communities with a population exceeding 800 in the Texas Medical Association's District 4, the office reports that it received no

requests from the laymen for doctors. Nevertheless, physicians themselves, apparently, are more concerned with the distribution of doctors than are the key civic leaders, for it was the doctors' belief that excellent opportunity for additional physicians' services were warranted in from five to eight of the West Texas counties.

FROM OVER THE STATE: Bexar County Medical Society has entered into agreement with the National Bank of Commerce in San Antonio to facilitate handling of medical loans. Available for lump-sum services, such as obstetrical fees, surgical fees, hospitalization in excess of $75, the loans are drafted in the doctor's office by the secretary and the patient, and the bank clears the application within twenty-four hours. The society finds that this procedure clears secretaries for more valuable work and delegates any disagreeable collection relationships directly to the bank and the patient.

Several societies are sponsoring drop-in ads in their local druggists' ads on Sunday. Their approach is to remind readers that they are enjoying the finest medical care available in the world today, regardless of ability to pay. A well-founded series of this type should help to counteract complaints of the high cost of medical service. Any societies wishing information on this series can write the central office, 1801 North Lamar Boulevard, Austin, marking inquiries, "Attention: PR Diagnotes."

ON THE NATIONAL FRONT: The first comprehensive guide for county medical PR chairmen is just off the presses. Published by AMA Department of Public Relations, the 112 page manual is designed expressly to show county societies how to emulate or adapt to their own needs some of the most successful PR programs used by societies throughout the country. Soon to be available at the central office in Austin, this step-by-step outline of practice is slated for January distribution.

TIP OF THE MONTH

A lending library of TV-tested visual aids has been prepared by the AMA Bureau of Health Education for demonstration purposes. Anatomic charts, three-dimensional relief models, and films are available to medical societies without charge. Put your name on the list at the bureau for supplementary literature which will be issued as these lending library facilities expand.

WORLD MEDICAL MEMBERSHIP

Much has been said and written about organized medicine, from the grass roots level to the national level, but the medical organization extends further. The World Medical Association, although only in its eighth year of existence, plays an increasingly important part in the over-all health picture of the world. An organization interested primarily in the methods by which medical care is provided, the relation between physician and patient, and the freedom of choice of treatment by the physician, the World Medical Association is the only medical organization that is in a position to speak on a voluntary basis at an international level on medical affairs, be they scientific, economic, or political. It is not controlled by any government, the basic difference between it and the World Health Organization.

The WMA's objective of assisting all people of the world to attain the highest possible level of health can and will be reached through promotion of closer ties among national medical associations and doctors, exchange of information on matters of interest to the medical profession, maintenance and protection of the honor and interest of the medical profession, study of and reports on professional problems, and other similar methods which require widespread support.

That doctors the world over are eager to cooperate in providing the best possible medical care for their patients was evident at the WMA's most recent meeting, held in Rome, Italy, September 26 to October 2. Delegates representing more than 600,000 physicians practicing in fifty member-countries discussed their mutual problems and the World Medical Association's major problem, finances. The usual financial struggle accompanying an organization's early growth is further complicated in the WMA's situation. There is a lack of funds on the part of some of the national medical associations and also a difficulty in transferring funds from one country to another.

The American Medical Association in 1947 formed a special committee of leaders in medicine and industry to support the World Medical Association. The United States Committee, Inc., pledged $50,000 a year for five years,

and already contributions from various sources have exceeded $500,000. In 1953 more than 4,000 doctors paid annual dues of $10; more than forty drug and other firms gave $50,000; and about forty medical organizations, foundations, and medical book publishers provided about $24,000. Texas has 158 members, ranking seventeenth among the states.

There are three types of membership in the United States Committee, Inc., World Medical Association, each type bringing with it the following benefits: (1) certificate of membership, (2) the bimonthly *World Medical Journal,* (3) letters of introduction to foreign medical associations and their members, (4) a part in defending the interests of practicing physicians before international groups, and (5) the satisfaction of sharing the advantages of our medical progress with other lands. A member pays dues of $10 a year, a sponsoring member $100 a year, and a life member $500 (no further assessment).

The work of the World Medical Association can be done only with the support of physicians—by giving and by joining. Membership dues and donations are tax deductible and should be included in every doctor's budget for 1955 professional expenses.

Christmas Prayer

Don't give us fame, oh Lord above,
Don't give us riches great.
We beg for peace, we long for love,
That stem from heaven's gate.
Let Christmas be,
Eternally,
The symbol of a world set free.
Not fame, nor pow'r, nor worldly worth,
But peace on earth!

PATIENT CARE EMPHASIZED

Less than a year ago the medical, hospital administrative, and nursing professions of Texas banded together in a Joint Commission for the Improvement of the Care of the Patient to "stimulate, implement, assist in, and sponsor activities which will contribute to the care of the patient." First major activity of this commission, which was preceded by organization almost six years ago of a national commission with essentially the same objectives, was a conference on nursing held November 5 and 6 in Austin and reported at greater length in the News section of this JOURNAL.

Potentially, the Joint Commission for the Improvement of the Care of the Patient can perform a useful role. With representatives from the Texas Medical Association (four), Texas Hospital Association (four), Texas Graduate Nurses' Association (two), and Texas League for Nursing (two), the commission is a logical agency to which the professions concerned can bring information, problems, criticisms, suggestions, and plans with the expectation of receiving attention, help, explanations, advice, and cooperation as justified. The frankness of discussion and the specific recommendations already evident indicate that the current members of the commission are taking seriously the challenge of improving patient care.

Nevertheless, although discussions of mutual problems by even a few doctors, hospital administrators, and nurses are worth while and although workshops such as the nursing conference held recently can elicit important facts, the Joint Commission for the Improvement of the Care of the Patient essentially is limited to the extent that physicians, hospital managers, and nursing personnel working together in individual situations become aware of some of the problems pointed up by the statewide commission and unite to reach the best possible solutions locally.

One of the recommendations arising during

the conference on nursing was that local joint commissions for improvement of the care of the patient, representing at least the three professions on the state commission, be established. It is no more the responsibility of members of the Texas Medical Association than it is of members of the other cooperating state organizations to facilitate establishment of such local commissions, but it would be appropriate and praiseworthy if physicians would take the lead.

For those who plead that multiplicity of organizations already is confusing both the issue and the individual who attempts to understand and do something about it, it might be pointed out that the Joint Commission for the Improvement of the Care of the Patient is a vehicle for clarifying and coordinating thinking and effort which already is being expended but perhaps less effectively than it should be. Too, the central and all important focal point, the patient and his welfare, may have been brushed aside at times to make way for other laudable but tangential goals. It should be a salutary experience to concentrate again on the patient for whose benefit hospitals were built and doctors and nurses were trained.

IMPROVING MEDICAL ASSISTANTS

Stemming partly from the realization by physicians that their office personnel if properly trained can do much to keep patients happy and partly from the desire of doctors' assistants to improve themselves and increase their professional stature, a movement toward the establishment of organizations of medical assistants is under way.

The first such organizations in Texas appear to be in Dallas and Austin, where medical assistants have adopted constitutions, elected officers, and undertaken programs which eventually will embrace specific instruction in how to handle problems in the doctor's office as well as permit fellowship with others engaged in similar activities and informal exchange of questions and answers. The women currently holding membership in the organizations are enthusiastic over their future and what these associations can mean in added efficiency and satisfaction for their members. They also are gratified at the expressions of approval of the projects by their doctor-employers. The Travis and Dallas County Medical Societies and their officials are cooperating in efforts to assure that sound objectives and program are adopted.

Experts in medical public relations have pointed out repeatedly how important to public good will are the persons who work closely with the doctor and his patients. They add parenthetically that good medical assistants can mean the difference between a lucrative practice and one that keeps the doctor just one jump ahead of the bill collector. Although every physician bears the responsibility of explaining his own routine to his employees, most doctors welcome help in getting across to receptionists, secretaries, office nurses, and others who share the daily round of practice the basic differences between mediocre methods and attitudes and truly effective procedures. Organization of medical assistants with the proper motivation and guidance might contribute to this end.

Some have voiced the fear that doctors' assistants might eventually create another ancillary profession which would have to be regulated by law and which might complicate further the definition of practice of medicine. This objection to cooperation by physicians in the organization of medical assistants may have some validity. On the other hand, it seems evident that the medical assistants themselves, like persons in many other occupations, have felt the call toward greater skill, increased recognition, and in some instances adequate pay for a job well done and are not going to be satisfied with the status quo. Recognizing legitimate desires of their employees and acknowledging the worth of adequately trained assistants, physicians can do much in shaping the

pattern of medical assistants' organizations if they will take the initiative or will proffer their cooperation when it is sought.

The Committee on Public Relations of the Texas Medical Association sometime ago prepared material suitable for study by medical assistants. This basic outline has tips on a variety of subjects from how to answer the telephone to how to keep patients' charts, from what not to wear on the job to what to do to avoid malpractice suits. This material plus other information pertinent to the problem may be had from the central office of the Texas Medical Association by county medical societies upon request.

CURRENT EDITORIAL COMMENT

BUYING AND USING HEALTH AND ACCIDENT INSURANCE

After a prospective purchaser of health or accident insurance has decided about the type and amount of insurance he should have, he still needs to know about the specific policy he is considering. His doctor may help him to understand the policy by raising certain questions and helping to answer them. Here are some of the most important:

QUESTION. What are the exclusions and waiting periods, if any?

ANSWER. They vary with each policy. Usually preexistent conditions are not covered. Otherwise a person would not have to buy a policy until he fell ill. The resulting large volume of benefit payments in such a situation would soon force premiums for the healthy policyholder out of the market.

Q. Is a physical examination necessary to buy a policy?

A. Generally it is not. The patient's statements as to his health and history on the application are usually enough, but his medical history sometimes may make an examination advisable. Some companies reserve the right to have him examined when a claim is presented. Noncancellable insurance—that cannot be stopped unless the policyholder fails to pay the premiums—sometimes does require a physical examination to obtain insurance.

Q. What happens if there is an omission or falsification on the application?

A. In the event the status of the applicant's health was intentionally misrepresented, the company may refuse payment of benefits or may cancel the policy. Actually few policies are thus voided, but since the application often becomes part of the insurance contract, an applicant should read and answer everything before signing his name.

Q. What happens if a person is injured while working on the job?

A. Policies are issued which cover the insured on a twenty-four hour basis or provide only nonoccupational coverage, depending on what type of coverage is wanted. Most nonoccupational coverages are purchased by employees who are already eligible for disability payments under a workmen's compensation or occupational disease law.

Q. Can a person get coverage for the remainder of his family?

A. Most companies offer a family hospital-medical-surgical policy which is cheaper than buying individual policies for each family member.

Q. How and when will benefits be paid?

A. The insurance company has to receive proof that the insured person is disabled or has received treatment. A check is made out to the individual or, if authorized, to the doctor or to the hospital, or jointly, whichever way is desired.

Once the policy is bought, the next question likely to arise relates to the problem of the forms on which requests for benefits are made. At times these forms may seem an unnecessary bother to both the doctor and his patient. Uniform claim forms for Texas hospitals have been in use for more than two years. The Hospital-Insurance-Physicians Joint Advisory Committee of Texas was instrumental in drafting and securing acceptance of these forms by most of the hospitals and insurance companies operating in Texas. On a national level the insurance industry already has developed uniform claim forms for group policies and is at work now trying to streamline and unify the others.

Claim forms are necessary and perform two important functions for the patient and his

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and others closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions preferably should be between 300 and 500 words in length.*

physician; they bring the payment of needed money quickly and they provide the evidence the company needs to make the payment. Unless that evidence is presented, the company cannot tell what it owes or if it owes anything. Thus it is of top priority that all information given be complete and in as much detail as is necessary to establish adequate justification for the payment of the benefits.

One further question may arise if the benefits on the policy are not enough to pay the doctor or hospital bill. A physician may help the patient to recognize the inherent limitations as well as the benefits of health insurance.

In general, it should be remembered that health insurance is primarily a method for helping people finance the costs of needed medical care. In fact, many doctors feel that the insured patient ought to share some part of his medical care costs, if for no other reason than that human nature requires this safeguard against unrealistic demands for professional services. Also, although it is true that the ownership of health insurance may facilitate a patient's ability to pay, the insurance industry does not create new or additional funds to provide benefits to its policyholders. Every dollar paid out for health insurance benefits comes originally from the policyholders, who some day may need health insurance benefits themselves. Thus, any general increase in medical care costs stemming from ownership of health insurance not only would minimize the effectiveness of that insurance but also would penalize the foresight of all the other persons who saw fit to buy it.

In buying a policy, a person gets what he pays for. There is no magic that can provide sweeping protection at unrealistic "bargain" prices. The value of the policy depends on how well its provisions fit the individual's needs. But most important about health and accident insurance is that it gives security and peace of mind against an event everyone hopes will never happen. Fortunate indeed is the man who need never make use of his health insurance benefits, for he enjoys not only the blessing of good health but also the satisfaction of knowing he has, in large measure, safeguarded his family fortunes against the unforeseen.

HEALTH INSURANCE COUNCIL,
Chicago, Illinois.

208 South LaSalle Street.

This is the fourth and last in a series of articles on insurance coverage for doctors and their patients prepared at the request of the Hospital-Insurance-Physicians Joint Advisory Committee of Texas. The other articles appear in the September, October, and November issues of the JOURNAL.

Parkinson's Disease Treatment

It has been claimed that in this country over a million persons, mostly older ones, have paralysis agitans, or Parkinson's disease. Most of them can be treated easily and can even continue to work, Dr. Lewis J. Doshay, New York, said in the October 16 *Journal of the American Medical Association.*

Dr. Doshay said that the most important thing is that the patients remain under a physician's care and learn that employment will not weaken muscles and hasten paralysis. The author expressed the belief that most sufferers from paralysis agitans are easy to treat because "they expect so little and are appreciative of any help rendered," and because they have long periods when the disease is not active. He added that chemical, physical, and psychological treatment must be a continuous process and that with treatment, some patients can live comfortably for ten to thirty years after onset of the disease.

The physician reminded that patients with this condition can be cheered by evidence that they are less susceptible to many other diseases than the average person in the same age group. Paralysis agitans seems to cause most patients to have normal or low blood pressure, to keep those with high blood pressure within safe limits, and to keep all of them from suffering with diseases such as cancer and tuberculosis. Only one proved instance of cancer and not a single case of tuberculosis appeared during twenty years among thousands of patients, the author pointed out. Ulcers are also rarely found in persons who have Parkinson's disease.

Patients should be assured that the entire illness is just rigidity of the muscles, that there is never paralysis in this illness, and that the more they use the muscles the less chance there is for development of shortened and contractured muscles that produce pain and deformity, he stated.

PSYCHIATRIC ASSOCIATION RESEARCH MEETING

The regional research meeting of the American Psychiatric Association will be in Galveston February 18-19, 1955. The theme will be "Physiologic Basis, Values, Limitations, and Hazards of Pharmacologic Products Recently Introduced in the Treatment of Psychiatric Disorders." Physicians interested in presenting papers on this topic at the meeting should contact Dr. Martin L. Towler, 112 North Boulevard, Galveston.

ACUTE INFECTIONS COMPLICATING PREGNANCY
Panel Discussion

S. FOSTER MOORE, JR., M. D., San Antonio, Texas, Moderator; A. LOUIS DIPPEL, M. D., Houston, Texas; R. P. McDONALD, M. D., Fort Worth, Texas; WILLIAM F. MENGERT, M. D., Dallas, Texas; and E. STEWART TAYLOR, M. D., Denver, Colorado

DR. S. FOSTER MOORE, JR., San Antonio, Moderator: We have in mind including in this panel discussion the acute infectious diseases complicating pregnancy, particularly rubella, poliomyelitis, and the miscellaneous diseases which are said to have a deleterious effect upon the fetus. In addition, such infections as pyelitis, pyelonephritis, and acute appendicitis and the effect of acute respiratory infections upon maternal morbidity may be of interest. However, any questions pertinent to the subject may be included.

MATERNAL RUBELLA

Dr. Moore: One of the most controversial phases of this whole subject, I think, is the matter of rubella in pregnancy. It is my belief that this needs to be viewed in perspective. Certainly there is no uniform opinion about it, and we may have a difference of opinion concerning it among the members of this panel. Therefore, I am going to give all the panel members time to discuss it if they care to do so.

I would like to present the first question myself and ask Dr. William F. Mengert, Dallas, to answer this: What is the present status concerning rubella in pregnancy?

Dr. Mengert: This is a difficult assignment and a difficult question to answer. There is still a definite idea that rubella is associated with fetal malformation. I think it is well recognized that rubella must occur as part of an epidemic, that the diagnosis of rubella must be made objectively and must not be accepted from the patient's history, and that it must occur during the first half dozen or eight weeks of pregnancy if it is going to cause any trouble to the fetus. It is during the formative period of the embryo that rubella is most likely to cause difficulty. At first it was thought that almost universally the disease would cause fetal malformation. Today we have revised our figures downward. Probably a representative figure would be somewhere around a 10 to 25 per cent possibility of fetal malformation at present.

There is an interesting article which came out a number of years ago from South Africa,[3] where the investigators used trypan blue, the particles of which dye act much as the virus of rubella. They are absorbed onto the albumin fraction of the protein molecule and mechanically interfere with the formation of the fetus. This group of investigators, using a pedigreed colony of rats, was able to produce malformation in approximately one-fifth of the rats. They found also that if the trypan blue was given prior to conception, it was effective. It was not so effective if given immediately after conception and was most effective when given both prior to and immediately after conception.

Dr. Moore: Dr. Dippel, I wonder if you feel as Dr. Mengert does about this incidence of fetal malformation following rubella and also if you consider the possibility that the disease described by Gregg,[4] which allegedly caused congenital anomalies in Australia, perhaps might have been a different disease from the rubella that we recognize epidemically in this country.

Dr. A. Louis Dippel, Houston: In answer to the first question, I probably am even more skeptical than Dr. Mengert about the effect of rubella upon the production of congenital anomalies. The original story coming out of Australia in 1943[6] with the report of 100 per cent congenital anomalies resulting from maternal rubella was hard to believe. As I remember, this was a study of 100 cases of fetal congenital anomalies which could vary from anything from congenital cataracts to congenital deafness to congenital heart disease and microcephaly or any combination thereof—100 per cent of all these. Then the question went back to the mothers; did they have some disease during pregnancy? The diagnosis of rubella is, in my mind, an extremely difficult one to make. I certainly would not want to make it myself. The reports in this country vary from a questionable effect to congenital anomalies in as high as 40 per cent. In my experience, the few cases I have followed

Presented before Section B (Surgical), Texas Medical Association, Annual Session, San Antonio, May 4, 1954.

through have had no congenital anomalies resulting, and those mothers had an authentic diagnosis of rubella made by somebody who knew more about it than I did. The reported high incidence of that first series in Australia, of course, raises the problem of whether it might not have been some other disease or a particularly virulent type of rubella that was involved in the production of the congenital anomaly.

Dr. Moore: It appears that there is a general attitude of conservatism toward this matter of rubella in pregnancy. Each spring I see in consultation perhaps a half dozen patients who have been exposed to rubella or who allegedly have had rubella, and the question comes up of what to do. Of course the intention of the consultation is to consider abortion. We acknowledge that abortion for such a condition cannot be done legally in Texas, but I think it might be well to consider the matter of whether or not an abortion should ever be done or considered for maternal rubella. Dr. McDonald, would you care to comment on that?

Dr. R. P. McDonald, Fort Worth: Obviously, I think, each case should be considered individually. It is hard to establish a general set of rules to cover every case. If I may, I would like to go back a little. We have depended largely on our knowledge from the original articles from Australia. The situation over there is a little different from ours. It is largely a rural country, and during the war years 1939 and 1940 when they had those tremendous epidemics, the people were migrating from the rural areas into camp sites and cities, and reports were rather conclusive. I do not think there was any doubt that the disease in question was rubella, and the Australians have tabulated their results fairly well. As Dr. Mengert says, probably now we are a little more conservative. We think about 25 per cent abnormalities. We in the United States have been handicapped somewhat by a scarcity of concise reports. In the first place, many cases of rubella are so slight as to go unrecognized, and obviously few cases ending normally are reported. Since we have done a considerable number of therapeutic abortions for these cases during the first trimester, we have no way of knowing how such cases might have terminated if they had been allowed to proceed. Now, I think, the consensus in our literature is that therapeutic abortion should be considered in any patient having rubella in the first trimester without trial at immunization.

The only thing for immunization we have, and correct me if I am wrong, is the gamma globulin that is from pooled blood; in Australia they now have and have had for about four years the gamma globulin taken from the serum of convalescent patients having rubella only in epidemics and only in large areas. As Gregg[4] has reported, in Australia 670 women were inoculated, each with 4 cc. of gamma globulin, I believe, and 520 of these have been followed carefully. Among these 520 women receiving gamma globulin, only 7 cases of rubella have been reported; of these, 3 pregnancies terminated spontaneously in abortion, 1 infant was stillborn, and 3 fetuses were normal. I do not believe that we have that type of gamma globulin in the United States yet, and our present gamma globulin, even in large doses, is of questionable value in the treatment of rubella. The literature is confusing. Dr. Bass,[1] a pediatrician in New York, has reported 9 private patients with rubella who received the gamma globulin after being exposed and had no abnormalities.

I certainly feel, getting back to the question, that therapeutic abortion should be considered in the first trimester in proved cases of rubella. I think too that actually the case should be observed by at least two physicians after a definite diagnosis has been made. Also, I certainly would feel more inclined to do a therapeutic abortion on a patient who had four normal children than perhaps in an infertility case with the patient's first pregnancy.

Dr. Moore: Dr. Taylor, how do you in Colorado feel about this question?

Dr. E. Stewart Taylor, Denver: I do not have anything new to add. I am always glad when the problem does not come up. Usually it is this time of year when a physician receives a few telephone calls and has some conversation about rubella, and in order to put the patient's mind at rest, I find out how many weeks pregnant she is. If she is ten weeks pregnant or more when infected or exposed, I say forget it. If the infection occurred before ten weeks of pregnancy, I think we should worry about it. I always quote the risks to the patient; there are approximately 1 in 5 bad results. We did 2 therapeutic abortions last year and 3 the year before in our university hospital, but we are getting away from it.

Dr. Moore: I think we should not leave this subject without getting Dr. Mengert's and Dr. Dippel's views on the matter of abortion in such cases. If we ought to do abortions in any case in which the mother has had rubella, then it probably should be made a legal procedure in Texas,. How do you feel about that, Dr. Mengert?

Dr. Mengert: The best way to find out how a person feels about anything is to ask him what he has done under the circumstances. Of course, the Texas law has to do with the prevention of injury to the mother. The only way that an abortion can be done legally is for the physician to state that the mental trauma to the woman is so great that the

pregnancy is interrupted to avoid this mental hazard to her—the hazard of worrying about whether or not she is going to have a malformed child. I think there are some rigid criteria, all of which have been mentioned here, regarding the question of whether or not we should do therapeutic abortion, but I would like again to summarize those criteria. First, the only time one can be sure of a diagnosis of rubella is during an epidemic; an isolated case of rubella is a difficult thing to diagnose. Second, rubella must be diagnosed objectively by a pediatrician who frequently sees such diseases. The third thing has been emphasized by virtually every member of the panel and it is the timing with pregnancy. The disease must be in the early formative period of pregnancy if any harm is to come to the child, and I would certainly agree with eight or ten weeks as the absolute outside limit.

In view of the work that was done in South Africa with trypan blue, which obviously works the same way, I would be afraid of rubella occurring just before the woman conceived. That is, if she were just getting over the disease when she conceived, it is likely to be more dangerous than if it occurred say at eight weeks of pregnancy. With criteria as rigid as that, you will not find many patients who fall into the category of needing therapeutic abortion.

Dr. Dippel: One of the main things I could do would be to stress again the timing effect which Dr. Mengert has emphasized. The time that the organ system is laid down in the embryo, generally four to eight weeks after conception, is supposed to be the time when the virus of rubella would be most detrimental. I have never produced an abortion, nor been a party to the production of an abortion because of maternal rubella. I do not believe I could be induced to do so. I know of 4 cases in our city in which therapeutic abortion was done for that indication. In each case, the embryo was turned over to an anatomist for microscopic examination. There has been no written report from him, and I presume this means that no abnormality was found.

Dr. Moore: Before we get off the subject, Dr. McDonald, I wonder if you would comment for just a minute about the other miscellaneous infectious diseases and their possible effects, if any, on the embryo.

Dr. McDonald: Well, of course, regular measles or morbilli have been confused with rubella by the laymen, and many patients are confused as to whether the serious condition is the rubella or the morbilli. In the literature, of course, sporadic cases have been reported with morbilli in the first trimester ending in some fetal abnormalities, but there is certainly not enough consistency to this type of report to consider even remotely therapeutic abortion for this condition. We also undoubtedly have heard of other virus diseases affecting the embryo, particularly smallpox, chickenpox, mumps, and infectious hepatitis—conditions of that type—and also, I believe, of some cases of malaria. There is also the rather rare condition toxoplasmosis, I believe they call it. But as with morbilli, I do not think there is any definite proof that these cause fetal abnormalities.

Audience member: Dr. McDonald, if your wife had rubella and you felt that there was a 20 to 40 per cent risk to the fetus, would you go ahead and do an abortion?

Dr. McDonald: Well, this is sort of putting me on the spot but not as much as it would if the case were actually true. In the first place, a doctor would not take care of his wife. I think that one would call for help in making a decision like that. However, with two normal healthy children I would certainly hate to take a 25 per cent chance of bringing an abnormal child into the family. I do not think it is fair to the other two children.

Audience member: Dr. Moore, just as a point then, do you not think that the family involved has to be seriously considered, I mean the desires and wishes of the family?

Dr. Moore: My personal feeling is that at such a time an unemotional decision must be made. I think that it is the responsibility of the physician to make the decision and advise the patient accordingly, but I would like the panel members to comment on that. Dr. Dippel?

Dr. Dippel: Well, I agree with you wholeheartedly on that point, Dr. Moore. I think that is a time when clear thinking is most needed and you want to keep family decision out of it as much as you can. It seems to me that before you can seriously consider doing a therapeutic abortion because of maternal rubella, you have to do something more about proving that it is really responsible for the production of congenital anomalies than has been done up to this time. For example, it would call for a series much larger than most of them reported so far. The study should begin with the accurate diagnosis of rubella in the mother and then should follow all of her children through the early pediatric months, particularly in disclosing the presence or the absence of congenital anomalies, before we can really solve this problem. In many of the published series, the congenital anomalies are not described completely; for example, the congenital heart disease is not described as being of one particular type. I think we have to find out just what role rubella really does play before we can advise.

Dr. Moore: I have not in any case seen a baby

affected by rubella except when the diagnosis of the infection was made in retrospect. It is easy to get a history of rubella from the mother who has just found out that her baby is congenitally deformed because, first of all, she *wants* to find some reason, some tangible explanation for this deformity. As Dr. Dippel has pointed out, we have to make the diagnosis and then follow through a number of these patients. Where this has been done in cases which I have seen, all have been normal babies.

Audience member: How about rubella having occurred in the husband within the period of time preceding conception, that is, within four to six weeks previously?

Dr. Moore: Dr. Taylor, would you care to comment on that?

Dr. Taylor: I have never heard of a case like that. I think that I would be inclined to ignore that possibility as far as the conception is concerned and just not worry about it.

Dr. Mengert: I cannot see that the husband would have anything to do with it. If his wife did not get rubella, I do not see why the man would have anything to do with it. It is not the germ cell which is affected; what is affected is the developing embryo which results after the fusion of the male and female elements.

Dr. Moore: The next question is, In the event of epidemic rubella is it advisable to give the immune globulin? Would you comment on that, Dr. McDonald?

Dr. McDonald: I think that certainly the consensus is yes, that most of the general practitioners and pediatricians who are much more familiar with gamma globulin than I think it advisable to give it. Now, of course, there are several factors in using our gamma globulin; you must use large amounts, I believe 20 to 30 cc., and the expense is no little item. Australian gamma globulin is effective if given within eight days of exposure and the amount is 4 cc. However, I think that definitely when there is a history of exposure and no history of previous rubella, gamma globulin should be used.

Dr. Moore: The question is asked, When you refer to ten weeks of pregnancy, do you refer to ten weeks after the last menstrual period or ten weeks after conception?

Dr. Mengert: I mean eight weeks of pregnancy, not eight weeks after the last menstrual period. It is said that organogenesis is complete at the end of eight weeks so that theoretically there is little chance for any noxious influence to affect the child after that time unless it kills him. Incidentally, I would like to raise a question. Nobody has mentioned anything about the possibility of prophylactic therapy in young unmarried daughters. How many of you think young girls should be exposed to rubella before they get married?

Dr. Moore: I think it has been pointed out that if you intentionally infect the young girl with rubella, she then becomes a public health menace herself and has to be isolated during the course of the incubation period of her disease and the disease. I believe, though, that if this could be done on any large scale, it might offer some hope in the future. Dr. Dippel, would you comment on that?

Dr. Dippel: I had not considered that in the treatment of my daughter, but from a prophylactic point of view it certainly sounds good. Carrying it out would be quite a different problem—like doing a lot of other things on a prophylactic basis. It would call for a rather tremendous program. If we actually get even further into this and prove that there is really a high incidence of involvement of the embryo as a result of rubella, for example if it is at least 25 per cent, then I think a program of that kind would be something that should be seriously considered, even though it does call for isolation of the child for a definite period of time. Getting the girls to have rubella would be an ideal method of eliminating the possibility of congenital anomalies later on in life.

PYELITIS AND PYELONEPHRITIS

Dr. S. Foster Moore, Jr., San Antonio: There are several questions concerning pyelitis in pregnancy. One doctor asks that you discuss the management of recurrent pyelonephritis in pregnancy. Dr. Taylor, would you comment on that, please?

Dr. E. Stewart Taylor, Denver: I will avoid going into the whole management of that, but I think that pyelitis, especially chronic pyelitis, as well as acute pyelitis, is a cause of premature emptying of the uterus. I suppose that people have known that for a long while, but having gone over my own material trying to find out why premature delivery occurs in some cases, it has been reimpressed on me. I have been astonished at the number of times the patient has had a recurrent acute urinary infection or has had a carryover of a chronic urinary infection from an earlier acute one. Just what the mechanism involved in it is, I do not know, but I am convinced that it is important that chronic urinary infections not only be controlled symptomatically but bacteriologically during pregnancy because they are associated with premature deliveries.

Dr. Moore: Dr. Dippel, I know that you have been interested in that problem. Would you care

LIBRARY OF THE
COLLEGE OF PHYSICIANS

to say something about recurrent pyelonephritis in pregnancy?

Dr. A. Louis Dippel, Houston: I look at the problem a little bit differently from the way Dr. Taylor has presented it. I have not been so much impressed with the incidence of premature labor as a result of pyelitis, though there definitely is a correlation. I would be much more concerned with the future of that patient's renal function. These recurrent attacks of acute pyelitis are certainly going to end up with inroads upon the renal parenchyma and pyelonephritis, and renal function obviously will be reduced with each subsequent pregnancy complicated by pyelitis.

We follow much the original plan laid down by Traut and McLane[7] by way of prophylactic treatment of every pregnant patient who has previously had pyelitis either in a pregnant or nonpregnant state, giving her prophylactic therapy with a sulfonamide throughout the pregnancy. It requires a relatively small amount of sulfonamide given a few days out of each month in the great majority of the cases to control totally and prevent the recurrence of the disease. If acute pyelitis appears in such a treated patient or in a person who is not under treatment and who has not previously had the condition, then of course the treatment is exactly the same as with any other patient with acute pyelitis.

Again, agreeing with Dr. Taylor in this problem, we certainly have to treat these patients to get them bacteriologically free and not just symptom free from the disease. We see too much of that in our hospitals today—treating the patient until she is symptomatically free but paying little or no attention to bacteriology. It of course is known that the patient will harbor these organisms in the upper urinary tract for a long time, even after her symptoms are gone, so we must push the treatment so that she actually will be cured of the disease. Follow-up examinations by a competent urologist after the pregnancy is over cannot be stressed too strongly.

Dr. William F. Mengert, Dallas: I would like to know what is meant by the term recurrent pyelonephritis. Do we mean pyelonephritis recurring during the course of a single pregnancy or recurring in a subsequent pregnancy? For purposes of answering this, I would like to take an entirely different approach and define it as recurring in the same pregnancy. I feel that the all important thing is the question of why this infection recurs during a particular pregnancy. The urinary stasis that is necessary for the development of the disease comes about physiologically through dilatation of the kidney pelves and ureters. I have never seen a pregnant woman who would drink the necessary minimum of three quarts of fluid a day and who had no urinary tract disease prior to pregnancy develop pyelonephritis. One of the most important things in prenatal care is to get the patient to drink water. Selling water to women, incidentally, is one of the most difficult jobs you ever tried. I feel that if a woman developed pyelonephritis, responded to the usual treatment, and then on a good water intake developed it again, the important thing would be urologic diagnosis. Then the condition would be getting out of the field of the ordinary pyelonephritis of pregnancy, and we should look for such things as stones, aberrant artery, and the like.

Dr. Moore: Dr. Mengert, do you know of any reason why the pregnant patient should not have the ureters catheterized in such cases?

Dr. Mengert: We used to do it repeatedly, and not only that; I have seen a pregnant woman go for a week with bilateral indwelling ureteral catheters.

Dr. Moore. What effect would the knee-chest position or postural drainage have on pyelonephritis?

Dr. Mengert: As a general rule, it is not so efficacious in pyelonephritis in pregnancy as it is in the pyelonephritis that sometimes occurs immediately puerperal. The ureter does not only dilate during pregnancy, it also elongates, but to compensate for this to some small extent the uterus in a pregnant woman pushes the kidney up about the size of one whole vertebra. You can see that repeatedly on your intravenous pyelograms. However, it should be remembered that if the patient does not respond in other ways, then it is worth while to put her to bed with her feet high in the air; but, as I say, I have seen that work better with immediate puerperal pyelonephritis than I have with the antepartum.

Dr. Moore: Dr. Dippel, the question has been raised as to what you mean by small doses of sulfonamides.

Dr. Dippel: We use sulfadiazine, and we give .5 Gm. five times daily for five days out of each month for the prophylactic treatment against pyelitis in the patient who has had pyelitis or pyelonephritis previous to that pregnancy, even though she has no symptoms during the current pregnancy.

POLIOMYELITIS

Dr. S. Foster Moore, Jr., San Antonio: There is a question here concerning poliomyelitis. Is there an increased incidence of poliomyelitis during pregnancy? Also, would therapeutic abortion ever be considered following acute poliomyelitis in early pregnancy in which there was considerable paralysis of the lower extremities? Dr. McDonald, would you comment on that, please?

Dr. R. P. McDonald, Fort Worth: In the first part

of your question concerning increased incidence of poliomyelitis in pregnancy, or rather susceptibility to poliomyelitis in pregnancy, I would like to state that Bowers and Danforth[2] at Northwestern University summed up all the reported cases in the country in a recent comprehensive article and they concluded that the incidence of poliomyelitis does not increase with pregnancy. In other words, pregnant women are not more susceptible. However, a series of cases was reported at Wayne University in Detroit during an epidemic in 1949 and 1950;[5] the workers concluded that there, according to the public health figures, the incidence of poliomyelitis increased three times during pregnancy.

In reply to the second question, I do not feel that therapeutic abortion is indicated in poliomyelitis. You are just adding other hazards to a bad situation. The pregnancy itself has little effect on the poliomyelitis, and I think vice versa.

Dr. Moore: Dr. Mengert, I know that this is a subject in which you have been interested. Would you care to comment on that?

Dr. William F. Mengert, Dallas: Of course, if a pregnant woman develops poliomyelitis, I think that the only thing to do is to treat her for poliomyelitis and completely ignore the pregnancy. But the question was asked, as I got it, about the woman who has had poliomyelitis and now has residual paralysis of her legs and becomes pregnant after the poliomyelitis is over. Is that the way of the question?

Dr. Moore: I think that the question is: Following acute poliomyelitis in the early pregnancy in which there was considerable residual paralysis of the lower extremities, would you consider interrupting the pregnancy?

Dr. Mengert: No, I would not abort.

Dr. Moore: What about the necessity of delivering a patient in a respirator? Are there any special procedures that should be followed in such instances? Dr. Taylor, have you had that experience?

Dr. E. Stewart Taylor, Denver: No, I have not. We have delivered women just after they have been in a respirator or when they have had to go in one a few days later. I think that if you follow the dictum about treating the disease and letting the pregnancy take care of itself, you will not make things any worse. There is, I believe, no indication for any type of interference in any of the acute or chronic conditions which arise from poliomyelitis.

Dr. Moore: Would you say that the same thing applied in the case of bulbar poliomyelitis in a patient at or near term, for instance in a patient in whom you anticipate immediate delivery will be necessary?

Dr. Taylor: Absolutely; the same thing applies. That whole question has arisen, and curiously enough, it is the internists who get after us most often and want us to deliver by cesarean section a woman who has acute bulbar poliomyelitis. I see no purpose in it. It is largely based upon a misconception. Here is a woman in respiratory embarrassment. The idea is that if you relieve her of the pregnancy, you relieve her of her respiratory embarrassment. This is based on a misconception that pregnancy causes respiratory embarrassment. As a matter of fact, it does not. All the physiologic work that has been done shows that not to be the case; and it is far better, if the woman has respiratory embarrassment, to do a tracheotomy, to feed her oxygen, to keep her in a respirator, and to ignore her pregnancy.

OTHER INFECTIOUS DISEASES

Dr. S. Foster Moore, Jr., San Antonio: Should acute infections in general be treated differently in pregnancy than when the patient is not pregnant? If so, what additional precautions should be used during pregnancy? Dr. Mengert, would you comment on that?

Dr. William F. Mengert, Dallas: I do not think they should be treated any differently. Again, I come back to the dictum, "Treat the disease and ignore the pregnancy," because the pregnancy lasts longer than any acute infectious disease with the possible exception of tuberculosis. Even here, I feel that it is far better to treat the disease and not worry too much about the pregnancy. There are two ideas to consider. How does an acute infectious disease affect the pregnancy, and how does the pregnancy affect the disease? Actually, only a few infectious diseases affect the pregnancy. Fever has been thought to affect the pregnancy. As a matter of fact, it does not. Women have been given artificial fever to untold heights and yet have gone to term and produced live, healthy children. With some acute infectious disease, the toxin crosses the placental barrier and kills the child. I do not know what good could be done by doing away with the pregnancy or by treating the acute infectious disease in any other way. Again, I wind up with the dictum, "Treat the disease and ignore the pregnancy."

Dr. Moore: Dr. Dippel, would you comment on that?

Dr. A. Louis Dippel, Houston: Well, I certainly agree with what has been said and can think of only rare instances in which one might want to deviate from that. For example, in the case of malaria in

pregnancy, one of course would want to avoid the use of quinine because of its toxicity to embryotic tissue; but today we probably are not using quinine as much but other drugs which would not have the same effect on the embryo. In general, that dictum certainly is true—treat the disease, pregnant or not pregnant.

Dr. Moore: Dr. McDonald, do you have anything to say in summing up on this subject?

Dr. McDonald: No, I agree with the others. We know, of course, that both penicillin and streptomycin can be found in comparable concentration in the fetal blood and apparently are not harmful at all. And in malaria, as mentioned, we feel that cases of malaria in the newborn occur in the process of birth —on separation of the placenta rather than filtered through the placenta during pregnancy. I feel just as the others do on that subject.

Dr. Moore: How about you, Dr. Taylor? Would you like to comment?

Dr. Taylor: I would like to bring up the question of vaginitis during pregnancy. There is a feeling among some physicians that one should not treat actively such infections during pregnancy for fear of interfering with the pregnancy. I know in my part of the country we constantly run into the situation of a patient suffering with one of the more common vaginal infections which is easily treated in the nonpregnant woman. The physician in charge of the patient becomes conservative. I think that is a mistake; the vaginitis should be treated.

Audience member: What is presently considered to be adequate treatment of tertiary syphilis discovered during pregnancy?

Dr. Dippel: I do not think it makes much difference what the stage of syphilis is so far as treatment during the pregnancy is concerned. The standard recognized amount of therapy required to protect the fetus against development of congenital syphilis is in the neighborhood of 4.8 million units of penicillin.

Dr. Mengert: I might comment that there is a general rule that the effect of syphilis on the baby in utero depends upon when the woman got her syphilis. If she acquired her syphilis and got pregnant at the same time, the baby almost certainly is going to be involved. However, as the syphilis becomes older and more chronic, in other words as a period of years elapse, the effect on the child is less and less pronounced. At one time, it was said the number of pregnancies would take care of that. I think it is not so much the number of pregnancies as it is the length of time, and the longer the time between the initial acquisition of syphilis and the conception or the pregnancy, the less likely the child is to be involved. So with tertiary syphilis, I think that we can more or less automatically figure that the child is not so likely to be involved, but definitely the woman should be treated.

SUMMARY

Dr. S. Foster Moore, Jr., San Antonio: Time has run short as it always does in the course of a discussion which stimulates as much interest as this has done. However, there are a few minutes left in which to summarize.

I think it may be concluded that certain acute infections occurring in the pregnant woman may have an undesirable effect upon the fetus. Chief among these seems to be rubella and, to a lesser extent, some of the other acute infectious diseases. This problem in general does not seem to be as grave as was thought a few years ago, and the occurrence of rubella in the pregnant woman rarely, if ever, justifies the interruption of pregnancy.

On the other hand, certain acute infections occurring during pregnancy may have a harmful effect upon the mother and thereby have an indirect influence on the fetus. I am thinking particularly about pyelitis and pyelonephritis, which were discussed at some length.

Generally speaking (and this I believe is a good statement with which to conclude), during pregnancy any acute infection should be treated in the most effective manner without regard for the pregnancy.

I would like to take this opportunity to thank the various members of the panel who, I think, have contributed significantly to our knowledge of this subject. I am particularly pleased with the splendid response which we have had from the floor.

Texas Adoption Laws That Affect Doctors

JOHN BEN SHEPPERD,* LL. B., Austin, Texas

TEXAS doctors of medicine, especially general practitioners, obstetricians, and pediatricians, need a working knowledge of the provisions of the Texas Adoption Law. This law is the culmination of years of evolution and at present offers a humanitarian protection for adopted children and adoptive parents alike.

The practice of adoption goes back to the early days of the Greeks and Romans and received considerable attention from Emperor Justinian. The Anglo Saxons, however, did not recognize adoption in any form, and it was unknown in the common law of England. At present all of the law relating to adoption may be found in the statutes and in their interpretation by the courts. The statutes of this state completely cover the subject of adoption, and their provisions offer the protection of the law to the practice of adoption.

The first adoption laws in Texas were contained in an act of 1850, which merely provided the right of adoption and the right of an adopted child to inherit from adoptive parents. No provision was made in this early law for the method of transferring parental custody or for the welfare of an adopted child.

Successive amendments, however, did fully provide the steps of adoption, and the last amendment in 1947 gave full consideration to the rights of the adopted child. Under the Texas law, an adult person may be adopted; however, most often adoption concerns children and usually babies.

Texas doctors may be asked by childless couples for advice on how they can obtain an adopted child. Doctors are peculiarly qualified, as a result of their knowledge of the physical, mental and economic condition of the prospective parents, to know if the couple will be suitable for an adopted child. Doctors also are frequently confronted with the pregnancy of unmarried women and in this respect need to be familiar with the laws of adoption.

*Attorney General of Texas.

STEPS IN ADOPTION

When it is possible for a suitable couple to adopt a child, the first step is the employment of a dependable lawyer who has the interest of all parties at heart. His first action will be to draw up the transfer of parental authority and to petition the appropriate court for the adoption of the child.

The petition of the prospective foster parents must set out certain specified information, such as sex, race, birth place and birth date of the person to be adopted, the date he was placed in the home of the petitioners, consent from the natural parent or parents, and other kindred matters.

After the petition for adoption is filed, the district clerk mails a certified copy of it to the State Department of Public Welfare and notes on his docket the date of mailing. In the ordinary case, the judge appoints an investigator to make a complete study of the child and adoptive home and to give a report of such investigation to the judge. The executive director of the Department of Public Welfare may make an independent report if he sees fit.

A hearing is held before the judge, at which the husband and wife who are petitioning must appear and the child to be adopted must be present if he is 14 years old or older. A younger child need not attend unless ordered to do so by the judge. After the hearing, the judge may authorize or refuse to authorize the adoption.

One important point should be kept in mind by anyone concerned with adoption. It is that no child may be adopted without the consent of its natural living parents unless those parents have abandoned and deserted such child for a period of two years, turned over the care and custody to other persons, or failed to contribute to the child's support during the period of two years. In such cases no parental consent is necessary from the natural parents.

If more than 14 years of age, a child may also express his consent to adoption in open court for consideration by the court.

The age of an unwed mother is not material in giving the required consent.

If the natural parents place a child in a child placing agency licensed by the State Department of Public Welfare, the agency may give the consent ordinarily required of the natural parents. Such consent must be in writing.

The consent given by natural parents for the adoption of their child always must be in writing, after the birth of the child, and fully acknowledged with the needed information and facts contained in such consent.

If the simple steps just set out and contained in the adoption statute are followed, all of the legal relationships, rights, and duties between the child and its natural parents cease and thereafter the child is considered to have all of the rights of children born to its adoptive parents in lawful wedlock. After a proper adoption, the new parents also are entitled to all the rights and privileges of natural parents.

The natural parents of an adopted child and their kin cannot inherit from and through such child, but an adopted child may inherit from its natural parents. Of course, an adopted child may be excluded by specific words in a will, a deed, or other instrument.

In this state a Negro may not be adopted by a white person and no white person may be adopted by a Negro.

Considerable comment has been caused in recent years by the occasional discovery of the sale of a baby—the so-called black market in babies. Texas laws have gone far toward prohibiting any such practice, and the ethical doctors of this state have been in the forefront of the fight against this practice.

The Texas adoption statutes are farsighted, inclusive, and effective and provide protection and justice for all persons involved in an adoption. The physicians of the state can be of great assistance in assuring that these laws will be properly carried out.

NURSING NEEDS IN TEXAS

Viewpoint of the Medical Profession

A. C. SCOTT, JR., M. D., Temple, Texas

I AM particularly pleased to be a member of this Texas Joint Commission for Improvement of Care of the Patient, primarily because its main objectives are centered on the patient and are not limited to such subjects as nurse shortages, doctor shortages, or hospital deficiencies.

Although temporarily acting in the capacity of a hospital administrator, my views are, ipso facto, those of a doctor. To me, good personal care of each individual patient by the doctor and the nurse is paramount above all hospital rules, regulations, needs, or aspirations; above the laudable desire for specialized training of doctors and nurses; above the justifiable wish on the part of any doctor or nurse to better his professional standing or financial status; above every other consideration in our daily contacts and care of patients.

I believe I can safely say that I represent the general medical profession's viewpoint with respect to nurses when I state that the doctor's greatest desire today is that we obtain for our patients better personalized bedside nursing care.

I had rather have one well-trained nurse, giving excellent personal and sympathetic care to four patients, than to have the same four patients nursed by twelve nurses who consider themselves specialists, know all theories, and meticulously follow all the rules and the clock. I shall have more to say subsequently about group nursing.

From the medical profession's viewpoint, the nursing needs of the state are twofold—related to quantity and quality of nursing care. Each of these is also probably affected or modified by two other factors, namely, (1) the views of those doctors who largely conduct their practice in hospitals and (2) the views of those doctors whose principal practice is in the home and office.

QUANTITY OF NURSES

Regardless of how or where they practice, doctors are well agreed that we do not have enough nurses to go around for all our needs, and I believe the vast majority would agree that the quality of good nursing care has diminished in the past two decades.

For the last dozen years, many of us in this state—doctors, hospital administrators, nursing educators, and representatives of the nursing profession at large—have been concerned with these problems of nursing care; studying them intensely; proposing methods

Read at the First Conference on Nursing sponsored by the Texas Joint Commission for Improvement of Care of the Patient, Austin, November 5, 1954.

of alleviating the shortage of nurses; conducting drives to interest more young women to go into the nursing field; devising new methods of training—in short, expending tremendous energy on many fronts to try to solve the problem of increasing the number of nurses of all classes available for patient care.

In spite of this tremendous amount of thought and energy expended, not too much has been accomplished, and we are still faced with shortages in some areas. Much more has been accomplished in our state than in many others, since we provided for training and licensure of vocational nurses; and the hue and cry from the doctors for more nurses is not as great now as it was three years ago. Nevertheless, the question arises as to whether we have not been expending too much of our energy in one direction.

In most of the conferences we have had during the past ten years, and in most of our drives, our efforts have been centered on the dearth of nursing care and how to overcome this shortage. In practically every conference I have attended (and I have attended many of them), all parties have agreed that there is a shortage, and that in order to overcome it, we must interest more young women in nursing. Beyond that, there has been division, and two central themes have stood out in our discussions.

Representatives of the nursing profession have maintained that in order to interest more young women in nursing, we must raise the standards ever higher and higher. The standards must be raised to meet the present rigid requirements for certification and licensure, and to make nurses eligible for more responsible positions and more lucrative compensation.

The doctors have repeatedly expressed a different view, namely, that we need more intensive training in personalized bedside care for student nurses and fewer scientific educational requirements.

Hospital administrators, by and large, have taken a middle view, that we need both things; but they have expressed great concern at the exorbitant cost of highly specialized training.

Controversial subjects such as these cannot be solved by dodging them or by dodging the issues involved. To solve any problem, one must face all of the facts and issues head on, laying all the views and cards, and the truth, out on the table. Then, and then only, can we use sound judgment in resolving the problems. I shall do that very thing in expressing the medical profession's viewpoint of our nursing needs in Texas. Come the time when this commission will discuss doctor needs in Texas—all of you should do exactly the same thing, and I shall join you.

With respect to the quantity of nursing care, that is, the shortage of nurses, I have only one brief comment to make at this time. In many hospitals, luxury nursing is as prevalent today as it was ten or fifteen years ago. The continuation of this practice is reprehensible in view of our shortage of nurses and indicates utter, pure selfishness on the part of doctors, nurses, and patients. We have not done a good job of informing the public that available nurses must be used where they are most needed. We simply must teach the rich Mrs. Joneses who are eight to ten days convalescent that they are not entitled to keep a full quota of single-duty nurses when there are two, three, or five critically ill patients who need those nurses badly.

Not only is this luxury type of nursing still being practiced, but group nursing has never been utilized to its fullest extent. It can be done successfully. We have had it in full and successful operation in our own hospital since the war years. Only the most critically ill patients and those who have had a very extensive or dangerous operation ever have single-duty nurses, and these patients are put on group nursing service as soon as they are out of danger. The universal use of group nursing in the hospitals of this state would at once alleviate some of our shortage.

QUALITY OF NURSES

Now, let us consider the quality of nursing care in more detail. To begin with, doctors think the Art of Nursing is rapidly being lost. Many doctors likewise agree with me that the Art of Medicine is fast becoming a dead art. The factors producing this rapid and unfortunate disintegration of the Arts of Medicine and Nursing are almost identical and threefold: (1) superscientific educational requirements; (2) over-specialization; both of which lead to (3) a lack of close personal contact with and understanding of the patient.

Perhaps it is true that the medical profession's desire for better, more personalized bedside nursing care for patients harks back to the dark ages of twenty, thirty, or forty years ago, when we did not have nursing station red tape, unions, eight-hour shifts, overtime, or specialists in metabolic, psychiatric, diabetic, urologic, orthopedic, pediatric, geriatric, and rocking-chair nursing care, and we simply had to be satisfied with personalized bedside nursing. But, oddly enough, we find the public, represented by individual patients all over the United States, desiring exactly the same thing as the medical profession.

The crux of most of the troubles of both the nursing and the medical professions today is that we have just about specialized ourselves out of business. The public is sick of it. Patients want one thing pri-

marily, *personal attention from the doctor or the nurse.* In our zeal ever to raise our educational standards higher and higher, which leads to greater and more intensified specialization, our minds have become so concentrated on the procedures and rules for attaining those ends that we have forgotten the humanics of patient care. The patient has become the means to our goal rather than the object of our training, attention, and care.

The time has come when we must reevaluate our ideas and objectives. It is not simply a matter of how do we get more nurses to train and super-educate into specialists, and how do we get more nurses to work in hospitals? The real problem is how can we satisfy the public's desire for personal nursing attention?

The medical profession, as represented by the officers and members of the House of Delegates of the American Medical Association, became concerned a few years ago about the seriousness of this problem in the practice of medicine. Medical practitioners began to recognize that extensive specialization, with ever increasing standards for recognition and certification in the various specialties, was doing two things: (1) creating among doctors an ever growing interest in research and science, with a corresponding breakdown in the former intimate and personal doctor-patient relationship, and (2) increasing the feeling among patients that they could no longer get close, personal attention from doctors. A special committee of the American Medical Association, of which Dr. F. J. L. Blasingame and I happen to be members, has been at work for the past three years, studying this problem and the possible means of overcoming it.

I am convinced that the nursing profession is faced with exactly the same problem but does not fully recognize its significance. The minds and endeavors of those of us who have worked in the nursing field have been so centered on the shortage of nurses, we have completely overlooked this more critical problem, namely, improving the quality of personal bedside nursing care—a thing the patients and doctors intensely desire.

Incidentally, and I think significantly, this decrease in the quality of good personal patient care has been a definite, silent factor in our shortage of nurses. Its effect on the public has probably kept many families from encouraging their daughters to enter nurse training.

TRAINING FOR QUALITY

The keystones of the Art of Nursing and the Art of Medicine are the fundamental urges of women and men to minister to and alleviate the pains and ills of fellow human beings. Actually, the urge is much greater in women than in men. My best guess is that 95 to 97 per cent of young women enter the nursing field because of this primordial urge, and 85 to 90 per cent of the young men entering medicine do so because of this urge to help patients.

The 3 to 5 per cent of women and the 10 to 15 per cent of men who do not have this urge enter the profession for financial or commercial reasons. But, for the time being, let us forget them. They are not worth remembering anyway. Let us consider the vast majority who enter these portals of training because of their fundamental humanitarian urge to help patients.

In the nursing field, these young women enter training school, thinking they will see patients and be with patients more or less constantly as they learn how to treat and care for them. They soon become disillusioned and find they were wrong in this belief. However, despite the fact that in their training period they seldom have an opportunity nowadays to be with, treat, or care for patients, the flame of this fundamental, humanitarian urge is so intense in a few of these students, thank God, that it burns on through all of their formative educational years of training and lights their path of practice clear on throughout life.

Unfortunately, the vast majority who started out with this fine, fundamental humanitarian urge lose it along the wayside in the complexities, profundities, and multiplicities of our scientific educational requirements, which more and ever more take nursing students out of close personal contact with patients.

Whereas in years gone by student nurses spent nine-tenths of their working time with and around patients, today I doubt if more than one-tenth of their time is actually spent with patients except in the very smallest hospitals.

It has oft been said that "absence makes the heart grow fonder," and this is true up to a certain point; but even in so fundamental a thing as love, it is a proven fact that too long, continued absence dulls desire and love is often lost. The things we remember best are those things with which we come in contact most often. Even to maintain an interest in and for a thing requires close contact with it.

Let us illustrate this in another way. A student of physics or chemistry can learn the theory, memorize the books, and pass an examination with a high grade; but when he gets through, he will have only a theoretical, smattering knowledge of either subject, virtually no knowledge of the practical application, and certainly very little interest in its practical application. Consequently, modern educators require and provide in collegiate training that the student shall spend only one hour in the lecture room as compared with four to six hours devoted exclusively to labora-

tory training, actually coming in close personal contact with the subject. "Experience is the best teacher" for intimate knowledge of and continuing interest in any subject.

Certain it is that the emphasis which has been placed on educational and scientific attainment in the last thirty years has paid off well in the form of new discoveries and many important, worth-while changes in both the medical and nursing fields, to the benefit of the public at large. Most certainly, we must continue to have many good specialists in both fields. But the emphasis has been so great on educational and scientific attainment in recent years that the pendulum has swung too far—just as it always does in all great, new, advancing movements. In this instance, it has been at the expense of the Art of Nursing and the Art of Medicine.

It is a hundred times more important that we reverse this trend back to a sensible middle ground than that we furnish hospitals double or treble the present number of nurses.

> Next to a good mother and a good mate,
> God's greatest gift to mankind is a good nurse.

Many good nurses are highly educated—nurse educators, nursing directors, administrators of hospitals, specialists in limited fields, department supervisors, or private duty nurses—but the best ones are those who in their early training had much close, frequent contact and personal experience with individual patients.

Doctors today want more good nurses, whose training experience with patients taught them to give excellent personalized bedside nursing care.

Our greatest nursing need today is a renaissance of the Art of Nursing.

Scott and White Memorial Hospitals.

Pediatric Tuberculosis in Texas

JOHN S. CHAPMAN, M. D., Dallas, Texas

In the years between 1950 and 1954, 376 children died of tuberculosis in Texas. All of these children were under the age of 4 years. The total deaths from this disease amounted to almost as many as died during the same period and in the same age group from poliomyelitis, heart disease, and renal disease combined. The important difference is that, whereas there are no specific treatments for these other conditions and whereas the deaths were probably unavoidable, in tuberculosis there are specific antimicrobial drugs available and it seems highly probable that many of these children could have been saved. Of course it is true that the amount of tuberculosis in the pediatric age group is dependent upon the amount of tuberculosis in the adult population. But it is inhumane to leave children whose lives might be saved to die while one is trying to start a control program among adults.

Facilities for children in the age group under 6 are not furnished at this time by the State of Texas. Children above that age are hospitalized in the regular tuberculosis sanatoriums. The highest death rate by far, however, is in the younger age group and in fact is highest in the first 24 months of life.

Although up to this point discussion has revolved around the death rate, the fact to be faced is that for everyone that has died there must have been possibly two or three others who had serious disease but happened spontaneously to overcome it. But that these children who obtained spontaneous arrests may have suffered severe visceral damage seems to be reasonable and almost certain. That they may even have been spreaders of the disease during their early illness seems to be a definite possibility, since children of this age group commonly have positive cultures from their bronchial washings.

At this time there are hospitals which accept children in the earliest age ranges in Dallas, Corpus Christi, Beaumont, Amarillo, and Houston. Possibly a very few are accepted in some of the other cities of the state. Because these various hospitals which accept tuberculous children are locally supported, the burden upon them of treating children from the rest of the state is great and in fact in some places becomes insupportable.

In all of these places, largely because they are for the most part required to confine their admissions to county residents, there are considerable numbers of empty beds. At present, as well as can be judged from information available, it appears that in the hospitals in the cities mentioned there may be enough vacant beds to permit hospitalization of every seriously sick tuberculous child in the state.

From the University of Texas Southwestern Medical School Department of Medicine, Ivor O'Connor Morgan Memorial Hospital for Tuberculous Children, and William Buchanan Laboratory.

SUGGESTED SOLUTION

Since there are available beds in institutions already set up to provide pediatric care, but beds that cannot be used on account of local restrictions in regard to admission, it would seem reasonable that the state as a unit of government might well contract with these local hospitals to care for tuberculous infants and young children. There is plenty of precedent in other states for this type of arrangement as between locally owned hospitals and the state, which is generally considered to be responsible for the care of tuberculosis. There is even in the past history of the tuberculosis situation in Texas some precedent for such an action, in that during the depression the state government leased beds from private sanatoriums for the care of adult patients.

According to the information available from one of the hospital administrators, a per diem of $7 would be adequate to provide completely satisfactory care for children in the age range of from birth to 6 years. Furthermore in the various cities named there is already an adequate staff set up to deal with the problem as it occurs in the youngest age group.

As a protection both to the state and to the patients involved it would be understood that these hospitals would be regularly inspected and approved by a representative of the State Board for Hospitals and Special Schools, but that the administration would be in the hands of a local administrator and the medical care in charge of the local staff. There would be no remuneration from the state for the local medical staffs.

The routine and regular inspection should adequately protect the interests of the state as well as of the patients and prevent the development of any conscienceless efforts to capitalize on the illness of these children.

ADVANTAGES

The advantages of the proposed plan are multiple:

1. This solution of the problem would result in the earliest possible activation of a plan to care for tuberculous children. The buildings are already erected and the beds are standing. The medical staff has been assembled and needs only to be supplemented by the addition of a few nurses or aides.

2. In terms of economy there is every argument in favor of this solution. The State of Texas and the Board for Hospitals and Special Schools would not be under the necessity of any large investment in land or buildings. If the fortunate time shall ever arrive when children do not develop tuberculosis, these buildings can be used for other pediatric services and the state would suffer no loss in consequence.

3. The State Board for Hospitals and Special Schools would be spared the extreme difficulty of attempting to assemble a superior pediatric staff at the sites of their present state sanatoriums. Such a problem would in fact be almost insuperable, particularly since in addition to the pediatric staff itself there should be available extensive consultation with other specialty services such as orthopedics, neurosurgery, and thoracic surgery.

4. This plan is equitable in that it distributes the cost of the care of tuberculous children throughout the state and places the burden of their care not on a single small unit but on the citizenry as a whole. The plan, moreover, is subject to revision and reconsideration in the event it proves to be unsatisfactory either from the standpoint of the local hospitals or from the standpoint of the State Board for Hospitals and Special Schools.

5. This plan has the further advantage that it distributes centers for the care of tuberculous children over the greater part of the state so that the geographic separation of the child from his parents is minimized.

Histamine Useful in Blood Vessel Disease

Histamine can bring relief from disabling leg pains caused by diseases of the peripheral blood vessels, Dr. Isidor Mufson of New York reports in *The Journal of the American Medical Association* for August 28. Infusions of histamine may help inadequate circulation by expanding nearby vessels and may bring about permanent structural changes which prolong the successful effect of the treatment. Histamine is too strong to be injected into the veins in concentrated form, Dr. Mufson says, but when infused it is safe and powerful.

Of 150 patients with foot and leg pain, 36 per cent were able to walk up to seven blocks after treatment with histamine, the article states. Fifty-two per cent could walk from seven blocks to an unlimited distance. Of this last group, 40 per cent remained improved for as long as two to seven years after treatment. In another group of 41 patients treated and reported by other physicians, 70 per cent walked better after histamine infusions.

Dr. Mufson indicates that 23 patients so disabled that amputation was being considered returned to normal routines. Only 6 patients required amputation. Many of this whole group had gangrene, which was cleared with the help of the histamine infusions and antibiotics.

TV Scripts Prepared by AMA

A script which can be narrated by a local physician and accompanying film to illustrate the script has been prepared by the Bureau of Health Education of the American Medical Association to help societies which want to use television but have a limited budget. The first of a series of two tells how vaccines are prepared, laboratory tested, and given. The second, "Jimmy's Noise Box," shows how to teach a deaf child to use a hearing aid.

PHYSIOLOGIC AND THERAPEUTIC ASPECTS OF HEPATIC INSUFFICIENCY

R. D. HAINES,* M. D., and J. A. COLEMAN, M. D., Temple, Texas

HEPATIC insufficiency, regardless of its cause, has a myriad of interesting manifestations, and many factors determine the patient's hope for recovery. These factors include (1) the functional state of the liver at the time of injury, (2) the nature and extent of the insult, and (3) the promptness of adequate therapy. As treatment of any disease is accomplished best if there is understanding of the abnormal physiochemistry, we present the various phases of the abnormal physiology of hepatic insufficiency as a basis for suggested therapy.

DIET

In the treatment of hepatic insufficiency, a highly nutritious diet, rich in protein and supplemented with vitamin B concentrate, has been advocated for a number of years by Patek and his co-workers.[1] This diet contains protein, 140 Gm.; carbohydrate, 365 Gm.; and fat, 175 Gm. It has been demonstrated by animal experimentation that in the absence of adequate protein and carbohydrate, fat is productive of cirrhosis and increases the injurious effects of toxins;[2] a moderate amount of fat is not harmful but is beneficial in that it adds palatability to the diet; and fat increases the caloric intake. Some[3] have allowed small amounts of alcohol to stimulate appetite; however, as alcohol is not a complete food and it is so frequently a cause of the patient's previous inadequate diet, it perhaps should be avoided entirely.

Those patients who are too ill to take anything by mouth must be supported by parenteral means until some improvement occurs. With the more liberal use of glucose given intravenously, the mortality rate of acute hepatic insufficiency has decreased. It has been demonstrated that by raising the blood sugar level with intravenous glucose, the damaged liver can be stimulated to store glycogen.[3] Insulin, under these circumstances, actually defeats the purpose, for it causes an increased storage of muscle glycogen which lowers the blood sugar level and stimulates the liver to pour out more sugar. Protein may be supplied in the form of protein hydrolysate since the cirrhotic liver can utilize amino acids.[4]

Patients maintained on parenteral therapy should have substantial vitamin supplements. These should amount to at least 500 mg. of thiamine hydrochloride, 1,000 mg. of nicotinamide, and 300 mg. of riboflavin daily. With the possible exception of vitamin D, there seems to be an increased need for practically all vitamins in patients with hepatic insufficiency. As they are fat soluble vitamins, the absorption of vitamins A, D, K, and E tends to be deficient when the bile content of the intestine is lowered. A defective vitamin A storage in the liver may increase the need for additional vitamin A. Added to the decreased intestinal absorption of vitamin K is the liver's decreased ability to utilize vitamin K in the synthesis of prothrombin. These deficiencies necessitate the administration of fairly substantial amounts of vitamin A (50,000 to 100,000 units daily) and vitamin K, preferably natural vitamin K (20 mg. daily). The absorption of water soluble vitamins is not affected by hepatic disease except in instances of a complicating gastrointestinal disorder. Their metabolism after absorption may be altered. That vitamin B complex is important in the treatment of hepatic insufficiency seems well documented.[1, 5, 6]

Lipotrophic substances, including choline,[7] methionine,[8] inositol,[9] liver extract,[10] and vitamin B_{12},[11] are of value in treating experimental hepatic insufficiency and human hepatic cirrhosis. It has been demonstrated that fatty infiltration precedes fibrosis[12] and, indeed, that fatty infiltration may cause hepatic insufficiency without fibrosis. It is thought that compression in the peripheral portion of the hepatic lobule by fat-swollen cells causes periportal atrophy and fibrosis.[13] Treatment of hepatic insufficiency, to be most effective, should begin as early as possible, preferably in the stage of fatty infiltration. While some physicians believe that lipotrophic agents are of benefit only in cases of inadequate protein consumption, there is some difference of opinion as to their value in the presence of adequate dietary intake. To be effective, choline should be given in a dosage of 4 to 6 Gm. daily; methionine, 3 to 6 Gm. daily. Cystine combined with choline has lipotrophic properties, but alone it may increase liver damage. For this reason, it always should be combined with choline. Liver extract has been used for many years in the treatment of hepatic insufficiency. We recommend crude liver extract in the dosage of 3 cc. three times weekly.

From the Department of Internal Medicine, Scott and White Clinic.
**From the Section on Gastroenterology.*

HEMATOLOGIC ASPECTS

Patients with chronic hepatic insufficiency frequently exhibit varying degrees of anemia. This is usually of the macrocytic type. Wintrobe[14] found that, except when hemorrhage or infection was present, anemia was normocytic or macrocytic. He believed that it was similar, if not identical, to pernicious anemia and that it showed spontaneous remissions and responded to liver extract.

Bateman, Shorr, and Elgvin,[15] in their studies, found a marked increase in total blood volume with relatively greater increase in plasma than in red cells. They thought that the hypervolemia with normal red cell mass at least partially explained the poor response in their patients to antianemic agents. Schiff, Rich, and Simon[16] were able to recover antipernicious anemia substances from the livers of cirrhotic patients with macrocytic anemia, and they suggested that the defect was one of utilization rather than of storage. Jarrold and Vilter[17] found the bone marrow of cirrhotic patients with macrocytic anemia to be normally cellular or moderately hypocellular. These authors concluded that the macrocytic anemia of chronic liver disease is produced by a metabolic defect entirely different from that present in pernicious anemia and related macrocytic anemias.

The evidence seems to indicate that the disturbed physiology responsible for the anemia of chronic hepatic disease is (1) hypervolemia with greater increase in plasma than in red cells and (2) a metabolic defect in the utilization of antianemic factors. From a therapeutic standpoint, iron deficiency anemia, as seen in patients with chronic hepatic insufficiency, responds in most instances to ferrous sulfate therapy.[15]

In rare instances, hemolytic factors may be responsible for anemia in hepatic disease. Morlock and Hall[18] found thrombocytopenia in 14 of 80 patients with hepatic cirrhosis. This fact, added to the frequent finding of a lowered prothrombin level, accounts for the severe bleeding tendencies seen in patients with severe hepatic insufficiency.

ALTERED HORMONAL EXCRETION

Evidence of endocrine imbalance is frequently encountered in the patient with cirrhosis and is manifested in the male by gynecomastia, impotence, testicular atrophy, and pectoral alopecia; in the female by menstrual disturbances (menorrhagia, amenorrhea), breast changes (cystic changes), and breast symptoms (pain); and in both sexes by palmar erythema, spider angiomas, and acne.

The original theory that the liver normally inactivates or detoxifies estrogens has been elaborated. Several authors found increased urinary estrogens and decreased 17-ketosteroid and gonadotrophin excretion during the phase of severe liver disease.[19] Cantarow and his co-workers[20] showed that estrogens are removed from the blood by the hepatic cells and are excreted in the bile in an active form. Later, as in the case of bile acids, they progress through an "enterohepatic circulation." In addition to the free forms of estrogen being excreted in the bile, metabolism of this hormone is also by conjugation,[21] as well as by transference to compounds of lesser biologic activity. The observed increase in urinary estrogen excretion doubtfully is related to increased production of estrogen, but more likely to a combination of decreased production and decreased biliary excretion.

It also has been demonstrated that diets deficient in vitamin B complex decrease the liver's ability to inactivate either endogenous or exogenous estrogens,[22] whereas yeast[23] and methionine[24] could correct this defect experimentally. Some investigators have found no correlation of hypoadrenal or hyperadrenal cortical activity as 17-ketosteroids were normal in 6 patients and low in 2 patients.[25] Engstrom and his associates[26] administered testosterone to patients with liver disease and found this group converted the same amount of 17-ketosteroids as did normal persons.

The actual relationship of liver disease and adrenal gland function is not clear; however, Topperman[27] has suggested that since the normal hepatic function of esterifying cholesterol is diminished, the esterified cholesterol may be absent as a precursor of the cortical steroid hormone. Also, the direct effect of suppression of adrenal function by increased estrogen may be a factor, as demonstrated by Hamblen.[28]

Smith and Smith[29] have shown that the luteinizing hormone increases after administration of diethylstilbestrol, as well as that this release of luteinizing hormone is augmented by the metabolic products of estrogen. One might theorize that the adrenotrophic hormone is released by the same stimulus as the luteinizing hormone. With these facts as the basis, Lloyd[30] has proposed a rational theory to explain the "endocrine" changes seen in cirrhosis. It can be summarized as follows: With the decrease in liver function, free estrogen accumulates in the blood and urine, which inhibits the release of follicular stimulating hormone, secondarily resulting in suppression of spermatogenesis and follicular maturation as well as estrogen stimulation of target organs. The decrease in the inactive oxidative products of estrogen leads to decrease in luteinizing hormone and, perhaps, adrenotrophic hormone. These will reflect themselves in menstrual irregularities, decreased Leydig cell activity, decreased adrenal function, loss of axillary hair, and decrease in 17-ketosteroid excretion.

Pathologic substantiation is available, as Bennett and others[31] found from a study of patients dying with

cirrhosis that definite microscopic changes occurred in the testes, breasts, and prostate. These facts suggest the need for male hormone in the male and the disadvantage of estrogen in the female with a history of jaundice. In addition, testosterone has a protein sparing effect, and this is an added advantage as liver disease is often associated with negative nitrogen balance and hypoproteinemia. One of its controversial drawbacks is its possible effect upon salt and water retention.

ASCITES AND EDEMA FORMATION

As more information is accumulated, it is apparent that production of ascites and edema is a subtle disturbance involving several different physiologic mechanisms. These five major factors deserve some emphasis.[32, 33, 34]

Alterations in Portal Venous System Pressures.[32]—Normal portal vein pressure is approximately 80 to 120 mm. of water; in patients with cirrhosis of the liver, the tension rises from 300 to 600 mm. of water. The increased pressure no doubt is conducive to ascites formation.

The syndrome of increased portal tension, splenomegaly, ascites, and increased venous collaterals was first explained on the basis of increased connective tissue within the liver, with subsequent contraction of the hepatic vascular space. Recently, evidence has appeared to substantiate another factor, and to quote Kelty and others, "the growth of the regenerative nodule is more important in the production of a distorted, narrowed, and obliterated vascular tree than the increased fibrous connective tissue."[32]

As early as 1933, McMichael and Smirk[35] noted correlation of portal vein obstruction and diminished rate of absorption of water from the gastrointestinal tract, as well as delayed diuresis. Bradley[36] showed that increase in intra-abdominal pressure produced by ascites decreases hepatic blood flow tremendously. In addition, blood flow from other organs—including kidney, cardiac, pulmonary, and gastrointestinal systems—is adversely affected.

Thorington and Schmidt[37] showed that intra-abdominal pressure up to 30 mm. in dogs is consistently followed by anuria. It is suggested that the anuria is related to secondary effects on renal circulation comparable to partial occlusion of renal veins. In man, Bradley and Halperin[38] have demonstrated correlation of intra-abdominal pressure and reduction in renal blood flow as well as cessation of urine formation in certain proportions of nephrons. These observations suggest that portal congestion causes delayed absorption of water from the gastrointestinal tract and that when intra-abdominal pressure exceeds certain limits, it adversely affects urine output.

Renal function in relation to patients with cirrhosis has been studied extensively. Leslie and his associates[39] studied this problem, measuring renal function by several means, and they found that the glomerular filtration rate, effective renal plasma flow, and maximum tubular excretory capacity for para-aminohippuric acid (Tm_{PAH}) are reduced during the phase of ascitic accumulation and normal when ascites has disappeared. These data suggest that it is important to establish normal renal function. Paracentesis, therefore, should not be used as a last resort measure, but early, considering the fact that loss of protein accompanies paracentesis as the lesser of the two evils.

Changes in Oncotic Pressure of Serum.—The effective osmotic forces are four in number; they are (1) capillary blood pressure, (2) ascitic hydrostatic pressure, (3) plasma colloid osmotic pressure, and (4) ascitic colloid osmotic pressure. The average colloid osmotic pressure ranges from 200 to 350 mm. of water, and colloid osmotic pressure of ascitic fluid ranges from 25 to 175 mm. of water. Effective serum osmotic pressure above a certain critical level differs in various patients and prevents ascites formation,[40] and below this level ascites reaccumulates. There has been debate as to whether the low serum albumin level seen in patients with cirrhosis is due to altered protein synthesis, low intake, poor assimilation, or persistent loss. It must follow that a variable depletion of tissue protein also exists; and perhaps plasma albumin values can be restored only after tissue protein depletion has been erased.[41]

There has been variable enthusiasm for the use of salt-free serum albumin in the treatment of ascites. Encouraging results were obtained by Kunkel;[42] however, others[43, 44, 45] have observed only conservative response. As reported by Kunkel and his associates,[46] its greatest value may lie in the treatment of two groups of persons, those patients with low plasma albumin levels and severe liver damage following infectious hepatitis and those patients of alcoholic and nutritional cirrhosis with short-lived ascites. Its cost may be prohibitive to some. One disadvantage should be mentioned, that is, the possibility of increasing total blood volume and therefore increasing the burden of esophageal varices and the likelihood of bleeding or the increased possibility of pulmonary edema.

Since there is clinical evidence that prognosis of life is increasingly grave as levels of serum albumin decrease[47] (levels of total protein and globulin are of no prognostic value), the use of human salt-free albumin should not be abandoned, nor should it be used as the sole measure of treatment, but rather it should be added to the therapeutic program of all patients with severe hepatic insufficiency. The avail-

ability of serum albumin as human salt-free albumin is not limited. The amount necessary for favorable response varies from a few to many units given, if no untoward reactions occur, once or twice daily depending upon results. The combined use of mercurial diuretics[48] and salt-free albumin has been recorded to give synergistic beneficial results and should be further investigated.

Alterations in Hepatic Lymph Flow.—Volwiler and his associates,[33] by constricting the thoracic segment of the inferior vena cava, have produced, experimentally, ascites which has protein content similar to hepatic lymph. It was their conclusion "that ascitic fluid associated with hepatovenous congestion is in reality hepatic lymph."

Changes in Permeability of Abdominal Venous Channels.[34]—As postulated by Karl and his co-workers,[34] the possibility exists that a factor tending to accumulate ascites resides within the endothelial cells lining the mesenteric vascular bed. It is closely connected with the tissue and cellular protein metabolism. In those persons with a decreased tissue protein there exists a factor within the individual endothelial cell which favors increase in permeability and, therefore, increased ascites.

Changes in Salt and Water Metabolism.—It has been demonstrated repeatedly in cirrhotic patients with ascites that there is an increased retention of sodium[49] as well as a diminished urinary sodium excretion.[50] There is debate as to whether there is impaired renal excretion of sodium[51, 52] or increased tubular reabsorption of sodium.[52] Epstein and others[53] found normal glomerular filtration rate and renal plasma flow values in 11 patients accumulating ascites; also, they added evidence that retention of sodium is due to increased tubular reabsorption. On the other hand, Leslie and his associates[39] noted reduction in filtration rate, effective renal plasma flow, and Tm_{PAH} during the phase of rapid accumulation of ascitic fluid. They considered renal alterations to be functional and reversible since insulin and PAH clearance returned to normal after therapy.

In any respect, regardless of the route administered, practically all ingested sodium appears in the ascitic fluid and little appears in the urine.[52, 53, 54]

In cirrhotic patients with ascites, another interesting observation relative to sodium excretion has been the finding of a reversal of the diurnal excretion rhythm of sodium and chloride.[55] Simultaneous with this was a noted increase in the nocturnal glomerular filtration rate and effective renal plasma flow.[56]

The subnormal concentration of sodium in the thermal sweat and saliva[57] of cirrhotic patients with ascites has suggested a generalized mechanism at fault, such as a hormonal imbalance. Leaf[58] and Faloon[54] have suggested that this abnormal sodium retention is probably related and regulated by the adrenal cortex. In a direct approach, Bongiovanni[59] attempted to demonstrate increased renal excretion of adrenal salt active hormones and did find slight elevation of reducing "cortin" excretion in cirrhotic patients with ascites. Blahd and others[60] demonstrated that in far advanced cirrhosis, DOCA, cortisone, and ACTH accelerated the development of ascites and edema whereas patients with less far advanced disease manifested only transient salt and water retention. With the discontinuance of DOCA, cortisone, and ACTH, withdrawal diuresis was pronounced, especially in less far advanced cases, and in certain instances all edema and ascites disappeared. Thorn[61] and Eliel[62] suggested that this "withdrawal diuresis" may be a state of temporary relative adrenal cortical insufficiency.

The volume of ascitic fluid in females with cirrhosis has been observed to increase during the premenstrual period, evidence that progesterone also has a salt and water retaining effect.

Closely related to sodium excretion is water metabolism itself. The clinical feature of oliguria in advanced hepatic insufficiency is well known. The presence of an antidiuretic factor has been demonstrated in the urine of cirrhotic patients with ascites and not present in those without ascites.[63] Ralli[64] and Dochios[65] found increased amounts of antidiuretic substances in the urine of cirrhotic patients with ascites as compared with normal persons.

Likewise, Perry and Fyles[66] measured an antidiuretic substance in serums of normal persons and patients with liver damage. They also demonstrated in normal males greater quantities of this antidiuretic substance when the patient was dehydrated. These investigators also correlated quantities of antidiuretic substances in patients with liver disease and in normal persons and found no significant variation. Therefore, they questioned the exact similarity of these antidiuretic substances found in urine and serum and doubted the cause and effect relationship of the serum antidiuretic substance and the production of ascites. Contrary to this, Dochios and Dreifus[65] established the presence of increased antidiuretic hormone titers in the urine of 2 patients with cirrhosis and also have shown that urinary levels of this factor have a correlation with degree of clinical edema.

Assuming, as is the consensus, that there is an increased antidiuretic substance present, one raises the question of whether this represents increased production or decreased inactivation. If commercial Pitressin can be compared with the antidiuretic hormone produced in vivo, the theory of decreased inactivation would not appear to be true as it has been reported[67]

that cirrhotic patients can inactivate injected Pitressin as rapidly as normal persons. Therefore, one must consider the prospects of increased antidiuretic hormone as the likely hypothesis.

Verney[68] postulated pressure "osmoreceptors," which in response to serum solute concentration regulate the pituitary antidiuretic level. With slight increases in total solute concentration of the serum, stimulation through osmoreceptors produces increase in antidiuretic hormone and subsequent increase in reabsorption of water from glomerular filtrate and resultant conservation of body water and dilution or serum solute concentrate to normal. The opposite effect also occurs.

Various authors[69, 70] have demonstrated that water diuresis was inhibited in patients who were in sitting position more than in those in recumbent position and that this water diuresis could be increased by increasing the cerebral venous pressure by means of a pressure cuff about the neck. This information suggests also a "volume receptor" which in response to decreased volume of cerebral blood and extracellular fluid stimulates antidiuretic activity in the presence of dilute extracellular fluid. Perhaps one can speculate that osmoreceptors and volume receptors reside within the pituitary gland and independently respond to specific stimuli.

Mazur and Shorr[71] have reported that the hepatic vasodepressor principle in experimental animals is profoundly antidiuretic by inducing an increase in tubular reabsorption of water. It is suggestive, therefore, that sodium metabolism may be under the influence of adrenal corticoids while water metabolism is under the influence of antidiuretic substance.

Other electrolytes, however, such as potassium, calcium, and phosphorus, have been recorded below normal value in severely decompensated portal cirrhosis, questionably due to dietary deficiency.

Kunkel[72] reported that in 13 patients the urinary excretion of sodium chloride ranged from .012 to .13 Gm. per day while the patients ingested 7 to 9 Gm. of sodium chloride per day.

It seems rational, therefore, that a diet low in sodium should be and is ideal for patients with ascites and edema. It has been our policy in patients with severely decompensated hepatic insufficiency to use a diet containing .2 Gm. of sodium per day. This restricted sodium diet has its advantages as evaluated by Lowe.[73] Since under ordinary conditions 150 mg. of sodium are lost in stool and sweat per day, only the remaining 50 mg. would be available for urinary excretion or retention, and since a liter of extracellular fluid contains 140 milliequivalents of sodium, even if 50 mg. of sodium (2.2 milliequivalents) were retained a day, it would take sixty-four days for 1 liter of ascitic fluid to accumulate.

This restricted sodium regimen is not without hazard, particularly in patients with chronic renal disease, as manifestations of "low salt syndrome" may occur as a result of diuresis and failure of the kidney to reabsorb sodium. Accompanying this low level of serum sodium (less than 130 milliequivalents of sodium per liter) are the findings of an increased blood urea level and a depression of the carbon dioxide combining power of the plasma. Various alterations in serum potassium have been found.

Because of the unpalatability of the low sodium regimen, "cation exchange resins" would seem to be advantageous, permitting some salt in the food. Although these substances themselves have inherent disadvantages, they often suffice to tide the patient over critical periods. However, with the use of hydrogen cation exchange resins, hypokalemia has been produced in persons with renal insufficiency.[74] This hazard has been overcome with the newer resins which have incorporated potassium with the substance thereby providing this anion for absorption.

On the other hand, paracentesis has been a common therapeutic practice; and in patients who previously followed a low sodium regimen and who were subjected to frequent paracentesis, hyponatremia and the "low salt syndrome" have been reported. It is not necessary for this latter group of patients to have renal disease as body sodium is depleted by removal of electrolytes in the ascitic fluid.

Mercurial diuretics also have been used to aid in eliminating ascites and edema and may have some value. Their beneficial effects seem to decrease with repeated use. It should be mentioned that these measures (paracentesis, exchange resins, and mercurial diuretics) should not all be used simultaneously as they would hasten the potentiality of inducing the "low salt syndrome."

As stated previously, even though paracentesis may deplete the body of electrolytes and proteins, its use should be encouraged as satisfactory diuresis is often seen immediately thereafter, perhaps on the basis of increased renal blood flow. To substantiate this, experimental evidence in dogs shows that increase in intra-abdominal pressure is followed by oliguria.[75]

The ingenious idea of reinfusing ascitic fluid[76] has two disadvantages, in that the reinfusion produces anaphylactoid reactions and increases the amount of an already excessive antidiuretic material.

Before instituting the previously mentioned procedures renal function should be assayed, and during treatment observations of the electrolyte response should be noted.

SUMMARY AND CONCLUSIONS

The therapy of hepatic insufficiency is not stereotyped; however, there are certain basic therapeutic aspects appropriate for all patients. Rest is fundamental. A high caloric diet, with emphasis on adequate protein and carbohydrate consumption, supplemented with necessary vitamins, is essential. The avoidance of sodium has been stressed. Adequate lipotrophic substances and liver extract are important.

During acute infectious episodes antibiotics are valuable. Value of paracentesis should be weighed in the light of anticipated loss of protein against possible increase in renal function and likelihood of diuresis. Transfusions to combat anemia, whatever its origin, are imperative.

Exchange resins may be a valuable adjunct to treatment despite their shortcomings—unpalatability, possibility of hypokalemia, and production of symptoms mimicking hepatic coma. Human salt-free albumin may be a means of increasing plasma levels, restoring depleted associated stores, and potentially improving vascular permeability. Plasma extenders may be of momentary value during shock. The use of balloon esophageal compression may be a life-saving measure during bleeding until other specific surgical measures, such as a local injection, can be undertaken. Mercurial diuretics may yield transient beneficial diuresis, and they may be administered simultaneously with human salt-free albumin with synergistic efficacy. Testosterone may be indicated in certain male patients. The use of intravenous glutamic acid in coma reveals therapeutic promise.

CHOLESTEROL METABOLISM

Evaluation of Polysorbate 80-Choline-Inositol Complex (Monichol) for the Management of Hypercholesteremia

ARNOLD ALBERT, M. D., and MONROE ALBERT, M. D., San Antonio, Texas

ALTHOUGH great strides have been achieved in recent years toward the understanding of the possible underlying causes in the pathogenesis of atherosclerosis, the internist still is faced with the problem of treating this disease and its complications.

In a recent review, Moses[1] pointed out the two factors from a practical view which are of prime importance in the development of arteriosclerosis. They are the cholesterol in the circulating blood and the stress and strain on the arteries carrying cholesterol. This same author[2] has stressed that the emphasis should be placed not only upon the quantity of the circulating cholesterol but also on the physical form in which this cholesterol is carried and presented to the liver for degradation.

Pollack[4] stated that stabilization of cholesterol in the serum emulsion would help reduce the incidence of atherosclerosis. Sherber and Levites[6] also have demonstrated the importance of the physical state of serum cholesterol, especially for its utilization by the adrenal cortex, during their study of a new physiochemical complex (Monichol) containing polysorbate 80, choline, and inositol. Schaff,[5] in his review of cardiovascular diseases, stated that hypercholesteremia with predisposition to atherosclerosis is considered an inborn error of lipid metabolism. He was doubtful whether the ultracentrifugal lipoprotein patterns are any more accurate an index of atherosclerotic tendencies than the total serum cholesterol determinations.

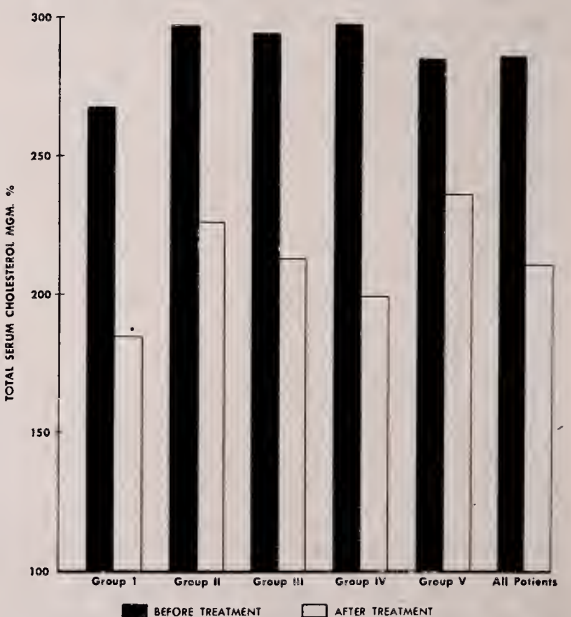

FIG. 1. A graph showing the mean serum cholesterol levels of five groups of patients before and after treatment with polysorbate 80–choline–inositol complex.

Over the years, many therapeutic methods and agents have been employed to lower elevated serum cholesterol levels. Among the agents suggested are potassium iodide, thyroid substance, pancreatic and brain extracts, lipotropic substances, plant sterols, heparin, estrogens, and low fat, low cholesterol, and low caloric diets.

It is not our intent to review the possible merits and limitations of any of the mentioned agents which may be antiatherogenic. Page,[3] in a recent article, summarized the present views concerning these methods and agents. He concluded that whereas no treatment exists for atherosclerosis, there may be ways of slowing its development and possibly aiding to reverse the existing pathologic process. Also, because the conditions under which experimental atherogenesis in animals is induced are of such an abnormal nature that its inhibition may result in producing an equally abnormal state, no practical means of a prophylactic or therapeutic nature can be judged from animal experimentation.

Since we believe that hypercholesteremia exists in a large number of average patients seen by the internist in private practice and that it may occur in the younger as well as the older age group, the problem of practical treatment for these patients becomes paramount. In our clinic we have used low fat, low cholesterol, and low caloric diets for the management of hypercholesteremia. This regimen has proved unsatisfactory as patients generally do not accept it after a period of a few months. We also have tried lipotropic mixtures and have found no significant change in the elevated serum cholesterol levels post-treatment as compared to pretreatment, confirming what already has been published to date concerning the use of lipotropic agents. Since Sherber and Levites published their results with the solution of polysorbate 80–choline–inositol, we decided to undertake an evaluation of this drug (Monichol*) in private practice patients rather than in hospital patients.

The expressed views that disturbances in lipid metabolism are an important factor in the pathogenesis of coronary artery disease and occlusion and the fact that patients with a family history of gallbladder dysfunction with gallstone formation and patients who are obese, diabetic, and hypothyroid all exhibit some degree of abnormal lipid metabolism led us to study the effects of the new polysorbate 80–choline–inositol complex, both therapeutically and prophylactically. The investigation we pursued had a twofold purpose. It was our intent to determine whether the polysorbate 80–choline–inositol complex would reduce the elevated serum cholesterol levels as well as whether it would improve the subjective symptoms of the patients studied.

METHODS AND MATERIAL

Cholesterol determinations were made on approximately 200 patients, and findings were considered normal if they were between 150 and 200 mg. of

cholesterol per 100 cc. of serum using Bloor's method. Liver function was tested, electrocardiograms were made, and basal metabolic rates were determined along with the cholesterol studies.

After screening these 200 patients, the 25 with hypercholesteremia were placed into one of five diagnostic categories: (1) hepatic and biliary tract disease, (2) diabetes mellitus, (3) cardiovascular disease, (4) idiopathic hypercholesteremia associated with obesity, and (5) hypothyroidism.

Monichol is a brand of polysorbate 80, with choline and inositol in a base consisting of water, glycerine, and flavoring agents. Each 5 cc. contains polysorbate 80, 500 mg.; choline dehydrogen citrate, 500 mg.; and inositol, 250 mg. The average dose was two teaspoons twice daily. However, occasionally when the fall in cholesterol was not restored to nearly normal with the average dose, two tablespoons were given twice daily.

FINDINGS

Group 1 represents patients who had a cholecystectomy performed because of a history of gallstones. In these cases surgery had been performed anywhere from one month to fourteen years prior to this study. Postoperatively, the patients complained of bloating, indigestion, and discomfort in the right upper quadrant with some pain in the subscapular region. The average serum cholesterol level of this group prior to instituting treatment with the polysorbate 80–choline –inositol complex was 269 mg. per 100 cc. After treatment the average serum cholesterol level was 184 mg. per 100 cc. (fig. 1). All of the patients subjectively improved, bloating subsided, indigestion ceased, and discomfort and pain subsided (table 1).

Group 2 consists of diabetic patients who were controlled with insulin prior to being included in the study. The average serum cholesterol level improved from 297 mg. per 100 cc. pretreatment to 228 mg. per 100 cc. post therapy (fig. 1). Individual results are noted in table 2.

Group 3 consists of cardiovascular patients, representing also the largest group of patients in the older age limits. Most patients in this group had anginal syndrome. Treatment with the polysorbate 80–cho-

12	66	F	Arteriosclerotic heart disease with anginal syndrome	380	April 6, 1954	EKG shows chronic coronary insufficiency	212	May 6, 1954	Feels better; no anginal symptoms
13	76	F	Arteriosclerotic heart disease with angina	271	March 20, 1954	EKG shows heart strain on left side & coronary insufficiency	198	May 28, 1954	Improved; fewer anginal pains
14	44	M	Anginal syndrome	233	May 8, 1954		212	June 9, 1954	Improved
15	65	M	Anginal syndrome; arteriosclerotic heart disease	264	May 15, 1954	EKG shows coronary insufficiency	160	June 5, 1954	Improved; no anginal pains
16	72	F	Anginal syndrome; arteriosclerotic heart disease	367	Dec. 29, 1953	EKG shows coronary insufficiency	180	April 27, 1954	Improved; few anginal pains
17	59	M	Hypertensive & arteriosclerotic heart disease; anginal syndrome; had coronary occlusion, age 58	227	March 24, 1954	EKG shows myocardial damage due to old coronary occlusion	202	May 8, 1954	Anginal pains relieved

TABLE 4.—*Effect of Polysorbate 80–Choline–Inositol Complex on Serum Cholesterol Level of Patients with Idiopathic Hypercholesteremia.*

Patient	Age (yr.)	Sex	History & Diagnosis	Initial Cholesterol (mg./100 cc.)	Remarks	Last Cholesterol (mg./100 cc.)	Subjective Findings
18	53	F	Obesity; menopausal syndrome	233 Sept. 29, 1953	On 1,200 calorie diet	155 May 15, 1954	Feels better; sense of euphoria
19	58	F	Obesity	248 March 22, 1954	On 1,200 calorie diet	205 May 6, 1954	Sense of euphoria
20	50	F	Menopausal syndrome; hypertension	353 Jan. 8, 1954	On medication only; no dietary restrictions	192 April 3, 1954	Feels better; sense of euphoria
21	38	M	Obesity	318 March 6, 1954	On 1,200 calorie diet	254 May 1, 1954	Feels better; sense of euphoria
22	33	F	Obesity	338 April 10, 1954	On 1,200 calorie diet	198 May 15, 1954	Feels better

line–inositol complex not only reduced the average serum cholesterol level from 295 to 213 mg. per 100 cc. but also gave these patients relief from anginal pain (fig. 1 and table 3).

Group 4 represents obese patients with idiopathic hypercholesteremia. This group, though small in number, presents some interesting data. Unlike the previous groups in which the patients were mostly in the fifth, sixth, and seventh decades of life, the average age of this group is 46 years and includes 1 man 38 years and 1 woman 33 years of age. The younger patients' serum cholesterol levels fell in like manner as the older patients. In six to eight weeks the levels went from 318 mg. per 100 cc. to 254 mg. and from 338 mg. per 100 cc. to 198 mg. respectively (table 4).

Four of the 5 patients studied in this group were maintained on diets consisting of 1,200 calories. One patient (patient 20), however, was maintained on a regular ad libitum regimen with no restrictions during the course of treatment with the complex. The result was just as striking in this patient (from 353 mg. of cholesterol to 192 mg. per 100 cc.) as in the patients on concomitant dietary control. The average cholesterol level following treatment fell from 298 mg. to 201 mg. per 100 cc. (fig. 1).

Group 5 represents 3 hypothyroid patients. On a diet consisting of 1,200 calories plus treatment with the complex, 2 of the 3 patients showed significant drops in their serum cholesterol levels. One patient maintained on a regular diet without restrictions experienced only a slight reduction in serum cholesterol. No thyroid therapy was instituted in any of the patients (table 5). The average cholesterol level for this small group fell from 288 mg. per 100 cc. to 238 mg. (fig. 1).

COMMENT

In this study lowering elevated serum cholesterol values helped the patients objectively as well as improved them subjectively. For hypercholesteremic patients, particularly those with cardiovascular disease and angina and those with postoperative biliary dyskinesia, there may be opened a new avenue of therapeutic approach. It is also important to mention that when treatment with the polysorbate 80–choline–inositol complex was stopped, the serum cholesterol levels rose to their pretreatment high. Upon resumption of therapy, the serum cholesterol levels were noted to fall again. While on treatment all patients reported a sense of euphoria. The complex possibly may possess a clearing, antichylomicronic property. Because of the small number of patients studied and for a relatively short period of time, it is impossible to draw definite conclusions. Some patients, however, have been on continuous therapy for almost one year and are in favorable condition.

A long range study with a larger group of patients undoubtedly would give further insight into the complexity of cholesterol metabolism and its physiologic significance. Prophylaxis of hypercholesteremia in obese, hypothyroid, and cardiovascular patients and in

TABLE 5.—*Effect of Polysorbate 80–Choline–Inositol Complex on Serum Cholesterol Level of Patients with Hypothyroidism and Hypercholesteremia.*

Patient	Age (yr.)	Sex	History & Diagnosis	Initial Cholesterol (mg./100 cc.)	Remarks	Last Cholesterol (mg./100 cc.)	Subjective Findings
23	44	M	Obesity; hypothyroidism	248 April 8, 1954	On 1,200 calorie diet	189 May 13, 1954	Sense of euphoria
24	36	M	Obesity; sluggish gallbladder; bloating; pain in right scapular region; hypothyroidism	248 March 13, 1954	Liver function tests normal	236 June 3, 1954	Losing weight
25	53	F	Menopausal syndrome; obesity; hypothyroidism	367 April 1, 1954	On 1,200 calorie diet	288 May 17, 1954	Feels better; losing weight; sense of euphoria

patients with a personal or family history of gallstones or even those with hypercholesteremia of unknown origin would be the ideal approach to this problem.

SUMMARY

The polysorbate 80–choline–inositol complex used was found to lower significantly elevated serum cholesterol levels in the patients studied. Patients studied with anginal syndrome and postoperative biliary dyskinesia with hypercholesteremia were improved subjectively and symptomatically. Diabetic, obese, and hypothyroid patients with hypercholesteremia likewise were improved objectively and subjectively.

Potassium Depletion in the Treatment of Essential Hypertension

ARTHUR RUSKIN, M. D., Galveston, Texas

A NEW method of treatment of hypertension needs no excuse even though, like all past methods, it explains little as to basic causes and is nonspecific in character. Psychotherapy, depressants like phenobarbital, or derivatives of Rauwolfia serpentina lower the blood pressure only slightly.

Potassium thiocyanate is a more definite hypotensive drug[6] but often must be increased to dangerously toxic levels. At such levels, the serum potassium on occasion has been found to be noticeably decreased—a parallel to the results to be presented. The median drops in blood pressure during therapy with thiocyanate were 20 mm. systolic and 10 mm. diastolic.

Drastic sodium depletion,[5, 8] accomplished in our Hypertensive Clinic by a 200 mg. sodium diet plus mercurial diuresis, lowered the blood pressure more markedly, that is, 25 mm. systolic and 15 mm. diastolic. The addition of preparations of Veratrum viride,* alone mildly hypotensive, aided this effect of sodium depletion without serious side reactions.

Powerful new sympathetic depressant agents, the methonium compounds, for example hexamethonium and hydralazine, alone or in combination, enjoy greater popularity than efficacy and safety. Even with the patient on rigid hospital control sudden marked drops in blood pressure from hexamethonium have been fatal. Increased dosage requirements and the development of a partial lupus erythematosus syndrome have plagued the administration of hydralazine.

Medical, if not surgical, sympathectomy has its place, however, in treatment of rapidly advancing malignant hypertension. Various combinations of the regimens just mentioned are also useful in the management of difficult cases of hypertension, and to these can now be added moderate potassium depletion.

In 1950 and 1951 a low potassium intake was found to lower the blood pressure of hypertensive as well as normal rats.[1] Various workers have demonstrated the lowering of potassium concentrations in serum, skeletal muscle, and possibly cardiovascular tissue on this regimen. As in human cases,[4] the blood pressure elevating effect of desoxycorticosterone was blocked in these rats, and the peripheral vessels became less reactive to various agents, that is, less spastic. The claim that potassium restriction was hypotensive only on a high, and not a low, sodium intake has not been confirmed (see below).

For the past two years my associates and I have been studying 22 patients with uncomplicated essential hypertension on various regimens involving potassium depletion. The low potassium diet[9] included diced meats and fish cooked for two hours in parchment paper, dairy products, cereals except bran and rye, certain vegetables, and canned fruits. Totally excluded were soups and gravies; dried fruits and most fruit juices; potatoes, spinach, dried vegetables, nuts, cocoa, chocolate, spices, catsup, mustard, and tartrate baking powders. Milk (1 glass), eggs (1), bread (3 slices), rice, and coffee (1 cup) were restricted; fats,

**Vertavis or Unitensen, Irwin, Neisler & Company.*

ginger ale, and sugar were unrestricted. The potassium of this diet was reduced to less than 20 milliequivalents (800 mg.) per day instead of the normal 70 to 100. To increase the potassium loss from the body further an ammonium type of carboxylic exchange resin* without potassium was administered in divided doses of 60 to 120 Gm. daily and generally was well tolerated. Unlike sodium, potassium is not greatly reabsorbed from the bowel and hence is largely excreted when absorbed by the resin. When the combined regimen failed to lower the serum potassium concentration and/or the blood pressure, occasional mercurial diuresis (for example, using Mercaptomerin, 2 cc. weekly) was added. This was necessary in only 5 cases.

For at least three week periods each the patients were observed on a regular diet and on the potassium depletion regimen just described. Blood pressures were checked in the early morning hours in triplicate at least twice weekly by the same observers. All the systolic and diastolic readings in each period were compared statistically as in our previous studies[5, 6, 8] to evaluate the drops obtained by potassium depletion. The efficacy of the regimen was also checked by weekly determination of serum potassium (and sodium) levels (flame photometry).

The results (table 1) indicate that the systolic pressure fell in most cases 30 mm. of mercury or more and the diastolic pressure 20 to 29 mm. from the control readings. The average falls were 29 mm. systolic and 17 mm. diastolic. At the same time there was a significant reduction in serum potassium, often to levels of 2.5 to 3.0 milliequivalents per liter (average fall of 1.3 milliequivalents per liter). The serum sodium did not change appreciably (average drop of 0.6 milliequivalents per liter).

TABLE 1.—*Blood Pressure Changes on the Potassium Depletion Regimen from the Control Values.*

Extent of Change (mm. of Hg.)	No. Patients Showing Change	
	Systolic	Diastolic
+ 10 to — 9	2	4
— 10 to — 19	2	6
— 20 to — 29	6	9
> — 30	12	3

Muscular weakness and dizziness were the most frequent complaints and were associated with an average weight loss of 11.8 pounds (7.4 per cent of body weight). Occasional nausea, vomiting, and loose bowels could be blamed on the resin, and not the low potassium diet. In many cases, on the other hand, headache, palpitation, insomnia, nocturia, and other hypertensive symptoms subsided rapidly with potassium depletion. The electrocardiograms and ballistocardiograms did not change significantly, presumably because the serum potassium level never fell below 2.5 milliequivalents per liter.

**Win-3000, supplied by Winthrop-Stearns Co.*

DISCUSSION

The results indicate that hypotensive effects could be produced in cases of essential hypertension by moderate potassium depletion. No severe toxic effects were noted beyond muscular weakness, precisely because the hypokalemia obtained was moderate in degree. The effects were comparable to those of drastic sodium depletion that we had used previously.[5, 8] Perera[3] also has noted significant but less marked lowering of blood pressure on a low potassium intake alone.

In Grollman's[2] animal experiments and in our work[7] in human subjects the use of a simultaneous low (or high) sodium regimen together with potassium depletion did not affect the hypotensive effects of the latter. This controverts the experimental findings in rats of Freed and Friedman[1] that potassium depletion is hypotensive only if the sodium intake is high, just as desoxycorticosterone depletes the body of potassium only if an adequate salt intake is provided.

The desoxycorticosterone type of potassium depletion (and sodium repletion), of course, may actually raise the blood pressure in hypertensive patients—a Cushing syndrome–like picture. Nor does hyperkalemia (with hyponatremia), prevent arterial hypotension, as witness clinical adrenocortical insufficiency. The type of hypopotassemia produced by us was associated with insignificant changes in serum sodium concentration. This is also true of the hypopotassemia (and hypotension) resulting from insulin administration. Hence, the low serum and presumably tissue potassium concentrations present in our cases must in some way relax the arterioles. Whether they do so directly or by interfering with acetylcholine synthesis and neuromuscular (sympathetic) transmission cannot be answered at this time.

SUMMARY

Dietary deprivation of potassium and its further depletion by means of the pure ammonium type of carboxylic exchange resin lowers the blood pressure markedly in hypertensive patients. The resulting hypokalemia, weight loss, and muscular weakness are moderate in degree and emphasize the method's safety and special usefulness in obese patients. Thus, these effects are comparable to those of drastic sodium depletion. If gastrointestinal symptoms due to the resin administration are persistent, the replacement of the resin by mercurial diuresis is generally adequate in sustaining the hypokalemia and the hypotension. Salt supplements are unnecessary except when mercurials are used in excess, since hypotension due to potas-

sium depletion occurs or persists whether the sodium intake is high or low.

The mechanism of the hypotensive effect of potassium depletion is unknown.

CASE REPORTS

FATALITY FROM PARENTERAL PROTEIN ADMINISTRATION

Case Report

J. C. GEORGE, M. D., Brownsville, Texas

IN SEPTEMBER, 1949, Coppinger and Goldner[1] reported that a review of literature revealed 4 deaths due to an injection of a protein hydrolysate and added a case of their own. These deaths were all reported following the use of Amigen. Two of these cases were not suggestive of allergic shock, 1 reported insufficient details to be evaluated, and 2 seemed to be sufficiently described to attribute death to anaphylactic shock.

Levey and others[4] have shown that the free glutamic acid levels in these solutions of amino acid have been responsible for the occurrence of nausea and vomiting, and measures have been successfully taken to remove this substance from the commercial products.

Hopps and Campbell[3] have expressed the opinion that severely damaged livers are unable to conjugate amino acids at sufficiently rapid rates to escape acidosis and that this may be a mechanism causing death.

The following is a case report which falls into the category of fatal anaphylactic shock following the administration of several cubic centimeters of protein hydrolysate made from bovine plasma (Travamin).

CASE REPORT

E. W., a 56 year old white man, was admitted to Mercy Hospital on July 20, 1953, with the complaint of flatulence and back pain and the desire to avoid alcohol. The admitting diagnosis was Laennec's cirrhosis of the liver and alcoholism.

The past history revealed that the patient had been hospitalized with vague abdominal complaints and backache eight months previously, at which time a diagnosis of cirrhosis of the liver had been made. At that time laboratory examinations revealed the hemoglobin, erythrocytes, and leukocytes to be within normal limits. The prothrombin time was forty seconds or 31 per cent of normal; the cephalin-cholesterol flocculation result was 2 plus in forty-eight hours.

The patient had been hospitalized three weeks prior to this admission at his own request to avoid alcohol and to aid in a postalcoholic neuritis. The laboratory tests at that time revealed normal erythrocytes, leukocytes, and hemoglobin. Bromsulphalein tests was reported as 20 per cent retention in thirty minutes, total proteins within normal limits, as was the albumin-globulin ratio. Blood cholesterol was 314 mg. per 100 cc.; van den Bergh's test showed 1.2 mg. of bilirubin per 100 cc. of serum; and cephalin-cholesterol flocculation was determined as 1 plus in forty-eight hours. Prothrombin time was 40 per cent of normal.

No definite food allergy or idiosyncrasy was known about. However, the patient had had two episodes of urticaria about the face and hands, which was thought to have occurred after he had eaten mushrooms. One episode had been within the past year. There had been no history of previous administration of plasma, blood, or protein digests.

Physical examination revealed a well developed, well nourished, slightly obese white man in no acute distress. The patient had a slightly increased psychomotor activity and a moderate tremor. His blood pressure was 140/90, pulse rate 90, and temperature 98.4 F. The abdomen was somewhat rotund and the liver edge was found to be somewhat smooth and rounded when palpated approximately three finger breadths below the right costal margin in the midclavicular line. There was absence of pulsation of the dorsalis pedis artery on the left.

Laboratory tests at this time showed hemoglobin 97 per cent; erythrocytes 4.86 million; leukocytes 9,000, with 62 per cent polymorphonuclear leukocytes, 6 per cent stabs, and 6 per cent young forms.

On admission to the hospital the patient was given 100 mg. of Demerol Hydrochloride and 30 grains of chloral hydrate. He was placed on a regimen of a high carbohydrate diet, high vitamin concentrate, 1 cc. daily of adrenal cortex extract, and 1,000 cc. of 10 per cent invert sugar with soluble vitamins B and C and 2 cc. of adrenal cortex extract in the solution. Subsequently he was given .5 ounce of paraldehyde, every three hours as necessitated for nervousness. He was given vitamin K daily.

The patient was relatively restless but had a satisfactory course for forty-eight hours, after which 1,000 cc. of plasma hydrolysate (Travamin) was ordered. The infusion was begun with a venipuncture in the antecubital fossa on the right in the median cubital vein using a 20 gauge needle, care being taken to avoid any administration of air. The solution was begun at a full drip with no obstruction in the tubing. The nurse who administered the solution left the room immediately, and a vocational nurse was left to observe the patient. After the nurse's departure, the vocational nurse noted that the patient was beginning to gag. At this point his false teeth were removed. The patient began to scratch his genitals, asked for a urinal, and began urinating. Subsequently he asked for a drink of water and was given a sip of water. After this he complained of difficulty in breathing. At this point the nurse was summoned, and the flow in the intravenous medication was decreased. He then began to complain of shortness of breath, and administration of oxygen was started immediately. He took a deep breath and then profuse diaphoresis and cyanosis began, and his eyes opened wide with the sclera showing marked hyperemia. He took a deep breath and collapsed. The intravenous medication was discontinued, and from observation of the solution, it appeared that the patient had received considerably less than 50 cc. Medication was then begun with 1 cc. of Coramine intravenously, 2 cc. of Benadryl intravenously, and subsequently 1 cc. of epinephrine hydrochloride in saline solution intracardially; however, no audible or palpable pulsations returned.

The patient made slow and feeble attempts at respiration and then was given artificial respiration for fifteen minutes with no results. He died approximately five to seven minutes after the administration of the fluid was begun.

An autopsy was obtained with the following pertinent findings being noted:

The sections from the heart showed fibrils which appeared slightly hypertrophied. Extensive cloudy swelling and transverse fragmentation was noted in some of the fibrils. Considerable interstitial hemorrhage of the petechial type was seen. All vessels showed marked engorgement.

The sections from the liver showed an increase in the amount of fibrous tissue in the portal spaces, with some round cell infiltration in these areas. All liver cells showed extensive cloudy swelling; some showed fatty degeneration. The deposition of bile pigment also was noted in several liver cells. All sinuses were engorged with blood, many being distended.

The sections from the lungs showed extensive engorgement of the smaller vessels. Marked emphysema of some of the alveoli was seen. Some of the alveoli were collapsed, while others showed rupture of their walls with the production of emphysematous areas. The smaller bronchioles showed narrowing of their lumens with stenosis, as though they had been spastic. A considerable number of eosinophils were seen in the lung and liver sections.

As the examiner noted, the histopathologic findings were compatible with the diagnosis of anaphylactic shock. The dilation of sinuses in the liver, the stenosis of the bronchioles in the lungs, collapse of some of the alveoli, rupture of the walls of other alveoli with the formation of emphysematous areas, and the peculiarity of the inflammatory cell infiltrations with the presence of neutrophils, all would support the diagnosis in this case as an anaphylactic type of death.

COMMENT

The Prausnitz-Küstner passive transfer test was not done; it would have been helpful in further establishing anaphylaxis. This is a test done by injecting 1 cc. of the patient's serum intracutaneously in the forearm of a normal person. Later intracutaneous injection of the hydrolysate in the area produces swelling and itching if the test is positive. This is thought to be a reliable test for hypersensitivity to a specific allergen.

Anaphylactic reactions to parenteral protein therapy such as in the case cited must be infrequent, but increasing reports of fatalities lead to the conclusion that these substances cannot be used with complete impunity. It seems more judicious not to use this method of administration for persons able to take protein therapy orally or in those cases in which withholding protein for a few days would not seem to cause undue hazard to eventual recovery.

SUMMARY

A case of fatal anaphylactic shock following administration of plasma hydrolysate (Travamin) is reported. It is suggested that a more judicious selection of patients for parenteral protein therapy be used and that testing for sensitivity of patients receiving protein digest would be a worth-while procedure.

Immunization Against Stress Needed

The emphasis in the mental health movement has shifted from the lowering of hazards to the raising of immunity, Sir Geoffrey Vickers, one of Britain's public health leaders pointed out at the Fifth International Mental Health Congress held in Toronto recently. "By all means let us reduce the occasions for stress," he declared, "but stress will remain a characteristic of human life."—*Alabama Mental Health,* October, 1954.

Eleventh District Society, Dr. Porter Bailes, Tyler, Pres.; Dr. Hugh F. Rives, Jacksonville, Secy.

Twelfth District Society, Marlin, Jan. 11, 1955. Dr. Neil Buie, Marlin, Pres.; Dr. Paul H. Mitchell, Corsicana, Secy.

Thirteenth District Society, Abilene, March 2, 1955. Dr. Mal Rumph, Fort Worth, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteenth District Society. Dr. J. David Thomas, Denton, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Mount Pleasant, 1955. Dr. R. L. Johnson, Mount Pleasant, Pres.; Dr. R. L. Hardman, Mount Pleasant, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 14-17, 1955. Dr. Lawrence B. Sheldon, Dallas, Pres.; Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco, March 2, 1955. Dr. Ross Shipp, Waco, Pres.; Dr. Milton Spark, 121 Dallas St., Waco, Secy.

International Medical Assembly of Southwest Texas, San Antonio, Jan. 24-26, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 7-10, 1955. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy..

North Texas-Southern Oklahoma Fall Clinical Conference. Dr. L. N. Simmons, 1518 Tenth St., Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, April, 1955. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, Dec. 2-4, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

UNIVERSITY OF TEXAS MEDICAL BRANCH

The University of Texas Medical Branch, Galveston, has been given a $10,000 grant for the maintenance of a loan fund for medical students by the T. J. Brown and C. A. Lupton Foundation, Inc., Fort Worth. A $5,000 grant has been given by the M. D. Anderson Foundation, Houston, for the establishment of a youth development center, which will be under the direction of Dr. Eugene C. McDanald and Dr. Brooks W. Mullen, both of the Neuropsychiatric Department.

Dr. André Lwoff, of the Pasteur Institute, Paris, spoke on "Nutritional and Virus Diseases of Bacteria" at the Medical Branch on December 10.

Sir Lionel Whitby, vice-chancellor of the University of Cambridge, gave a series of conferences and seminars on blood disorders on December 13. He also was scheduled to speak on aspects of medical education in different parts of the world while he was in Galveston.

Dr. Bingt Yohanson, Sweden, is visiting the Medical Branch for surveying methods in use in the treatment of severe burns; and *Dr. Pierre Grabar,* Pasteur Institute, Paris, is a senior fellow in the James W. McLaughlin Fellowship program in Infectious Diseases and Immunity at the Medical Branch. He will work in association with *Charles M. Pomerat, Ph. D.,* and *W. W. Nowinski, Ph. D.*

The Texas Medical Association Memorial Library needs your constant support. Have you used its facilities during the past year?

TEXAS NURSING SITUATION AIRED

Ten physicians, twenty-five hospital administrators, and seventy-six registered nurses (directors of schools and nursing services) were present for a two day conference on nursing sponsored by the Texas Joint Commission for the Improvement of the Care of the Patient at the Texas Medical Association headquarters building in Austin, November 5 and 6. The commission, organized early in 1954, is comprised of representatives from the Medical Association, Texas Hospital Association, Texas Graduate Nurses' Association, and Texas League for Nursing. Serving as delegates of the medical profession are Drs. Truman G. Blocker, Jr., Galveston; G. E. Brereton, Dallas; A. C. Scott, Jr., Temple; and Joseph F. McVeigh, Fort Worth, with the President and executive secretary as ex officio delegates.

Dr. Blocker, first regularly elected and current chairman of the commission, presided at the conference; Mrs. Ruth Barnhart, Dallas, executive secretary of the Texas Hospital Association and commission secretary, acted as secretary.

The conference was held to discuss all aspects of nursing education and recruitment in Texas and led to six specific recommendations which those in attendance believe will be effective in helping to alleviate the shortage of nursing personnel.

Program

Following a discussion of the objectives of the commission and of major problems in relation to nursing by Dr. Blocker, the presidents of the organizations constituting the commission spoke briefly. Tol Terrell, San Angelo, hospital administrator; Dr. A. C. Scott, Jr., Temple, physician; and Mrs. Ruth Yankauer, R. N., Fort Worth, director of nursing service, then expressed the viewpoints of their professions toward "What Are Our Nursing Needs in Texas?"*

The purpose of all educational programs in nursing in Texas were defined in a series of presentations. Programs covered were inservice training for aides, vocational nurse programs, modified diploma program, three-year diploma program, collegiate program, and two-year experimental diploma program. Also included was a review of the responsibilities of the Board of Nurse Examiners.

Dr. Brereton presided over a session in which nurse recruitment programs in Texas were outlined. Admissions to schools of nursing, fall-out rates in schools of nursing, recruitment on a local level, and the nurse recruitment program of the Woman's Auxiliary to the Texas Medical Association, the latter by Mrs. William D. Nicholson, Freeport, were discussed.

Finally, the entire conference, together with recommendations drawn up by the Joint Commission between sessions of the conference, was summarized by Miss Faye Pannell, R. N., Dallas, program committee chairman. The material which follows is drawn from her report.

Summary of Conference

The stage for the conference was set, Miss Pannell began, when the chairman reminded that problems cannot be solved by one group alone, but that they must be approached through an exchange of ideas and mutual cooperation of all concerned. It became apparent, as the president of each of the participating organizations spoke, that the primary objective of each group is the improvement of patient care. It also became apparent that everyone present favored the opportunity for doctors, nurses, and hospital administrators to think through together some of the ways by which each group may contribute toward "doing something" about nursing to improve care of the patient.

It was agreed that hospitals still are experiencing, and will continue to experience in the foreseeable future, an acute shortage of registered nurses. A few isolated hospitals report that they have adequate numbers of nurses but that other problems are encountered because of the fast turnover among registered nurses.

Texas hospitals have a high ratio of people in nursing services for taking care of patients as compared with numbers of beds, but the ratio of professional personnel to nonprofessional personnel is not high. There continues to be a number of completely constructed hospital beds in Texas that cannot be occupied because there are not adequate numbers of personnel for the hospitals.

Conference members were told that much talking is done about numbers of nursing personnel, but that equal concern should be exhibited about the quality of the preparation of the people who are going to give nursing care. For optimum production from nursing service staffs, the best utilization must be made of all the skills in each of the categories of nursing personnel.

The medical members who participated in the conference, as did the others, pleaded for a return of more personalized nursing care for their patients. Nursing service personnel determine what needs to be done for the patient and who can best do the job. They also should decide what qualifications are essential to do the job. The nursing educators likewise need to concentrate on preparing all levels of personnel in the nursing services.

It was recognized that one of the great needs in this state is for adequately prepared head nurses and supervisors and for qualified nursing school faculty personnel. Also needed are management skills in the people who will supervise and direct the activities of many other workers and, in instructional personnel, the ability to give the student who has intellectual curiosity a high motivation for carrying on her own education after she has completed the basic program.

The discussions of the objectives of the various nursing education programs in Texas indicated that there are six different programs for preparing all levels of nursing personnel, Miss Pannell reported.

The nurse aide is trained on the job through an inservice program. It is the responsibility of nursing service administration not only to carry on the educational program for these personnel, but also to conduct inservice training for other personnel in the nursing service.

Great strides have been made in the last few years in vocational nurse training programs in the state, and there now are seventy-one approved vocational nurse training schools with several more ready to apply for approval at the next meeting of the State Board of Vocational Nurse Examiners. The ratio of professional nursing personnel to nonprofessional nursing personnel probably will not be markedly altered in the near future, and it will be necessary to continue to depend upon licensed vocational nurses to take on many responsibilities. Efforts should be continued to strengthen and improve their training programs and recruit students for them as they should be for all other nurse education programs.

Members of the conference heard of the efforts of the Board of Vocational Nurse Examiners to assist the people responsible for vocational nurse education through workshops and conferences conducted in cooperation with the state vocational education department. They also learned that it is now possible in Texas for those who have been graduated from approved schools of vocational nursing to take a six months' postgraduate course in specific clinical areas to be more effective workers in the technical fields of their choice.

*Dr. Scott's address appears in full in the Original Articles section of this JOURNAL.

A report was made on the recently approved modified registered nurse education program. This program, an effort to help meet the nurse-shortage situation by providing more adequate numbers of prepared people to do nursing, is a departure from tradition, but there is a possibility that the end results will help solve the problem. One of the limitations in this program is that it will meet licensure requirements only in Texas and a limited number of other states. There are both limitations and advantages in each of the nurse education programs being offered, and all the affected allied professional groups have the responsibility of interpreting each of the different programs to those interested in a nursing education.

In the discussion of the objectives of the typical three-year nurse diploma program, which prepares the general practitioner nurse, it was agreed that the graduates should be ready for development into good bedside nurses, that they require supervision, that they have need of an opportunity for more maturity, and that they need good direction from people who have had more experience and additional educational preparation.

Also discussed were the objectives of collegiate nurse education programs, which prepare more highly educated young men and women to give comprehensive nursing care to all types of patients, in hospitals or in homes. Because of the additional maturity as well as the educational opportunities of these graduates greater stability can be expected in this group of nurses than in the others. They will have had a broad basic preparation and will meet qualifications essential for additional study on higher degree levels, and, after additional preparation and experience, will progress more rapidly to positions of greater leadership and responsibilities.

It was reported that the two-year experimental diploma program, started this fall, is expected to meet the objectives of the traditionally longer program in a shorter period, twenty-five months. During the last eleven months of the program, the student will be employed by the nursing service of the hospital, during which time she will participate in a continuous inservice educational program while completing the requirements for state licensure. She will thereby serve as a general staff nurse in a junior staff capacity, with a salary of three-fourths of that of the registered nurse.

Conference members learned that the Board of Nurse Examiners, which has responsibility for the accreditation of four of the six nurse educational programs in Texas, is interested in assisting in the development of each program because it is believed that each has a contribution to make toward helping to meet nursing needs in this state.

In all the discussions, Miss Pannell commented, there appeared to be an attitude on the part of program participants and audience of open mindedness, cooperation, and interest in alleviating the present critical situation. No one seemed to feel that only one approach or only one program will suffice.

From the report on the admissions of students to Texas schools of nursing, it was noted that there has been a continued increase in number of admissions, particularly in the last three years. If a similar increase continues, Texas schools of nursing can hope to admit 7 per cent of eligible high school graduates as is true on the national level, rather than the present 4.3 per cent.

All the facilities in schools of nursing are not being used; there still are vacancies in collegiate, diploma, and vocational nurse training programs. It was agreed that recruitment efforts should be for all types of educational programs, helping the student to fit into the program that most nearly meets her needs.

It also was shown that the rising trend in numbers of admissions is not apparent in the numbers of graduates from schools of nursing, but the increased admissions should be reflected in the numbers of graduates in the next three years.

Persons attending the November conference were made aware of the contribution that the Woman's Auxiliary to the Texas Medical Association is making over the entire state in its efforts to tell high school students of the opportunities in nursing as a career. In its campaign the Auxiliary is making scholarships and loans available to nursing students and is organizing Future Nurses Clubs in high schools.

A report of a survey of fall-out rates in schools of nursing made evident a need for careful evaluation of the schools' selection procedures and of established student qualifications. It was shown that 49 per cent of all nursing students who did not complete their education did so for reasons associated with these causes. Another important fact in the survey was that of all those who withdrew from the schools of nursing, 70 per cent showed continued interest in nursing.

A report was made on how one community in the state made student nurse recruitment "everybody's business" with excellent results for the local school of nursing. It was shown that there is a role for each person in the community to fill in nurse recruitment and that the particular role for hospital administrators, nursing administrators, and doctors is in interpreting to future nursing school applicants the opportunities that are available to them.

Recommendations

Miss Pannell concluded her summary of the conference on nursing with the six recommendations brought before the conference by the Texas Joint Commission for the Improvement of the Care of the Patient:

1. That every hospital in Texas set up a commission for itself, similar in organizational arrangement to the Texas Commission, with appointed representatives from hospital administration, nursing education and service, and medical staff, for study of mutual problems and exchange of ideas toward solving these problems, with their chief aim to be improvement of the care of the patient.

2. That all hospitals in Texas conduct detailed job analyses for all hospital personnel contributing toward patient care, with a view toward clarifying the duties of these personnel in their job descriptions and toward clarifying existing confusion in descriptions of jobs in the hospitals.

3. That the Board of Nurse Examiners for the State of Texas be requested to undertake a detailed and long-range statewide study of the curricula of the three-year schools of nursing with a view toward clarifying the aims of these schools in their education of practitioners of nursing.

4. That the Texas Hospital Association be requested to undertake a detailed study of salaries of all levels of nursing personnel in Texas hospitals.

5. That all component organizations of the commission and their members—doctors, nurses, and hospital administrators—make every possible effort to keep luxury nursing at the lowest possible minimum in hospitals and that they be encouraged to make use of group nursing whenever possible.

6. That the Woman's Auxiliary to the Texas Medical Association be commended by the commission and encouraged to continue its plans to arrange for a state-level meeting for members of Future Nurses Clubs in Texas, being assured of the cooperation and assistance of the commission in this endeavor, and that local-level organizations of hospital administrators, doctors, and nurses be encouraged to promote the organization of Future Nurses Clubs where they do not exist and to underwrite the expenses of selected representatives from their Future Nurses Clubs to attend the state-level meeting now being planned.

WORLD MEDICAL ASSOCIATION

The eighth annual general assembly of the World Medical Association was held September 26 to October 2 in Rome, Italy. More members from the United States were present than from any other nation; among them was Dr. F. J. L. Blasingame, Wharton, delegate of the American Medical Association.

Dr. Blasingame stated that the scientific program, conducted by Italian physicians, composed one afternoon session; the remainder of the program was devoted to socio-economic matters. The assembly meetings were conducted in four languages simultaneously. Interpreters spoke from booths into a system connected to headphones which could be tuned into any one of the four channels, English, Spanish, French, or Italian.

"In general," Dr. Blasingame said, "it was apparent that physicians the world around are very similar, that medical ethics are almost the same in all countries, and that an atmosphere of mutual respect and understanding exists on fundamental issues when physicians of the world are brought together. Naturally, training, cultural background, local economic circumstances, and other items may make for minor differences."

Plans were discussed at the meeting for a second World Conference on Medical Education to be held in North America in 1959. The first such conference was held in London in 1953. Also, the WMA considered sponsoring a World Conference on Occupational Health in the next few years.

Of major interest was a discussion of social security. As Dr. Walter B. Martin, Norfolk, Va., President of the AMA, wrote in a recent President's Page (J.A.M.A., November 27, 1954): "I believe it is of vital importance to American medicine that we be kept fully informed as to the social security activities on the international level. Proposals that are being 'whispered in the bed chamber' of the social security in Washington are being 'shouted from the housetops' by the International Social Security Association. The voice and the arm of the World Medical Association needs to be powerfully strengthened so it can adequately meet the sustained pressure from international groups and their American allies." The WMA, explained Dr. Blasingame, is a professional association of national medical groups representing the profession at the international level. Unlike the World Health Organization, which represents branches of government at the international level, the World Medical Association is free of governmental regulation and control, he added.

Another item of grave importance to the assembly was the financial condition of the WMA. Since the growth of the Association threatens to outrun the financial sources, more funds are needed urgently. Annual dues of the United States Committee of the WMA are $10, which includes subscription to the *World Medical Journal*. At present only about 4,600 Americans are members.

Some other subjects discussed at the meeting were supply and distribution of physicians, human experimentation, world population as related to nutrition and health, and the cost of medical care.

The ninth general assembly will be held in Vienna, Austria, in 1955.

Arizona Cancer Seminar

The third annual Cancer Seminar presented by the Arizona Division of the American Cancer Society in association with the Arizona Medical Association will be given in Phoenix, January 13-15, 1955. Nine out-of-state speakers will participate on the program.

TUBERCULOSIS CHRISTMAS SEAL SALE

For the first time since the beginning of the Tuberculosis Christmas Seal sales, a double seal is being offered this year. The sale, which was originally begun in 1907 in Wilmington, Del., began in Texas in 1909. Last year it brought $789,272.98 from the people of Texas toward the fighting of tuberculosis. Of that amount, 82 per cent remained in the counties where it was contributed, 12 per cent financed the statewide program, and the remaining 6 per cent went to the National Tuberculosis Association.

There are approximately three thousand local tuberculosis associations throughout the United States, Alaska, Hawaii, the Canal Zone, Guam, and Puerto Rico. Ninety-nine counties in Texas were served by their own local associations in

1953-1954. These counties represent almost 70 per cent of the Texas population, and, during that time, within their borders more than 80 per cent of the known cases of tuberculosis and tuberculosis deaths were concentrated.

It is estimated that the average cost of a case of tuberculosis now is $15,000; and the estimated cost of tuberculosis control in the United States in 1953 was six hundred million dollars. Even though the death rate from this disease has been cut 90 per cent since the organized fight against tuberculosis began fifty years ago in the United States, death from tuberculosis still strikes every five minutes somewhere in the country.

In 1907 several Wilmington doctors ran out of money while trying to cure 8 charity patients sick with tuberculosis. Miss Emily Bissell, a cousin of one of the doctors, had heard of the sale of stamps in Denmark three years earlier to help some sick children, so she decided to try it in the United States. She raised $3,000 that first year, and there has been a Christmas Seal sale each year since.

INDUSTRIAL HEALTH MEETING

In Houston September 23-25, the seventh annual Industrial Health Conference was held. Out-of-state doctors for the three day session included Drs. William C. Menninger, Topeka, Kan.; Dr. Elmer Hess, Erie, Pa.; Dr. G. H. Gehrmann, Wilmington, Del.; Dr. James H. Sterner, Rochester, N. Y.; Dr. George Manov, Washington, D. C.; and Dr. W. D. Norwood, Richland, Wash.

Citations for outstanding contributions to industrial health were awarded to Dr. Sterner, medical director of Eastman Kodak Company, and to the Atomic Energy Commission. Dr. John C. Bugher, director of the atomic energy medical division, accepted the plaque for that organization.

HOSPITAL DISTRICT AMENDMENT PASSED

Texans voted in the November 2 election to amend the state Constitution to permit the establishment of hospital districts in counties with a population of more than 190,000 and in Galveston County. This amendment went into effect on November 19 along with ten others which voters in the state approved. The hospital districts, instead of cities and counties, could assume the function of financing and operating hospitals, provided that the local voters first approved.

San Antonio Assembly to Meet January 24-26

The International Medical Assembly of Southwest Texas will be held in San Antonio January 24-26. The following guests will participate in the three day meeting:

DR. WILLIAM B. DEAN, State University of Iowa College of Medicine, Iowa City.

DR. EDWARD F. BROOKS, University of Toronto, Ontario, Canada.

DR. GARFIELD G. DUNCAN, Jefferson Medical College, Philadelphia.

DR. ROBERT A. KIMBROUGH, JR., University of Pennsylvania Graduate School of Medicine, Philadelphia.

DR. HAROLD G. SCHEIE, University of Pennsylvania Graduate School of Medicine, Philadelphia.

DR. LESTER A. BROWN, Emory University School of Medicine, Emory University, Ga.

DR. JAMES B. MCNAUGHT, University of Colorado School of Medicine, Denver.

DR. STEWART H. CLIFFORD, Boston Lying-In Hospital, Boston.

DR. EARL E. BARTH, Northwestern University Medical School, Chicago.

DR. GEORGE CRILE, JR., The Cleveland Clinic, Cleveland, Ohio.

DR. FRANK GLENN, Cornell University Medical College, New York.

DR. R. K. GHORMLEY, Mayo Foundation Graduate School of Medicine, Rochester, Minn.

DR. GEORGE F. CAHILL, New York Presbyterian Hospital, New York.

DR. WARNER BOWERS, Brooke Army Hospital, San Antonio.

After a general scientific meeting on Monday morning, January 24, sectional luncheons will be held at noon, with programs in the following sections being presented: general practice; surgery; medicine; pediatrics and gynecology; radiology and urology; and eye, ear, nose, and throat.

That afternoon there will be two medical panels, "Diabetic Problems" and "Diseases of the Thyroid," plus a meeting of the eye, ear, nose, and throat section and a surgical clinical-pathologic conference.

On Tuesday there will be a general scientific meeting in the morning; a buffet luncheon; and two surgical panels, a medical clinical-pathologic conference, and a meeting of the obstetrics and pediatrics section in the afternoon. Wednesday morning after the general scientific meeting, there will be sectional luncheons for the sections on medicine and surgery.

There will be a cocktail party Tuesday evening for all doctors and exhibitors and their wives, and following the adjournment Wednesday afternoon, a golfing tournament will be held at the Oak Hills Country Club.

Details of the assembly program, which is open to physicians who are members of their county medical societies, may be obtained from James C. Anderson, Executive Secretary, P. O. Box 2445, San Antonio 6. The registration fee of $20, which covers all aspects of the meeting, is also being accepted in advance at that address.

Television Shows on Medicine Increasing

Network television shows which hold special interest to medicine are increasing in number with eleven on the subject scheduled for presentation between the middle of November and the last of December.

A twenty-six week series of fifteen-minute medical news programs is being sponsored by Ciba in cooperation with the American Medical Association over the ABC television network. The inaugural telecast of the series, December 12, was on the subject of tuberculosis.

Texas doctors and a Texas patient were in the spotlight on the December 5 March of Medicine Show when the operation on an East Texas oil field worker which was developed by Dr. Michael E. DeBakey, Houston, and his associates, Dr. Denton A. Cooley and Dr. Oscar Creech, Jr., Houston, was described. The telecast showed George Chisum, the patient who underwent the operation, going to his general practitioner, Dr. Robert Ryan, Sour Lake, and then to the Texas Medical Center, where Dr. DeBakey and Dr. Cooley were able to use a human aortic graft to replace the patient's diseased tissue high in the chest near the heart. Dr. Creech reported on the use of the freeze-dry technique in preserving arteries from donors; Dr. Robert Hettig, Houston, explained the tests made on Mr. Chisum to determine his ability to withstand surgery; and Dr. DeBakey and Dr. Cooley showed the details of the operative procedure. The show was presented by Smith, Kline and French Laboratories with the AMA cooperating.

Medic, which is produced under the technical supervision of the Los Angeles County Medical Association and sponsored by the Dow Chemical Company, scheduled programs for November 22 and 29 and December 6, 20, and 27 over the NBC television network.

"The Search," a CBS public service show, scheduled a telecast to report on work at the John Hopkins University School of Medicine, "New Hope for the Deaf," on December 19. "Night Call," the December 7 Cavalcade of America telecast, starred Dean Jagger as Dr. Ben Collins and humanized the small town general practitioner.

PERSONALS

Dr. Donald W. Seldin, Dallas, participated in a symposium on electrolyte disturbances at the fifty-fifth annual meeting of the American Therapeutic Society, St. Louis, November 4-7.

Dr. T. G. Blocker, Jr., Galveston, spoke at the annual conference of the Kansas City Southwest Clinical Society, Missouri, the first week in October.

Dr. J. B. McKnight, San Angelo, and *Dr. Z. T. Scott,* Austin, were among four awarded medallions commemorating the fiftieth anniversary of the voluntary movement for tuberculosis control at the meeting of the board of directors of the Texas Tuberculosis Association, October 24, in Austin. Dr. McKnight, unable to attend the meeting, received his award at a Tom Green County Tuberculosis Association meeting.

A memorial library has been established at Southton, Bexar County Sanatorium, in honor of the late *Dr. R. G. McCorkle,* San Antonio, through efforts of a special committee of the Bexar County Tuberculosis Association.

Dr. Warren M. Jacobs, Houston, was named faculty doctor of the year by the students of Baylor University College of Medicine at opening exercises in September.

Dr. Ernest W. Grumbles, Atlanta, is new district chairman of the Sulphur District of Boy Scouts of America.

Dr. Franklin Yeager, Corpus Christi, a district governor of Rotary International, spoke to the Three Rivers Rotary Club on November 2.

Dr. Joe L. Stevens, Bonham, recently presented an outstanding registered Angus bull to the East Texas State Teachers College herd.

Dr. Thel Williams, Bonham, and Miss Nickie Farris, Jacksonville, were married in Jacksonville on August 20.

Dr. Woolworth Russell, Amarillo, and Miss Jane Doris Bobbitt of that city were married on October 23.

The *Alumni Bulletin,* The University of Texas Medical Branch, Galveston, lists new parents of boys as *Dr. Marjorie F. Roper and Leonard B. Roper,* Bullard, whose son was born September 5; *Dr. and Mrs. Edward A. Blackburn, Jr.,* Houston, July 1; *Dr. and Mrs. Ralph Lane,* Lubbock, September 8. The *Bulletin* lists *Dr. Miles Sedberry and Dr. Margaret Sedberry,* Austin, as parents of a girl, born September 27.

The Stethoscope, bulletin of the Woman's Auxiliary to Tarrant County Medical Society, announces the birth of a boy to *Dr. and Mrs. Tilden L. Childs, Jr.,* Fort Worth.

Ninth AAPS Essay Contest

The Woman's Auxiliary to the Texas Medical Association in cooperation with the Association will sponsor in Texas the Association of American Physicians and Surgeons' 1955 essay contest on "The Advantages of Private Medical Care." Prizes will be given to high school students in public, parochial, and private schools who contribute the best papers on the national, state, and local levels. Mrs. Perry J. C. Byars, San Angelo, is the Auxiliary's state chairman. Texans serving on the national committee for the 1955 contest are Dr. Mal Rumph, Fort Worth, chairman, and Dr. Charles D. Reece and Dr. Hampton C. Robinson, Houston.

A project of the AAPS Freedom Programs, this ninth annual contest will have six national prizes as follows: $1,000 for first place, $500 for second, $100 for third, and $25 each for the fourth, fifth, and sixth place winners. Certificates of meritorious achievement will be awarded to all contestants whose essays reach the finals. The Texas Medical Association has allocated $500 for state prizes, $250 of which will be given the first place winner, $100 to the second, $75 to the third, $50 to the fourth, and $25 to the fifth.

Two of the six national winners in 1954 were from Texas. David Curry of El Paso won $100 as the third prize, and $25 was given to Kate Wood of El Campo for the sixth best paper. In the 1953 contest two Texans also were among the national winners, taking second and third places.

Writing competition is expected to begin about January 1 so county judging can be completed and the three best papers submitted for state judging by March 15. National deadline is April 1.

Additional details are available from Mrs. Byars, 109 Churchill Boulevard, San Angelo.

Texas and Mexican Neuropsychiatrists Meet

The Texas Neuropsychiatric Association and the Mexican Neuropsychiatric Society held a joint meeting in Galveston, October 24-25, and tentative plans were made for a joint meeting next October in Acapulco.

Texas doctors participating on the program were Drs. Don P. Morris and Frank T. Harrington, Dallas; W. B. Cline, Jr., Corpus Christi; R. M. Finney, Pedro Caram Caram, George Ehni, James Greenwood, Jr., and Charles M. Gaitz, Houston; Neville Murray, Kerrville; E. Ivan Bruce, S. R. Snodgrass, Ira J. Jackson, George T. Hoffman, Hamilton Ford, Grace Jameson, Irvin M. Cohen, John D. Archer, and Kenneth Earle, Galveston; Howard C. Reid, Amarillo; C. M. Covington, Orange; Melbourne J. Cooper, Jean Head Cooper, James R. Blair, Jr., and Hector Jaso, San Antonio; and Robert P. Jeub and Henry A. Brandt, Lackland Air Force Base.

Invited guests were Dr. Howard D. Fabing, Cincinnati, Ohio; and Dr. John R. Green, Phoenix, Ariz.

Mexican physicians who opened the discussion after each paper were the following from Mexico, D. F.: Drs. Edmundo Buentello, Luis Saenz Arroyo, Guillermo Calderon, Joaquin Mendizabel, Manuel Falcon, Mario Fuentes, Miguel Ramos Murguia, Juan Cardenas, Augustin Caso, Hernando Guzman West, Dionisio Nieto, Pedro Ortiz, Frederico Pascual Del Roncal, and Jose Gonzalez Varela. Others were Drs. Mario Sanmiguel, Monterrey; Angel Ortiz Escudero, San Pedro; and Lorenzo Gallardo, Zapopan, Jal.

Entertainment for the session included a cocktail party and buffet supper at the home of Dr. and Mrs. M. L. Towler, Galveston, and a cocktail party and smorgasbord at the Jack Tar Hotel. Special tours were arranged for the wives.

Allied Health Professions

An interim committee has been formed since the September 3 meeting of persons interested in establishing an interprofessional health organization in Texas, and another meeting of the group is soon to be scheduled. Dr. F. J. L. Blasingame, Wharton, representing the Texas Medical Association, is chairman. He has appointed Dr. L. P. Walter, Austin, representing the State Department of Health, to head a subcommittee which will determine the most important items for inclusion in the agenda and dates and places for meetings. Serving with Dr. Walter are Miss Stella McCullough, Austin, Texas League for Nursing, and C. J. M. Roesch, Austin, Texas Pharmaceutical Association.

Dr. Paul B. Blunt, San Antonio, representing the Texas Veterinary Medical Association, was named head of a subcommittee to formulate a constitution and by-laws for the group. On his committee are Dr. Kenneth W. Thomas, San Antonio, Texas Dental Association, and Mrs. Sadie J. Brown, San Antonio, Texas Graduate Nurses' Association.

Also participating in the activities designed to foster closer cooperation between members of the health professions of the state are the Chiropody Society of Texas, Inc., with Dr. George Y. McMahan, Fort Worth, as its representative; Group Hospital Service, Ralph E. Webb, Dallas; and the Texas Hospital Association, John Dudley, Houston. Two who are cooperating but have not named delegates to the interim committee are the Texas Joint Commission for the Improvement of the Care of the Patient and the Texas Public Health Association.

Texas Pediatric Society

The Texas Pediatric Society met October 22-23 in Fort Worth and elected the following officers: Dr. Russell J. Blattner, Houston, president-elect; Dr. James N. Walker, Fort Worth, secretary; Dr. Jack M. Woodall, Big Spring, treasurer; Dr. A. O. Manske, Waco, counselor of District 4; and Dr. Frank H. Lancaster, Houston, historian. Dr. M. C. Carlisle, Waco, assumed the office of president.

There were 273 members present to hear the guest speakers, Dr. Douglas Buchanan, Chicago; Dr. Henry L. Barnett, New York; Dr. Wilburt C. Davison, Durham, N. C.; Dr. Russell J. Blattner, Houston; Dr. John Chapman, Dallas; and Dr. Harriet M. Felton, Galveston.

On the program the first day were "Tuberculosis in Infants and Children," by Dr. Chapman; "Hepatitis and its Risks from Blood and Plasma Transfusions," Dr. Davison; "Brain Tumors in Childhood," Dr. Buchanan; "Kidney Diseases in Children," Dr. Barnett; "Advances in Pertussis Immunization," Dr. Felton; and "Congenital Malformations," Dr. Blattner. The second morning, members heard "Common Problems Encountered in a Pediatric Metabolism Clinic," by Dr. Barnett; "Degenerative Nervous Disorders of Childhood," Dr. Buchanan; and "Evaluation of Infant Feeding and the Advantages and Disadvantages of Sour Milk Mixtures," Dr. Davison.

Members and wives were entertained during the two day session with a cocktail party and a breakfast. Wives were given a luncheon and city sight-seeing trips from a helicopter.

Pan-American Academy of General Practice

The Pan-American Academy of General Practice will hold its sixth congress meeting in Lima, Peru, February 11-25, 1955. Post convention visits to Quito, Ecuador, Cali, Colombia, and Panama have been scheduled. The meeting is combined with the Pan-American Association of Medical Specialties and the Latin-American Congress of Physical Medicine.

GERIATRICS SEMINAR JANUARY 9

The Texas Geriatrics Society and the Southwestern Medical School of the University of Texas are sponsoring a seminar on the problems of geriatrics on January 9 at Parkland Memorial Hospital, Dallas. In addition to lecture by faculty members of Southwestern, guests will be Dr. Edward Henderson, Montclair, N. J., editor of the Journal of the American Geriatrics Society; Dr. Stewart Wolf, Oklahoma City; and Dr. R. Hejtmancik, Galveston.

Dr. Hejtmancik's subject will be "Refractory Congestive Heart Failure," and Dr. Wolf will speak on "Psychosomatic Problems of Aging." A short business session will be held January 8, at 3 p. m. Additional information may be obtained from Dr. Martin S. Buehler, 3225 Turtle Creek, Dallas.

POSTGRADUATE COURSE IN HOUSTON

The University of Texas Postgraduate School of Medicine, Houston Division, will give a six weeks course in endocrinology to be held two hours each Tuesday and Thursday evening, January 11 through February 17. Dr. Mavis P. Kelsey, Houston, will be in charge of the course, which is to be at the Auditorium of the M. D. Anderson Hospital and Tumor Institute, from 7:30 until 9:30 p. m. The course offers twenty-four credit hours, and the tuition fee is $30.

Surgery Postgraduate Course

The University of Texas Southwestern Medical School in association with the Dallas Southern Clinical Society gave a course in Recent Advances in Special Surgery, December 2-4, in Dallas. On the faculty for the course were Drs. Morris J. Fogelman, Jerry A. Stirman, Grant L. Boland, Albert P. D'Errico, Willard C. Sellman, Jr., James T. Mills, Robert R. Shaw, Warner Duckett, Donald L. Paulson, W. L. Bush, Jack G. Kerr, Billie L. Aronoff, Louis E. Adin, Marvin P. Knight, T. M. Anderson, and Carroll W. Browning, all of Dallas.

LIBRARY SECTION

DERMATOLOGY

Dermatology, like other branches of medicine, had a small beginning. Its origin is found in the early times of Egypt, Persia, India, and the Hebrew nation.

In the historical writings of Egypt there are mentioned the "Nile boil," leg ulcers, and leprosy. Elephantiasis of the lower extremities is recognized in the statute of Pharoah Menthuhotp (2,000 B. C.). Among diseases of the scalp were "tumors, alopecia, and eruptions." Sunburn, freckles, wrinkles, roughness, and blotches were discussed under facial diseases. Pustules, prurigo, swellings, tumors, leprosy, eczema, scabies, itching, cankers, boils, and carbuncles were known and discussed in the famous Papyrus Ebers. There were remedies for baldness consisting of equal parts of fat of the lion, hippopotamus, crocodile, goose, snake, and ibis.

It seems that specialism had its origin in Egypt, as Herodotus says: "The art of medicine is divided among them. Each physician applies himself to one disease only, and not more. All places abound in physicians; some for the eyes, others for the teeth, others for the belly, and others for the internal disorders."

Cosmetics were in vogue in early Egypt, and it is recorded that Cleopatra wrote a treatise on the subject.

The Hebrews had no special books devoted to medicine, and their source of information was the Bible and the Talmud.

The Hindus used arsenic for leprosy; mixture of mercury and sulfur for pediculosis; hot applications, hot baths, oils, and fumigation for ulcers and skin diseases; and the cautery.

About 460 B. C. Hippocrates separated medicine from religious superstitions and philosophical sophistries. He endeavored to prove that diseases arose from natural causes rather than from the anger of the gods.

In the works of Cornelius Celsus forty diseases of the skin are mentioned. Many remedies are listed for various conditions, among them the great truth that "no remedy whatever can prevent the heads of some people from becoming bald with age" and that it is "almost folly" to attempt to cure freckles.

The first treatise on dermatology was prepared by Hieronymus Mercurialia of Venice in 1572, "De Morbis Cutaneis et de Omnibus Corporis Excrementis," a compilation of the ancient writers.

Historically, dermatology is covered in three periods, the ancient; the second period, which includes the works of Mercurialis, Daniel Turner, Torrey, and von Plenck; and the modern period of Willan, Alibert, Rayer, Wilson, Tilbury Fox, Hebra, Kaposi, and their contemporaries.

A recent book, "Classics in Clinical Dermatology" by Dr. Walter B. Shelley and Dr. John T. Cressey, is worth-while reading material for anyone interested in the history of medicine.

The following items on dermatology are available in the Texas Medical Association Memorial Library:

Books

Andrews, George Clinton: *Diseases of the Skin,* ed. 4, Philadelphia, W. B. Saunders, 1954.

Behrman, Howard T.: *The Scalp in Health and Disease,* St. Louis, C. V. Mosby, 1952.

Conant, Norman Francis: *Manual of Clinical Mycology,* ed. 2, Philadelphia, W. B. Saunders, 1954.

Frazier, Chester N., and Blank, Irvin H.: *A Formulary for External Therapy of the Skin,* Springfield, Ill., Charles C Thomas, 1954.

Holmquist, Ivar: *Occupational Arsenical Dermatitis,* Acta Dermato-Venereologica, Supp. 26, 1951.

Lerner, Marguerite Rush: *Dermatologic Medications,* Chicago, Year Book Publishers, 1954.

Lewis, George Morris: *Practical Dermatology for Medical Students and General Practitioners,* W. B. Saunders, 1952.

MacKenna, Robert Merttins Bird: *Modern Trends in Dermatology,* New York, Paul B. Hoeber, 1948.

Moss, Emma Sadler, and McQuown, Albert Louis: *Atlas of Medical Mycology,* Baltimore, Williams and Wilkins, 1953.

Polano, M. K.: *Skin Therapeutics, Prescription and Preparation* (materia medica dermatologica), with Introduction by Clarence S. Livingood, Houston, Elsevier Publishing Company, 1952.

Shelley, Walter B., and Crissey, John T.: *Classics in Clinical Dermatology,* with Introduction by John H. Stokes, Springfield, Ill., Charles C Thomas, 1952.

Simons, R. D. G. Ph.: *Handbook of Tropical Dermatology and Medical Mycology,* Amsterdam-New York, Elsevier Publishing Company, 1952, 2 volumes.

Skinner, Charles E.; Emmons, Chester W.; and Tsuchiya, Henry M.: *Henrici's Molds, Yeasts and Actinomycetes,* ed. 2, New York, Wiley and Sons, 1947.

Sulzberger, Marion B., and Wolf, Jack: *Dermatology, Essentials of Diagnosis and Treatment,* Chicago, Year Book Publishers, 1952.

Swartz, Jacob Hyams: *Dermatology in General Practice,* foreword by C. Guy Lane, Baltimore, Williams and Wilkins, 1953.

Waldbott, George L.: *Contact Dermatitis,* Springfield, Ill., Charles C Thomas, 1953.

Wittkower, Eric, and Russell, Brian: *Emotional Factors in Skin Diseases,* New York, Paul B. Hoeber, 1953.

Yearbook of Dermatology and Syphilology, Chicago, Year Book Publishers, 1953.

BOOKS RECEIVED IN NOVEMBER

Adriani, John: *Nerve Blocks—A Manual of Regional Anesthesia for Practitioners of Medicine,* Springfield, Ill., Charles C Thomas, 1954.

Akl, F. M. A.: *Surgical Technigrams,* New York, McGraw-Hill, 1954.

Association for Research in Nervous and Mental Disease: *Metabolic and Toxic Diseases of the Nervous System,* Baltimore, Williams and Wilkins, 1953.

Bauer, Julius: *Differential Diagnosis of Internal Diseases,* New York, Grune and Stratton, 1950.

Burrows, Harold, and Horning, Eric S.: *Oestrogens and Neoplasia,* Springfield, Ill., Charles C Thomas, 1952.

Ciba Foundation Symposium: *The Spinal Cord,* Boston, Little, Brown and Company, 1953.

Drinker, Cecil K.: *The Clinical Physiology of the Lungs,* Springfield, Ill., Charles C Thomas, 1954.

Jones, Georgeanna Seegar: *The Management of Endocrine Disorders of Menstruation and Fertility,* Springfield, Ill., Charles C Thomas, 1954.

Lassek, A. M.: *The Pyramidal Tract, Its Status in Medicine,* Springfield, Ill., Charles C Thomas, 1954.

Lown, Bernard, and Levine, Samuel A.: *Current Concepts in Digitalis Therapy,* Boston, Little, Brown and Company, 1954.

Major, Ralph H.: *A History of Medicine,* Springfield, Ill., Charles C Thomas, 1954.

Markowitz, Jacob: *Experimental Surgery,* ed. 3, Baltimore, Williams and Wilkins, 1954.

Moore, Daniel C.: *Stellate Ganglion Block,* Springfield, Ill., Charles C Thomas, 1954.

Morgan, Willard D., and Lester, Henry M.: *Graphic Graflex Photography,* New York, Morgan and Lester, 1947.

Najjar, Victor A., Chairman: *Report of the Eleventh M & R Pediatric Research Conference,* Columbus, Ohio, M & R Laboratories.

Pitkin, George P.: *Conduction Anesthesia,* ed. 2, Philadelphia, J. B. Lippincott, 1953.

Rydberg, Erik: *Mechanism of Labour,* Springfield, Ill., Charles C Thomas, 1954.

Saunders, Lyle: *Cultural Difference and Medical Care, The Case of the Spanish-Speaking People of the Southwest,* New York, Russell Sage Foundation, 1954.

Selman, Joseph: *The Fundamentals of X-Ray and Radium Physics,* Springfield, Ill., Charles C Thomas, 1954.

Spencer, William A.: *Treatment of Acute Poliomyelitis,* ed. 2, Springfield, Ill., Charles C Thomas, 1954.

Stallard, H. B., ed.: *Modern Practice in Ophthalmology,* New York, Paul B. Hoeber, 1949.

Thorek, Philip: *Diseases of the Esophagus,* Philadelphia, J. B. Lippincott, 1952.

Watson, E. H., and Lowrey, G. H.: *Growth and Development of Children,* ed. 2, Chicago, Year Book Publishers, 1954.

Welch, Henry, ed.: *Antibiotics Annual, 1953-54, Proceedings of the Symposium on Antibiotics,* New York, Medical Encyclopedia, 1953.

Wolstenholme, G. E. W., ed.: *Chemical Structure of Proteins,* Ciba Foundation Symposium, Boston, Little, Brown and Company, 1954.

Wolstenholme, G. E. W., ed.: *Mammalian Germ Cells,* Ciba Foundation Symposium, Boston, Little, Brown and Company, 1953.

Wolstenholme, G. E. W., ed.: *Preservation and Transplantation of Normal Tissue,* Ciba Foundation Symposium, Boston, Little, Brown and Company, 1954.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Ciba Foundation, Summit, N. J., 4 books.

Dr. Wylie F. Creel, Austin, 108 unbound journals, 11 bound volumes.

Dr. P. R. Fayle, Baytown, $10.

Dr. J. O. S. Holt, Jr., Dallas, 3 journals.

Dr. J. Edward Johnson, Austin, 83 journals, 1 book.

Dr. Karl J. Karnaky, Houston, 250 reprints.

Dr. Sam N. Key, Jr., Austin, 13 books.

Dr. James E. Kreisle, Austin, 15 books, 25 reprints.

Dr. Georgia Legett, Austin, 3 journals.

Dr. N. L. Schiller, Austin, 5 journals, 25 reprints.

Dr. S. P. Todaro, Austin, complete set of "Obstetric and Gynecological Survey," consisting of 15 bound volumes.

Dr. Milton E. Turner, Austin, 7 journals.

Dr. David R. Womack, Austin, 47 journals, 1 book, 1 case of antique surgical instruments.

MOTION PICTURES FOR LOAN

Molly Grows Up

16 mm., sound, 16 minutes.

This film on the subject of menstruation was designed especially for girls of junior high school age. It is up to date in its educational approach and presentation. It shows Molly, a school girl, growing into a healthy knowledge and attitude about womanhood. Without being shocking, the film deals directly with all the problems and information which girls want discussed. Everything in the film is handled naturally, and girls easily identify with Molly, the 13

year old who, in the film, experiences her first menstrual period.

Both teachers and children like the way the information they want is "gotten across." The film is excellent not only for girls but also for parents. It is recommended that the film be used only in an organized, educational setting and that a competent person be on hand to conduct discussion.

Artificial Respiration, Back Pressure–Arm Lift Method

16 mm., sound, 21 minutes.

In addition to giving an excellent demonstration of the back pressure–arm lift method of artificial respiration, this film also presents a number of other methods and illustrates the circumstances in which they should be used. This is an excellent film for all lay groups and also can be utilized in nursing classes.

Operation Herbert

16 mm., sound, 27 minutes.

This excellent public relations film on the cost of medical care shows Herbert, under the watchful eye of his penny-pinching Aunt Agatha, going to the hospital for an appendectomy. To win an argument with Aunt Agatha, Herbert, with the aid of his attractive nurse, demonstrates that it costs less to have an appendectomy now than it did in 1937.

Done in an amusing and entertaining style, this film will be useful to physicians and Woman's Auxiliary members who are planning programs for the public.

BOOK NOTICES

The Physics of Radiation Therapy

HAROLD ELFORD JOHNS, M. D., Ph. D., F.R.C.C., *Professor of Physics, University of Saskatchewan; Physicist, Saskatchewan Cancer Commission, Saskatoon, Saskatchewan, Canada. 287 pages. $8.50. Springfield, Ill., Charles C Thomas, 1953.*

The purpose of this monograph is to explain to students and physicians the physical principles basic to an understanding of radiotherapy.

The first chapter on the nature of matter and of radiation is followed by six, explaining roentgen rays, energy absorption, and radium, and high energy devices such as the betatron. Emphasis is placed on the therapeutic use of materials like radioactive cobalt that emit gamma rays. There are splendid tables, diagrams and illustrations. It is recommended for students and specialists using radiation therapy.

[1]Cancer—Diagnosis, Treatment, and Prognosis

LAUREN V. ACKERMAN, M. D., *Professor of Surgical Pathology and Pathology, Washington University School of Medicine, St. Louis, Mo.; Surgical Pathologist, Barnes Hospital and Affiliated Hospitals, St. Louis, Mo.; and* JUAN A. DEL REGATO, M. D., *Director, Penrose Cancer Hospital, Colorado Springs, Colo.; Associate Professor of Radiology, University of Colorado Medical School, Denver, Colo. Second edition. 702 text illustrations and 23 color reproductions. 1,201 pages. $22.50. St. Louis, C. V. Mosby Company, 1954.*

This book is well organized as to discussion of anatomy, incidence, etiology, clinical presentation or characteristics, gross and microscopic pathology, clinical evaluation, differential diagnosis, treatment, complications, and prognosis of cancer.

The bibliography at the end of each chapter for those who are scholarly inclined is excellent, comprehensive, and apparently covers the important contributions to each subject discussed. The sketches, photographs, line drawings, radiographs, and color reproductions are all sharp and clear and represent the best in publication workmanship.

This book is a handy reference work with answers to many questions; it is recommended to all who have to deal with neoplastic lesions.

[2]Surgery of the Biliary Tract, Pancreas and Spleen—A Handbook of Operative Surgery

CHARLES B. PUESTOW, M. D., Ph. D., (Surg.), *Clinical Professor of Surgery, College of Medicine and Graduate College, University of Illinois; Chief Surgical Service, Veterans Administration Hospital, Hines, Ill.; Chief Surgeon, Henrotin Hospital, Chicago. Illustrated by* JESSIE W. PHILLIPS. *370 pages. $9. Chicago, The Year Book Publishers, Inc., 1953.*

This is one of a series of books on operative surgery published by the Year Book Publishers and, like its predecessors, is an excellent addition to a surgeon's library. This book is a guide for surgical residents and trained surgeons but would be inadequate for the physician inexperienced in the surgical procedures.

The book is divided into four sections: the liver, the extrahepatic biliary system, the pancreas, and the spleen. Each section is then considered under the subdivisions of anatomy and physiology, surgical diseases, and surgical procedures. The subjects are briefly but adequately covered in the space allotted. For more detailed investigation of any particular subject, further fundamental literature should be consulted. However, for a concise review of operative procedures successful in the experience of the author, the book is highly recommended to those doing surgery.

Fifty Years of Medicine

T. J. H. HORDER, G.C.V.O., M. D., F.R.C.P. *70 pages. $2.50. New York, Philosophical Library, 1954.*

The three lectures published here were presented in condensed form by Lord Horder as the Barben Lectures and delivered at the Royal Institute of Public Health and Hygiene in 1952. They are divided into the "Birth of Scientific Medicine," "Medicine Enlarges Its Boundaries," and "The Present and the Future."

Lord Horder states his reasons for advocating birth control and reviews the story of the Noise Abatement League and his support of the Cremation Society. The lectures are of great historical interest.

Carcinoma of the Colon

LELAND S. MCKITTRICK, M. D., F.A.C.S., *Clinical Professor of Surgery, Harvard Medical School, and Surgeon-in-Chief, New England Deaconess Hospital; and* FRANK C. WHEELOCK, JR., M. D., F.A.C.S., *Assistant in Surgery, Massachusetts General Hospital, and Assistant in Surgery, Harvard Medical School, Boston. 94 pages. $3.25. Springfield, Ill., Charles C Thomas, 1954.*

This is one of the most comprehensive texts written on the colon; all the important facts are included in the 94 pages. The essential points in the diagnosis and treatment of lesions of the large bowel and rectum are well presented. The sigmoidoscope and its importance in the diagnosis of lesions of the colon, showing how the general practitioner can use it effectively, are included. For a surgeon doing colon surgery, this book is highly recommended, and other physicians may find it a competent reference.

[2]*Mitchell S. Madison, M. D., Austin.*

ORGANIZATION SECTION

TEXAS MEDICAL ASSOCIATION

Annual Session Hotel Reservations

Reservations for the period of the Texas Medical Association's 1955 annual session are being accepted now by Fort Worth hotels. Requests should be sent directly to the hotel of choice. If necessary, requests which cannot be filled are being forwarded to the chairman of the Association's Hotels Committee, Dr. Ray V. Brasher of Fort Worth, who expects to be able to obtain comfortable accommodations for all wishing to attend the meeting April 24-27.

Applications for reservations should include the type and number of accommodations desired, the date and hour of arrival and departure, the relation to the Association or Auxiliary of the person sending the application, and the names and addresses of all persons who will occupy the rooms requested. No deposit is being required, but it is expected that all persons who later find it impossible to attend the annual session will cancel their reservations promptly.

Blocks of rooms have been promised for those requiring special priority as follows: Hotel Texas, Association officials and members of the House of Delegates; Hilton Hotel, guest speakers and Woman's Auxiliary officials; Worth Hotel, technical exhibitors. It has been recommended that persons fitting these categories apply to the hotel suggested at their earliest opportunity so that rooms not needed for these purposes can be released to other members of the Association and Auxiliary.

Among the Fort Worth hotels and motor courts which are cooperating to assure adequate accommodations are the following:

Century Motel, 3434 E. Lancaster.
Coates Hotel Apts., 611 W. 4th.
Fayette Hotel, 615 W. 3rd.
Fortune Arms, 200 Burnet.
Hickman Hotel, 515 W. 5th.
Hilton Hotel, 601 Main.
Ivanhoe Hotel, 709 W. 3rd.
Loring Hotel, 3101 Camp Bowie.
Park Plaza Motel, 1815 E. Lancaster.
Texas Hotel, 815 Main.
Town and Country Motel, 3520 Camp Bowie.
Town House, 600 W. 3rd.
Westbrook Hotel, 408 Main.
Western Hills Hotel, 6451 Camp Bowie.
Westmoor Courts, 5800 Camp Bowie.
Worth Hotel, 310 W. 7th.

It is anticipated that a number of committee meetings will be held in Fort Worth on Saturday, April 23. The House of Delegates will convene first Sunday morning, April 24, and some of the specialty societies will meet that day. The Executive Board of the Woman's Auxiliary will meet for a luncheon Sunday, and joint memorial services will be held in the afternoon. A special program of scientific motion pictures is being planned for Sunday evening. Refresher courses, registration for which will be in advance by mail, will be held each morning Monday through Wednesday, with general meetings later each morning. Scientific sections will meet Monday and Tuesday afternoons. Specialty societies not meeting Sunday will have programs Monday. Alumni banquets Monday night, fraternity parties and the President's entertainment Tuesday night, and a general luncheon Wednesday noon are on the docket. The Auxiliary, which will join the Association for the entertainment features just mentioned, will continue its activities through Wednesday morning.

Final plans for the scientific program will be reviewed by the Council on Scientific Work on January 16. Anyone interested in submitting a paper for the program should act promptly, Dr. May Owen, Fort Worth, chairman of the council points out.

County Society Officials to Meet

The program for the Conference of County Medical Society Officials, which will be held at the headquarters building of the Texas Medical Association, Austin, January 22, has been announced. Formerly the County Medical Society Presidents' and Secretaries' Meeting, this year it has been broadened to include delegates and public relations and legislative committee chairmen. Members of all councils and committees of the Texas Medical Association also have been invited to attend the day long conference which precedes the January 23 Executive Council meeting.

Guests participating in the county officials program are Dr. George F. Lull, Chicago, secretary and general manager, American Medical Association; Frank G. Dickinson, Ph. D., Chicago, director of the Bureau of Medical Economics Research, AMA; and Edwin J. Faulkner, Lincoln, Neb., president of the Woodmen Accident Company. Mr. Faulkner is also a trustee of the Bryan Memorial Hospital in Lincoln, being chairman of the finance committee, and served in 1950-1951 as president of both the Health and Accident Underwriters Conference and the Insurance Federation of Nebraska. These men plus officers and staff members of the Association will speak to physicians attending the meeting about topics on which they are especially informed.

The complete program of the Saturday meeting of county society officials appears in this same section.

Many of the committees of the Association will meet Friday and Saturday, January 21 and 22. Meetings scheduled at press time included the following on Friday: 7:30 p. m., Committee on Liaison with Workmen's Compensation Insurance Companies; 7:30 p. m., Board of Trustees; 8 p. m., Committee on Public Relations. On Saturday: 1 p. m., Committee on Blood Banks; 2 p. m., Board of Councilors; 2 p. m., Committee on Negro Medical Facilities; 2 p. m., Council on Medical Education and Hospitals; 3 p. m., Committee on Tuberculosis; 3 p. m., Council on Medical Economics; 4 p. m., Committee on Maternal Mortality; 4 p. m., Committee on Nursing Care; 4 p. m., Committee on Mental Health; 4:30 p. m., Committee on Public Health; 5 p. m., Council on Medical Jurisprudence; 5 p. m., Committee on Rural Health and Doctor Distribution; 5 p. m., Committee on Revision of the Constitution and By-Laws; 7:30 p. m., Advisory Committee to the President; 7:30 p. m., State Committee for American Medical Education Foundation; hour to be designated, State Council on National Emergency Medical Service.

All members of the Association present for earlier meetings are invited to attend the Executive Council session on Sunday morning, January 23, when reports will be given.

January Visitations

Visitations scheduled for January to county medical societies by officers and members of the central office staff of the Texas Medical Association are as follows: Smith County Medical Society, January 11; Dallas County Medical Society, January 13; Cameron-Willacy Counties Medical Society, January 17; Victoria-Calhoun-Goliad Counties Medical Society, January 27; Tarrant County Medical Society, January 4.

Conference of County Medical Society Officials

January 22, 1955, 9:00 a. m.–4:15 p. m.

9:00—*Registration.*

9:30—*Organized Medicine: Its Importance to Each Physician.*
DR. F. J. L. BLASINGAME, Wharton, President, Texas Medical Association.

9:45—*Internal Problems Confronting Medicine: Activities of Texas Delegates in the House of Delegates of the American Medical Association.*
DR. MILFORD O. ROUSE, Dallas, Delegate, American Medical Association.

10:00—*Issues Pending Before the House of Delegates of the Texas Medical Association at Fort Worth in April, 1955.*
DR. HOBART O. DEATON, Fort Worth, Speaker, House of Delegates.

10:10—*An Accounting of Stewardship: What Happens to Your $50 Dues?*
DR. ROBERT W. KIMBRO, Cleburne, Chairman, Board of Trustees.

10:20—*Obligations of Members to Organized Medicine and Medical Ethics.*
DR. R. G. BAKER, Fort Worth, Chairman, Board of Councilors.

10:30—*Services of the Texas Medical Association: Improving Liaison with County Medical Societies.*
C. LINCOLN WILLISTON, Austin, Executive Secretary, Texas Medical Association.

10:40—*The 1955 Annual Session at Fort Worth.*

The Scientific Program.
DR. MAY OWEN, Fort Worth, Chairman, Council on Scientific Work.

Welcome to Fort Worth.
DR. C. S. E. TOUZEL, Fort Worth, President, Tarrant County Medical Society.

11:00—*Medical Economics and Public Relations.*
DR. HARVEY RENGER, Hallettsville, Chairman, Council on Medical Economics, Presiding.

The Cost of Medical Care.
FRANK G. DICKINSON, PH. D., Chicago, Ill., Director, Bureau of Medical Research, American Medical Association.

The Present Role of Voluntary Health Insurance.
EDWIN J. FAULKNER, Lincoln, Neb., President, Woodmen Accident Company.

Combating Criticism Through Public Relations.
DR. WILLIAM M. CRAWFORD, Fort Worth, Chairman, Committee on Public Relations.

12:30—*Buffet Luncheon.*

DR. GEORGE F. LULL, Chicago, Ill., Secretary and General Manager, American Medical Association.

2:00—*Medical and Health Legislation Anticipated in Washington and in Austin.*
DR. JOSEPH B. COPELAND, San Antonio, Chairman, Council on Medical Jurisprudence, Presiding.
Why Reinsurance Won't Work.
MR. FAULKNER.
The Physician and Social Security.
DR. DICKINSON.
Malpractice Insurance and Other Legislative Problems in Texas.
PHILIP R. OVERTON, Austin, General Counsel, Texas Medical Association.

3:30—*Implementing the Legislative Program in County Societies.*
County Societies with 5-50 Members.
DR. J. W. RAINER, Odessa, Moderator; DR. HERBERT DONNELL, Waxahachie; DR. CARLOS E. FUSTE, Alvin; DR. RALPH E. GRAY, Lake Jackson; DR. C. E. OSWALT, Fort Stockton.
County Societies with More Than 50 Members.
DR. J. R. DONALDSON, Pampa, Moderator; DR. E. E. ANTHONY, Fort Worth; DR. DELPHIN VON BRIESEN, El Paso; DR. JAY WADDELL, Dallas; DR. FORD WOLF, Temple.

AMERICAN MEDICAL ASSOCIATION

TV Visual Aids Available for Societies

The American Medical Association Bureau of Health Education now has a lending library of television-tested visual aids to lend without charge to medical societies for demonstration purposes. These include anatomical charts, three-dimensional relief models, and films.

The filmed television programs which are available include the "What to Do" series of a dozen five-minute shows; "Sally's Little Noise Box," a script with accompanying ten-minute film; and "Double Take," a script with accompanying ten-minute film about smallpox vaccination.

Three dimensional models including skin, heart, brain, head, eye, and obstetrical models are also available. In addition to twenty-six anatomical charts in full color, there are many black and white diagrams and line drawings. A list of these AMA Televisuals can be obtained from the Bureau of Health Education of the AMA, 535 North Dearborn Street, Chicago 10.

COUNTY SOCIETIES

Bell County Medical Society

October 6, 1954

(Reported by F. M. Hammond, Secretary)

The Bell County Medical Society met in Temple on October 6 with fifty members and four guests present. Guests included J. Wilson David, Corsicana, councilor of District 12, and H. O. Smith, Marlin, vice-councilor. Mr. Philip R. Overton, Austin, legal counsel to the Texas Medical Association, and Mr. C. Lincoln Williston, Austin, assistant executive secretary, spoke on "The Physician's Stake in National and State Legislation."

At the business session, it was decided a program similar to those in the past should be carried out during Annual Diabetes Week, November 14-20, and the diabetes committee was put in charge. Harry Frey, Belton, reported that his committee, which was appointed to investigate the feasibility of a permanent x-ray unit connected with the Bell County health program, recommended that a tuberculosis chest clinic be established in Bell County. After problems of establishing this clinic were discussed, the report was approved.

C. L. Stevenson, R. A. Barrow, Jr., and J. F. Tracey, all of Temple, were elected to membership in the society.

Dallam-Hartley-Sherman-Moore Counties Society

October 7, 1954

(Reported by John A. Blaschke, Secretary)

Self-Regulatory Function of a Medical Staff — Walter C. Watkins, Amarillo.

The Dallam-Hartley-Sherman-Moore Counties Medical Society met on October 7 in Dumas for a business meeting and to hear the above paper. John R. Purgason, Stratford, was elected to membership in the society.

John H. Cunningham, Dalhart, reported that the tuberculosis x-ray campaign in the area had been successful, and that he had been requested to make arrangements for a return visit in 1955, preferably at the time of the Dumas fair.

Hale-Floyd-Briscoe-Swisher Counties Society

October 12, 1954

(Reported by John C. Long, Jr., Secretary)

Surgical Indications and Diverticulosis of Colon—Harold Warshaw, Lubbock.

The Hale-Floyd-Briscoe-Swisher Counties Medical Society met in Plainview on October 12 to hear a scientific program and visiting officers and a staff member of the Texas

Medical Association. Visitors participating on the program were Chester Callan, Rotan, chairman of the Committee on Rural Health and Doctor Distribution; Frank B. Malone, Lubbock, councilor of District 3; and Mr. N. C. Forrester, Austin, executive secretary. After the duties and functions of the county medical society and the central office were explained by the visitors, Dr. Warshaw gave the scientific paper outlined above. The paper was discussed by other surgeons present.

Lubbock-Crosby Counties Society

October 5, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Acute Head Injuries—William Evans, Lubbock.

The Lubbock-Crosby Counties Medical Society met on October 5 in Lubbock and held a short business meeting prior to the scientific paper outlined above. Frank C. Goodwin, Lubbock, president, told of the opportunities for part time work by physicians of the area at the Reese Air Force Base Clinic; Frank B. Malone, Lubbock, discussed plans for the dinner meeting in November at which F. J. L. Blasingame, Wharton, President of the Texas Medical Association, will attend and announced that some of the neighboring society members are interested in attending meetings of the Lubbock-Crosby Counties Medical Society and would like their names added to the monthly mailing list.

Dr. Evans, in his scientific paper, discussed the operative procedures available and the complications which might arise in acute head injuries. A discussion of the subject by R. Q. Lewis, William H. Gordon, J. D. Donaldson, Harold Warshaw, Olan Key, Grady Wallace, and Richard K. O'Loughlin, all of Lubbock, followed.

Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Society

September 17, 1954

The Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Medical Society met at the Uvalde Country Club on September 17. Speakers were J. W. Kopecky, John J. Hinchey, and Elmer T. Coates, all of San Antonio; Mr. W. E. Syers, Austin, public relations counsel to the Texas Medical Association; and C. P. Hardwicke, Austin, vice-speaker of the House of Delegates.

Nueces County Society

October 12, 1954

(Reported by G. S. Ahern, Secretary)

The Nueces County Medical Society held a business session in Corpus Christi on October 12. Plans for raising funds for the American Medical Education Foundation were introduced by Maurice D. Nast, Corpus Christi, chairman in Nueces County, and Sterling Martin, Corpus Christi, was appointed chairman of the business-industrial-educational council.

William E. Morris, Corpus Christi, discussed the United Fund Drive and introduced Mr. Alton Weeks, director of Boys City, and Mr. Bill Woosly, who showed the film "Your Neighbor," depicting the projects financed by the fund.

Taylor-Jones Counties Society

September 14, 1954

Symposium on Public Relations—C. E. Adams, Abilene, Moderator.
Organization—R. W. Varner, Abilene.
Fees—J. P. Gibson, Abilene.
Medical Ethics—O. E. Harper, Abilene.
Doctors' Exchange—L. J. Webster, Abilene.
Cost of Medical Care—L. J. Pickard, Abilene.

The Taylor-Jones Counties Medical Society members heard the above symposium at the September 14 meeting in Abilene.

It was decided that public medical forums will be held in Abilene early in 1955, with the society and the *Abilene Reporter-News* cooperating. Members of the society will discuss vital health and medical questions which the public will help to select through questionnaires published in the *Reporter-News*.

The society voted to sponsor again the essay contest conducted nationally by the Association of American Physicians and Surgeons, giving cash prizes to winners.

Travis County Society

October 17-20, 1954

(Reported by C. H. McCuistion, Secretary)

The Travis County Medical Society celebrated its one hundred first anniversary October 17-20 with a four-day program in Austin. A special section in the Austin newspaper giving history of the society and doctors appeared on Sunday, October 17. From Sunday afternoon through Wednesday, an open house was held at the Texas Medical Association headquarters building. A large number of exhibits and motion pictures pertaining to the progress in medicine during the past 100 years were shown. Members of the society and the woman's auxiliary were present to act as hosts and hostesses.

Monday evening, the society cooperated with the Altrusa Club to host a public forum on the "Causes of Death in Travis County" in the Sam Thompson Room of the headquarters building. J. Edward Johnson, Austin, was moderator for the panel, and members were George E. Clark, Jr., William W. Kelton, Jr., James Herrod, Charles Dildy, and J. J. Brady, all of Austin. They were introduced by Ben Primer, city health officer. This was the first in a series of monthly forums scheduled to be presented with the two organizations cooperating.

Tuesday evening F. J. L. Blasingame, Wharton, President of the Texas Medical Association, spoke to the society members. Special invitations were sent to each physician in the Seventh District; members of the Board of Trustees and Board of Councilors and chairmen of all committees of the Texas Medical Association; deans of the three medical schools; the State Department of Health; Bergstrom Air Force Base, Austin; Gary Air Force Base, San Marcos; and the state eleemosynary institutions.

DISTRICT SOCIETIES

Eleventh District Society

October 27, 1954

(Reported by M. T. Braswell, Secretary)

Heart Disease—George M. Jones, Dallas.
Back Pain—George N. Aldredge, Dallas.
Poliomyelitis with Regard to Recent Immunological Developments—William B. Dean, Dallas.
Medico-legal Problems—Mr. Philip Overton, Austin.

The Eleventh District Medical Society met on October 27 in Jacksonville with thirty-six members present. After the above scientific program, the following new officers were elected: Porter Bailes, Tyler, president; Royal Kay, Palestine, vice-president; Hugh Rives, Jacksonville, secretary-treasurer; and Loyd Deason and M. T. Braswell, Henderson, and R. H. Bell, Palestine, board of directors. C. E. Willingham, Tyler, was nominated for councilor, and Lynn Hilbun, Henderson, vice-councilor.

F. J. L. Blasingame, Wharton, President of the Texas Medical Association, that evening spoke on the county medical society at a dinner with members of the auxiliary present.

AUXILIARY SECTION

COUNTY AUXILIARIES

The *Galveston County Auxiliary* is sponsoring twelve television programs in a "Healthy Living" series. The shows, which began in October, will be presented on alternate Saturdays through May by fifth and sixth graders of Galveston, Texas City, and La Marque schools. This is the second year of the television series sponsored by the auxiliary.

The *Camp-Morris-Titus Counties Auxiliary* met at the home of Dr. and Mrs. L. E. Rutledge, Daingerfield, on September 29 to hear reports from Mrs. William A. Taylor, Mount Pleasant, president, and Mrs. Charles Wise, Naples, council woman of District 15. Mrs. P. A. Reitz, Pittsburg, read an article on poliomyelitis, and yearbooks were distributed.

The *Cass-Marion Counties Auxiliary* met at Atlanta on September 29 with the society for a dinner, then held a business session at the home of Dr. and Mrs. James Brooks. A nominating committee was appointed.

Mrs. Mark H. Latimer, Houston, President of the Woman's Auxiliary to the Texas Medical Association, spoke on "Better Health in a Free America" when she was a guest of the *Taylor-Jones Counties Auxiliary* on September 14. Other guests were Mrs. W. Frank Armstrong, Fort Worth, council woman of District 13, and Mrs. A. B. Pumphrey, Fort Worth, a past State Auxiliary president. Another auxiliary visited by Mrs. Latimer was the *Kerr-Kendall-Gillespie-Bandera Counties Auxiliary,* at which she was a luncheon guest on October 1.

The *Bexar County Auxiliary* had a luncheon on October 8 in San Antonio honoring Mrs. Latimer. Other guests were Dr. Merton M. Minter, President of the Bexar County Medical Society; Dr. Charles W. Tennison, counselor to the Bexar County Auxiliary; Dr. J. Layton Cochran, President-Elect of the Texas Medical Association; and Mrs. John Parsons, council woman from District 5.

The *Dallas County Auxiliary* heard Dick West of the Dallas *Morning News* analyze the November elections at the November 3 meeting.

The *Bowie County Auxiliary* heard Mrs. Hoyte Choate of Little Rock, President of the Woman's Auxiliary to the Arkansas Medical Association, at a September 24 coffee.

Other auxiliaries having social meetings in September were the *Cherokee County Auxiliary,* a coffee at the home of Dr. and Mrs. J. T. Boyd, Jacksonville, on September 29; the *Harris County Auxiliary,* a tea at the Doctors' Club, September 29; and the *Wichita County Auxiliary,* a coke party, at the home of Dr. and Mrs. K. W. McFatridge, Wichita Falls, September 22.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. Mark H. Latimer, Houston; President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas; First Vice-President, Mrs. Mal Rumph, Fort Worth; Second Vice-President, Mrs. Harold Lindley, Pecos; Third Vice-President, Mrs. Howard R. Dudgeon, Jr., Waco; Fourth Vice-President, Mrs. Troy A. Shafer, Harlingen; Fifth Vice-President, Mrs. August J. Streit, Amarillo; Recording Secretary, Mrs. P. M. Kuykendall, Ranger; Corresponding Secretary, Mrs. William M. Palm, Houston; Treasurer, Mrs J. C. Terrell, Stephenville; Publicity Secretary, Mrs. A. H. Neighbors, Jr , Austin; Parliamentarian, Mrs. John E. Hill, Marshall.

DEATHS

F. J. SLATAPER

Dr. Felician J. Slataper, Houston, Texas, died in a local hospital of leukemia on September 18, 1954.

Dr. Slataper was born on October 23, 1880, in Chicago and moved to Texas when he was six with his parents, D. Lee and Alice Leah Slataper. He attended the University of Texas, Austin, and its Medical Branch, Galveston; was graduated in 1906 from the University of Pennsylvania School of Medicine, Philadelphia; and received a master of medical science in ophthalmology degree in 1923 from the same medical school. He interned at Episcopal Hospital, Philadelphia, and served a residency at the Houston Infirmary, where he later was a house surgeon. Dr. Slataper did graduate work in Boston and New York.

Practicing in Houston since 1907, he was a former chief of staff at St. Joseph's and Jefferson Davis Hospitals and former supervisor of hygiene for the Houston Public Schools. He became chief pathologist for the city of Houston in 1909 and led a fight against a city-wide meningitis epidemic.

A member of the Texas and American Medical Associations through Harris County Medical Society almost continuously since 1907, Dr. Slataper was elected an honorary member of the state organization in 1954. He had served as secretary, vice-president, and president of the Harris County Medical Society and was a member of the American Academy of Ophthalmology and Otolaryngology and the Texas Society of Ophthalmology and Otolaryngology. He was a member of the Selective Service Medical Advisory Board. He was a lieutenant colonel in the Texas State Guard, being an instructor in rifle marksmanship. Dr.

DR. FELICIAN J. SLATAPER

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

Slataper was a clinical professor of ophthalmology at Baylor University College of Medicine, Houston, from 1943 until September 1, 1954, when he was named an emeritus professor of ophthalmology.

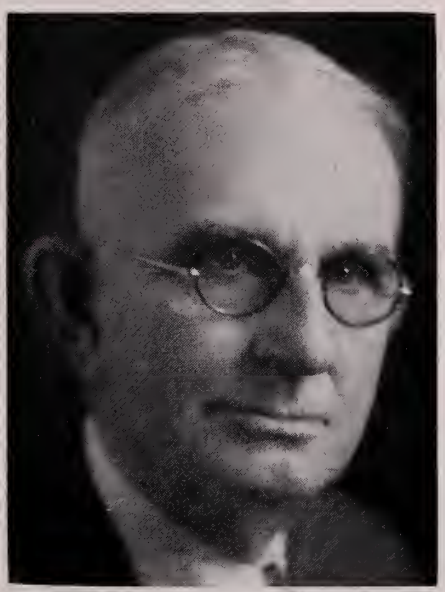
A tireless civic worker, Dr. Slataper particularly enjoyed working with projects for boys. He was a leader in the organization of the Boy Scouts in Houston and one of the organizers of the Little Camp Perry Rifle Club for Boys. He was an expert marksman and was a member of the National Rifle Association and Bayou Rifles. He had participated in national rifle meets.

The former Miss Valborg Berger and Dr. Slataper were married in Houston October 3, 1914. She survives, as do three daughters, Mrs. Ivan Berger, Bishop; Mrs. William Sabom, Houston; and Mrs. Asbjorn Aares, Oslo, Norway; three brothers, Clarence J. Slataper, Alvin; Howard J. Slataper, Arkansas; and Harry A. Slataper, Houston; and seven grandchildren.

I. RASCO

Dr. Isaac Rasco, Amarillo, Texas, died in a local hospital on September 16, 1954, after a series of strokes.

Born on January 13, 1869, in Madison County, Dr. Rasco attended school at Allen Academy at Madisonville, which was a predecessor of the present Allen Academy at Bryan,



DR. I. RASCO

and was graduated from the Northern Normal School, now Holbrook College, Lebanon, Ohio. Teaching school until he had the necessary funds to go to medical school, he was graduated in 1897 from Tulane University of Louisiana School of Medicine, New Orleans. Dr. Rasco began his practice in Madisonville in 1897, moved to Amarillo in 1907, and practiced there until shortly before his death.

A member of the Texas and American Medical Associations through Madison and then Potter County Medical Societies almost continuously since 1906, Dr. Rasco was elected an honorary member of the state organization in 1950. President at different times of each of his county medical societies, he was also a member of the Third District Medical Society. Dr. Rasco was the local surgeon for the Rock Island Railroad Company for fifteen years and division surgeon for twenty years. He was a charter member of the medical staff of St. Anthony's Hospital. Dr. Rasco made many of his early calls with horse and buggy and continued to have a love of animals and growing things from his childhood spent on a farm.

The former Miss Willie Westmoreland and Dr. Rasco were married in Madison County in August, 1898. He is survived by his wife; a son, David Rasco; and a daughter, Mrs. Lewis Dodson, all of Amarillo. Also surviving are two sisters, Mrs. Minnie Smith, Bryan, and Mrs. Emma Blount, Angleton; a brother, Sam Rasco, North Zulch; three grandchildren; and three great-grandchildren.

G. T. O'BYRNE

Dr. George Theodore O'Byrne, Corpus Christi, Texas, died there on September 28, 1954, from a heart ailment.

Born November 17, 1900, Dr. O'Byrne was the son of Mr. and Mrs. Joseph O'Byrne of Neosha, Mo. Dr. O'Byrne received his preliminary education at the University of Notre Dame, South Bend, Ind.; he received his medical

DR. GEORGE T. O'BYRNE

education at the University of Colorado School of Medicine, Denver, being graduated in 1925. He then interned at Hotel Dieu, New Orleans. He was on the staff of the Shreveport Charity Hospital from 1925 until 1926, when he went to LaJunta, Colo., and was on the staff of the Children's Hospital, Denver. He was a resident in pediatrics at Cook County Children's Hospital from 1931 to 1933, being chief resident in 1932 and 1933. In 1934 he moved to Overton, practiced in Tyler from 1938 until 1940, and then moved to Corpus Christi.

Dr. O'Byrne had been a member of the American and Texas Medical Associations continuously since 1934, when he moved to Texas. He was first a member through Rusk County, then Smith County, and finally the Nueces County Medical Society since 1940. He also belonged to the Southern Medical Association. Dr. O'Byrne, certified by the American Board of Pediatrics, was a member of the American Academy of Pediatrics and was a past president of the Nueces County Pediatrics Society. He was a member of the Chamber of Commerce and the Rotary Club in Corpus Christi and belonged to the Catholic Church. He was a member of Phi Beta Pi medical fraternity.

Dr. O'Byrne was interested in and worked toward the establishment of a premature station in Cook County Pedi-

atric Hospital, Chicago, and the establishment of a Well Baby Clinic in Corpus Christi. His specialty in pediatrics was allergy.

The former Miss Byrnis Hart and Dr. O'Byrne were married on November 26, 1921. She survives, as do two daughters, Mrs. Randolph Coleman, San Antonio, and Mrs. John Armstrong, Midland; his father, Walsenburg, Colo.; and three sisters, Mrs. Mary Lamone, Las Animas, Colo.; Mrs. J. T. Matteson, Palisade, Colo.; and Mrs. Mack Walters, El Paso.

S. T. McGUIRE

Dr. Scott T. McGuire, Austin, Texas, died there September 19, 1954, of cerebral atrophy.

Born January 11, 1914, in Wilmore, Ky., Dr. McGuire was the son of Mr. and Mrs. Scott T. McGuire, Sr. He attended Berea College, Berea, Ky., and was graduated in 1937 from the University of Kentucky, Lexington, with a bachelor of science degree prior to being graduated from the University of Louisville School of Medicine in 1941. Dr. McGuire took his internship at Touro Infirmary, New Orleans, before beginning his practice in Berea. After practicing there for two years, he moved in 1945 to Ralls and practiced there until 1948, when he moved to Austin.

A member of the Texas Medical Association continuously since moving to Texas, first through Lubbock-Crosby and then through Travis Counties Medical Societies, and the American Medical Association through 1953, Dr. McGuire was elected an inactive member of the state organization in 1954. He was a member of the Texas Academy of General Practice. A member of Alpha Kappa Kappa medical fraternity, Dr. McGuire was a member of the Methodist Church.

The former Miss Catherine Harris and Dr. McGuire were married on April 29, 1937. Surviving are his wife, his parents, and four children, Lola June McGuire, Scott T. McGuire, III, Harris McGuire, and Charles Patrick McGuire, all of Austin.

J. H. B. BULL

Dr. John Horace Beverly Bull died in Corpus Christi, Texas, on September 28, 1954, from burns.

Dr. Bull was the son of Dr. John Henry Bull and Elizabeth Bull and was born on November 27, 1900, at Holland Center, Ontario, Canada. He received his preliminary education at the YMCA School of Technology and Adelbert College, both in Cleveland, Ohio, and was graduated in 1936 from the Western Reserve University School of Medicine, Cleveland. Interning at Charity Hospital in Cleveland, Dr. Bull began his practice in Aransas Pass in 1937 and practiced there until he moved to Corpus Christi, July, 1954.

Dr. Bull had been a member of the Texas and American Medical Associations through San Patricio-Aransas-Refugio Counties Medical Society continuously since 1938. He was a member of the American Academy of General Practice, being director of the local chapter. He had served as quarantine officer, United States Public Health Service, and as a physician for the Standard Oil Company. Dr. Bull was a member of the Elks Lodge and Lions Club and of Phi Rho Sigma medical fraternity. He was a member of the Methodist Church.

Dr. Bull and Mrs. Myrtle Gauker were married in Beeville on May 11, 1952. He is survived by his wife, a daughter, Miss Elizabeth Kay Bull, Corpus Christi; a sister, Mrs. Muriel Johnson, Toronto, Canada; and two brothers, Robert G. Bull, Toronto, and Ford Bull, Chagrin Falls, Ohio.

H. DONALD

Dr. Homer Donald died at his home in Dallas, Texas, on October 20, 1954, after a heart attack.

The son of James Henry and Rebecca (Hall) Donald, Dr. Donald was born November 14, 1886, in Lewisville. He received his early education at Lewisville Academy; attended the old Trinity University, Waxahachie; and was graduated with a bachelor of science degree from Westminster College, New Wilmington, Pa. In 1912 he was graduated from the University of Texas School of Medicine, Galveston, after which he interned at the John Sealy Hospital there. He began practicing medicine in Dallas in 1913 and practiced there continuously until his death, with the exception of 1916 and 1920, when he did postgraduate work at the Harvard Medical School, Boston, and 1918, when he was a lieutenant in the United States Army Medical Corps.

A member of the Texas and American Medical Associations through Dallas County Medical Society since 1915, Dr. Donald was president of his county society in 1941. He served as secretary of the Section on Radiology and Physiotherapy of the Texas Medical Association in 1935. Dr. Donald was a fellow of the American College of Physicians; a member of the Dallas Southern Clinical Society; and a founder of the Dallas County Medical Plan, a prepayment medical care plan for employed groups. He was a founder and one of the senior partners in the Physicians

DR. HOMER DONALD

and Surgeons Clinic in Dallas. He had been an associate professor of clinical medicine at Baylor University College of Medicine when it was in Dallas and had served as president of the Methodist Hospital staff. He was a consultant in internal medicine at Southwestern Medical School of the University of Texas. He was a past president of the Sunset High School Dads Club and a member and former elder of the City Temple Presbyterian Church.

The former Miss Beatrice Addison and Dr. Donald were married in Dallas, November 24, 1914. In addition to his wife, he is survived by a son, Dr. James Homer Donald, Colorado Springs, Colo.; two sisters, Mrs. W. H. Jones and Miss Ola Donald, both of Garland; and two grandchildren.

INDEX

Abbreviations: (AMA), American Medical Association; (CEC), Current Editorial Comment; (CR), Case Report; (E), Editorial; (L), Library; (N), News and Miscellaneous; (O), Original Article; (PP), President's Page; (TMA), Texas Medical Association; (WA), Woman's Auxiliary.

All items relating to the Woman's Auxiliary are under "Auxiliary, Woman's"; books reviewed are under "Book Notices"; book reviewers are under "Book Reviewers"; motion pictures reviewed are under "Motion Pictures"; deceased physicians are listed under "Deaths"; most other items are listed by title, subject, and author.

New!...

1954 Current Therapy

Here is another great Saunders Book—the New 1954 CURRENT THERAPY—presenting the best treatment available today for every disease you'll meet. This is not a collection of "recent advances," nor is the material taken from literature. Rather it is a complete reference on exact methods of treatment actually being used in practice.

More than 100 of the treatments in this 1954 volume are new—different and better in some way than the best treatments known last year for the same disease. (See Cortisone in bronchiectasis; Anticoagulant therapy of phlebitis; Aureomycin for acute viral pericarditis; Treatment of cerebral palsy.)

By 384 American Authorities selected by a Special Board of Consulting Editors. Edited by Howard F. Conn, M. D. 966 pages, 8"x11". $11.00. Ready February 26.

Diseases of the Skin

Here is an unexcelled reference on skin disorders—vital to your daily practice.

All information is up to the minute including the latest classifications and most recent developments in the field. 777 illustrations help you with recognition by showing you the exact appearance of the diseases.

This comprehensive text meticulously outlines the anatomy, physiology, etiology and pathology of the skin and its disorders. You can count on this helpful source book for full details on diagnosis, current drugs, treatment and management.

By George Clinton Andrews, M. D., F. A. C. P., Clinical Professor, College of Physicians and Surgeons, Columbia University; Attending Dermatologist to the Presbyterian Hospital, Columbia-Presbyterian Medical Center, New York. 877 pages, 6⅜" x 9¼", with 777 illustrations. $13.00. *New (4th) Edition.*

HORMONE CHEMISTRY LABORATORY

HOUSTON, TEXAS

PROTEIN BOUND IODINE

The serum protein bound iodine level is an accurate indication of the circulating thyroxin. With it the physician can determine hypothyroid, hyperthyroid and euthyroid states. He can differentiate more readily tension states, and subclinical degrees of hypothyroid and hyperthyroid activity. In therapy it assists him in maintaining the euthyroid condition.

Harold Wood, M. D.

ANALYSES LIMITED TO:

SERUM PROTEIN BOUND IODINE

17-KETOSTEROIDS
OXYCORTICOSTEROIDS
DEHYDROISOANDROSTERONE
TOTAL ESTROGENS
TOTAL GONADOTROPINS
PREGNANDIOL
FOLLICULAR STIMULATING HORMONE

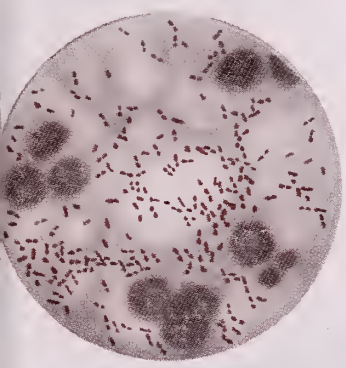
in bacterial endocarditis

"Within ten days [after therapy with CHLOROMYCETIN was begun] there was a dramatic improvement in the patient's clinical appearance and the sedimentation rate and temperature became normal."[4]



in rickettsial diseases

"Chloramphenicol [CHLOROMYCETIN] has been used with striking success in patients with scrub typhus, murine typhus, Rocky Mountain spotted fever, and epidemic typhus."[5]

nycetin®

(Chloramphenicol, Parke-Davis)

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.
